It had no year date, and therefore the canvas must have been manufactured after the Acts of Queen Anne and George III. had been repealed, which was done in the year 1831. The marks were obviously either of the maker of the canvas or of the dealer who supplied it. The initials, in fact, stood for T. Brown, an artist's colourman resident at 163 High Holborn in the 'thirties and 'forties, and probably later, of last century, whose name will be duly found in the London directories of the time. The canvas had never been 'lined'—that is, 'backed' by another canvas to prevent the original from perishing. This was a disturbing element, and even Mr Langdon admitted that it was a very serious set-back to his claim. The significance of the other figures did not come into the story at all.

Mr Cyrus P. White's picture, on the other hand, had no stencil or other canvas-marks of any kind on the back. Moreover, it had evidently and at no remote date been 'lined.' There was only one way of finding out if the original canvas had any Government or other marks, and that was by separating the two canvases. This would at the best be a difficult and a dangerous process, and might possibly result in the destruction of, or partial damage to, the beautiful picture. But Mr White, while concerned to think that his portrait might be irretrievably ruined, was a sportsman, and wanted to get to the bottom of the mystery. He placed the picture in the hands of the most expert picture-restorer in New York. The special kind of preparation used for 'lining' pictures can be dissolved only with the greatest care and delicacy, and it was many weeks before the beautiful Paolina was 'stripped.' The original canvas

was exceedingly brittle, but about half-way down an inscription was discovered, which, so far as the fragments could be deciphered, read thus:

32 Geo III	158	14	115	1792
---------------	-----	----	-----	------

Fortunately the year date in the last section was perfectly clear, and that was all that mattered, for it proved beyond the shadow of a doubt that it was this canvas on which Romney had painted the portrait, and that, therefore, this picture was the original.

During these 'delicate investigations' Mr Langdon received a request from the committee charged with the selection of pictures for the winter exhibition of old masters at Burlington House that he would lend some of his family portraits to the forthcoming show. He readily fell in with the suggestion, and invited a member of the committee to come down and make a selection. The academician to whom this duty was assigned was an elderly man of great knowledge and probity; and at lunch he was placed in a seat immediately facing the portrait of Paolina. After lunch he toured the rooms with his host, and indicated those pictures which he thought suitable. In front of the portrait of Paolina he stood still, and said, 'Unfortunately I cannot select this, for I remember most distinctly copying it in the gallery of a London dealer when a young man over forty years ago. You should find my monogram in red, (E), at the extreme edge of the top right-hand corner of the canvas.' With the aid of two workmen, the picture was removed from the wall, and at the place indicated, beneath the varnish, was found the monogram of the copyist.

'But,' Mr Langdon insisted, 'the picture has never been out of the house since it came here a century ago.' The old butler, however, who had been away ill for some months, and who knew nothing of the controversy which had arisen concerning the portrait, intervened with the remark that Mr Langdon's elder brother (now dead) had one summer, during the absence of the family, sent the picture to London to be cleaned and revarnished, and that it had come back after a week or ten days' absence brilliant in its fresh coat of varnish. 'But to me,' added the old retainer, 'the picture was never quite the same. It was, so far as I could see, the same picture in every respect, but it always struck me that Madame Paolina went away alive and came back dead.' In other words, she had lost her soul, which only a great artist such as Romney could have transfixed on canvas. The copyist had caught the form but not the spirit of the beautiful Paolina. And the picture with the soul was in the collection of Mr Cyrus P. White of Boston, Massachusetts.

SOME CURIOUS REMINISCENCES.

By KITTY NEWCOME.

IN the good old days—and they were good old days—before the most popular of our present modes of transport were in force, our forebears had to make use of such aids to travelling as were then available—namely, the boat, the stage-coach, the horse, and even of shank's-mare. Distances were undertaken on foot in those days that would positively stagger the ordinary pedestrian of to-day, and my own grandfather walked the whole of the way from Leeds to Aberdeen, averaging fifty miles per day. Both he and my father were in the habit of walking exceedingly long distances, mostly, from what I could gather, for the sheer pleasure of walking. My father, however, as a business man, could not spare the necessary time to do all his travelling on foot, even if such had been his desire. Before the railways started in Scotland he was in the habit of taking the boat from Hull to Leith, and he was also a regular passenger on the coach that ran from Leeds to London. The journey was accomplished in nineteen hours, and the horses, which galloped all the way, were changed twenty-two times. On one occasion during the winter my father returned from London on a very full coach. He told me he came the entire distance with one leg swinging quite clear, and that his ears were frozen to his head. It all sounds very Spartan, especially in our days of luxurious travelling; and yet surely there is much to be said for the hardiness of the people in those times, who lived to a ripe old age without the assistance of the specialist and the operator, those indispensables of to-day.

My father had the distinction of being a passenger on the first train to run into Scotland. The accommodation appears to have been anything but comfortable, and the carriage was exceedingly draughty; but railway travelling was a great saving of time, which always means so much to a busy man.

On one occasion when journeying to Scotland he had, for business reasons, to stay a night at Carlisle, and here a very curious experience befell him. He chose his hotel, possibly on the recommendation of some friend or acquaintance, and in preparation for the following day's journey retired early to bed. Being a keen observer, he noted that his room wore a somewhat disused air, but thought little of the matter, and having undressed, and fastened his bedroom door, he got into bed, and promptly fell asleep. He did not know how long he slept, but he awoke quite suddenly, warned by some sense of menace or danger, and lay motionless with every nerve on the alert, staring out into the darkness. He was wondering what had awakened him, but even as the thought passed through his mind he felt the sudden grasp of an icy hand upon his wrist.

Assured that his assailant was a common thief, he lay quite still, yet in perfect readiness for the moment when his antagonist should transfer the grip from his wrist to his throat. Such a moment, however, never came. After an interminable time of waiting, or what would seem an interminable time under such conditions, the hand relaxed its hold and fell away. There followed some minutes of tense expectancy, in which my father listened vainly for any sign or sound; and finally, being determined to fight his opponent in the light, if fight he must, he struck a match and lit the candle at his bedhead. The flickering light revealed nothing that he had not seen in the room on retiring for the night; so, getting out of bed, he made a thorough search of the whole room and the furniture it contained. All was as he had left it on going to bed, even to the door itself, which remained securely fastened. Utterly baffled, and feeling that here was some mystery beyond his understanding, he returned to bed, and actually slept till morning. After breakfasting, he sought out his landlady and asked her if there were not some curious story in connection with the room he had occupied the previous night. She looked grave and rather upset, but apparently either could not or would not throw any light on the affair. She offered him another room, apologised for his disturbed night, and the matter ended there, for all his questions were met by either silence or evasion, and ultimately he had to leave the episode as the unsolved problem it always remained.

The recollection of this incident brings back to mind a remarkable occurrence that befell my grandfather. My father, I may say, kept an entirely open mind on matters occult. He always held that many things happen in this world that are not explainable by any process of logical deduction. With my grandfather, however, it was otherwise, for he disbelieved in any spiritual manifestation whatsoever, and this in spite of his own peculiar experience to the contrary. The story is as follows.

A man who was well known to him, though not a personal friend, left the district and went up to London for a while. Some time after his departure came the news that he had committed suicide in London. The news was a shock to the whole neighbourhood, and a great blow to the man's relatives. Suicide was not so common in those days as it is now, and the impression created on the minds of his townfolk was deep and lasting.

About a year after this tragedy my grandfather also went up to London. What is rather remarkable, perhaps, is that he lodged in the same house where the tragedy had occurred, and with a friend, a medical student, actually

slept in the same room in which the deed was committed. The medical student, like my grandfather, had known the man who committed suicide, but I am sure, in view of what happened afterwards, that he was unaware of lodging in the same house in which the act was perpetrated.

One night after they had retired to rest the sound could be distinctly heard of footsteps restlessly wandering up and down the room.

'Joe,' whispered the student, 'there's some one in the room.'

'There is no one in the room,' said my grandfather quietly; but as though to give the lie direct to any such statement, the footsteps again began to move up and down the room.

'There certainly is somebody in the room,' repeated the medical student; and getting out of bed, he lit the gas and made an exhaustive search. Nothing was to be seen, but the footsteps could still be heard.

'There is no one in the room. Settle down and go to sleep,' advised my grandfather—hardly very soothing advice under the circumstances, and it is not wonderful that it failed to allay

the agitation of his friend. Seeing that some explanation must be made in order to pacify him, my grandfather calmly asked him if he recognised the footsteps as those of the dead man.

The effect on the medical student was instantaneous.

'My God, Joe,' he whispered, 'it is his very walk!'

'Yes; he did the deed in this very room;' and then my grandfather proceeded to lay the ghost by the simple method of requesting it to be quiet and leave them in peace. Immediately there was a cessation of the noise, and for the remainder of the night quiet reigned supreme. The following day saw the medical student in quest of a fresh lodging, but I have every reason to believe that my grandfather remained on in the house, probably still sleeping in the same room.

It seems almost impossible to believe that he never changed his views with regard to spirit manifestations, but so it was.

For myself, I prefer to echo Hamlet, and I do believe that 'there are more things in heaven and earth than are dreamed of in our philosophy.'

MILLE BOMBES!

CHAPTER VI.—MATHILDE.

MEANTIME, at home, Mathilde was busy and happy with Caldecott's dear, delightful drawings of John Gilpin. She laughed with them, and tackled the nimble verses, one by one, learning them swiftly by rote. In an accent never before heard, probably, as Mathilde had never had a lesson in English, she recited them aloud, marking time with her right hand, while Lion, surprised and interested, looked on, his ears pricked and his eyes alight with affection.

Time passed rapidly in this amusement. The clock struck nine. Mathilde counted the strokes. '*Tiens!*' she muttered, and uneasiness came into her face. About three hours had gone by. Why had Prosper not returned? Even through deep snow his journey to the village and back should have been done in ninety minutes. His business in the village would take less than half-an-hour. Prosper, then, should have been home at eight o'clock.

Anxiety grows from within itself after it is awakened. Mathilde went to and fro between the door and the clock, followed by Lion, whose moods changed with Mathilde's. At half-past nine anxiety turned into alarm, and Lion began to whimper.

As a rule silent people act with swift resolution, probably because they do not let off energy in too much talk. At a quarter to ten Mathilde put on her outdoor things, lit the smaller lantern, and went briskly to the door. Lion barked excitedly, and the door being opened, bounded out and began to leap in the snow, as terriers hunt

harvest-mice in growing hay, in spasmodic jumps comic to behold. In an instant he was following Prosper's track.

Though Mathilde had grown pretty tall for her age, anxiety and courage had sent her into an adventure full of risk. Somewhat more than two feet of snow on a dark night, with a much greater depth in hollows and drifts, is trying enough to a strong man; but to a girl of twelve, hindered by petticoats, it became horrible. Lion went ahead, keeping to Prosper's footsteps, while Mathilde struggled on as best she could with painful slowness, the lantern held up high; and when her right arm ached with fatigue, and her fingers became cramped and cold, she changed the lantern to her other hand. The snow, thawing now more rapidly, clung about her boots and legs; and presently, instead of the snowstorm expected by Prosper, a fine rain began to drizzle.

A strange fatigue—a fatigue like sickness—settled in her limbs and ached. Tears rolled with the rain down her cheeks. She tried not to weep, but it eased her to sob; then the good dog whined and kept close to her. It was this companionship and the pale gleam of light from her lantern that enabled the child to go on till she heard far off a hoarse cry. Lion heard the cry first, and instantly knew his master's voice. Barking, he began to leap forward more rapidly, but soon he stopped, and, whining plaintively, looked back at Mathilde. His love was with two persons; he knew not what to do. Prosper

answered the dog's barking, and presently the words '*À moi !*' could be heard distinctly.

A new fear, as well as excitement, moved Mathilde. What was the matter with Père Prosper? She tried to call, but her shrill cry was lost in Lion's gruff noise. When she reached the ditch, and crossed it by the plank, for some time neither she nor Prosper was able to speak. What could a brave man say to such courage in a child?

'*Fillette*,' he said at last, 'I might have been alive in the morning, for I am very strong; but to be saved from such a night by your courage! *Bon Dieu!*—it is very beautiful! Yes—well—and yet—I must ask still more from you, my darling. We can't stop here, and I can't move. So then'—he paused, greatly moved—'can you go on to the village—and seek help? I've lost the use of one leg, you see, and to pull me out of this ditch—*mille bombes!*—it'll be no light job for two or three strong fellows. It's horrible to ask you to do more, *fillette*, but'—

'If Lion comes with me, I can do it,' said Mathilde. 'I'm better now—now that I know what *must* be done.—Come, Lion!'

Without saying another word, she faced the deep-set snow again. For some time she could hear Prosper bawling encouragement to her; and a little later, when she was feeling lost without the sound of Prosper's voice, she saw in the distance a twinkle of moving light—the gleam from another lantern. Her heart beat fast with joy. The light came slowly towards her path from the right. Mathilde hailed it at once, and Lion began to bark. The lantern ceased to move, but soon it approached her once more. The district doctor, Jean Tiriard, had been to a bad case at an outlying farm, and was returning home.

When he came up to her, Mathilde was on her knees in the rain and deep snow, with her head bent in prayer and her hands clasping the lantern to her heart. The encircling gloom had gone from her pain. All would be well now.

Dr Tiriard was a man of fire, ardent and untiring. The child's courage stirred him through and through, and her condition, drenched to the skin and numbed with cold, made him infinitely pitiful. In an hour after they met he had roused up the village, and Mathilde was in bed at the doctor's house, with three hot bricks to give her warmth, and Madame Tiriard to nurse her.

Lights gleamed in the village windows; children got up and dressed; and soon the aroma of coffee implied that breakfast-hour had arrived with another day's toil. Only one person was reticent and backward—the inn-keeper, Charles Janssens, who wondered what part in the drama his bottle of absinthe had played.

After many difficulties, and with many lanterns twinkling around him, Prosper had been carried

to the village on a hurdle—an experience never forgotten by those who bore his weight. During frequent halts he told his story, forgetting no detail. He chose the village himself. Mathilde was there, and he was certain that heavy rain, aiding the thaw, would cause in a few hours a great flood, and that his cottage would be inundated. In this forecast he was right. Next morning, when Crowley arrived, eddying water had risen to a depth of more than four feet in the cottage, and a swirling, dangerous enemy raged over many miles of valley. So much damage was done in his little home that Prosper felt half-ruined, and Mathilde for a time was inconsolable. 'And M'sieu Caldecott will be gone altogether,' she said to Crowley. 'Ah, the beautiful book!'

Prosper had been carried to Tiriard's house, as no cottage had a spare room. Janssens would have taken him, as Prosper's presence at the inn would have drawn custom there, but Dr Tiriard had no faith in *estaminets* as nursing-homes. For all that, Janssens was now in full feather, sharing the honours of an eventful night with Mathilde, Prosper, and Lion.

'If,' said he, 'my heart had not spoken, I should have failed to give that bottle to Prosper, and our good giant would have gone home without accident. What then? Would he have gone to bed? Yes, would he, and the child too. How tragic! For they would have been caught by the great flood! Who knows with what dreadful results? My bottle, then, coming from my heart, was a godsend to Prosper, let gossip say what it will.'

A few days later Crowley came upon the bottle of absinthe lying in a soppy field. Prosper had asked him to look for it in order that it might be returned to Janssens. Crowley was struck by the liquor's pale colour.

'Isn't it too pale to be pure?' he asked Janssens. 'It looks like absinthe-and-water. Shall we set it side by side with a sealed bottle?'

'Hush, m'sieu!' said Janssens, flushing. 'Let me explain. Let me speak out. Was I to put too much temptation into Prosper's hands?'

'Anyway,' Crowley answered, 'this part of the story—shall we call it thrift in your gift-making?—must be made known, as you have talked so much about the other part.'

It was made known, and never was it forgotten by the peasants. 'Not too much temptation in it, please!' they said to Janssens when they asked for faro or some other drink.

In about two months Prosper was able to return home, but he was very lame, and remained lame ever afterwards.

Ever afterwards, too, Dr Tiriard and his wife took a great interest in Mathilde and Père Prosper—in Mathilde particularly; and it was

Tiriard's judgment that discovered the true bent of the child's nature and helped her to make her home in a great profession.

CHAPTER VII.—CROWLEY AND MATHILDE.

IT was in 1909, Mathilde's seventeenth year, that Crowley made up his mind to leave Brussels in order to try his luck in London, aided by only £200 of capital. Gray, anxious days had come to him all at once. His father, long a man of wealth, had become suddenly poor through unfortunate speculations in business, and was now unable to supply his son with 'a fighting fund,' as they called a handsome allowance. A cheque for £200 accompanied this news of a breakdown at home; also a brief postscript: 'Take a header, rise to the surface, and swim hard. Not in Brussels, a mere civic pond, but in London, humanity's rough Bay of Biscay. To drown bravely in London is better than to float elsewhere.'

When Prosper heard of his friend's changed outlook, he begged Crowley not to set out for London till after the summer holidays had begun, when Mathilde would return home from her convent school, in which the influence of Dr Tiriard had found her a place just five years before. Her last term there was drawing to a close, and surely the three should have a farewell gathering.

Crowley stayed, and early in July, after settling all his affairs in Brussels, went for three weeks to the Semois valley, with its hospitable peasants and its lusty old fields and trees.

Prosper had added ten acres to his farm, and two strapping lads worked for him. 'You see, m'sieu,' he said to Crowley, 'cows and my stiff knee make no end of work, with losses in it at times, *mille bombes*! But I'm still a model. These boys of mine copy me, and tell tales about me, and stand by me through thick and thin. You should see 'em when they feel the muscles in my arms! Should I have had good friends if my body had been puny, like M'sieu Colin's? Sometimes at night I fret myself over this question. To be a friend and to have friends is a food that makes me warm here;' and Prosper with a vast hand thwacked himself over his heart.

If Crowley had been going to the North Pole, a greater fuss over his farewell visit could not have been made by Prosper and his neighbourhood. Mathilde alone was reticent. Prosper wondered why, as she kept with great care all the many presents she had received from Crowley; and whenever she wished to say something pleasant about an artist or an author whom she had seen, perhaps in a photograph, she would suggest doubtfully that he seemed almost as tall or almost as good as M. Crowley.

Mathilde, at seventeen, was tall and slight,

with a sort of elastic grace, and a luminous beauty that set her apart as uncommonly gifted. Girls in the Semois valley, resenting the unsought charm that placed her in a rank aloof from their own, spoke of Mathilde as *La Duchesse des Choux Blancs*—a stroke of malice never to be forgiven by Prosper. But Mathilde liked it as clever and funny; for she was so much absorbed in her duties that she never worried about herself.

Among her aspirations was a desire to be a hospital nurse, or what she, being convent-bred, called 'a prioress over pain and disease.' This ambition showed itself after Prosper's accident, and Dr Tiriard and his wife had encouraged it constantly. It became a ruling passion, the girl's second nature, and in two or three months Mathilde was to begin her apprenticeship in a Brussels hospital. Now and then Prosper would pass a week in the little white city; and meantime he was throwing a spell over the village schoolmaster in order that letters to Mathilde might be dictated twice or thrice a week.

In several walks Crowley and Mathilde spoke from the heart about their professional outlook, all the richer thought and fervour coming from the girl, in a simple and musical French quite free from a Belgian accent. There was opposition enough in their likes and dislikes to form the strongest of all harmonies—the harmony of contrasts all in tune. Very soon they knew each other as sympathetically as a musician knows a favourite piece after learning it by heart. Feelings of caste and class took flight; talent spoke to talent, aspiration to aspiration, in that one fellowship that levels up and up to a plane where all are truly equal as comrades in gifts of the spirit.

'Mathilde, you have genius, not a doubt about it,' he said to her on the evening before his departure. 'If only I had a touch of the same great thing, I should not feel work as work, toil as toil, and get stale and fagged.'

'What right have you,' she asked, 'to use such words as "stale and fagged"? Why think of yourself at all? Is it not enough to lose yourself in your work, and to sing in it with all your heart? Am I to think that past reliance on your father's allowance has taken from you the wish to make your way through deep waters into a harbour of your own? What will "failure" matter to you, or to me, if we do our best always with hope and joy?'

She turned suddenly and looked him full in the face, her cheeks glowing and her large blue eyes deep with intense inward light. They were standing in twilight by the cottage door, while Prosper was busy in the shippen, where a calf was ill.

'Yes, of course, you are right,' he answered. 'I'll promise not to keep black-edged notepaper in my mind.'

'Notepaper?' she repeated. 'Père tells me a great deal of it is going to be used, as he cannot bear to think of being cut off from you. His gift for friendship—you know what it is, don't you? Père is fond of Colin and Bertrand, but his feeling for you is far and away deeper. It will be with him always. Never forget that. To be loved by Père is to be loved by a big tender natural force. As soon as I can earn money enough as a nurse, he must come to me, for we need each other all day long.'

Next day Crowley carried away with him a new hope, a fresh outlook, that lifted him out of that poor circle of egoism in which so many artists shut themselves up as prisoners. He loved Mathilde, but it was the influence of her mind that opened to him new and widened prospects.

CHAPTER VIII.—TOWARDS THE TERRIBLE YEAR.

THERE were no downs in Mathilde's career as a nurse. Buoyancy, good health, and such a devotion to her calling as no doctor in Brussels had ever seen before sent her up and up. Her rapidity in reading must have been as remarkable as her intuitive sympathy and her comforting touch of hand, a sort of healing touch that seemed almost superhuman to her patients. Instinct, memory, experience were all hers; she compared in a flash, understood at a glance, without conscious effort, and never forgot what she had read. Hence her positive joy in long days of labour. And great success, as usual, piled toil on toil. When three years had gone by, she was wanted by the well-to-do for dangerous cases. At first she declined these offers, because her mind was set on being a firm friend to the poor in hospitals; but Prosper and Crowley, aided by many surgeons and physicians, convinced her at last that her hospital duties would be enriched by her wandering experiences as a private nurse, which would teach her many useful things about life and the world.

'I am in a tidal river which has a great many tributaries,' she wrote one day to Crowley; 'and now I see that I must try to visit the tributaries. And you? In your letters I find too many—too many—shall I call them complaints? You tell me that you do not rise; but is this a reason why you should help yourself to sink? Oh, my dear old friend! let us not hiss the wondrous drama that Heaven makes from day to day with women and men and little children. If you do your best, you will rise to your full height—work enough, surely, in the short seasons of a lifetime. To my mind, a happy composure is quite simple, because death is a friend—if death comes with honour. No more complaints, then, if you please. Père Prosper wants to see you again; and so do I, of course.'

Crowley's tussle was keen and nasty, for the

changing tides of art's wayward fashions tossed him here and there, doing to him what they do to most modernists. As a rule artists and authors are like topical songs; and though they may talk a great deal about being pioneers and innovators in their experiments, they know that the only futurists are the very few rare spirits that become classics.

It was his love for Mathilde that made Crowley so eager to rise into a position good and secure. In 1911 he passed a week with Prosper, but Mathilde was away from home nursing the head surgeon of her hospital.

Their correspondence went on; and all at once, early in 1912, good luck came out of the dark to Crowley. He painted a far-famed American, and afterwards accepted gladly an invitation to the United States. Here he struggled to keep in step with good commissions, which thronged to his studio and took him from city to city, gathering a great many dollars.

Two years of prosperous work through all the seasons made Crowley eager to take a holiday in Europe; and at the beginning of July 1914, about a week after the tragedy at Sarajevo, he postponed some pressing new commissions, caught a good boat for Liverpool, and on his arrival in England was soon wrapped up in the anxieties of Black Week.

Mathilde in her most recent letter had told him that she was working in a hospital at Louvain, and that good old Prosper, now in his sixty-fourth year, had come to her to be nursed a little, as acute rheumatism had settled in his lame leg. He lived in two rooms near the hospital, and hoped soon to be able to sell his live-stock in order to retire from farming. He suffered much from pain, and was unable to walk; now and then he went out of doors in a wheeled chair, which he described as a foolish sort of cradle for a man of his inches and weight. But if his leg made his body no better than a sick child's, his mind was perfectly sound; and M. Crowley could be equally sure that both Prosper and Mathilde thought of their best friend incessantly, and wanted to know if a fondness for stars and stripes and dollars ought to keep him too long from Belgium. As for other old friends, M. Colin was in Brussels, quite well, and happily married to a rich widow; while M. Bertrand, who wrote perhaps once a year, was in Paris, with a family of three sons to keep his brush very busy.

Crowley telegraphed at once to Mathilde, and waited anxiously for a reply. Thirty-six hours passed before he received news. 'We fear invasion,' the answer said, 'but we mean to meet it bravely if it comes. Don't expect letters as a nurse in war must be strictly neutral. But know that we both love you.'

Soon captivity closed upon Belgium. Crowley's war experiences are aside from this story. He lost his left arm in the battle of Loos, and after-

wards was an invalid for about eight months. On his return to civilian life he was a solacing historian, for he painted for mothers a good many portraits of boy subs., whose lot at the front was horribly precarious, and far too often fatal. His palette was a small table with a white marble top.

Not a word came from Mathilde. Once, in 1915, a Belgian soldier spoke to him of her as the Belgian Florence Nightingale; and much later, after the tragical spring-time of 1918, a refugee in London passed on a rumour that Sister Mathilde had died of enteric fever.

'I don't feel it to be true,' said Crowley, who

as an artist had faith in his premonitions. Yet the rumour startled him greatly, for love is incomplete till we are threatened with loss and bereavement. Crowley read once more Mathilde's old letters, lingering over them, and responding to their sweet, serene candour and ardour. In each the spark of genius was present.

After Foch's finale had got into flood-tide movement, Crowley managed, with patient help from influential friends, to obtain a passport to be used as soon as events would allow him to enter Belgium; and a fortnight after Armistice Day he set out on his journey.

(Continued on page 398.)

PRODUCE-RAISING IN GUERNSEY.

By B. C. DE GUÉRIN.

GUERNSEY, the second in size of the Channel Islands, was once described as 'a greenhouse in the sea'; and though this is rather an exaggeration, nevertheless there is no other island of equal acreage in the world where so much space is covered with glass and occupied by the 'growing' industry.

The raising of forced and cold-house crops for the English market is a business of comparatively recent growth. Thirty years ago it was unknown, the inhabitants of the island, with the exception of the tradespeople in the quaint little old-fashioned town of St Peter Port, forming a purely agricultural community.

The boom in raising tomatoes under glass came at the end of last and during the opening years of the present century, and since that time it has indeed proved itself to be a 'growing' business in more ways than one.

As many varieties of soil as one can imagine are to be found within the compass of the island's boundaries; and as some are naturally more suited than others to the raising of certain crops, these parts quickly became the Mecca of the local builders and contractors, with the result that to-day there are points of vantage on the island where one may stand and view a literal sea of glass extending for a mile or more in every direction, until it merges at length into the real and much less stable seas of the English Channel.

Roughly speaking, Guernsey is nine miles long by three or four miles wide, and its population was at the last census 45,000. The majority of the inhabitants are engaged directly in the production of fruit, flowers, and vegetables, and the remainder are no less dependent for a livelihood upon the same trade, though in a more indirect fashion.

The principal town is that of St Peter Port, whose narrow cobbled streets, built upon a steep slope on the eastward side of the island, remind one of that first great Norman, William the Conqueror, whose possessions the Channel Islands were

at the time of the Conquest. The harbour and town of St Sampson, situated near the northernmost point of the island, in pre-war days depended for existence upon the export of the famous Guernsey granite, but the trade in this stone is at present practically dormant, and commerce at this port is now confined almost entirely to coal.

The variety of climate to be found in such a small area as the Channel Isles is truly remarkable, that of Jersey, the largest of the group, being milder and more relaxing than that of either Guernsey, Alderney, or Sark, though a distance of only twenty miles separates Jersey from her smaller sisters.

Frost of any degree of severity is rarely felt in any of the islands, while snow is practically unknown, several consecutive winters often passing without a snowflake falling, although occasional snowstorms have been blown out of their course from the Atlantic, and have burst upon the islands, where the presence of this unaccustomed phenomenon has frightened the lives out of the insular-bred horses—and even, be it whispered, of some of the insular-bred country-folk. Guernsey has an average of 9 per cent. more sunshine than the sunniest part of England, and its mean temperature in winter is considerably higher than that registered at Greenwich. On the other hand, hail and wind often play havoc with greenhouses and outside standing crops; in fact, the severe wind-storms which break upon the island in winter, with the full force of the Atlantic behind them, are the growers' and the farmers' greatest anxiety.

Since the introduction of the tomato-raising industry the business has grown from the level of a tentative experiment to that of a scientific profession. No longer can the novice or the amateur plant out his stock and go off and play golf on the excellent local links until the fruit is ready to pick. That kind of 'culture' was only too frequently practised in the old days, and the experience that it led to disaster, together

with the more intimate knowledge of the plant gained year by year, has brought growers to a realisation of the fact that to-day one must be as much a scientist as a practical man to make the business pay. And those who grasped this truth in time, and sacrificed their leisure to the study of artificial manures and their composition, plant-diseases and their prevention and cure, and like topics, which are all of the utmost importance to the successful grower, have no reason to regret their action.

Until recent years the tomato was not grown out of doors in any considerable quantity in Guernsey, although the warmer climate and more southerly aspect of Jersey made this a profitable undertaking. Now, however, the acreage of 'outside toms' is increasing annually by leaps and bounds in the smaller island, though climatic conditions will never allow the growers to compete with their more favoured neighbours in Jersey. The 'forced' and 'cold-house' tomato is Guernsey's speciality, and as such will always hold pride of place.

The seed for the earliest forced plants is sown in late October or November, and the plants are finally transplanted to their 'fruiting-pots' about Christmas-time. From this period onward no two growers adopt the same method of culture, some leaving their plants to run to eight or nine bunches or more, others stopping them at four or five to make way for a second crop of plants later in the season. Provided an average amount of sunshine is available in the late winter and the early spring, fruit can be picked in April, and the crop should be in full swing by May, when prices are at their highest. Tomatoes are packed in baskets, twelve pounds in each, and are carefully sorted and graded, the quality being stated on the label. The size of the greenhouses varies considerably, but when the fruit is being retailed at the high prices of the last few years, it is refreshing to hear a grower talking of his annual output in tons. The larger firms, however, think nothing of shipping several hundred tons of tomatoes alone in the course of a season.

But tomatoes, though they undoubtedly rank as Guernsey's main crop, are not by a long way the only produce which is raised locally. Bulbs of all kinds, grapes, melons, and figs, to say nothing of early spring flowers, potatoes, and broccoli, constitute a goodly percentage of the total annual export from the island.

Bulb-growing especially ranks as one of the leading branches of the trade, as, although the greater profit is made from the sale of the bulbs themselves, they are also raised for the sake of their flowers. These can be obtained very early in the year by forcing, and for this purpose the bulbs are planted out in boxes in the autumn, and slow heat is applied throughout December and January. After forcing, the bulbs must have a rest for a period, and they are planted out in beds and left for a few years.

The favourite bulb for this purpose is the narcissus, which is also grown as a main crop in the open; and a truly delightful experience it is to cycle through the narrow country lanes on a sunny spring morning and view field after field upon either hand waving and nodding in a flood of white and yellow bloom. These flowers are bunched and packed in boxes by women and girls, who often work all night, so that the blooms will be fresh enough to stand the journey on the morning boat for England.

Next to bulbs in importance come grapes, though the culture of the vine requires very expert knowledge. The nature of the soil and its drainage are subjects upon which the grower must be an authority to achieve success, and he must also possess more than an idea of the practical work of planting, pruning, disbudding, thinning, and the thousand and one other items connected with the growth and health of the plant. Prices realised for best quality produce, however, amply repay the grower for the time and labour which he devotes to his stock.

Melons and figs also require the attention of an expert, though the work necessary to produce a crop is not so exacting as it is in other lines. Coal is a heavy item of expenditure for early melons, but as they are on the market in March, they command prices which leave a substantial profit.

Enough has been said to give a general outline of the occupations followed by the majority of the inhabitants of Guernsey, and a decidedly peaceful life it is, though the fighting-blood of their Norman ancestors still runs in their veins, as was proved by the way in which they flocked into the ranks of the British Army during the late war. Ninety per cent. of the people are bi-linguists. French is still the official language used in their 'States' or local House of Parliament, and the people talk a *patois* of their own, which, though now fast dying out, is a relic of the ancient Norman language spoken by their duke when he conquered England.

HAIL AND SNOW.

OFFSPRING of a fleeting cloud,
Begotten in mid-air,
I often wonder why they are
So contrary a pair.

For Hail is noisy, hard, and cruel,
Of desolating power
That wounds and strips the tender branch,
And mars the beauteous flower—
It revels in a summer's day
When warm aerial currents play :

While Snow is quiet, soft, and kind,
Protecting by its fall
The bounteous earth's frail progeny
Beneath its shelt'ring pall—
Its gleaming crystals deck the ground
When winter spreads her chills around.

JAMES T. JOHNSTON.

Chambers's Journal

SEVENTH SERIES

AN ECHO OF THE 'FORTY-FIVE.'

By IAN MACKAY.

I.

I WAS staying with my friend James Macdonald, at his place in Stratherrick, when the extraordinary experience befell that I am about to relate.

We were seated in his library one evening, and the conversation had turned to the subject of local legends.

'By the way,' said my friend, 'here's something that ought to have a history;' and opening a drawer, he took out the skull of an animal and a piece of rusty metal.

I examined the latter curiously. It was evidently a weapon, some sort of dagger, with the remains of a horn handle secured at the top with a cap of brass ending in a small knob of the same metal.

'It's a dirk,' said Macdonald; 'quite a good pattern. I found it away on the hill about two miles from here, between two great rocks. There was a human skeleton there too, which I had removed and buried in the kirkyard at Boleskine; and the bones of some sort of a dog—this is the beast's skull. At first I thought that a shepherd had taken refuge there in a snowstorm and perished, but I soon saw that theory didn't fit. This is not the head of any sheep-dog I've ever seen. What do you make of it?'

I took the skull into my hands and examined it closely. It was massively formed, with heavy jawbones, and a pointed frontal development. 'It was certainly no sheep-dog,' I said. 'It's much more like a bloodhound.'

'A bloodhound!' cried Macdonald. 'I've often heard that Butcher Cumberland used to chase our people with such brutes. Well, that's all past history now, and I suppose we shall never know the truth of these old stories.'

The conversation then drifted into various channels, but I found that my thoughts would keep turning to the strange discovery on the hillside. A thousand speculations pursued each other through my mind. How had this man met his end? What connection had the dog—no ordinary animal, judging from the skull—with the poor remains that my friend's care had laid in a more fitting resting-place? I heard Macdonald's voice pouring forth details of sport,

but my answers were mechanical. My thoughts were still busy with his find. The thing seemed to have obsessed me. Something within was urging me to discover an explanation of the mystery, and I felt that there would be no peace of mind for me till I had done so.

We retired early, but most of the night I tossed about sleeplessly. In the morning I felt stale and unrefreshed.

Macdonald noticed my condition. 'I'm afraid you haven't had a good night, doctor?'

'No,' I replied; 'that old dirk and the dog's skull seemed to get between me and sleep. I cannot get them out of my head. The whole atmosphere of your discovery has gripped me.'

'Well, you must get a good rest to-night,' he said; 'and if walking in this air doesn't have the desired effect, I don't know what will.'

We covered a good many miles before dusk, and when we returned to the house I was thoroughly tired.

After dinner the talk turned to stories of haunted houses, and Macdonald related several strange incidents from his own experience. I had made some study of occultism, and the conversation stirred up much that lay dormant in my memory. All at once an idea occurred to me that seemed to bear directly on the matter that had so persistently occupied my thoughts.

'Do you know,' I said, 'that it is an accepted theory among psychic students that material objects are able to retain and give out, under certain circumstances, definite impressions that they have received in the past? That is one theory to account for haunted houses.'

'I never heard that before,' he said, 'but it would account very well for some of the queer things I have been telling you about.'

'And more than that,' I said; 'for instance, that dirk and skull. Suppose you let me have them for the night? I'll sleep with them by me and see if anything happens.'

My friend looked at me curiously. 'Do you mean it?' he said. 'Do you really believe in such things?'

'It will certainly be a new experience for me,' I replied; 'but I have heard of very remarkable results following such experiments, and have often desired to test their possibilities.'

'Well,' said Macdonald, 'good luck to you!'

I shall await your revelations with much interest.'

When I retired to my room I took the skull and the dirk with me, fixing the latter to the head-rail of the bed with a strap in such a manner that the brass knob of the handle was just over my pillow. The skull I placed on a chair at the bedside.

When I lay down, the dirk-handle was a few inches above my eyes and a trifle behind the line of vision. I fixed my gaze upon the little gleam of brass above me, lit up as it was by the flicker of a fire at the other end of the room. This I knew to be one of the methods of inducing hypnotic sleep. My bodily weariness was a factor in favour of the success of my experiment. I lay in this manner for several minutes. A clock somewhere in the house struck eleven, and that was the last thing I noticed before sinking into unconsciousness.

II.

I have no idea how long I had been asleep, but all at once I became conscious of a change. I was no longer in my friend's house, but in what appeared to be a small hut constructed of rough stones. Heavy beams supported a roof of thatch. A peat-fire smouldered on the wide hearth; and in the middle of the apartment were a rough stool and a table. A few simple domestic utensils lay about. In one corner was a clumsily made bedstead, upon which lay a man in Highland dress fast asleep. I noticed the heavy breathing of the sleeper, and the smell of the peat-fire.

Then the quick patter of feet sounded outside, and the door opened to admit a woman with her head and the upper part of her body wrapped in a plaid. As she came into the firelight I saw that her face was drawn and pale, and terror was in her eyes. With swift steps she crossed the floor, and shaking the sleeping man by the shoulder, cried, '*Thiad a tighinn! Thiad a tighinn!*' ('They are coming! They are coming!'), pointing to the door in evident terror and excitement.

The man sprang to his feet—a strongly built fellow, with a shock of dark hair and a tangled beard. He said a few words to the woman in a low tone, then embraced her and darted out of the hut; while the woman sank down at the table with her head on her arms, and I saw the heave of her shoulders and heard the catch of her sobs.

All this passed before my senses quite clearly and unmistakably, but I was conscious of a curious feeling of detachment. I was keenly alive to all that was going on around me; my senses were peculiarly active, but I had no cognisance of movement or will-power. I was simply there, and an influence outside myself seemed to control my actions.

I passed out of the hut, and found myself upon the hillside. The Highlander was speeding

along the face of the hill, and some way behind I saw three or four figures running, and heard shouts. Overhead the stars shone brilliantly, and a soft breeze blew gently through the heather.

Then I saw another figure spring up in front of the flying man. The fugitive paused, and looked back as if to measure the distance between himself and his pursuers, then dashed straight on and hurled himself upon the single opponent in front. I saw a flash and heard the report of a shot, and the two went down together, the Highlander uppermost. He raised his arm above his head. Something that gleamed bright in the starlight was in his hand. He brought it down twice upon his enemy; then, springing to his feet, he ran diagonally up the hillside in the direction of a dark patch of wood, and disappeared into its shadow.

The pursuers came up, and stopped at the prostrate figure of the man who had fired. They were soldiers, as I saw by their faded red coats and the white belts and the brass buckles of their equipment.

The leader, a heavily built man, evidently a sergeant from his dress, was panting with his exertions. He stooped over the body on the ground. 'Dead!' he grunted. 'Damn him! Too much flustered to aim straight, I suppose. What's to be done now, I'd like to know?'

One of the party had moved ahead, and was closely examining the ground. 'Here's blood,' he cried. 'And here's more. The shot must have told, after all.'

The sergeant joined him. 'You're right,' he said. 'He was hit, then. We'll put the hound on this.'

Placing his fingers to his lips, he emitted a shrill whistle, which was answered some way down the hill.

Presently a man appeared holding a huge dark-coloured hound in leash. He put the dog on the trail of blood, and the creature at once set off with a whine of eagerness.

On reaching the wood it ran in among the trees, baying loudly. I heard the sound of a fall, a volley of oaths, and then saw the hound bounding rapidly forward with the leash trailing loose, while the man who had held it picked himself up, swearing volubly.

'You've let the dog go, curse you!' growled the sergeant. 'Now we're done.'

'He can't be so far away,' said the other, 'and wounded too. Anyway, we'll hear the hound giving tongue.'

And again the clear bay of the hound smote the still night-air, and the whole party moved forward in the direction of the sound.

III.

The influence that was controlling me, and yet was not myself, carried me on again. I became aware that I was much farther up the hill; the wood was behind and below me. I

looked down upon it. Toiling upwards with many a stumble, swaying as he came, was the Highlander. His breath was coming in gasps, and as he drew near I saw with a thrill of horror that his breast was mottled and flecked with blood. He looked back over his shoulder, but his pursuers were not in sight, and there was no sign of the hound. He struggled on in evident distress, stopping every few yards and looking back at the wood. It was certain he could not go much farther.

Again the bay of the hound sounded, and the hunted man made another despairing effort. I saw a dark form emerge from the wood and come bounding up the hill.

The Highlander saw it too. He looked about him for a moment; then, with the air of a man who has made a desperate resolve, he turned sharply to the right and made for two huge rocks that stood side by side upon the brae, and threw himself down between them. I saw him stretched upon the ground, and heard his laboured breathing. Pity filled my breast for a fellow-being in such sore straits. But there was scant time for feelings of sympathy, for the grim drama before me moved swiftly to its tragic conclusion.

The baying of the hound now sounded much nearer, and the wounded man raised himself on his knees and peered out into the starlight. He held a weapon in his hand; it was a dirk, and the blade was no longer bright.

Once more I heard the ominous bay of the hound, and down the hill I saw its dark form moving like an evil shadow among the heather and scrub of the hillside. Up it came, nearer and nearer, bounding forward, its nose near the ground; but ever and anon it raised its head and uttered its sinister cry.

The man between the rocks leaned forward to watch its progress. I saw the gleam of his staring eyes, and the white line of his clenched teeth through the tangle of dark beard. Sometimes he looked towards the distant wood, but there was no sign of his pursuers; and ever the hound drew nearer to his hiding-place.

I find it difficult even now to analyse my feelings; all I know is that I looked on, spell-bound, something telling me that I was about to witness the climax of events. Once or twice the hound paused, but the trail was too fresh for it to be long at fault. It reached the place where the man had turned aside. It was a patch of boggy ground. Round and round the creature ran whining, but ever drawing nearer to where the hunted man lay. He was kneeling upright in the opening between the stones. His position was well chosen. It was secure on each flank and in rear. The boggy nature of the ground in front would hinder attack in that quarter. The hound was now close upon him. I could hear its panting breath, and the sucking sound of its feet in the soft, wet soil. Another

moment and it had reached the opening; it gave one clear bell-like cry, and sprang straight forward.

I saw the Highlander stiffen into a tense attitude, his arm drawn back. As the beast sprang the man's arm shot forward to meet it, his hand grasping the dirk. The blow took effect in the creature's neck, and it fell, limp and bleeding, just outside the opening. One convulsive effort to rise, and it rolled over and lay still. The Highlander swayed dizzily for a moment, then with a hoarse cry fell forward upon his face.

I had remained a spectator of this thrilling scene, unable to relax my attention, to move, or utter a sound. But at the death-cry of the Highlander something seemed to give way. The controlling influence under which I had hitherto acted suddenly ceased, and in a moment I was wide awake.

IV.

The hillside, the dead hound, the man under the rocks, had all vanished. The morning sun was shining in through my bedroom window, and above my head there was the twinkle of brass, the last object upon which my eyes had rested before I went to sleep. I was still thrilling with the excitement of this extraordinarily vivid dream, and lay for some time thinking over my strange experience.

Could it be possible that the dirk had really given out impressions received more than a century and a half before? Was it just a dream, or had a piece of history been enacted before me?

Macdonald listened with the deepest attention as I related my experience. When I had finished, 'It's like enough,' he said. 'The place where I found the dirk was just what you describe, and the wood is there too. Let's go and see the place.'

For the greater part of an hour we scrambled up a steep hillside, and at length reached a place where two huge rocks stood out among the heather, leaning inwards till their tops met. There was just enough space between them for a man, and Macdonald had to stoop to enter.

It was the very place I had seen in my dream. There was the same hillside, and about half a mile below us was a dark belt of pines.

'Macdonald,' I said, 'this is the most remarkable experience I have ever had. Here is where the man crouched to await the hound; there is the wood. It is all exactly as I saw it.'

My companion was silent till we came in sight of the house; then he suddenly turned to me. 'Did you notice the tartan?' he asked.

'Yes,' I replied; 'it was the same as yours.'

'So he was a Macdonald,' said my friend. 'I'm glad he had a decent burial at last—and,' he added after a pause, 'that he died game.'

HABITS AND CHARACTERS OF BRITISH WILD ANIMALS.

II.—THE PINE-MARTEN.

By H. MORTIMER BATTEN.

I.

THIS beautiful and graceful creature is now so rare that to most people it exists only as a name on the list of the British fauna. It can still be said to inhabit north Devon, Yorkshire, Cumberland, and Durham, but in all these English counties its occurrence is such a rarity that when one falls foul of the gunner the event is considered worthy of comment in the local press. In the north and west of Ireland, the Highlands of Scotland, and the wilder parts of Wales it is a little more plentiful, but it is to be feared that the depredations of this active little creature must ere long lead to its final extermination. Indeed, if the marten is to keep its place among the wild-folk of our woods, its protection should be made as thorough in this country as is that of the osprey.

The era is long since past when the pine-marten could justly be persecuted on account of its destructiveness. A creature of the trees, it is far less likely to destroy the nests of ground-birds than are stoats and weasels. Tree-birds of all kinds, from hawks and ringdoves to the smallest songsters, are its natural prey, and its cleverness in circumventing them is largely due to its knowledge as to the whereabouts of their favourite perches. It will lie invisible in the crotch of a tree, and the very instant a bird alights near—while, indeed, the unfortunate victim is absorbed in gaining a footing—the marten darts forth like a streak of lightning and clinches the deal.

The pine-marten is a beautiful tree-weasel, possessing gifts of all the musk-bearing fraternity, together with several unique accomplishments of its own. It does not, however, secrete musk; in fact, while a weasel in spirit, and of the pukka fighting breed, it seems to have been shorn by nature of the repulsive features most conspicuous in the land-weasels—the polecat, the skunk, the mink, the fisher, and the two smaller members of the family resident in this country. It is so large and formidable a beast that it has no wild enemies on British soil, while all, excepting the fox, the badger, and the otter, probably come within the scope of its destructive powers. Even wild deer enjoy no immunity from the marten cat, for the tiny mottled fawn, lying among the leaves, has been known to fall to it. It will, moreover, dispute the right of way with any wildling of our woods, and has been known vigorously to pursue a fox out of its home range.

The exquisite sable is a marten, though in

this country the marten's fur is not of great value. In general colour the creature is chocolate-brown, the longer hairs being richly glistened with sepia and umber. The under fur is squirrel-red, the paws are generally black, and the tail is long and bushy. The hall-mark of the marten is, however, its flaming orange breast, touched with lighter shades towards the sides. Sometimes, but rarely, the breast is pure white.

The 'tip-to-tip' length of adult specimens is generally about twenty-two inches, the tail being from nine to twelve inches.

II.

In a small town in the Vosges which served as a base hospital during the war there lived a tame (beech) marten which afforded me many an hour's happy diversion during brief spells of alleged 'rest' from the line. The town was subjected to shell-fire almost daily, and aircraft usually helped to enliven the hours of darkness; in fact, the condition of things became so bad that there eventually followed an almost complete trek of the civilian population to healthier quarters. This meant the departure of the marten's mistress, duly succeeded by an influx of American soldiers, each intent on occupying in the little captive's heart the place previously held by that lady. Bread, nuts, biscuits, cheese, and chewing-gum littered the cage in unsavoury confusion; but whether these attentions or the shell-fire were responsible, the marten became so fierce and distrustful in disposition that it was the height of folly to attempt any liberties.

I was told that before the war this creature was as gentle and lovable as a kitten, curling itself round the woman's neck in poses of affection, and spending hours gambolling on the veranda and about the eaves while she sat at her sewing. It was said to be seventeen years of age; and the son of the house, who was aged twenty-one, told me that he could remember its existence in the yard for so long as he could remember anything. This fact would appear to indicate that the pine-marten is a long-lived creature, albeit the most active and restless of all the wild beasts with which this series of articles deals.

The cage which held the captive was about six feet high, three feet wide, and nine feet long, and the antics it performed in this confined space were truly marvellous. Choosing a quiet time and sitting at some little distance, so as not to excite the animal's interest, I have watched it for minutes on end looping the loop

round its cage at a speed which made one giddy and bewildered to watch. It would mount the wire netting on one side at a speed which carried it, back downwards, across the narrow span of corrugated iron roof, obtain fresh impetus as it descended the opposite wall, head down, to tap the floor, and bound up the wire again, so lightly that the movements of its paws were scarcely audible. It was more like some accurate machine on frictionless wheels than a living creature of flesh and blood, though occasionally it would vary the programme by lengthening the loop, mounting the wire, and descending the wall at an angle from the perpendicular. It must have run miles in this way every day, and except for the very natural sense of pity one feels for so active a thing in confinement, its evolutions were certainly a joy and a wonder to behold.

The only wild marten I have ever seen in a natural state lived in some low crags in the heart of a beech wood in a secluded West Riding valley. I saw it on two occasions, and each time its behaviour was identical. As I silently approached the foot of the crags it darted from a cranny somewhere among the heather and ferns at the brow of the cliff, and ran up the slanting trunk of a blasted mountain-ash growing from a shelf. Here it crouched, tilting its head, now on one side, then on the other, as it regarded me with an air of playful innocence. One could not but be struck by its exquisite beauty. A picture, indeed, amidst its rugged setting; yet in those bright eyes was a hint—the merest hint—of the devilish brain which commanded that death-darting body. After a few seconds of closest scrutiny it descended the trunk a little, as though to obtain a better view; then, like a flash, it was gone.

Seton, in dealing with the Canadian species, comments specially on the marten's powers of avoiding detection. While in northern Ontario we used regularly to take marten in steel traps and deadfalls, but I have never seen a wild one in those woods, nor have I met any white man who has. It is possible, therefore, that this beast is not so rare as is generally thought, and that where it exists its presence may be unknown even to the oldest woodsmen. Seton comments also on the animal's preference for dense timber, and on its habit of retreating to more remote cover, never to return, on being disturbed by man; and if this be so in the wilds of Canada, where most animals are utterly fearless of man, owing to their ignorance of his ways, it would certainly apply with far greater strength to the wild martens of our own woods, where man is a much more potent enemy than in a bush country.

III.

Mice, birds, squirrels, rabbits, hares, rats, berries, fish, lambs, and occasionally poultry are, in the order given, the pine-marten's special fare. As the otter has specialised as a water-weasel

and become a past-master in the art of swimming, so the pine-marten has developed the art of climbing to such a standard of skill that it can truly be described as the weasel of the trees. Like the otter, the marten is a creature of exceptional gifts, but whereas the first named is of a loving and sociable disposition, the pine-marten is fierce and solitary, avoiding its own kind at all times except during the mating season.

All the weasels are notorious for their reckless bravery, which often outruns sound judgment, and the marten is by no means an exception. It is both nocturnal and diurnal in its habits; in fact, like the otter, it is one of those creatures which seem never to rest. Probably it curls itself up in some sunny or sheltered spot after a meal, and when the meal is digested, an hour or so later, sallies forth again on its lifelong pathway of destruction.

Martens have been known boldly to raid heronries, attacking the young birds in their nests, forthwith to be themselves attacked by a croaking, gasping, screeching army of bayonet-armed defenders! Herons readily unite to help members of their own clan, and the marten that failed to make himself scarce when the massed attack descended would have a very thin chance of getting to earth alive.

The squirrel is no sluggard in the branches, yet compared with the marten it is an indifferent climber. In hunting squirrels the marten is at a disadvantage at the outset, for, being a heavier animal, it must leap sooner and alight later in passing from tree to tree; it cannot run to the extreme end of the slender branches as does the squirrel, and so must take much longer leaps at every turn of the chase. Well the squirrel knows this and tries to profit thereby, seeking the slenderest branches and making the longest leaps; yet its chances of escape are as good as nil from the outset. Its stronger and more agile foe is its superior both in speed and in distance, and a short run, generally tending earthwards, usually suffices to bring the little drama to a close. The squirrel is caught and killed instantly, then speedily borne off to some fork high up in the timber, where its remains are left to bleach.

Often, however, in the lightning fury of the chase, the marten miscalculates its own abilities, and if there is no undergrowth to break its fall it may be crippled or even killed on striking the earth below. Martens have been found lying dead owing to a fall of this kind, and in the slender likelihood of such a mishap lies the squirrel's only chance of escape.

In the Highlands at one time a good many lambs were killed by martens, and the little murderers have been known so to mangle the faces of the defending ewes that, but for man's merciful intervention, a lingering death would inevitably have followed the injuries.

As a raider of hen-roosts the marten is a very occasional offender, save in those localities where

it may have become more or less indifferent to the close proximity of man, and where its raids are consequently common. A half-tame animal is at any time calculated to be infinitely more destructive to man's property than a truly wild one, and whereas a wild marten characteristically steers clear of all human habitation, seeking the most lonely glens and corries, a marten educated out of this highly desirable characteristic will very readily attack hens, ducks, geese, turkeys, even cats—anything that suggests a meal and a lively exchange of sentiments.

The marten will pursue hares and rabbits in just the same manner as does a stoat, and in the case of a well-seasoned hare the chase is often of considerable length. This may be owing to the fact that the pine-marten is scentless, and therefore incapable of exercising upon the fugitive the same hypnotic effect as do its musk-tainted relatives. (It cannot be doubted that the stink of stoat or weasel is as fear-inspiring to its normal prey as is the very sight of the beast itself, for many animals well able to defend themselves, such as foxes and cats, will turn away in fear from that ominous taint.)

The pine-marten is an expert swimmer, and has been known to live by hunting such creatures as musk-rats and beavers, so no doubt it just as readily hunts water-voles and gray rats, whose swimming-powers would not suffice to save them from it. In common with its near relative, the fisher—which, by the way, does practically everything except fish—the marten can be said to angle only in so far as it will attack partially stranded fish, lying in such shallow water that they are unable to escape; though one or two authorities hold that this animal will systematically work a stream as does a cat while the trout are running.

Berries the marten eats greedily, but probably more by way of medicine than as a staple article of diet; and so far as I know this is the only exception to an otherwise strictly carnivorous fare. If facts were obtainable, I believe we should find that all our four-footed warm-blooded carnivores eat berries to a greater or less degree. From the evidence afforded by the captive (beech) marten in France, I should say that the marten, in spite of its squirrel-like form, strictly eschews anything in the way of nuts.

IV.

During my early studies of this animal I was of the opinion that at any rate it observed the laws of propriety and decency so far as its marriage customs were concerned—that, indeed, the marten was strictly monogamous, and that both parents shared in the upbringing of their young. The occasional newspaper reports that 'two martens were shot at so and so' were probably responsible for this belief, together with the fact that I had constantly heard Highland keepers state that, one marten having been shot, it

was usual to find 'the other' somewhere near. Unless, however, the British marten differs widely from its Canadian cousin in this one respect, and unless the habits of caged martens stand as no criterion for the customs of free specimens, the marten is totally despicable in its mating habits. In this respect, if in this respect only, its habits indicate a standard of morals lower than that of the common stoat, for in the wild morality usually begins with the observance of marriage bonds and some sense of tenderness on the father's part towards the young.

Seton says that after the young are born the less they see of their cut-throat sire the better. He also says that no two martens have ever been known to meet with feelings other than those of deadly enmity. It is probable, then, that the 'mated' couples run together only for a short time, and that thereafter, though their respective home ranges may not be far apart, they do not associate as mated couples.

Wild British martens kept in captivity behave in just the same way as do those on the fur-farms in Canada. The big-cage system, in which a number of martens are allowed to run together in a large confined space, has never yet proved possible. This is owing to the fact that the member of the clan who is strong enough to kill all the rest cheerfully proceeds to do so—or, rather, he kills the survivors of the general *mêlée* with which the social intercourse begins. In this way a cage of promising martens has been reduced to one tattered and moth-eaten specimen when the man came next morning with food for a dozen—a somewhat expensive process by which, nevertheless, a very fit strain can speedily be arrived at!

Thus, fur-farmers, having found that the big-cage system merely resulted in providing amusement for one solitary specimen, speedily tried the separate-cage method, which is to-day yielding good results. Marten-farming, however, is not likely to prove widely profitable, as, owing to the disposition of the marten, its rearing is somewhat precarious. Overfeeding leads to infertility, and a large cage must be employed for each individual specimen; otherwise the beast suffers from lack of exercise. The violence of the males is, however, the chief difficulty and the most common cause of loss. The cage of the female must be provided with shelters into which she can retreat in order to escape her lord; though even when every provision is made in this way the female is apt to be killed by the male's long corner teeth penetrating her brain. The death of the female is instantaneous. Only by long weeding out, the gentler males being kept for breeding purposes, can loss in this way be reduced.

It is probable that in a wild state such mortality does not occur. It is as unjust to judge the characters of wild creatures from examples afforded by their less fortunate kindred kept in captivity, as it would be to attempt to gauge the character of man by a study of

prisoners in solitary confinement; and particularly as concerns the mating and breeding habits of animals does captivity upset the natural order of things. How can they be natural when everything that nature gave them as a birthright is taken away?

The wild marten usually adapts a bird's nest as a nursery for its young, though it may choose a hollow tree or a crevice among boulders, in the latter case loosely constructing a nest of grass and moss.

Gestation lasts about ninety days, very considerably longer than with the otter and the polecat; but whereas the young of the otter are blind for three months or more, the young martens receive their sight at the end of four weeks. When they are about six weeks old, the parent marten begins to take meat to her offspring, and by about the end of the seventh week they first leave the nest. They are full-grown at six months.

The number of young per litter ranges from two to five. Three is the usual number, and occasionally as many as seven occur. Sir Harry Johnston thinks it probable that two litters per season are born; but in view of the fact that the first litter must occupy the mother well on into the summer, this would seem rather an open question.

It is probable that the young begin to breed in the spring succeeding their birth; so, considering their longevity, martens cannot be said to be unprolific creatures.

v.

The marten has not developed its climbing-powers at the expense of its powers of running. On the ground it is considerably the fastest of all the weasels. A boy of twelve can easily outrun a stoat on open ground, while an otter is comparatively helpless if surprised far from its beloved element. A marten, on the other hand, can hold its own over a short distance against a normal sheep-dog. True, it will tree up at the first possible opportunity, or seek refuge among the rocks; but, nevertheless, it will probably escape the dogs unless the run be a long one. The marten is a past-master in keeping up a running fight, and will punish an inexperienced dog severely at every effort made to close.

The marten's hankering to learn and to know is a characteristic by which hunters are often able to profit. The unaccustomed sound of an axe is calculated to bring any marten hearing it to the spot, to peer through the leaves in eager inquiry, then to dart off to the uttermost corner of the forest on having satisfied its curiosity. Any unwonted sound has the same effect, and a trick sometimes practised by keepers is to remain perfectly still, making at intervals the grouse-call by sucking between closed lips through the stem of a pipe. The marten will then come quite near, moving from point to point in search of a better view, and a quick shot probably puts an end to the little creature's craving to see and to know. In the same way this animal is sure to be

attracted by anything moving which it does not immediately recognise, and a common way of trapping it is to use as a lure some conspicuous object, such as the wing of a partridge, so placed that the bird moves from side to side as the wind blows. A marten will always go for a moving bait even though he be suspicious of it, and such a set generally yields good results, as the animal is not likely to escape seeing it.

More especially along the west coast of Ireland martens regularly become attached to the sea cliffs, making their homes in the rocky fastnesses, and seldom or never venturing inland. They become almost a cragland species, and owing to the constant abundance of food are apt to grow into finer specimens than those inhabiting inland forests.

Naturally, the marten is thoroughly at home among sea cliffs, and a vast variety of food is always at hand. Rabbits are generally abundant among the crags, shore-scavenging rats exist in thousands in many parts, and almost countless forms of wild-fowl life throng the ledges. These seaside dwellers are said also to quarter the seashore in search of shellfish or any stranded sea-life washed up by the tide.

Probably the day is not far distant when the marten will no longer exist as a creature of our woods, but long after that day has dawned it will continue to hold its own here and there along the coast crags. It is not likely to be exterminated on the west coast of Ireland for many decades to come, for among those wild and inaccessible crags it is practically secure from destruction by man. The only trouble is that a little marten goes a long way—by which is meant that, since they are not sociable beasts, two martens for every mile of coast would be a comparatively dense population, and the rising generations that could not claim and hold a hunting range along the crags would, perforce, have to travel inland in search of their fortunes.

The shrinkage of its home range during the last few years has proceeded rapidly. So far as I can ascertain, it is eight years since the last pine-marten was shot in Wigtownshire, where once it was abundant; while it is entirely gone from Kirkcudbrightshire and Dumfriesshire, where it is a creature unknown to the present generation of gamekeepers, though comparatively familiar to their fathers. The marten can be said, indeed, to have gone entirely from the Scottish Lowlands—or at any rate to have become so scarce as to go undetected. In the Highlands its range is slowly gathering in on every side. In England it can only just be said to exist.

Is the marten to go?—while we, like Tamahawa, spread out our hands and say, 'Farewell, little brother! My heart is heavy for you; but, alas! it cannot be otherwise. Farewell!'

Why preserve the marten? Why preserve any other gem of nature or of art? If there is anything at once tragic and pathetic in the ways of Dame Nature, it is that she should have

presented this least lovable of all our fur-clad fauna in the most lovely form. The beauty of the marten is in its quickness, its restlessness, its darting, animated poses, in its very *life*. Take that life away and you have left a bit of carrion. A dead marten is an object from which we shrink,

knowing it to have been a blood-thirsty and cruel thing; but to have seen a living marten in the trees is to go your way the richer and the happier for the view, for you have seen *Life*—Life radiantly materialised, the most living and lively of all God's moving things.

THE PARTS MEN PLAY.

CHAPTER XVIII.—*continued.*

III.

ABOUT three o'clock that afternoon a little stream of visitors began to arrive, and Thomas Atkins, with his extraordinary adaptability, gravely, if somewhat inaccurately, answered the catechism of well-meaning old ladies, and flirted heartily and openly with giggling 'flappers.'

To the visitors, however, Austin Selwyn paid no heed. He was enduring the lassitude which follows a fever. He knew that the crisis had come, the hour when he must face fairly the crash and ruin of his work; but he put it off as something to which his brain was unequal. Like slow drifting wisps of cloud, different phrases and incidents floated across his mind, shadows of things that had left a clear imprint upon his senses. With the odd vagrancy of an undirected mind, he found himself recalling a few of Hamlet's lines, and smiled wanly to think how, after all those years, the immortal Shakespeare could still give words to his own thoughts: 'This goodly frame, the earth, seems to me a sterile promontory; this most excellent canopy, the air, . . . this brave o'erhanging firmament—this majestical roof fretted with golden fire, why, it appears no other thing to me than a foul and pestilent congregation of vapours.'

The wings of memory bore him back to Harvard, where once in a scene from *Hamlet* he had mouthed those very words, little dreaming that in a few short years he would lose the sense of euphony in the cruel realisation of their meaning.

Then, before he saw her or heard her step, he knew that she had come. His heart quickened, and his breathing was tremulous with mingled emotions.

'Well,' she said, coming to his bedside and offering her hand, 'how is the invalid?'

'Elise,' he said, 'it is wonderful of you to come.' He looked at her khaki uniform, at the driver's cap which imprisoned her hair. 'Now,' he went on dreamily, 'it all comes back to me. It was you who brought me here.'

'Had you forgotten that already?' she said, bringing a chair to the bedside.

'I couldn't remember,' he answered weakly. 'All I know is that I was walking alone—and there came a blank. When I woke up I was

here with a head that didn't feel quite like my own. But I knew, somehow, that you had been with me.'

'What does the doctor say about your wound?'

'It is not serious.'

'You have heard since what happened?'

'Yes.'

'It was absolutely topping the way you fought for that child's life.'

He made a deprecatory gesture, and for a moment conversation ceased. He was wondering at her voice. A subtle change had come over it. Her words were just as uncomfortably rapid as in the first days of their friendship, but there was a hidden quality caught by his ear which he could not analyse. Looking at her with eyes that had waited so long for her coming, he felt once more the affinity she held with things of nature. Her presence obliterated everything else. They were alone—the two of them. The hospital, London, the world, were dimmed to a distant background.

'After such a night,' he said, 'it is very kind of you to make this effort.'

'Not at all. We're cousins, you know.'

'I—I don't'—

'The Americans and the English, I mean. Relatives always go to each others' funerals, so I thought I might stretch a point and take in the hospital.'

'Oh! That was all?'

'Goodness, no! You automatically became a protégé of mine when I picked you up last night. Isn't that a horrid expression!—but frightfully fashionable these unmoral days.'

'You must excuse me,' he said slowly, 'but I was foolish enough to think you came here because—well, because you wanted to.'

'So I did. An air-raid casualty is ever so much more romantic than a wounded soldier. If he lives through it, he always proposes the very next day either to the nurse or to the ambulance-driver, whereas a Tommy, after his third wound, becomes so *blasé*.'

'You shouldn't torture me,' he said, wincing noticeably under the incision of her words.

Just for a fleeting instant her eyes were softened with a tender look of self-reproach. His heart warmed at the sight, but before he could convince himself that it was not a creation

of his own fancy, it had passed, and once more she was holding him at bay with her impersonal abruptness.

'Will you tell me about yourself?' he urged. 'Please.'

'What do you want to know?'

'Everything—everything!' he blurted out, impetuously leaning forward. 'My heavens! Don't you know how I've longed and waited for this moment ever since that night at your flat? I want to hear all about you—what you've done—where you've been, and—and in what mysterious way you've changed.'

'Have I changed?'

'Of course you have. You're trying to appear just as you were when we first met, but you can't do it. Even if I hadn't noticed the difference in you, I should have known that no one could live through these times and remain the same.'

'Why not? Haven't you?'

He laughed grimly, and his head sank back on the pillows. 'I want to know all about you, Elise,' he repeated dully.

'Very well.' She smoothed her skirt with her hands, and folded them Quakeress-fashion. 'As you know, I once had a flat in Park Walk—which I shared with various and variegated female patriots, also engaged in guiding the destinies of motor-cars. Edna was the first one to follow Marion, after she and I quarrelled; but Edna couldn't break herself of the habit of wandering into the Ritz for luncheon every second day with only a shilling in her pocket.'

'But I don't see how'—

'You poor innocent! Some one always paid—don't worry. So we parted company on that issue, and I asked Mabel to take Edna's place. Mabel was frightfully nice, but took to opium cigarettes, and then to heroin. She disappeared one night, and never came back. Poor girl! Her going made room for Lily, who read the very nicest modern novels, and always cried through the love scenes. I wish you could have seen her sitting up in bed reading a book, eating chocolates, and sobbing like a crocodile. Lily had only one weakness—marrying Flying Corps officers. It was really the army's fault giving two of her husbands leave at the same time.'

Selwyn frowned. 'What a dreadful experience,' he said.

'Oh, I don't know.' She gave a little shrug of her shoulders, but the spirit of badinage had vanished both from her face and from her voice. 'It didn't take long to lose most of one's illusions. It is one thing to meet people as Lord Durwent's daughter, and quite another as a free-lance ambulance-driver. I've seen what people really are since I've been on my own, and I'm sick of the whole thing.'

'You don't mean that, Elise?'

'I do. Men are rotten, and women are cats.'

He smiled quizzically, but she kept her eyes

averted from his. It almost appeared as if she were determined to retain her pose of callousness at any effort, but his sense of psychology told him that his first conjecture was correct. The girl who had endured was trying to hide herself behind the personality of her old self.

'My dear girl,' he said slowly, 'it is an old trick of women to talk for the purpose of convincing themselves. I don't care what you have seen—you could not have passed through the ordeal of these long months and believe in your innermost soul that either men or women are rotten. In many ways I feel as if what little knowledge I possess dates from last night; and I have learned things about men right here in this ward to-day that have made me humble. These chaps that we call ignorant, the lower classes—why, they are superb, wonderful. I tell you they have greatness in them. I wish you could have seen them'—

'Haven't I seen them,' she cried, with a little catch in her throat, 'hundreds and hundreds of times? Almost every day, and at all hours of the night, I've gone to meet the Red Cross trains. I have seen men die while being lifted out of the ambulance—men who would try to smile their thanks to us just before the end came. I have'— She caught her hands in a tight grip, and her eyes welled with tears. 'But they're just jingoes, I suppose,' she said, blending a scornfulness with her repressed grief.

'I have deserved this,' said Selwyn, his face drawn. 'Nothing that you can say is half so bitter as my thoughts.'

'I didn't mean to hurt you,' she said.

'If ever a man was sincere, I was, Elise. Since I left you at Roselawn I have followed the one path, thinking there was a great light ahead. Now I am afraid that, perhaps, it was only a mirage.'

'No, it wasn't,' she replied vehemently. 'I hated you for thinking English women would not aid their men to fight, and I wanted never to see you again. But do you remember when I said that the glory of war was in women's blood? There was a certain amount of truth in it at the beginning; for when I first saw the wounded arrive I was madly excited. I wanted to shout and cheer. But as the months have gone on, and I have seen our soldiers maimed and bleeding and suffering, while thousands of their women at home have simply broken loose and lost all sense of decency or self-respect—oh, what's the use?'

'But you mustn't forget the women who have done such great things for the country.'

'I know—but what's it all for? Since this battle of the Somme our casualties have been frightful, and every day means so many of our real men killed, and so many more shirkers and rotters in proportion to carry on the life of England. We've had our women's revolution all right. There are not many of the old barriers

left; but what a mess we have made of our freedom! When I think of all that, and then recall what you said about war, I know that you were right, and we were wrong.'

'You are wonderfully brave,' said Selwyn, 'not only for having done so much, but in telling me that.'

'No,' she said, lowering her eyes to the gloves which she held in her hand; 'I have lost all my courage. Every night I feel as if another day of meeting the wounded will kill me. . . . If it could only end! Anything would be better than these awful casualty lists.'

'Elise'—he raised himself on his elbow and leaned towards her—'you prove yourself a woman when you say that; but you're wrong. I can't give my reasons yet, but since last night I have been seeing clearer and clearer that Britain not only must not lose, but must win. I know other men have said it ten thousand times, but only to-day have I begun to see that, in its own strange, unidealistic manner, this Empire is fighting for civilisation.'

'Then'—her eyes were lit with sudden, glistening radiance—'then you don't think our men have died uselessly?'

'I could not believe in God,' he answered, wondering at the calm certainty of his voice uttering things which would have infuriated him a few hours before, 'if I thought that this war's dead had fallen for nothing.' His hand, which had been raised in gesture, fell limply on the bed. 'Up to yesterday,' he went on slowly, 'I reasoned truth; to-day—I feel truth. I wonder if it is not always so, that higher knowledge begins with the end of reasoning.'

For a couple of minutes neither spoke, and his head was throbbing with anvil-beats. Twice she started to speak, but stopped each time as though distrustful of her own words.

'I am going back to America, Elise,' he said, without looking at her, 'to try to discover what I really think. After all these wasted months, with last night's climax of damnable murder, every conviction has been stripped from me, except two: first, that Germany, for her own sake and for the future of humanity, must be beaten; the other—well, it is hardly a conviction. It is more like a hunger—a gnawing hunger—for a civilisation that will in some manner atone for all these lives that have been lost.'

A wall of pain pressed against his head, and his face went gray with agony. In an instant she was standing over him arranging his pillows, and soothing his temples with the gentle pressure of her hands.

For the first time in many months he knew the help and compassion of a woman—and the woman was Elise. He was weak from loss of blood, weary from the long travail of the mind, and her presence, with its indefinable fragrance of clover and morning flowers, was as exquisite music to his senses.

'If you only knew,' he murmured, 'how I have longed for this moment. And though I have been dreading the hour when I should have to face the future, and admit my terrible failure to myself, your coming has made it all so easy. Listen, Elise dear'—

The Cockney patient leaned over with a bag in his hand. 'Ave a gripe?' he said genially.

'No, th'—' began Selwyn.

'Thanks so much,' said Elise, taking the bag and picking a small cluster for the American, afterwards handing the bag back to the Tommy.

'Ave a few yourself, won't yer?' said the warrior.

'May I?'

'Ere,' said the Cockney, with mock brusqueness. 'Tike a bunch.'

As she selected two or three of the grapes and smiled her acknowledgments to the delighted donor, Selwyn's conception of the new Elise grew in certainty. Without being in the least dictatorial, she had overruled his thoughtless refusal of the fruit; and, equally without patronage or maudlin effusiveness, she had contrived to make the most of the little incident, giving as much pleasure to the wounded Britisher as was possible in so trifling a matter.

But, small as the incident was, Selwyn noted her delicacy, and the quick understanding of the different personalities involved. Many people possess the virtue of unselfishness; to him, it seemed that Elise had attained to the art.

Perhaps from the very intensity of their previous talk, the threads snapped, and her quickly uttered sentences, with the accompanying sparkle in her eyes, showed him that he could hope for little more than badinage for the rest of her visit. Almost as if she desired to eradicate the memory of her emotional admission, she gave her vivacity full play. For a few minutes he tried to bring back the close intimacy of their souls, but she fenced him off, and met his heart-hungry glances with the gayest of smiles.

Roselawn, she told him, had been transformed into a convalescent home, and Lord and Lady Durwent were living in one of the wings. Practically all the servants had enlisted or gone into war-work; and even Mathews, the groom, after perjuring himself before a whole regiment of army doctors, had been accepted (with grave official doubts) for military service.

Interspersed with these details she recounted incidents of her London life as an ambulance-driver, and it was all her listener could do to follow the swift irrelevance of her course. Only once did she pause when, in answer to his question, she told him she had heard nothing of Dick.

But though her sentences still had the crispness of a whip, and though her cheeks were lit with life's fire, as in the days when she led Boy-blue through leafy paths of adventure, she was not the Elise of former times.

Marred as she had then been by the domination

of her intensive dissatisfaction, the tyranny of her moods, the lack of human response, yet she had gripped his imagination as no other woman had ever done. But out of the moonlight, in the very presence of hell's vapours, had come the new Elise whose utmost efforts could not succeed in belying her changed personality. She had lived in close companionship to suffering, and though, in her dislike of self-righteousness and her hatred of mock sentimentality, she tried to deny the fact even to herself, her experiences had diffused all her wilful, unbridled paradox with the warm glow of sympathy—that gentle, wonderful, secret gift of deft understanding; that transcendent power of the mind to penetrate another's soul, and call to life the slumbering best.

Even her face, the revelation of the soul, showed her achievement. There was no longer the dulling of eyes and the pouting of warring lips, demanding their little moments of ascendancy. She had not lost her spontaneity or the instinctive charm which had made her seem so much more in tune with out-of-doors than with the confines of a house, but all had blended. Her spirit and her body had become an indissoluble unison. In the forgetfulness of self, she had found herself.

And while his veins were coursing with the potent fluid of his love for her, and only her, he

found himself glorying in the very femininity of the girl. Even in the quick exchange of conversation, and in the grip of his newly awakened passion, his mind experienced a delight in contrasting her with other women he had known.

He had seen so many whose only attempt at individuality was an aping of men's habits and mannerisms; he had met such numbers in his own country who had let the acquiring of a certain tabloid intellectuality make them sexless; he had encountered countless women, too frivolous or callous or timorous to admit the verities of life. But before him was a girl whose warm-coloured pride of womanliness linked her with the great women of the past.

The daughters of vikings, looking out to sea with their bosoms, like its own, rising and falling in the salt-foamed air; the daughters of Norman kings following their fathers into the Saxons' land; the daughters of Royalists defying the Roundhead hordes—this English girl, in her admission and acceptance of womanhood's traditions, had become sister to all of these.

And looking at her with half-open, dreamy eyes, the unuttered words came to Selwyn: 'Daughter of a great past. . . . Mother of a greater future.'

(Continued on page 405.)

LA PAZ DE AYACUCHO.

By A. R. GROVES.

HARDLY any railway journey in the world can be more fascinating than that across the uplands of Bolivia—that roof of the Western world, the Tibet of the American continent. Hardly any city in either hemisphere can seize so dramatically the traveller's attention, or retain so long his interest, as La Paz de Ayacucho, which, before the memorable day of 9th December 1824, when Antonio José de Sucre captured the viceroy, routed his forces, and ended for ever the rule of Spain in South America, was called Nuestra Señora de la Paz. Was it consummate art, one is inclined to wonder, or was it mere caprice, that led the *conquistadores* to select so beautiful a site for the city whose name was to them commemorative of the peace attained only after the long, bitter struggle between Pizarro and Almagro? The truth is that it was neither. The previous existence here of an Indian settlement, Chuquiapú ('the place of gold'), determined Alonzo de Mendoza in 1548 to lay the beginnings of a town; greed of gold brought into being the 'City of the Clouds.'

The great Titicaca plateau, which stretches a hundred thousand square kilometres round the lake of that name, approaches its limits at La Paz, where the Andes rise in towering majesty, the rugged depths of their *quebradas* giving

picturesqueness to a scene of imposing grandeur. The snow-capped peaks of Illimani and Sorata stand out in pristine splendour against the bluest of skies, or, under the clear light of the moon, seem to tower like twin guardians over the sleeping city. It is a wonderful panorama. 'God,' said a traveller once, on beholding La Paz for the first time, 'when He created the world, must have wished to leave a souvenir of primeval chaos, and so neglected to mould into form this corner of His world.' Around and above La Paz all is titanic, overwhelming. One is surrounded by the testimony of ages, so little of man's handiwork is to be seen. Some giant hand might have set these mountains here, and have scarred the plateau with huge rents and chasms, have overturned and by the pressure of his palms thrown into a strange chaos these vast, lonely regions, in order to fix them in an eternal savagery of nature.

The traveller who alights from the train at Alto La Paz sees only this vision of desolate grandeur, at times a little chilling and overwhelming in its bleak aridity. Nothing prepares him for the unmatched spectacle of La Paz. Around the little station-house there is nothing; the cloud-capped mountains dominate all. He will, if he be wise, walk a little way along the

stony and dusty road. He will, indeed, almost instinctively do so, for the cold at Alto La Paz is often intense, lying as the station does 13,000 feet above sea-level. But he will look in vain for the distant towers and high buildings of a city which shall come into his view gradually. The vision of La Paz is instantaneous, startling. A sudden turn in the rough road brings him to the superb spectacle of a city of glowing colours lying at his feet, at the bottom and along the sides of a great natural basin, whose scarred basaltic cliffs are coloured by the red-tiled roofs of the houses and the vivid green of trees and flowering creepers. From so great a height, as one gazes over the edge of the precipice, the town looks small, though it contains 70,000 inhabitants—a fantastic patch of colour in the midst of these gray, stern surroundings, an exotic growth upon the bed of this ancient inland sea, a wonderful oasis in a weary desert.

Nowadays an electric-car service conveys you from the heights above to La Paz, which itself, situated nearly two and a half miles above sea-level, is one of the highest cities in the world. The old mode of reaching your destination by mule-driven stage-coaches was perhaps more exciting, and certainly coincided more with the essential spirit of the place. Electricity and the brilliant red and green ponchos of the Aymará herdsmen do not seem to harmonise; though, once in La Paz, one meets with signs of the most advanced civilisation. You are in a city of contrasts, of contradictions, where summer and winter alternate by hours, and where the sixteenth century jostles the twentieth and is no whit abashed. In no other town, perhaps, is there so intimate a mixture of the indigenous and the European. It is a Spanish city which Indians seem to have invaded and made their own. They are everywhere, and they do everything. Grave, silent people, these ancient herdsmen of the stony hills, the Aymarás of the Bolivian highlands; strange, gaudy figures in their bright ponchos, without which they are never seen; the universal and omnipresent porters in a city where there are few carriages—not so long ago there were but two, those of the president and the archbishop; dignified during the day, as only Indians can wear a dignity that is born of race and suffering; and then, having drunk their fill of the potent native beer at some roadside *chichera*, dancing for hours into the night in a kind of ecstatic frenzy, till they sleep the sleep of exhaustion, wrapped only in the bright-hued poncho, on the cold stones, under a pallid moon.

One is often tempted in La Paz and throughout Bolivia to ask if the ancient races who so long possessed the land have derived a single 'benefit' from the civilisation which has dispossessed them, other than the taste for strong liquors. Even the War of Independence did not liberate the Indian. The whites of to-day have the same disdain for him as had

their ancestors, the first Spaniards. Some rights he has received—the right to live in a certain freedom. But it is rarely that he is allowed to possess the land which for centuries he has sown and cultivated. He bears the stamp of serfdom upon him; he has but seldom revolted, and his voice is not often heard. Since the time of the last Tupac Amaru he has had few sympathisers, and none to voice his woes. In all South America there is nothing which so compels the attention as the irremediable sadness of the Indian of Bolivia and Peru. It is more noticeable, of course, as one leaves behind the rare cities with their change and opportunity; but everywhere it is a misery without horizon, without escape, without any other compensation than the stupor of drunkenness, or the periodical forgetfulness induced by the chewing of coca. The *chuspa*, or little pouch, which is ever at the Bolivian Indian's belt holds the green leaves of the coca-plant from which he can draw a few minutes of oblivion whenever he wishes. You watch a string of Indians working in any of the rough hillside streets of La Paz. One of them falls out of line, and withdraws from his fellows; for, like opium, the coca must be taken with deliberation. He will stretch himself down under a tree, or inside an empty building, and slowly from his *chuspa* draw forth the leaves with a little unslaked lime. With infinite grace and patience he rolls them into a ball (*acullico*), which he chews contemplatively for from fifteen to twenty minutes, rising thereafter refreshed, and then, as quietly as he lay down, returns to that monotonous round of labour in which the coca is his only and much-prized distraction.

Some take coca to excess, and to these the name of *coquero* is given—usually, it has to be admitted, with the addition, *coquero blanco*. The Indian has always regarded the coca-leaf with far too much reverence to misuse it. Von Tschudi, the Austrian scientist, who made a most thorough study of the customs of the Incas, tells how 'during divine worship the priests chewed coca-leaves, and unless they were supplied with them it was believed that the favour of the gods could not be propitiated. It was also deemed necessary that the supplicator of divine grace should approach the priests with an *acullico* in his mouth.' Among the Quichuas and the Aymarás it is still believed that any business undertaken without the benediction of coca-leaves cannot prosper, and to the shrub itself worship used to be rendered. To-day the miners at Cerro de Pasco will throw chewed coca upon hard veins of metal, in the belief that it softens the ore and renders it easier to work. They still put coca-leaves into the mouths of dead persons in order to secure for them a favourable reception on their entrance into another world; and if a Bolivian Indian journeying across the

Atacama desert falls in with a mummy, he, with the timid reverence characteristic of his race, will present to it some coca-leaves as his pious offering.

The Aymará woman is sometimes very beautiful, and the gravity of her expression lends her a strange and sympathetic allurements. She toils throughout the day at the most unfeminine tasks. To meet a train of women, in the broad light of a twentieth-century day, toiling up a steep hill carrying loads of earth or of bricks in their coarse shawls slung behind their backs, like so many human ants, gives one something of a shock. Yet the practice is immemorial. The first railway in Bolivia was built in this way, and most of the Inca works relied for their foundations upon the labour of the women. But the real foil to the Aymará in his poncho is the Chola—the Bolivian belle of mixed ancestry. A Chola of La Paz, when adequately dressed for a *fiesta*, has veritably, in the words of an old slang phrase, 'got 'em all on.' As the Argentine *gaucho* carries all his worldly wealth in the trappings of his horse, so the Chola bears hers on her back, or, it would be more true to say, round her waist. For she wears at least a dozen starched white petticoats, embroidered half-way to the waist, and over these a red, green, blue, or yellow velvet skirt, which reaches to the calf of the leg, the voluminous petticoats showing their ruffled edges beneath. These petticoats are the Chola's pride and wealth. Twenty-five is said to be the record worn at once, which point of ostentation reached, one would think walking were impossible. Yet, in general, the Chola has a fine and easy carriage, in no way hampered by over-adornment. Two bright-coloured shawls are worn, coquettishly pinned, one on the right shoulder, the other on the left; a high, dome-shaped straw hat, with an absurdly narrow brim, rather spoils the effectiveness of this *tout ensemble*; stockings are not always worn, but invariably high-heeled buttoned boots of bright-coloured leather. And if, after staring with unaffected bewilderment at so brilliant an apparition, you meet two or three of the *damas distinguidas* on their way to or from church, their dead-white, impassive faces framed in the severe black *manta*, you will realise again how La Paz is above all a city of contrasts.

With all its wealth of fruit and flowers, Covent Garden Market is a drab affair compared to the Mercado of La Paz. The Mercado's colour-scheme is one of barbaric splendour. It glows and radiates like a moving prism under the strong light of the sun on the high plateau. Wherever there is colour it seems intensified, and the bright blues, yellows, and greens of the ponchos and the voluminous velvet skirts are not more persistent than the tones of the adobe walls in their neighbourhood, painted to match the costumes. Even the vegetables and the flowers appear dyed in the deepest hues; the sky is bluer; the fleecy clouds are whiter. It is as if Nature amused

herself in this little corner of her domain, this giant hollow plunged among the everlasting hills, by putting great splashes of colour on everything, to offset the severity of her grays and browns in the dreary stretches of highland plain which she has so generously bestowed upon Bolivia, and which geographers call the Altiplanicie.

As there are few carriages in La Paz, so there are few horses. But there are mules, and there are llamas, long droves of which are constantly entering and leaving the city at all points.

La Paz has never played a great part in the national history. In the colonial days and later it was too far from the coast—a journey of forty-five days by horse across a waterless region—to have any importance as a distributing centre; and it has only had an occasional existence as the national capital, the Bolivian Governments having for long been as nomadic as they were unstable, and seeming, like the knights of the Middle Ages, to seek always an ideal residence. The palace of the chief of the state was fixed sometimes at Chuquisaca, sometimes at Oruro, sometimes at La Paz, where revolutionary outbreaks have been frequent and progress slow. For many years now the executive power has been installed here, since communication with Mollendo, on the Peruvian coast, became regularised *via* Lake Titicaca; and now that La Paz has good railway facilities with the Pacific, and looks forward to the making of a line that will give her an outlet on the Paraguay River, and so to the Atlantic, the growing prosperity of this little 'City of the Clouds' seems to be assured.

Through La Paz flows the Chuquiapú River, a noble mountain-stream spanned by many bridges, one of which—a massive stone one—remains from the time of the Incas. It is on the lower side of this bridge, where the air is less rarefied and locomotion less painful, that the white population mainly lives. This river is a remarkable stream, in that it does not flow into the Pacific, as do most rivers formed on the western slope of the Andes. The Chuquiapú defies the natural order and flows through a cleft in the mountains, joining the streams bound for the Amazon.

La Paz has its Plaza Mayor, its Alameda, and its Prado, but their one-time glories have for the most part left them. Their interest is archaic rather than persistent. They were laid out for other times and other manners, when romance was as the breath of life to the Spaniard and servitude the badge of the Indian tribe. There is an enormous cathedral, which, if it is ever completed, will rank as the costliest in South America. It took over forty years to raise the edifice. No derricks or machinery of any kind were used in its construction, but the walls were raised in a curious way. As fast as a tier of stone was laid the earth was banked up against it inside and outside, and upon this inclined plane the stones for the next tier were laboriously rolled into

their places, more earth thrown on, and the process repeated, until, when the walls were finished, the whole building was immersed in a mountain of dirt. This was allowed to remain until the roof was laid, when the earth was carried away upon the backs of llamas and Indians. Thirteen years are said to have been occupied in clearing out the inside of the building, as the earth could be taken away only through the narrow windows and doors.

Railway enterprise and international trade have to some extent changed the face of La Paz. Business-like Americans from the States are to be seen in increasingly large numbers, mining

prospectors and rubber agents come and go, and La Paz grows a little more cosmopolitan and a little less unique in its isolation every year. It must needs be so. Even in the clouds, under the shadow of Illimani—'the Everlasting'—change must come with the passing years. Yet still the troops of llamas walk about its rough unlaidd streets; still the herdsman in his russet poncho plays on his reed-pipes to the Chola of his fancy; still the Indians of the highlands celebrate their dances to plaintive music centuries old; in spite of the inroads of modernity, some of the simple splendour of the past still pervades this city of high lights.

MILLE BOMBES!

CHAPTER IX.—THE SEARCH IN BELGIUM.

CROWLEY travelled first to Louvain, and made inquiries about Prosper and Sister Mathilde. Both were well known; but they had left Louvain early in 1915, and as to their present whereabouts nothing definite was to be gathered. Rumour had said many things, and in a country invaded by German militarism rumour had barriers to pass through that increased its usual untrustworthiness. One clear-drawn picture of Père Prosper Crowley obtained, and at once he put it into a sketch. After the Germans, revelling in carnage, had poured over the doomed land, Prosper declined to use a wheeled chair. He hobbled out in great pain to the streets, and stretched himself to his full height whenever German soldiers passed by, his blind eye twitching, and the other alight with challenging independence. He said nothing more than '*Mille bombes!*' but even this would have been too much, probably, but for the protection thrown around him by Sister Mathilde's fame.

Crowley went from town to town, and at last made his way to Namur. Here he visited a hospital where very critical cases were nursed. In a ward where sixteen soldiers lay, he seated himself beside an English Tommy who, as the patient said, had 'caught it bloomin' 'ot and strong in the battle of St Quentin—one leg blown into pulp almost, and afterwards some pepper over the body from a M.G.' His case had been badly septic, but now he was on the mend.

'Yes, sir,' he said, '*She* has pulled me through. If anything can be done *She* 'll do it, never fear. Lord bless me! Such patchin' and mendin' as *She* can do—it's orf the top shelf, I can tell you. Top-hole it is! Blarsted wonderful!'

'*She*?' Crowley questioned.

'Yes, sir; the head nurse, of course; our matron. Who else?'

'Hasn't she a name?'

Tommy looked at Crowley. 'Why, yes; but I don't bother abart it. To us she's *She*, an' to the nurses and surgeons she's matron. My

word, aren't they bloomin' fond of her! You bet! Don't you see all the chaps here are lookin' at that door over there? What for? 'Cause it's Her time for the afternoon go-round. It's like a bloomin' 'oliday when *She* comes. But it's 'ard to find words.' Tommy thought for a moment, and went on: 'It's this way, sir. When I wuz a lad an' went to the theatre, an' saw a lovely gurl in a fix that made me gurgly in the throat, I used to think of that gurl as a wision in white an' gold, or some such, an' that, though I'd fight for her like fits, I'd be mortal feared all the time to 'urt her feelin's. Sky-high above me she was! Well, *She*—our matron—hits me in the same way; only, *She*'s a bloomin' sight more than a gurl. *She*'s a saint! . . . Yes, an' I'm a married man wi' kids o' me own. That's true.'

Crowley watched Tommy's face, and mentally softened the routine trench oaths with which the brave fellow had tried to dilute his affectionate gratitude. Then he said with deep emotion, 'Old chap, I can say something to interest you. Perhaps I know your matron, though I haven't seen her for about ten years. I am searching for such a nurse as you describe.'

A queer look of mingled surprise and envy settled in the soldier's face. 'How I wish I wuz you, sir!' he muttered. 'But if *She* is the nurse you mean, you'll tell me, won't you, sir?'

'Yes; but not in her presence. If I do recognise her, I shall steal away from this ward before she sees me. I don't know what has happened to her father, a very great chum of mine; and if the good old man has died, as many old Belgians did die during the war, she would be too much moved if she recognised me here.'

'But, sir, you'll tell me later?' Tommy persisted.

'Yes. I've promised,' said Crowley.

At this moment a rustle came from all the beds, as though the patients were being slightly moved all at the same time.

'I know that sound,' said Tommy. He spoke in hushed tones. 'My word! She's coming! Look, sir, the door's opening!'

It opened quietly, and a tall, slim woman, dressed in white, with pale golden hair showing against the white coif, entered noiselessly, followed by several other nurses. 'A vision in white and gold.' These words described her accurately; for the large blue eyes were singularly luminous and appealing, and the pale, intense face was that of a mystic inspired by a faith that put heart and soul into every motion, into every action. In this woman, clearly, nursing was a wondrous varied charity, a beloved devotional office, a genuine religion; and Crowley, standing erect, and awed by sympathy and eagerness, recalled to memory one of Mathilde's ideas—that she 'wished to be as a faithful prioress over pain and disease.' Her face had been changed greatly by sorrow and overwork; but he knew her at once.

The matron went slowly from bed to bed, examining clinical charts, talking to each patient in looks, smiles, and undertones, and giving advice to the nurses. Every movement had in it that spontaneous sympathy which is musical and solacing. The matron was entirely unconscious of herself and lost in her calling. When she passed on, a patient's eyes followed her, yearning and grateful, fully responsive to the healing grace in her faith and her ardent presence.

'Yes, isn't she wonderful?' Tommy whispered.

'God in her charity is very wonderful,' Crowley murmured.

'My turn soon,' Tommy whispered again. 'My word!'

In fact, Sister Mathilde had begun to visit the eight patients on Tommy's side of the room, so Crowley moved away, tiptoed to the door, and went downstairs.

Tommy's turn came; and at once it was clear that Sister Mathilde was greatly interested in his character and case. She asked many questions, speaking in a soft, low, hesitating English that charmed with its wayward accent. Tommy's natural voice was gruff and harsh, but it acquired from somewhere a gentle modulation as he related how his wounds itched in their healing, and that he felt 'as cocky as a robin with one leg and a few feathers blown from its bloomin' wings.' 'I'm—I'm a fair credit to you,' please,' he ended, and looked down suddenly at the bed-clothes.

'You are too English,' she declared. 'You are far too hopeful, so you tire yourself.'

'One in the eye for me!' said Tommy, looking crestfallen.

'And I want you to understand me,' the nurse went on. 'My English patients do not *collect* their returning strength; they get rid of it again by being too active, too lively, too hopeful. Oh, they worry me a great deal, far

and away too much! They seek trouble because they do not control their hope. They seem to be afraid of unpleasant facts, for they turn away from them, to be happy with dreams and illusions. Yes, I know the English soldiers! So I want you to remember that hope is a spring of holy water—not to be wasted like steam from a kettle. Do you understand?'

Her eyes grew full of light as she spoke, and Tommy took a deep breath. 'Yes, please, I've got the 'ang of it all right, and it's true; truer 'cause you sez it, please, matron. We *do* get into messes, us English. We don't bother about the bad side o' good things, so we get fixed up in "too late," so to speak. Bless me! "Take cover!" is the right ticket—done at the right time everywhere. You mean *that*, matron, don't you? Lud, but I'm learnin'!'

Sister Mathilde nodded and smiled. 'You had a visitor just now,' she said. 'Did he excite you? Your temperature has risen since yesterday.'

'Oh, my visitor was a bit of all right. Did me no 'arm, not 'e! And—well, yes, matron, I think you'll be glad to see 'im too.'

Tommy stopped suddenly, feeling that he was not playing the game. Sister Mathilde repeated his last words; then she passed on and left the ward.

In her room downstairs she found the hall-porter. 'Matron, an English gentleman sends you his card.'

She took the card and looked at it. 'Yes, I'll see him at once;' and her voice trembled.

CHAPTER X.—TO END WELL IS TO BEGIN RENEWED.

WHEN Crowley was shown in Sister Mathilde stood at her bureau, and through a long casement the winter sun splashed her white figure with keen lights, and also with shadows from a plant standing in a copper bowl on a small table below the window. Her face was very pale and agitated; but at once, without an instant's pause, she met Crowley and took his hand fondly and tremulously.

'Only one hand!' she said, her lips quivering.

'A shell at Loos; but I'm quite well.'

'I saw you in the ward,' she went on, 'but at a distance and carelessly; saw just a man, a visitor merely.' In her low voice was a tone of wonder. 'Père Prosper would have known you at once, at any reasonable distance. He thought of you always, as you know, longing week after week for letters. Shall we sit down? There's much to be said.'

The room was bare and large, an office rather than a place for rest; but a little pile of Caldecott's picture-books was on the bureau, recalling bygone days. Near the stove, facing each other, were two arm-chairs without cushions. Mathilde chose the one that faced the window. She

smiled at him and waited; while Crowley, shy, and self-conscious like most Englishmen, was tongue-tied.

Presently he said, 'For a fortnight I've been searching for you and Père Prosper. You see, your letters—I was all alone without new ones.'

'Yes,' she said. 'The loneliness in war is dreadful, and we long for letters to unite hearts and minds together. Yes, I know.' She seemed to be speaking to herself. 'We had many delightful letters from Colin and Bertrand,' she added wistfully.

'Since the war!' asked Crowley.

'Not from Bertrand, of course; but it was my lot—and I was moved through and through—to nurse two of his younger brothers, dear brave lads. One of them—Charles—came to me after the first battle of the Marne; the other—Robert—during the intolerable misery of Verdun. Ah! Robert was saved, if a boy crippled for ever can be called saved; while Charles—Charles died as bravely as he fought. "*Vive la patrie*" was the passion to which he offered his twenty-five brief years—and offered them with a glad pride and will. . . . Colin—poor Colin—now a broken man, has given to the cause his other lives—his two baby boys! He tried to escape with them and his wife from Brussels, and his little ones, after two nights out of doors, died of fatigue and privation. Poor Colin! Père Prosper was moved as only a noble soul can be moved by the long, unceasing sacrifice of the young and promiscuous. To him, as to me, the sun set in young blood and rose wet with young tears. His heart ached. Every day he told me that boyhood and early youth paid in their blood for the pre-war blindness of their seniors. He believed this passionately, and in fierce words blamed himself for voting without thought at pre-war elections. One evening he said to me, "What is the thing they call Justice? I cannot see it anywhere, but I feel it inside me. If Justice ruled, the battles would be fought on all sides by men between thirty and sixty, and not by the cream of youth. *Mille bombes!* Why should the boys be slain? What had they to do with politics when Germany was getting ready for another war?" Oh! Père Prosper did not cheat himself with pretty words. He tried to see the whole truth—and at last he became very aged and infirm.'

Her voice broke, and Crowley, watching spell-bound the anguish in her eyes, waited silently till she continued.

'One thing troubled him very much when friends came to see him—to talk alone, always in undertones, and quite frankly. His friends used to say, "Will the English ever come?" and Père Prosper answered always, "Yes, will they, for I know the English!" Well, during last spring, when great defeats came to our cause in the West, the friends said, "Père Prosper, after these new blows, so terrible, can the English

ever come? How can it be possible?" Then the darling old man was enraged. "*Mille bombes!*" he cried. "Do I tell lies? Have faith, and the English will come!"'

Again Sister Mathilde broke off, and Crowley's eyes were full of tears.

'At the beginning of June,' she went on, 'Père Prosper became ill with enteric. "I must live to see the English; I must indeed," he said to me many times as he fought fiercely against death. His little strength ebbed away; he passed into a stupor. Père did not know me. On 5th June, at midday, the stupor began to leave him; and at one o'clock, quite suddenly, he rose in bed with a strange light in his face. I took him softly in my arms, but he did not feel me, for he was gazing far into the distance. And then, in a thrilling voice impossible to describe, he said, "Ah, *mille bombes!* I see them coming, the dear English—I see them plainly! . . . My wife was English, my best friend is English, and I knew—I knew they would come!" And Père Prosper's dying presentiment was right. Thank God! the English did come; and now—now his best friend is with me.'

As she spoke these words the sweet, soft, pitiful music of her voice rose and fell; all self-control as a nurse melted away, and she wept bitterly.

Crowley gripped the chair with his hand, awed, overpowered. Inwardly he looked at the noble drama of his old friend's death, and outwardly, through tears, at the noble woman he loved. A moment later he went to her, put his arm round her shoulders, and held her while he said, 'Yes, I am here, and never will I leave you unless you wish it.'

At first she did not seem to hear, but presently she drew herself away from him and gazed up at him. 'Why should I tell you to leave?' she asked very low. 'Am I not otherwise alone? But hush! It would be wrong to say any more now, for this hospital is a symbol of all that agony by which many nations have been wrung and torn. Let us wait, then, till my work here is finished.'

THE END.

DRIFTWOOD.

WE are nought
But driftwood on the open sea of life
Without free-will. What is the empty strife,
The empty tumult, of the souls we own?
Can they affect the rising of the tide?
Or what avail the fears that we have known
Save to chastise the folly of our pride?
Great men are only those the waters lift
Above the rest; we all drift with the sea,
With neither hope nor aim, despairing, lost.
And when our friends and dearest ones are tossed
High on the dreadful waves of tragedy,
We cannot help them; we can only drift.

KATHERINE GOWER.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

LADIES and gentlemen at home in England, diligent readers of their daily papers, being accounted well informed upon events and transactions in a disturbed world, were moved to the utterance of a 'Dear, dear!' and a 'Good gracious!' and also a 'What next?' when, upon a recent morning, their eyes lit upon some slight telegraphed news to the effect that revolution of the most drastic kind had broken out in Portugal, and that there, first to follow the wild example in the East, a government by Soviets had been proclaimed. And in these exclamations of the astonished readers there was, as it might be said, something of reproach. There are troubles nearly everywhere. We of Britain, who have so many difficult problems of our own to solve, must by day and night, and all the time, pre-occupy ourselves with such anxieties as other nations, in their social and political turmoils, have prepared for themselves, or in some measure have had thrust upon them, for, alas! more and more as the days pass do we discover that no country of this modern world is a thing apart and independent, sufficient for direction of its own destiny, self-contained and complete, as was imagined up to most recent times, and in some measure even when the Treaty of Versailles, setting out to arrange the future world, was made. We, the nations, all of us, depend the one upon the other, each a link in an endless chain of earth, and by no power of industry or policy or self-provisionment that we know can we escape that mutual dependence. It is like a newly discovered fact that gives humanity, in its disposition towards continual fratricide, something severely to think upon. And so when Britain, general financier and assistant, one exercising a certain moral guardianship here and there, perceived that Portugal also had broken loose and was turned to most horrid internal strife—the Portugal that was imagined to be peaceful and patient and not unduly suffering, conducting herself with diligence in her own distinctive corner of the continent, to which the shrieks of social strife in other lands did not penetrate—the British people felt they had some sort of grievance against this now misguided Portugal. Least of all was this expected of her. '*Et tu, Brute!*' they would say to their old protégé,

as Cæsar is said to have reproached the last to stab him. But in this attitude there is some misconception.

* * *

The upheaval in Portugal was not a thing to be so much wondered at as those British newspaper readers imagined. Had they been properly apprised of the situation as it existed in Portugal for months, and indeed years, previously, they would have understood how the people were being urged towards it, how desperately strife was being fomented, how enormous were the problems presented, and how dangerous was the state of things. It was quickly discovered that the news about the Portuguese Soviets was an exaggeration; that there were no Soviets thus far, but only strikes of various kinds, on the railways, in the post and telegraph offices, and in sundry other important departments of life and labour, that paralysed the efforts of the country for the time being. But yet, as those who have lived there understand, the most gigantic upheavals among the people of the little state we are wont to describe as our oldest ally are far from being an impossibility. In her present situation there is something that is amazing. It is an enormous contradiction, a strange perplexity. Here we seem to have paradox established as a system of general method and control; and so little to national governmental conventions has Portugal in these latter days attached herself that, fearful and desperate as the situation may have been and is, yet, as at all times when people turn aside from the ordinary way, there has been something in it quite romantic. With a little imagination, walking and ruminating through the *ruas* of Lisbon, across the splendid public squares, the Praza de Commercio and the Rocio, up the Carmo and the Garrett, the most popular and fashionable shopping streets, along the noble Avenida da Liberdade, seeing the people apparently happy, and yet always with the Portuguese solemnity of visage (but remembering the bombs that only the other night exploded almost beneath the window of my hotel), observing that there is apparently a plenitude of the necessaries and even the luxuries of life, and that all seem so amazingly cheap in contrast with our British prices, though we are told that the country is in the most desperate

financial and economic straits, and that such machines in Portugal as work most busily night and day are those which manufacture the paper money which is universal from almost the smallest values upwards—one wonders, and with only the utmost difficulty comes by a little understanding. Here, one considers, are all the romance and illogicality of a republic in Ruritania! And as to the surprise of the British people that the patient Portuguese, as they had imagined them, should thus turn to turmoil, there are two things to be said. The first is, that the world is at the present time far too full of difficulties and strange events for any people to be apprised of all of them and fairly to comprehend even more than the smallest part; while, again, the more one wanders in foreign places in these days, the more does it appear that our own insularity, our failure of appreciation of the world outside, has not lessened as the result of the tremendous events of the last few years, when we were flung into the strange mosaic of a world conflict, but seems in some strange ways to have increased.

* * *

Perhaps it is for the reason just expressed—there is so much to be considered and comprehended—that, the task seeming hopeless, it is relinquished, and the homelanders revert to willing obsession by the politics of their place. The second thing in explanation is that circumstance expressed a month ago, that communications having been broken, suspended, or materially injured and delayed by the war, so that the world has become bigger, wider, more abounding in vast and untraversable spaces than it has been since early Victorian days, Portugal, instead of being so near at hand as six summers back, has receded far. She is so distant as to seem in a region for new discovery; sailing up the Tagus on a sunny morn one may feel that here there is some emulation of Vasco da Gama himself. A fortnight at times for letters from London to Lisbon; sometimes the same or nearly the same for a telegram; parcels despatched, but never arriving; officials smiling indulgently and pityingly if you should ever murmur a complaint, as who would say, 'Forget not that you live in 1920, and even yet the great war of civilisation smoulders!' So it is. The communications, the most vital necessities for the economic ordering and the social healing of the people, fail, and no politician has such moral sense or disinterested desire for the welfare of humanity as to attempt or assist to put them right again. We are back to the Middle Ages. The aeroplane gives us hope; but now it appears that there is room in literary fiction for an antithesis to Jules Verne, one who, by marvellous means and cunning contrivances, an exploration of the resources of human ingenuity in hindrance and delay, could achieve the slowest

transits, journeys most encumbered with strange and perplexing adventures in unexpected and unnecessary difficulty. There are real facts for such romancers as would inspire them to marvellous stories about Piccadilly to the Strand in forty days, or of Edinburgh to London by shanks' pony. So Portugal has receded, and, having receded, there has been less inquiry for her. For these and for other reasons—perhaps of a political character—there has been at times little or no news of Portugal in the British newspapers of the most passionate and, from the readers' point of view, deeply entertaining events. Hence surprise when some one exclaimed, 'Soviets!' Recently I happen to have spent many weeks in Lisbon and other parts of this most interesting country; occasion placed me in close contact with places, events, and persons greatly concerned with the drama that was being unfolded. Indeed, I left Lisbon for Madrid on the eve of the general railway strike by what was believed might be the last train to run on that long line for some time. Even then soldiers and marines were being suggestively marched through all the streets of Lisbon, bands playing most vigorously at the head and the tail of each column. The people knew what was meant by such a demonstration of armed force—that it was a warning; but some murmured that it did not matter, as the forces were themselves more than half disposed to revolution. . . . One might give a brief account of a few observations and thoughts in Portugal at this period in her history, beyond doubt the most critical of all.

* * *

In general, Portugal, and especially her capital, puts a light appearance on the gravest situations, but only the newest stranger can be deceived. This country has not been in the habit, outwardly at all events, of meeting her troubles half-way. Rather has she seemed to live for the hour, with little care for difficulties that might be ahead. It is a philosophy of national life that has certain advantages, and many disadvantages. But the war-worn European, having been in the thick of conflict, privations, and restrictions, and being disgusted with such paltry political machinations as have followed on an immense sacrifice of human life in the name of patriotism, liberty, and goodness, coming to Lisbon when her crisis had arrived, would say to himself that here was a happy and contented city in which, with certain reservations, he might like to live always. Portugal, it might appear to him then, though she had fought in the war, had for herself been too far from it in her snug corner of the peninsula to be harshly affected as other peoples had. Her sufferings had been limited, and under the pleasant sun of Portugal, shining agreeably and with a nicely regulated warmth during most of the winter-time, it

would seem easy to forget. Seeking explanations of seeming paradoxes and mysteries, that stranger would put it to himself that Portugal was a self-sufficient country, that she could and did grow her own food, and had little need of the assistance of the outside world; and, again, he would say, seeing the free way in which money was being spent, that this country had really more of it than others had thought, and that she was rich indeed. It might seem also that in some matters of war and peace the people were more righteous, and that there was less of what we call profiteering, than in some other countries. Yet there has been very much of that, and it has been the cause of many of Portugal's difficulties; and in the other respects referred to the stranger who thus answered his own questions from superficial observations and simple conclusions would be wrong. There is an appearance of plenty in Portugal, but the distribution has been bad, unfair. The stranger may have enough of the most splendid food to eat. Portugal's meat does, indeed, come from her own pastures, and it is far better meat than Europeans in general have been privileged to eat for some years; and so with other foods. And as for the cheapness thereof, the first meal I had on Portuguese soil last winter—an excellent three-course lunch, including such a beefsteak as had not been seen in any public place in England for five years, the like of which some pessimists think will never be seen there any more, with a small bottle of mineral water—cost less than three English shillings, and this was in the best restaurant in Oporto. A few miles from Lisbon, on a picturesque strip of coast which they are calling the Portuguese Riviera, where, indeed, on Christmas Day I lolled in flannels in the sunshine (but it is not always thus, and there was some bitter weather later), one may be housed in a very fine hotel, with all the best advantages, and fed far better than I have known any people to be fed—splendid food, perfectly cooked and handsomely served—since we were called to war, for four guineas the week; and many wise and eminent British folk were assisting themselves in this manner and at this charge. Here at Mont Estoril there is a very considerable British winter colony, who for the most part advertise not their advantages, lest by advertisement they should disappear; but these people go by steamship from England to Lisbon, and they linger there through the winter. In our hotel there were more than a hundred rooms, and the proprietor says that during one winter all but one were occupied by British visitors. The Portuguese are a peculiar people in respect of matters of warmth and chilliness; and on those days when the hardy and joyful Englishman would be happy in his summer flannels you would see these native Portuguese creeping along their sunlit roads muffled in their overcoats, which only with reluctance and apprehension

do they ever seem to discard. They have told me that there are more dangers in climate, and especially sunshine, than other peoples seem to think; and in particular they say that there are 'sun colds' that one may catch through walking in sunshine when not most thoroughly protected from this dangerous thing.

* * *

The Portuguese are certainly a strange and an interesting people. Always they clothe themselves in the darkest costumes, and the women in general take little pains to make themselves attractive, though such a rule applies not to the males. A French cynic—and there are many such—has written unkindly, and perhaps unfairly, that the true explanation is that beautiful women in Portugal are rare, and that the men deck themselves to their very best to capture them. If unfair, it seems at least a natural explanation. Taking their lives in a somewhat heavy way, the Portuguese are particularly strange on their gala-days, as on the carnival in February, when their festivities, even in Lisbon, seem to the stranger, enlightened upon all the maddest ways of modern merriment, to be crude and stupid. Such a stranger finds this carnival the most depressing thing. The enterprising public entertainers will assemble outside his habitation at early morn a sort of band of some five pieces of brass, the performers attired in tail-coats of cotton print, gorgeously striped trousers, and so forth, and for an hour or two will play to him a steady succession of 'God Save the King,' 'Tipperary,' and the Belgian National Anthem. Being, after four or five such cycles, much depressed by this, he gathers energy and goes out to the city, and there he finds the young people in an adventurous and a rollicking mood, which finds vent in their procuring muddy water and squirting it upon the faces, collars, and garments of the passers-by. This is an honoured custom of continual and intense occurrence. But if these things seem to be said against the Portuguese, let it be added here in passing that these people, lacking the quickness, the sharp animation, and the spirituality of the Spaniards, have some most excellent qualities of which their near neighbours know little. They compare with the Spaniards much as the British might be said to compare with the French. They are more serious—as some would say, more dull—but they have a splendid perseverance, a dogged persistence, and a capacity for labour. So on this carnival-day, while the bands blared their tributes to other nations, and the old war-tune one had almost forgotten—and, with fair respect to it, wished to forget—was vigorously jerked into this smiling morn, Portuguese brick and stone and mortar men alongside were busily engaged, as usual, in building a new house, and doing their business with all that steadiness of

application and excellent industry that in former days we were led to understand the excellent Balbus applied to his task in Rome. It is one of the mysteries of the country, as it seems to strangers, that, with all the economic and labour difficulties that exist, and all the menaces that are supposed to hang upon this land, one sees everywhere this building going on, and most splendid building of new villas, veritable palaces, too. Mont Estoril is being occupied by innumerable new villas that must be among the prettiest in new Europe, and is becoming something like what Tivoli and Frascati were in olden times. It is a mystery, perhaps, but we lead ourselves, or are led, to the old and true explanation of the war millionaires and the profiteers.

* * *

But upon the general affair of wonder and doubt, the seeming plenitude and cheapness of things, as exemplified in many ways (ladies have told me that here they could buy the nicest hats of Paris at less than half of what they regarded as the proper price), there are four main points of explanation. In the first place, there is a general recklessness, such as has been experienced in other countries, due to the feeling that the basis of life and things is unsound and bad, and that vast troubles, a tremendous breakage, may be ahead. In this circumstance there is a disposition to live for the day, and to pay little heed to true values. Ordinary business rules are relaxed; the profiteers make their piles; but many others seem not to care what they make so long as they get rid of things. Then there is the gambling spirit which is abroad—this, again, leading to the destruction of true standards of value. There is gambling in everything; and, as will be shown later, Portugal last winter reached a terrible crisis when it was perceived that she had become a gambling country such as had never been known before. There is gambling in everything. The leading hotel in Lisbon was sold last summer for 650 contos, a conto being a thousand escudos, and an escudo nominally a little more than an American dollar, being the old milreis, which is still the term most commonly applied to it. A month later the hotel was sold again for 1100 contos, and at the end of the year for 1800 contos. On its existing lines and at its existing charges—which were by no means light or anything at all of the four-guineas-a-week description—it could not be made to pay, and for a time it became a question as to whether it might not be converted into a gambling establishment. It had changed hands in this manner not as a business proposition, but each time just in the way of gambling. So it is with other things, and so there is demoralisation. But the two other points are more germane to this present explanation of some apparent cheapnesses, and the

first is that the British stranger, much as he may growl at home about the loss of value of his old sovereign, finds here that it is still a power among the moneys, for as the result of the exchange-rates his pounds sterling all last winter—and it may still be the same—were worth nearly thrice their ordinary value in Portugal; that is to say, the escudo, which normally and nominally is of the value of nearly four shillings and sixpence, was now worth very much less. When I reached Portugal in December the exchange rate was roughly one shilling and sixpence to the escudo, and from that it sank at times to about one-and-threepence. Hence, even with allowances made by some wily Portuguese traders, the British shilling here had an enhanced purchasing-power, as the result of which all things seemed cheap, since for four guineas, a figure we have quoted, one might in terms of Portuguese thought and reckoning, as one might say, read ten or twelve. And the fourth point is the paper money. Portugal is sadly flooded with it, as elsewhere; but here, to the most exaggerated extent, it aggravates the general difficulties. The whole economic situation is false; again values are lost, people treat this paper money with contempt, and rid themselves of it as best they can and in the quickest way. The finances of Portugal are very bad, and the country can scarcely see its way through its difficulties. Governments in the recent past, playing the old game of easy expediency, with certain future disaster as to which they were minded not to think, have sought to stifle troubles of the hour by the printing-press. Practically all money in Portugal is made of paper. There are a few bronze coins of one and two centavos, and some nickel ones of four (the centavo is a hundredth part of the escudo, and so nominally a halfpenny, but now actually of much less value), but these are comparatively rare. There is no silver money in circulation. Instead there is paper for five centavos upwards, and so for the smallest purchases one must use this insignificant stuff, and the pockets become packed with it. The five-centavo note is a little thing printed in green, measuring three and a half inches by two and a half; the ten-centavo is printed in brown, and is a quarter of an inch longer. More and more money being needed, the printing-presses have been gaily producing it in the most reckless way for long past, and it is remarked that the small denominations have not been numbered, and so no count is taken of them. There is vastly more paper money in the land than there are real funds with which to meet it, and it is in these circumstances that economic, political, and all other difficulties have been created and speedily intensified, and some most extraordinary situations established, as to which more may be written in continuation.

THE PARTS MEN PLAY.

CHAPTER XVIII.—*continued.*

IV.

A FEW minutes later she rose to go. 'I have stayed much too long,' she said. 'I do hope you'll get better quickly.'

He took her hand in his, but made no attempt to translate the meaning of the moment into language. He had worked against her country; while she plied her rounds of mercy, he had written on the debasement and the fallacy of it all. Lying in the wreck of his idealism, in the grip of physical pain, dreading the torture of his own thoughts, could he express what her coming had meant? He wanted to tell her of his heart-hunger, of his loneliness, his gratitude, understanding, reverence, and, above all, of his love. There was so much that it made him silent.

'Good-bye, Elise,' he said.

'Good-bye,' she answered.

That was the end. Of such paltry substance are words.

'By Gar!' said the French-Canadian, looking after her as she disappeared down the ward, 'she mak me tink of my leetle girl Marie; only Marie, mebbe, is only so high, *comme ça*, and got de black hair, so! I am homeseeek. Yes. It mak me verra homeseeek. *Godam!*'

V.

She did not come again. Every morning his heart quickened with hope, and each afternoon grew heavy with discouragement as the hours passed by without the step he listened for. The arrival of the mail was an instant of mad expectancy and mute resignation. But every day carried its cargo of renewed hope, and he grudged the very hours of sleep that separated him from it.

He wrote to her three times—pleaded with her to come again. He begged forgiveness for omitted or committed things which might have hurt her, but no reply came. He thought of writing to Roselawn, fancying she might have gone there, but he was certain that before it could reach her she would have come again, and they would only laugh at the idea of any misunderstanding.

He blamed himself for a hundred imaginary crimes. He had not asked her if she would return. Perhaps he had carelessly uttered words that wounded her. He knew her pride; knew that after their parting at the flat it must have been hard for her to make the first move towards reconciliation—and she might have mistaken his joy for petty personal triumph.

Or—had he been an utter fool? Was this her punishment of him? With the consummate artistry of her sex, had she simulated sympathy and forbearance to make his torture all the more exquisite? He dismissed the suggestion as some-

thing vile, but, feeding on his doubts and longings, it grew stronger and more insistent with every hour's passing. A hundred times a day he closed his eyes and lived the sweet memory of her visit; but with the gathering arraignments of his doubts, he wondered if it had all been the studied act of the English girl's reprisal on the American who had dared to challenge her nation.

Weary, weary hours; the inactivity of the body lending fuel to the flames of his mind. He determined to dismiss her from his thoughts, and with his power of mental discipline he reduced his mood to one of mute resignation.

Then the thought of America came to him, and he was seized with an impetuous craving for his own country, his own land, where men's natures were broad and mountainous, like America itself. He pictured New York towering into the skies, the charming homes of Boston, where so many happy hours had been spent in genial, cultured controversy. He smelt the ozone of the West, where sandy plains melted into the horizon; where men lived in the open, and a man was your friend for no better reason than that he was following the same trail as yourself.

America. . . . He was impatient now of every day that kept him in England. He felt that his emotions, his brain, his convictions would all be rudderless until he breathed once more the air of the New World, with its vassal oceans bringing tribute to both Eastern and Western coasts.

He would not call himself a failure or a success until he looked on his handiwork in the light of the great Republic. As his ancestors leaving the shores of Holland and Ireland, as millions of men and women had done with the Old World dwindling away in the distance, he looked towards America for the answer to existence.

Ten days after his admission he was allowed to leave the hospital for his rooms in St James's Square.

He took his leave of the little group who had been his companions for the time—the little Cockney with his incessant exuberance; the French-Canadian, picturesque of language and imagination; the one remaining Australian, vigorous of thought and forceful of temperament; the nurse, carrying Florence Nightingale's lamp through the blackness of war. He tried to say a little of what was bursting for utterance, but they only laughed and fenced it off. They wished him 'Cheerio—good-bye—good luck;' and he wondered if the whole realm of lived or written drama held any farewell more sublimely expressive of a great people enduring to the uttermost.

His servant had a taxi-cab waiting for him.

Driving first to a florist's, he purchased roses for the nurse; then, stopping at a tobacconist's, he left a generous order for all the occupants of the ward. After that he went directly to the American Consul's office and made arrangements for his return to New York.

VI.

It was late in December when, driving to Waterloo to catch the boat-train to Southampton, Selwyn was held up in the Strand by the crush of people welcoming the arrival of Red Cross trains from the front.

Leaning out of the window, he watched the motor-cars and ambulances coming out from the

station courtyard, while London's people, as they had done from the beginning, welcomed the unknown wounded with waving handkerchiefs and flowers, with hearts that wept and faces that bravely smiled.

With a suppressed cry, Selwyn opened the door and leaped into the crowd. He had seen *her* driving one of the ambulances, and he fought his way furiously through the human mass to the open roadway. But it was useless. The ambulance had disappeared.

Struggling back to the taxi, he re-entered it, and turning round, made for Waterloo Bridge by way of the Embankment.

(Continued on page 423.)

BEES IN STRANGE PLACES.

By HERBERT MACE.

THERE is an incident in the fascinating story of Samson which has at times—like other Scriptural stories—been the subject of criticism.

In the course of a journey the strong man encounters and kills a lion. On a subsequent journey he finds a swarm of bees in the carcass, refreshes himself with the honey, and subsequently propounds a puzzling riddle based on the experience. Various people have ridiculed this story as absurd and impossible, but in the course of considerable beekeeping experience I have come across many instances of bees taking up almost as strange abodes.

Any one who has been in the East knows that dead animals do not receive decent burial, but beasts of prey are so numerous that it is not many hours before a carcass is reduced to a mere shell. In such a shell there is nothing very surprising about a swarm of bees, unable to find a suitable hole in which to start their new colony, taking up their abode. And in the height of a honeyflow, when a strong hive of bees, even in England, will sometimes store more than ten pounds of honey in a working-day, it would not be long before the carcass became a storehouse of sweetness.

The favourite places for swarms of bees are holes in cliffs, rocks, and banks, or hollow trees. In England nine out of ten choose a hollow tree, these being as a rule not only commodious, but safe, the entrance often being too narrow to admit enemies with which bees are not capable of dealing effectively.

In cases where trees are scarce and the country-side broken and rocky, holes in rocks are generally chosen, and usually the entrance is narrow enough to be easily defended. It was, therefore, a great surprise to me when I found in a Balkan ravine a colony established in a cave which was entirely open on one side, so that the sun shone full on the hanging cluster. It had been there some time, for several combs

had been built, and were filled with honey and brood. What its fate would be when the honeyflow ceased, and prowling wasps and bees came round, one could readily imagine. Nothing but desperation could have induced them to select such an exposed position.

In civilised surroundings, where holes in the ground are scarce and hollow trees are not allowed to remain long, bees frequently select human constructions for founding their homes, and all sorts of hollow and more or less inaccessible places are occupied by them. The most common is a chimney, which has some resemblance to a hollow tree. Entering at the top, the swarm finds a suitable place for attachment of its combs in the arch of the stack or under a ledge where two chimneys converge. When winter comes and fires are lighted there is a commotion, and bees, dead or alive, come tumbling down. If the chimney is entirely disused, however, it proves a very safe home, and colonies have been known to occupy one for years. There was such a chimney in Bletsoe Castle. It was particularly inaccessible, and although bees had been known to be there for years, no one had been able to dislodge them, until Mr Mason, of Bee Cinema fame, who used to make a speciality of removing bees from difficult places, succeeded in exposing the hive. Many of the combs in this chimney were as much as nine feet in length, and contained great quantities of honey.

Immense stores are often found in places where bees have been undisturbed through several seasons. I have known more than two hundredweight of honey taken from a church roof where bees had been ensconced from time immemorial.

Another favourite place is the hollow between the inner and outer layers of lath-and-plaster houses. Although the space is not very wide, there is plenty of room for expansion downwards,

which is the bee's favourite method of enlarging its combs, and I know more than one old house wall which hums day and night during the summer with the song of a strong hive of bees. The space between the ceiling of one room and the floor above is occasionally occupied by bees, and one can imagine the perturbation of a stranger sleeping in the room on a July night, hearing the high-pitched hum of a busy hive under the floor.

The wife of a beekeeping crofter near Buchan was surprised one summer day at seeing bees entering a store-room through a broken pane of glass. On investigation, she found them going in and out of the upper part of an old wardrobe. Looking inside, she found the swarm had taken possession of the goodman's top-hat, in which comfortable abode they had already accumulated a considerable store of honey.

When Lord Selborne was in South Africa he had two experiences with swarms of bees in a place where he was staying. One entered the drawer of a wardrobe in the room he occupied, and not long after this had been removed by a professional beekeeper, his man found another swarm had taken possession of a portmanteau he was about to pack for his lordship. Naturally its deportation was not attended with much difficulty.

Indeed, all sorts of places, providing a fairly uninterrupted refuge, have been occupied by bees at one time or another. They have been found in tombs, pumps, and clock-cases; in tea-chests, piano-cases, and hay-lofts; and often in situations where human beings and horses passed and repassed frequently, yet have never been troublesome or been interfered with.

On the other hand, big swarms of bees have often lodged themselves in places where they were able to hold up the public for hours together. Last year there was a case in the west of England of a swarm settling in the entrance to a railway goods-yard where there was a great deal of traffic, and as no one dared to go near them, and they were very active and irritable, traffic was suspended until an expert beekeeper could be found to take them away. I well remember, in a northern suburb of London,

a swarm entering a pillar-box and effectually preventing any letters being posted there for a whole day. When the time came for clearing the box, the postman made it his business to seek out a beekeeper before he opened the box.

The place where a swarm intends to take up its abode is carefully selected by scouts before the swarm leaves its hive, but it sometimes happens that the queen, who has not been on the wing for a long time, is unable to fly far, and in such a case the swarm will endeavour to carry on where it first settles after leaving the hive. In the middle of a hedge, or on the bough of a tree, I have found swarms which had been there weeks and built much comb. But the first alighting-place is often more unsuitable still. Swarms have settled on horses, dogs, and men, to their mutual discomfort. The most extraordinary case I have heard of was of a swarm which issued as a boy was passing on a bicycle, and the queen elected to settle upon him. Her followers, who were very numerous, copied her example, and the boy was soon busy flicking bees from his face and neck, fearing to be suffocated. This irritated the bees, and he was badly stung before they decided to leave him.

Perhaps the most singular cases on record are the following. In a certain French town there is a monument, consisting of a tall column, on the top of which is a cast-metal figure of the Gallic emblem—a cock. From a hole, caused by a flaw in the casting, bees can be seen flying all through the summer, a swarm having taken possession and thoroughly established itself there; and since there is no way of dislodging them except by breaking open the figure, they are likely to remain.

At another place in France, a wayside calvary is occupied in the same way, the bees entering near the base of the figure at the back. These also have occupied their strange home for many years.

The most striking thing in connection with these last two places is the fact that metal is a substance bees do not, as a rule, have anything to do with, for, on account of its conductivity of heat, such a home is likely to be overpoweringly hot in summer and bitterly cold in winter.

THE DAY.

By HARIZ.

IT was a hot day for January, but particularly hot and sultry there on the bank of the half-dried river, where the dense belt of date-palms seemed to catch the heat, and the small channels of sluggish, muddy water to reflect it.

They had been sitting there, some four hundred of them, for over two hours in the heat of the day; but what are two hours to an Indian peasant? They had had their *roti* (bread), and,

the stomach being full, having to wait was a small matter; and was not this 'the Day'—the day of reunion with their *bhais* (brothers) who had been at the war from October 1914 to the fall of Kut, and prisoners in the hands of the enemy ever since?

It was a gay scene, this motley crowd of sepoys—all in their best mufti, as befits the great occasion; spotless white shirts, some with

bright-coloured waistcoats over them; snowy loose pantaloons of the Mohammedans, and tight white trousers of the Sikhs and the Jāts; and *pugris* of white or biscuit or blue and white, or black with scarlet and gold fringes. And, if this were not enough, there was a great Union-Jack spread between two poles, and a guard of honour in scarlet *kurtas* (blouse-tunics), red-striped navy-blue trousers, with navy-blue puttees, dark-green *kamarbands*, and dark-blue *pugris*, with red and white silk stripes, tied round a *kulla* or conical skull-cap of scarlet. The band, too, was there with its glittering instruments.

The place, with its date-palms and its bridge of boats, the low river and the stretches of sand that showed where the bed was dry, vividly recalled another country; and Mohabat Khan, with his memory thus stimulated to reminiscence, was recounting to a small group of admiring friends tales of the Tigris and the Euphrates, the Karun and the Karkheh. The old wound that showed on his brown forearm as, before passing it on, he took a couple of long and meditative pulls at the cigarette that was being shared by the five of them, gave extra weight to his words in the ears of his hearers, and rendered them more ready to accept the personal deeds of valour that were not altogether absent from his story.

He was plodding again, with his battle-weary friends, marching away from the scene of an amazing victory, whose fruits could not be reaped. Behind, shrouded now in darkness, stood, vast and lone and seemingly eternal, the great Arch of Ctesiphon. It was the last he remembered of those gallant friends who were now to be welcomed back after a year of victories, five months of heroic defence and privation, and nearly three years of bitter, galling captivity and oppression—the little remnant of the old regiment that had fought its way to Ctesiphon, and endured the sufferings of Kut al Amarah.

He saw again visions of hard-fought fights amongst the palm-trees and the irrigation channels; swamps green with slime and vocal with frogs; a strong, swift river swum by a dauntless little party in the face of the enemy; a hard-shelled village; breastworks built by us where it was impossible to dig on account of the water, and enemy trenches, thronged with dead, on the only dry ground; but all led alike to that classic battlefield, and over all towered the great Arch of Chosroes.

Soon they would be here—that remnant; but many there were who now lay in some lost grave in the Mesopotamian desert. Never again would they see cheery Jaggat Singh, or faithful Bahadur Khan, or stolid Kishan Chand. Many a little, flat-roofed mud hut on the plains of the Punjab or the terraced fields of the lower Himalayas had long grown resigned to its loss. But did Mohamed Khan still live, or Badlu, or Harnam Singh?

They are late. The prisoners cannot have come by the first train. Surely they will be in the second.

Anon comes a string of camels laden with merchandise of Ind, and led by a big-boned, ragged man, whose florid, bearded face shows him to be an Afghan. He strides along in front of his shuffling, superciliously indifferent camels, with his stick held at both ends across the nape of his neck, and the nose-rope of the leading camel in his hand.

It is no use asking him, for it is long since he left the distant station, and he is a foreigner and a stranger in the land. Beside him trots a great, fierce, shaggy, yellow hound. 'Powindah,' grunts Mohabat Khan, and resumes his odyssey.

Now a cloud of dust is seen, and a tum-tum appears far out on the road that leads, from bridge to bridge, across the river-bed. Can it be they? No; for no bugle-call has been heard from across the river, where buglers wait to herald the approach. As it crosses the last bridge in a cloud of dust of its own creating, a jemadar steps into the roadway to stop it and make inquiries.

There must be a woman in it, for a sheet hanging from the hood completely hides the occupants of the back-seat, providing the necessary privacy.

'Peace be on you,' the jemadar hails the driver, who is a local Mohammedan.

'On you be peace,' replies the tum-tum walla, as he checks with difficulty his weary nag that has at last awakened to the proximity of home and a feed. 'Oh *sura*!' (pig), he vociferates as he gives its obstinate mouth a final tug.

Yes, the train was in when he left. There were two or three carriages full of sepoy on it.

So they had arrived.

The tired animal exhibits as much reluctance to start again as it did to stop; but at last the little gray, decked with blotches of orange stain and a necklace of blue beads, is prevailed upon to resume an awkward canter, to the tinkling accompaniment of its many bells.

A hum of conversation arises amongst the men as the news becomes known; excitement and curiosity permeate the many recruits, and speculation arouses the few old soldiers.

A score of names are eagerly discussed by the little groups, and the chances of various old friends being amongst the survivors.

'Mirza Khan is my *chhota bhai*' (younger brother), says Mohabat. 'He came out in a *darāf* [draft], and joined us at Kut. He was wounded at Suleiman Pāk [Ctesiphon], and got a *tagma* [medal] for *bahadure* [bravery]. Allah knows if he yet lives, for no news has come of him for over three years.'

'Mirza was all right when I saw him last,' breaks in Ali Haidar, who escaped from the Turks after a year's drudgery on railway construction at Ras el Ain. 'He was taken away

with many others towards Haleb [Aleppo], but I was too sick to go. He was a sturdy *jawān*, and his wound did not trouble him any more.'

'I, too, have a kinsman whom I hope to greet to-day,' says a big bearded Sikh who had been standing behind the group that squatted round Mohabat Khan. 'He is my cousin, Rattan Singh, the great wrestler. Only Ganda Singh could beat him, who was killed at Nasiriyeh. We had a post-card from him a year ago, from Konia, and that was fifteen months old. But perhaps he, too, has gone to be with the *guruji*.'

A faint bugle-call from across the river interrupts their reveries, to be taken up by one nearer, and by yet another—the regimental call, and 'Fall in.' So they are near.

The sepoy rise with a buzz of excitement, and line the roadway from the bridgehead.

Far away is a long cloud of dust, and then, as the tongas come in sight, the excitement increases.

The tongas draw nearer, while the buglers, now no longer needed, run at their sides.

They halt, and the prisoners get out. They seem so few—only about seventy. They fall in, form fours, and, headed by their Indian officers, march towards the little bridge over the last narrow channel. As they step upon it a whistle blows, and three 'Hip, hip, hurrahs!' are given, as the occasion demands, and the prisoners cheer in return; then, as they reach the bank, there is a wild rush of friends and relations to greet them.

The hubbub dies almost to silence, for now, in the embracings that follow the years of priva-

tion and grief and separation, hearts are too full for speech.

And now, again, men find their voices, and on all sides are heard the Hindu, Mohammedan, and Sikh greetings: '*Rām, Rām,*' '*Salām aleikūm,*' '*Aleikūm salām,*' and '*Sat sri akālgur bar akāl.*'

Mirza Khān is there, and even now he and his brother Mohabat are locked in the fervent embrace of reunion. But it is not the strong, clean-built, athletic Mirza of old; he stands only with the help of a crutch, for his left thigh had been smashed while he was working on a tunnel through the Taurus range, and his right hand is gone from the wrist from a blasting charge.

But Hākim Singh seeks his *bhai* in vain, for Rattan Singh has indeed gone to be with the *guruji*.

Then once again they disentangle themselves from the crowd, and, garlanded with roses and jasmine, fall in behind the great Union-Jack—the emblem of the King-Emperor whom they have so faithfully served.

The band strikes up '*Zakhmi Dil*' ('The Wounded Heart,' a famous Pathan love-song), and they march in state through lines of cheering sepoy to a thunder of '*Ganga jī ki jai!*' (Hindu war-cry), '*Alla-a-ah!*' (Mohammedan cry), and '*Wāhī guru jī kā khalsā, sri wāhī guru jī ki fatteh!*' (Sikh cry), that drowns the memory of the first alien cheers; and all the bitter, dreary past, and all the death and the suffering, are forgotten in the glorious, happy present.

The dream of years has become a reality, and this is, indeed, 'the Day.'

AGATES AND AGATE-COLLECTING.

By A. R. HORWOOD, F.L.S.

VISITORS to the seaside, whether they be young or old, frequently have some hobby or other. Often this takes the form of collecting. Many people bring back shells or seaweed or what they term curious stones, picked up on the seashore. Very often, however, knowing something of the various kinds of pebbles to be found on an ordinary beach, a fair percentage of holiday-makers and tourists, not to mention the professional collectors, go in for collecting a particular kind of stone, especially if it has some intrinsic value. Amongst such stones are agates, which are very plentiful on some coasts, and present considerable variety in colour and markings. Being susceptible of a high polish, they are put to a variety of purposes, and there is a considerable trade in agates. To know something about them, and how best to search for them, is therefore of interest.

Agates occur chiefly in rocks of igneous origin, in rounded nodules in cavities, and usually have an irregular surface, or they may occur in veins.

Sometimes a rock is crowded with these nodular agates, and is then amygdaloidal. When the rock weathers the nodules drop out, and are found in the beds of streams, or are obtained in quarries. Many find their way to the sea, and are washed out of cliffs and are distributed along the coasts.

In this country agates occur in Cornwall in quartz rocks on Carnbrae Hill, and in serpentine rocks at Kynance Cove, Devil's Bellows, near Lizard Point. They are also found along the coast on the Chesil Bank, and on other parts of the south coast. They are, too, abundant on the east coast, especially in Norfolk and Suffolk, where there are shingle beaches. In Cumberland agates are obtained at Carrock Fells and Falcon Craig. In the Midlands they occur in older rocks at Mickleton, Gloucestershire, and in gravel-beds at Lichfield, in Staffs.

Known also as 'Scotch pebbles,' they are found at Jedburgh (Roxburgh); in the Pentland Hills (Peebles); at Dunure, Galston, and

along the Ayrshire coast; at Habbie's Howe (Midlothian); Montrose (Forfar); Dunbar; of fine red mottled type at Dunglass (Haddington); Stonehaven (Kincardineshire); Kinnoull Hill (Perth); in the bed of the river Tay; and in Fife, Kinross, and at Dunvegan Head, Isle of Skye, of a gray colour. In Ireland agates are found in Antrim, on the Ballycastle coast, on the shores of Lough Neagh, in Donegal, near Malin Head, on Lough Swilly, and on the Clonca coast. The Wicklow agates are reddish in colour. Jasper agates come from Bray Head, and occur in amygdaloids in Donegal and at Lambay.

Abroad, the chief centre of the agate industry is Oberstein, in Germany. Large factories for polishing and colouring them exist here and in other places. They are also found in Hungary, Brazil, Uruguay, India, Iceland, and the Faroe Islands have furnished a large proportion of the supplies in recent years.

As a variety of quartz agate is a cryptocrystalline form of silica, and may be considered as a variety of chalcedony. It contains 70 to 96 per cent. silica, and a variable amount of alumina, coloured by oxide of iron or manganese. By some agate is used as an aggregate term to include chalcedony and carnelian, and thus is composed of chalcedony with quartz and jasper or opal in patches. But it may occur in a purer form and be uniform in colour, differing in colour from carnelian, and lacks then the opaline appearance of chalcedony. Occurring in cavities in rocks into which silica, which is soluble in natural waters, permeates, it has been formed by the deposition of layer after layer within this cavity, differing in transparency, or colour, thickness, &c., the outer layer being often a greenish one, coloured by chlorite, which is the colour of prase. The pure silica layers are clear and translucent or gray, but the silica is often impure, and successive layers are of various colours, giving a banded, variegated appearance, often of great beauty. Oxides of iron produce red, brown, or yellow colours; whilst other combinations afford green, purple, or pink. The layers following the outlines of the cavity are concentric, and give rise, when irregular, to what are known as 'fortification agates,' where the bands are angular. Agate is hard like quartz, but brittle.

Treated as an aggregate, agates include chalcedony, the browner forms of agate, and carnelian, which is reddish and translucent; mocha stones, clear gray moss agates, with dendritic markings caused by manganese as if including mosses; bloodstone, dark green with red markings; plasma, grass-green and coloured by chlorite, found on the Schwarzwald; and chrysoprase, apple-green, coloured by oxide of nickel, found in Silesia. In another way agate is a variety of chalcedony, which is one of the nine varieties of quartz, and is included as a sub-variety of it along with chalcedony proper, onyx, sard, sardonyx, carnelian, jasper agate, heliotrope,

mocha stone. Flint is also regarded as a form of chalcedony in the same manner. These forms may be distinguished by their degree of transparency, colour, and markings.

When they occur on the seashore agates are in the form of rounded pebbles, from an inch to three or four inches in length or longest diameter. They are most abundant where a shingle bank is formed. In some cases these banks consist of a series of successive tiers, the oldest being at or above high-water level. In such cases the proportion of agates in a mass of shingle is probably large, and the point to consider in collecting from these natural agate stores is what to collect and what to reject. The older pebbles are bleached; the surface is dull, and it is necessary to moisten it to ascertain if a stone is of a fine colour or well banded. The very opaque forms with milk-white bands will, of course, at once reveal themselves, as will others, such as fortification agates.

Elsewhere the shingle is less abundant. A bank may not exist, or may be in only a very early stage, and may lie up near high-water level or farther down, occurring as an irregular band with a few stones only, and in not more than one layer. Where this leaves off there may be patchwork arrangements of scattered shingle and sand, or this mode of distribution may obtain above the shingle band proper. It is where the pebbles are more scattered that one has a better chance of singling out the best and choicest varieties.

How to find agates is necessarily largely a matter of experience, but certain main principles and a method of working the beach may be explained; and these will help the collector to work on right lines and to enrich his collection with the better varieties, and enable him to save time by the immediate discardment of rubbish.

As has been said, the pebbles require when bleached to be wetted in order to examine them most readily when held up to the light. It is well, as the pebbles are often large and many occur on a beach, to take with one a small can of water in which to dip them. If, as is sometimes done, a pebble is placed in the mouth to wet it, a repetition of this process will cause, especially on a hot day, when a shingle beach radiates a tremendous amount of heat, a disagreeable taste and a parching thirst. A good plan, also, is to take a stick, partly as a support for one hand in leaning down to pick up a pebble with the other, and partly to turn likely pebbles over as one is going along. Walking on shingle is tiring work, it must be remembered.

As the shingle in tiers is covered by the tides up to a certain level, it is necessary to examine each tier at a time, partly because the tiers are separated by slopes, and the only method is to walk along one level at a time, and

to return along the next lower, as one cannot wander up and down or across the tiers; but more especially because by following the coast-line parallel to the ebbing tide one finds the pebbles naturally moistened, or wet, with the receding water, and the agates when wet show up more readily, being transparent when clear, and they then glisten in the light and can be readily detected. This fact is one of the most helpful in searching for agates. A further aid is the shining of the sun on the wet pebbles, causing them to show up amongst the surrounding mass of more opaque or non-transparent pebbles.

The importance of these two factors having been grasped, the method of working the beach may be adapted to local circumstances. The tiers may be worked first one way, then the other. Special attention should be paid to the tides, so that the stones may be examined when wet. Also, the sun should be called to one's aid. For the rest, the selection made should be of the best, and all mediocre specimens thrown away.

It will be found that a large proportion of pebbles that look at first like agates or carnelians are only rolled pebbles of quartz of a more or less transparent colour when wet, but quickly becoming dull when dry; and there is usually a large amount of flint of the same type on the beach, generally of a pale straw or yellow colour, sometimes tinged orange or red with iron. Care must be taken to distinguish between these and agates.

Agates are very porous and lend themselves well to polishing, and the colour may be heightened very readily by the Oberstein methods. The stones used are those that take up water most readily. First of all they are dried naturally,

and are then soaked in honey-and-water, and placed in a heated oven, and left for from two to three weeks, being afterwards washed, dried, and put in an earthen vessel with sulphuric acid. The vessel is covered, and put in an oven for from one to twelve hours. They are then taken out, washed, and dried. They are placed in oil for twenty-four hours, cleaned, cut, and polished. By this method, the different layers being porous to a different degree, the colour is varied. The gray is strengthened, some are made of a shade varying from brown to black, and the white parts are intensified by the darker layers in contrast. By this means veined agates are converted into onyx. The brown and yellow rings produced are formed by a process of carbonisation. In other cases sugar is used in place of oil for immersion. The forms treated as onyx were cut for cameos and intaglios, like the stones used in the antique sculptured gems fashioned by the ancient Greeks, and still earlier by the Egyptians, the Assyrians, and the Etruscans. A yellow stain is produced by treating them with carbonate of soda at a high temperature.

Agates have been used in the manufacture of jewellery in Scotland and in other parts of the country for a long time. Cut and polished, they may be used for making handles for knives and forks, cups, and rings, and they are often carved in the form of animals, human figures, &c. Owing to its hardness, and its not being affected by damp or chemical fumes, agate is also used as a knife-edge for beams in chemical balances, and in the making of mortars and pestles. In jewellery agates play an important part, being fashioned into brooches, ear-rings, cameos, gems, charms, and into beads for bracelets, necklaces, and other ornaments.

LINKED WITH DICKENS.

By CHARLES M. CLARKE, LL.D.

HALF a century has swept swiftly away since the reading-world was staggered by the intelligence that 'The Great Master of Modern Fiction,' as George Augustus Sala dubbed Charles Dickens, had been suddenly removed from our midst. The fiftieth anniversary of that fatal 9th of June recalls vividly to the writer's memory an interview and a conversation which took place with the genial humorist earlier in the month.

On a certain bright, fresh morning I was strolling up Ludgate Hill, and when nearly opposite the Daniel Lambert tavern, met Mr Dickens. For the moment I could scarcely realise the fact. The man who approached was crawling limply along, with a weary progression as different as it was possible to conceive from the alert, springy action of his accustomed stride, in which every muscle seemed to quiver with the

ecstasy of exercise. No other man of my acquaintance ever appeared to derive so much physical enjoyment from walking as did the novelist.

But there was no mistaking the sad, serious face, the lofty intellectual brow, with the hair brushed forward over each ear, or the refined aquiline nose, the drooping moustache, and the short iron-gray beard, let alone the expressive eyes, which even weariness could not rob of their natural brilliancy.

I raised my hat in courteous salutation as I said, 'Good-morning, Mr Dickens.' A look of bewildered inquiry flashed from his eyes, while he replied, 'I do not remember you, sir. Really you have the advantage of me. Pray, where have we met?'

'It is not surprising,' I hastened to add, 'that a literary triton should find some difficulty in

recognising a journalistic minnow; but perchance you may remember that George Augustus Sala introduced me to you some months ago at the Savage Club.'

'Ah! yes, yes, of course, dear old Sala, dear old Savage Club, to be sure; yes, now I place you;' then, extending his hand, he cordially shook mine. 'Forgive me, dear boy,' he continued. 'Expect I'm losing my memory. Why—would you believe it?—only t'other day lady asked me who wrote *Sketches by Boz*. For the life o' me couldn't remember. All I could say was, "How the dickens should I know, madam?"' However, the genial smile that rippled round his mouth and the gleam of humour which twinkled in his eyes considerably discounted the accuracy of his statement.

After walking beside him in silence for a few minutes, I presently remarked, with possibly a slight absence of tact, 'I am sorry to notice an appearance of languor in your walk; your step lacks its wonted elasticity. Is it the weather, or are you not feeling well?'

'I'm all right. Well, well, dear boy, perhaps I am a little run down. I must confess I don't feel quite up to concert-pitch. I guess I have been rather overdoing it lately, not only burning the candle at both ends, but setting it alight in the middle as well, with the result that for about the first time in my life I do *not* enjoy walking.'

I murmured some conventional regret, but, without heeding my words, he continued: 'Sure I'm not taking you out of your way? No? Then I'll make use of you. No, don't be afraid; I'm not going to put you into a book. Still, I will immortalise you. Just give me your arm, and long after I am laid to rest in Westminster Abbey you can boast to your grandchildren that you are the only man who ever walked arm-in-arm with Charles Dickens.'

The look of whimsical drollery by which the speech was illustrated robbed it of all sense of egotism, and from that instant he began to lean less heavily on my arm. Throwing off all lassitude, he stepped out briskly with more of his old form, the while he discoursed in the most entrancing manner, quoting in character whole passages from *Edwin Drood*. One minute he personated Rose Budd; then he drifted into Durdles, and changed into Mr Crisparkle, the minor canon; anon he imitated the saturnine Jasper, reproduced the pompous Mayor Sapsea, or illustrated the vagaries of the lovable hero of the unfinished novel.

In reply to a question as to his favourite production, he said, 'Of all the books I have written, my favourite is *David Copperfield*—very possibly from its containing more of my own life than any of the others. At any rate, I derived more pleasure in its composition. But the book which took most out of me, which carried me quite out of myself, is *The Tale of Two Cities*. That certainly is my supreme

effort. That work will, I believe, live long after all my other books are forgotten.'

It was the most memorable walk of my life. It was the *last walk* that Charles Dickens took down Fleet Street, and the sole occasion on which I or any other man was linked arm-in-arm with him.

All too soon we arrived at Charing Cross Station, where he took a ticket for Rochester; then, pausing under the station clock, he announced that there was still five minutes to spare before his train was due to start, and his gaze wandered furtively in the direction of the refreshment-room.

'I don't know, my young friend, whether you have been cherishing any "great expectations" of a modest quencher, but if you have, why, here's a buffet, as Wemmick would have said. Suppose we go and get a drink.' So saying, he led the way up to the counter, where the presiding genius, having satisfied herself as to the condition of her coiffure, suddenly remembered some item of news which she desired to convey to the other female assistant. Then, with a sniff of supreme disdain and a fixed stare of astonishment, she sailed gracefully down the bar, and condescended to supply us with a sawdust sandwich, which was washed down by a glass of tepid sherry.

I accompanied him across the platform past the book-stalls. Passing the ticket-barrier, I escorted him to the door of a first-class compartment, which I closed after him; and just before the clock indicated half-past one the train slowly steamed out of the station, while the last thing I saw was the delicate white hand of the novelist waving an adieu from the window of the carriage ere it finally disappeared in the distance. I turned slowly away, my hand still tingling under the pressure of his valedictory grasp, and my mind suffering from an unaccountable impression of sadness.

Four days later, in the upper apartment of that Swiss chalet which had been given to him by his friend and admirer Charles Fechter the actor, and which stood in the garden of Gad's Hill Place, forming the favourite workroom of the great author, he died. Here, on the 9th of June 1870, seated at his table with the ink scarcely dry on the page of *Edwin Drood* at which he had been writing until the last moment of his life, he passed away. As a matter of fact, it was within two hours of his being engaged on Chapter XXIII. ('The Dawn Again'), containing the words, 'And preach the Resurrection and the Life,' that the great writer died.

Thus passed away suddenly, in the prime of life, the spirit of a genius well-nigh as immortal as Shakespeare; a genius that appealed equally to prince and peasant; a genius that fought ever on the side of honesty and chivalry, and unflinchingly opposed sham and shoddy.

Leaving aside the reform of abuses which the

novels of Charles Dickens brought about, it is a grand record to have called forth the tear-drop of sympathy, to have aroused innocent laughter, and to have stimulated the love of humanity, as no other writer ever did, in millions of readers whose lives have been brightened by the message of the great master of fiction.

In his will he had desired that he should be

buried in an inexpensive, unostentatious, and strictly private manner, without any announcement of the time or place of burial. These conditions were observed; but his executors did not consider them inconsistent with his receiving the honour of interment in Westminster Abbey, which took place accordingly on the 14th of June 1870.

THE MONTH: SCIENCE AND ARTS.

A FLOATING SAFE FOR MAIL-STEAMERS.

HOLLAND has always been noted for her shipping, which in recent years has grown considerably in importance, more especially as regards the services between Europe and the East Indies. It is not altogether surprising, therefore, to find the Dutch postal authorities taking the lead in adopting means for safeguarding mail matter in cases of shipwreck, as shown in those which have been applied to the mail liners of the Netherlands Steamship Company. This development takes the form of a huge safe, carried upon the deck of each vessel where it can float off should the ship sink. The safe is cylindrical in shape, with hemispherical ends, and it is carried in a cradle which releases it when the vessel has sunk to a predetermined depth, this condition being necessary to avoid the possibility of a big sea coming on board and carrying off the safe. After floating to the surface from a sinking ship the safe is almost human in its apparent efforts to attract attention, these being carried out by automatic appliances which come into action half-an-hour after the safe leaves the ship. They comprise an occulting light shown during every fourth minute, while for one minute in every nine a signal-horn is blown. Moreover, these signals will continue for three months if the safe is not picked up. Should the light and the horn fail to attract attention in twelve hours, a rocket is sent up, this signal being repeated every hour. Every possible precaution is taken to safeguard the contents. The safe has several doors, one inside the other, and of these the innermost can be opened only by means of a secret code. 'Finally'—says James Anderson in the *Scientific American*—'every safe is provided with one separate compartment which automatically destroys all its contents should an unauthorised person attempt to open the safe.' Letters to be shipped in the safes have to carry special stamps, which are on sale in all Dutch post-offices, and also on board the mail liners. For a small fee passengers can have letters or valuables put into the safe during a voyage, the captain being provided with keys for this purpose. As in the case of safes in banks, the joints are welded, and there are three shells of special steel, one inside the other. Besides,

the safes are in full view of the bridge, where they are continually under the eye of the officer on watch throughout the voyage.

SIGNALLING BY INVISIBLE LIGHT.

By no means the least remarkable invention of the war was a system of invisible signals, requiring no wires, developed by J. Herbert-Stevens and A. Larigaldie for use in the French Army. Like the heliograph, and a similar instrument for telephoning which formed the subject of a recent note, the new device is based upon the transmission of light by parabolic mirrors. It has, however, this advantage, that no light is visible to outsiders; consequently signalling may be carried on at night without the enemy's cognisance. The infra-red rays of the rainbow and the spectrum, although invisible to the human eye, can be reflected and projected, and these are used for transmission in the new instrument. The transmitter consists of a searchlight fitted with a screen which cuts off all the visible light and projects only the infra-red rays. For the small portable apparatus an incandescent electric-lamp of the nitrogen or neon-filled type is used, this being rich in red rays; while for longer range transmission an arc-lamp is employed. The small lamp is supplied by a storage-battery at about six volts. With a lamp of 100 candle-power and a reflector eleven inches in diameter, signals can be transmitted over two-thirds of a mile. More powerful forms of the apparatus have ranges up to eight miles. Signalling is carried on by the Morse code in dots and dashes, the searchlight being fitted with a shutter for this purpose. The same instrument is used for both transmitting and receiving, a detector being placed in the focus of the reflector for the latter purpose. These detectors may transmit the message to the eye or the ear. As with all similar systems of signalling, the direct line between the transmitting and receiving points must be clear of obstructions, and the instruments must be pointed exactly towards each other, which is done by sighting-tubes in line with the beams projected.

A SIMPLE OIL-BURNER AND COOKER.

In these days of threatened strikes it is just as well to have some alternative source of heat

to coal, gas, and electricity, supplies of which may become scarce, or, in extreme cases, be cut off altogether. This desideratum is well met by the 'Welcome' heater, which burns paraffin, and has been designed to take the place of a coal or gas fire for all kinds of cooking and heating. The essential parts of the apparatus are a burner, which is put into the fire-grate, a paraffin-tank to be hung on a wall or placed on a shelf, and a small flexible pipe connecting the two. Where the pipe joins the tank is a screw needle-valve, which is used to regulate the supply of paraffin to the burner. As the paraffin flows to the burner by gravity, it is necessary to place the tank well above it, a height of about five feet being recommended by the makers. After flowing down the tube, the paraffin, as it passes through a pipe over the flame, is vaporised ere it reaches the point where it is consumed. The burner is very simple, and comprises, among other parts, a horizontal U bend, which forms the vaporiser, whence the hot vapour passes down into another horizontal U provided with two small holes, which constitute the flame-jets. The lower U is fixed in a rectangular pan with an open top and holes in the bottom to admit air. The pan has an asbestos lining, and contains an asbestos pad at the bottom. The *modus operandi* is as follows. A little methylated spirit is poured upon the pad and a light applied, as the vaporiser must be heated before the jets will ignite. When the methylated spirit is well alight a trickle of paraffin is admitted to the vaporiser by opening the needle-valve a quarter of a turn for five seconds. When vapour begins to come out of the jets, the needle-valve is again given a quarter of a turn, and the jets are lit. Air coming through the holes in the pan mixes with the vapour at the jets, and the combination produces intensely hot blue flames, which continue so long as there is any oil in the tank. The apparatus gives as much heat as a coal-fire at full blast; moreover, the vaporiser is fitted with deflectors, which can be so manipulated with a poker as to direct the heat where it is most needed. As compared with some other kinds of stove, there is the great advantage that the paraffin is not under pressure, and the stove is, therefore, safe to handle. It is also portable, and can be moved about from room to room—a very valuable feature in the small household. Used in the kitchen-range first thing in the morning, it will provide water for washing in five minutes, and for baths in twenty, and will then serve to cook the breakfast. It can next be placed below the copper or transferred to a sitting-room as desired, and may afterwards be returned to the kitchen for further cooking operations. In country districts without a gas-supply the 'Welcome' heater should prove invaluable, as the price is comparatively low, and the cost of the paraffin consumed is only about

twopence an hour; while its use dispenses with the handling of coal, the cost of firewood, and the cleaning of grates and flues.

LOCKING DEVICE FOR NUTS AND BOLTS.

Practically every form of mechanism is held together by bolts and nuts, and it has always been a difficult problem in those mechanical appliances subject to vibration, such as motor-cars and locomotives, to prevent the nuts from shaking loose in course of time. Numerous locking devices have been invented to overcome this difficulty, but until recently all have been open to some objection. Those which were effective were too costly; while the cheap ones could not be depended upon. These drawbacks have been overcome in the 'Palnut' safety lock-washer, of which the half-inch size is sold for less than a penny. It consists of a thin, slightly conical, steel disc, with the edges turned up to form a hexagon of the same size as the nut. Through the middle of this disc is a circular hole, the edge of which fits into the screw-thread on the bolt. After a nut is screwed on to its bolt one of these washers is screwed up against it, and then tightened with a spanner, the effect being slightly to flatten the cone, and so cause the washer to grip the thread tightly. It will be noted that no alterations need to be made to either nut or bolt, and neither is damaged. All that is necessary is that the bolt should project through the nut to the extent of a couple of screw-threads, and this is generally the case with any combination of bolt and nut.

A NON-DRIP CANDLESTICK.

Even when stationary and in perfectly still air, few candles can be depended upon to burn away without trickles of grease running down the sides; and if they are carried about, not only is the socket in which they are placed apt to be filled with such overflows, but often the whole candlestick becomes liberally sprinkled with grease. In fact, unless extreme care is exercised, not a few drops of grease fall on to clothes, carpets, or furniture. Owing to this, bedroom candlesticks in households having any pretensions to smartness have to be cleaned daily, which involves a considerable amount of irksome work. Again, the piece of candle left in the socket is wasted. All these drawbacks are overcome by the 'Sunbeam' non-drip candlestick. In this device a cone-shaped hood with a hole through the top is placed over the top of the candle, and falls automatically as the candle burns away. The hood is somewhat similar to that of a carriage candlestick, but there are two important differences. First, the pressure is very light, and is perfectly even from start to finish, being due only to the weight of the hood. Second, the hood is made in two pieces, soldered together, leaving a chamber between them to hold the melted grease, which is thus prevented from

overflowing. A pillar and a bar at one side guide the hood in its downward course, and hold the candle from falling out should the candlestick be knocked over. The writer has burnt a candle away in one of these holders without a drop of grease escaping, although the candlestick was purposely jerked about and knocked over several times. Moreover, the candle burnt steadily without the slightest attention until its height was little more than the thickness of a shilling, and when it became necessary this small remaining portion could be easily extracted without causing any mess. The 'Sunbeam' candlestick is made of tin, is painted an attractive colour, and is so constructed that it may be hung up on a nail or a hook, if that is desired.

REVIVAL OF JET-PROPULSION.

Among the more interesting features of the recent motor-boat show at Olympia were two examples of the apparatus used for propelling ships by water-jets. One of these was the model of an experimental hydraulic propeller, lent by the Admiralty; the other was a jet-propulsion outfit installed in a twenty-six-foot boat. These exhibits were novel so far as the apparatus was concerned, but the water-jet is quite an old method of propelling ships, having been tried in H.M.S. *Waterwitch* many years ago, while at least two of the Royal National Lifeboat Institution's boats were at one time fitted with jet-propulsion. The system was not repeated in naval craft until the end of the war, when a number of vessels to be propelled in this way were built by the Admiralty for a special purpose. In the case of lifeboats liable to ground on sandbanks, or to be called upon to operate frequently amongst wreckage, jet-propulsion has obvious advantages; but in spite of these the system was abandoned by the Institution. The model lent by the Admiralty is of apparatus designed by Mr D. V. Hotchkiss, and constructed at the Admiralty experimental station at Shandon. The propelling arrangement is very simple, water being drawn in through inlets facing the direction in which the ship is proceeding, to be whirled round by an impeller and discharged towards the stern. A simple device, worked by a lever, reverses the jets and drives the vessel astern, or cuts them off entirely. Any speed, from zero to maximum, is obtainable in either direction. The apparatus fitted to the twenty-six-foot boat worked on similar principles, except that the impeller was of the turbine type with a vertical spindle. In this case all three jets could be swung round by turning a hand-wheel, so that the boat could be driven ahead or astern, or turned about in any direction, with the greatest ease. Either of these appliances may be actuated by any form of prime mover, but they offer special advantages in combination with gas or oil engines, which can be kept running at their

normal speed, while all manœuvring is done by the propelling device. It will be interesting to note whether these new forms of jet-propulsion meet with more success than previous ventures in this direction.

ALARM-BELLS RUNG BY WIRELESS.

Our readers will remember that last month we published a paragraph dealing with a new device recently designed by the Marconi Company for ringing alarm-bells on all ships fitted with the necessary apparatus within a range of eighty miles, and thus attracting attention at once, even should the operator be off duty. Further information is now to hand as to the working of this latest product of the inventive genius of those in charge of the Marconi Research Laboratory. In the receiving instrument there is a small magnet carried on a spindle in jewelled bearings, and fitted with what corresponds to the hair-spring of the balance-wheel of a watch. This magnet, if pulled round half a turn or so, will swing to and fro, at the rate of 180 times a minute, until it gradually comes to rest. Most of our readers will know that if a magnet is surrounded by a coil of insulated copper-wire through which an electric current is passing, the magnet will try to set itself at right angles to the coil. In this case the coil is connected to the wireless apparatus. When the initial electric waves pass over the aerial they produce therein a feeble current. This current is amplified to a convenient intensity, and then rectified—i.e. transformed into direct current, which energises the electro-magnet just referred to. Such currents, however, are too feeble to swing the magnet to its limits, unless they are received at the rate of exactly 180 to the minute, the natural rate of swing of the magnet. What happens is this. The first current produces a slight movement; this is increased by the next, and so on until the magnet swings round to its full limit. When this takes place a platinum-pointed arm on the spindle makes an electrical contact, which causes a strong current to flow from a battery round the coils of another electro-magnet. The magnet, thus brought into action, attracts a soft iron bar, the movement of which switches the current through an electric-bell, and causes it to ring until the operator attends to it. A message made up of dots and dashes would not swing the magnet; the signal must be all dots, transmitted at the rate of 180 to the minute. The instrument for transmitting the distress-signal, like that for receiving it, also has its 'balance-wheel.' In this case, however, it is fitted with a bar of soft iron which is attracted by powerful electro-magnets, by means of which the 'balance-wheel' is pulled round against what may be called the 'hair-spring.' The spindle of this 'balance-wheel' is also fitted with a contact arm, which makes an electrical connection at each end of its stroke.

In this case there is no question of getting up a swing, the magnets being powerful enough to turn the wheel at once. When a key is pressed, current is passed through the electro-magnets, which, thus brought into operation, pull round the wheel to the contact-point. The operator then releases the key, current is cut off, the electro-magnets no longer operate, and the 'hair-spring' swings the wheel back 'with a run,' so that it makes another contact at the other end of its stroke. This contact passes current through the magnets again, which turn the wheel back to the first contact. In this way the wheel keeps swinging and making contacts at each end. The spring is so adjusted to the length of the swing that the first contact is made 180 times a minute. This contact opens and closes the circuit in place of the usual operating key, and in less than a minute bells are rung on all ships within range which are fitted with the apparatus.

A NEW HEATING DEVICE.

An objection urged against the old-fashioned type of gas-fire was that a large part of the heat supplied was not radiant heat, but convected heat—in other words, that, in proportion to the amount of heat furnished by the direct rays of the fire, too great a share was provided by the air in contact with the warm portions of the stove becoming heated, and by its circulation conveying the heat to the various parts of the room. The air of a room warmed by convected heat always feels less invigorating than that of a room warmed by radiant heat; hence the antipathy to the older type of gas-fire to which we have referred. In the more modern type of gas-fire, however, a much larger proportion of the heat supplied is radiant heat, and there has recently been placed on the market an invention by a medical man which tends not only to reduce still further the amount of convected heat, but also to increase the efficiency of the stove by projecting the heat where it is needed, and to lessen materially the consumption of gas. It is made throughout of polished brass, and consists of a horizontal tray eighteen inches square, bordered on each of two opposite edges by an upright, detachable, and adjustable side. It is supported on four telescopic legs, which permit of the tray being adjusted so that its height from the ground may be anything between four and eight inches; while the sides may be adjusted within a range of four inches so as to make the apparatus fit the width of any particular stove. The legs having been so manipulated that the tray is at the height of the lower margin of the flame in the stove, the 'heater' is placed close up to the fire in such a position that the two side-pieces are at right angles to the front of the stove. When the gas is lit, the heat rays, impinging upon the three brass surfaces, are reflected into the room with

such power that it becomes comfortably warm in a remarkably short time. So marked are the magnifying-powers, as it were, of the apparatus that the gas need never be turned on at full, thus effecting a distinct economy, and preventing the formation of convected heat by keeping the canopy and the framework of the stove from becoming hot. Another advantage accruing from the use of this invention is that ground draughts are prevented from reaching the incandescent surface of the stove and cooling it. The apparatus is said to be nearly as efficient with coal-fires and electric heaters as with gas-stoves, and the more up-to-date the stove or the fire the better the result. Food placed on the horizontal tray is kept perfectly hot; indeed, water can be boiled on it, and the apparatus is thus of special service in the sickroom. Not the least of its advantages is that it can be taken from room to room as needed.

AN INDELIBLE, NON-CLOGGING INK.

The general use of fountain-pens at the present day renders a form of ink which will not clog the pen an important desideratum. Several varieties of ink specially adapted for service in fountain-pens have been placed on the market during the last few years, and we have recently made trial of one which has proved eminently satisfactory in this respect, owing, we are informed, to the entire absence of gum-arabic from its composition. This ink also possesses other characteristics which appear to make it worthy of favourable consideration. It is made in various colours, does not fade, does not corrode the pen, and is not affected by acids except such as also damage the paper, thus giving indubitable evidence of their use. The employment of this writing-fluid, therefore, affords an additional guarantee against the unauthorised alteration of cheques and other documents without inevitable detection of the fact. It is put up in the form of a powder, to which it is only necessary to add a specified amount of water to produce instantaneously a writing-fluid which appears to meet every legitimate requirement.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

SEVENTH SERIES

THE AWFUL MISS BROWN.

By WILLIAM CAIRNS.

CHAPTER I.

I.

HESTER BROWN was the most striking personality in Dredgefield. This was indicated in her being invariably spoken of as 'Miss Brown,' though the parish contained no fewer than four other single ladies of the same name. There was the oldest inhabitant, Bridget Brown, who was not only in the parish, but on it; there was Deborah Brown, who distributed various kinds of dry-goods (including the contents of a circulating library) at the village post-office, and who was usually mentioned in connection with her official position. Others were identified topographically, as 'Miss Brown o' Borehams' and 'Miss Brown down by Todd's Lane;' but when any one spoke simply of 'Miss Brown,' everybody knew who was meant.

Born in Dredgefield, she had lived there all her life, and, at forty-three, was a tall, slim woman, decidedly handsome in a rather forcible style. Her fine complexion was healthily tinged by a rustic outdoor life; she had keen gray eyes, firm clean-cut lips, and a somewhat square chin; while as for her nose, the fact that it was of a more patrician type than most of the Dredgefield noses inclined many people to a belief that it made her the woman she was; but, independently of this feature, she could not have failed to impress you as of commanding presence.

Dredgefield was proud of Miss Brown, as of a woman whose equal none of the adjacent parishes could show. At the same time, it occasionally remarked, behind her back, that she was 'a bit of a Tartar.' This had served to protect her from the importunities of certain bucolic admirers who were anxious to settle in life, but who, shunning the ordeal of a proposal, remained single or married elsewhere. In recent years only one had been hardy enough to approach her with matrimonial intentions, and he had done so to the astonishment of all concerned—that is to say, of the entire population; for when Dredgefield found anything very exciting to talk about it made the most of it, and everybody took a share.

Though Mr Giles Jobson, the individual
No. 497.—VOL. X.

referred to, said to himself, 'Hollybush Farm's a good bit o' land as 'ud let easy,' it is but fair to state that his chief motive was the love of distinction which had been engendered some months previously, when his bull took a first prize at the county show. Worldly-minded people would have considered him as eligible a suitor as ever dined at a farmers' ordinary, or took an extra glass on market-day; for he was a substantial freeholder, who paid his way and cared for no man. On the other hand, they would have thought no one less likely to make his appearance in the character of a wooer, or to plant the Myrtle of Venus in soil which would yield such a poor return. Stout and ruddy, with a prosperous, broadcloth air, and close on sixteen stone, he was too solid a man to give undue attention to the trivialities of mere outward display; and when he was suddenly transformed into a middle-aged rustic buck of the first head, with a nosegay in his button-hole, Dredgefield could scarcely believe its eyes.

'Why, Giles lad, be it you?' old Farmer Dobbs exclaimed, surveying him one evening when he entered the parlour of 'The Load of Hay.' 'Vine veathers make vine birds. What be you arter?'

'Well, if you *must* know,' Giles replied, overcoming a slight tendency to sheepishness, 'I be going to court Miss Brown.'

Mr Jobson had anticipated the effect of this announcement with a certain degree of pride; its reception fully justified his expectations. His hearers, taking their clay pipes from their mouths, stared at him and at one another for several minutes in amazement before they recovered themselves sufficiently to repeat, 'Going to court Miss Brown! He be going to court Miss Brown!' What was to be made of it? Had Giles Jobson suddenly gone crazy, or was there that in him which they had never supposed to be there? Was he a fool, or a hero? His reputation trembled in the balance, and then Farmer Dobbs (who was not only the oldest, but also the briskest, member of the company) settled the point.

'Well, Giles lad,' he cried, bringing his fist down upon the table, 'thou'rt the only man as

[All Rights Reserved.]

JUNE 5, 1920.

I knows on who'd venter it. Going to court Miss Brown? Dang! Ye'll never beat that!'

'No, no,' chorused the rest; 'ye'll never beat that!' The balance had turned in his favour. He was a hero.

II.

This inspired Mr Jobson with a dangerous confidence, so that Miss Brown was 'woo'd and married and a' before he had spoken a word to her on the subject. He pictured himself saying (in reply to the congratulations of his friends), 'I just said to her, "Miss Brown, maybe you're not the popularist woman i' the parish, but you're the one I think most on;" and i' less nor half-an-hour it was settled quite comfortable.'

When he called on Miss Brown, the affair was settled in considerably less than half-an-hour, but by no means comfortably. Within ten minutes after entering her door, he emerged again with an agitated air, and as he hurried along the garden path he glanced over his shoulder, as if apprehensive that she might be following him, like a classical Fury, with a fire-brand in one hand and a whip in the other. Crestfallen as he was, Giles bore the sallies of his friends with Christian meekness. Only once did he turn upon his persecutors at 'The Load of Hay,' when old Farmer Dobbs jocosely inquired what Miss Brown had said to him. 'That ain't nobody's business,' he retorted. 'But,' he added impressively, looking round him almost with an air of triumph, 'I'll tell ye *one* thing. It worn't only o' *me* she said it. She said it o' *the whole lot on us*.'

In that last sentence you had Miss Brown; there she was in a nutshell. Her salient characteristic was a contempt for the male sex as represented in the human biped.

There are people who insist on a reason for everything, than which nothing can be more unreasonable. Some of these remembered Hester Brown's father as being addicted to liquor and loquacity, and as indulging in public oratory, at 'The Load of Hay,' to an extent incompatible with the diligent management of his private concerns; so that, but for Miss Brown and her mother, the little farm would have gone to rack and ruin. Thus, argued they, the seeds of homophobia had been sown early. Likewise they hinted at a 'disappointment' connected with a male cousin who came on a visit from a manufacturing district in the time of her girlhood—a cousin who, being a town-made article, interested her as something strange and new. This explanation, however, was rejected by others as an unworthy fiction. These would have 'liked to see the chap as 'ud make a fool o' Miss Brown, even when she was a young un.' Miss Brown *was* Miss Brown, and there was no need to investigate further in order to explain why she was not some one else and a different sort of person.

But none of us is invariably consistent. More

than once Miss Brown had been known to depart from the inexorable tenor of her way, though her manner of doing so was all her own. When one of her pigs disappeared, and was traced to Simon Grubb, Mrs Grubb came to her with tearful protestations that she was the mother of six; and though Miss Brown told her it was a greater crime to have six children than to steal pigs, Simon escaped punishment for the sake of his wife and family. Again, when Martha Gibbs, who had served her faithfully for seven years, was going to be married come next Easter, Miss Brown drew, for her benefit, a painful picture of married life among the peasantry: of wretched women slaving early and late to keep things together, while the husbands sat in the public-house over their beer and tobacco; but she did the handsome thing by Martha when the affair came off. Therefore many people asserted that Miss Brown 'had a heart somewheres, though it didn't seem to be where most folk's were, and took a deal o' getting at.'

For this reason, Dredgefield commiserated the person whose fate was most directly under her influence—the orphan child of the late Mrs Brown's youngest brother, about whom (like the majority of his sex) the least said the better. When Miss Brown heard of her being left, a mere waif, in a distant county, she sent instructions for her to be forwarded without delay to Hollybush Farm; and, since it seemed absurd in a woman of thirty to call a child of six her cousin, she decided to be her aunt instead.

In the mere fact of being a girl and not a boy, the forlorn little creature had the good fortune to gratify her aunt from the first; but things did not turn out so well afterwards, for at nineteen Bella Croft was an attractive damsel, disinclined to a belief that the world would be a better place if Man was known only as an antediluvian animal whose prehistoric remains were examined by scientific ladies, who reconstructed his skeleton for museums. Nevertheless, Bella was devoted to her aunt, and everybody agreed that Miss Brown had done her duty by her niece. In spite of this Bella was commonly spoken of as 'poor Bella Croft,' for, though it was quite understood she would inherit Hollybush Farm and all her aunt's savings, it was predicted that 'Miss Brown 'ud never let a man come nigh her, unless it was Parson Doubleday, or some un like him.' Certainly no great harm could have resulted from this, seeing that the vicar was a meek little old bachelor who read his Bible very literally, and gave away among his poorer neighbours things he wanted very badly for himself.

III.

The Reverend Theophilus Doubleday was indeed a worthy man, and, moreover, a good scholar. Dredgefield, taking his erudition for granted, esteemed him for his worthiness, and none of his parishioners had a greater regard for

him than a youthful connection of his own, Richard Merryweather. Richard was a nephew, by marriage, of the vicar's sister, who had given up housekeeping for her brother to marry Farmer Merryweather, who was a person of such consequence in the neighbourhood that he might almost have been a Justice of the Peace in days when a J.P. had to be somebody. His red brick house was one of the best in the parish, and, standing a good distance apart from the farm-buildings, had quite an air of being above its business. Dying childless, he left the house and land to his wife in trust for his nephew Richard, the second son of a brother who was a thriving veterinary surgeon in the county town, twenty miles off. So when Richard's aunt died also, and he came to reside on his property, he was rich according to Dredgefield standards—that is, for one of good old yeoman stock. In his way he was a remarkable young man, and though Dredgefield began by resenting the cut of his coat and thinking him a little too cosmopolitan, he was so cheery and good-humoured that it soon agreed to overlook his defects. After all, a man who owned two of the biggest farms in the district, and who, while he lived on one, held the dignified position of landlord towards the person who occupied the other, had a right to wear things which fitted him if he chose to do so. It was a weakness, perhaps, but you could not put old heads upon young shoulders, and he'd know better some day.

'Love laughs at locksmiths,' but even if he regarded them seriously, Miss Brown could not have kept her niece under lock and key whenever her eyes were off her. To immure single young women for fear of the consequences was not the custom of the age and country in which she lived. It was not often, however, that Bella went anywhere without her aunt, but this occurred sometimes; and upon one of these rare occasions she met Richard Merryweather, with the result that, after a few more meetings, they fell in love with one another. For some time Miss Brown remained ignorant of what had happened, for, keen and observant though she was, she had no experience either of the tender passion or of the little signs by which its presence is betrayed. Had she seen the young people together her suspicions might perhaps have been roused, but she did not see them together. Knowing something of Miss Brown's character, Richard took care of that. He told himself that the way to catch a bird was not to throw your hat at it; and until he had made sure of Bella, he had no wish to bring her aunt upon the scene.

However, this state of affairs did not last long. With Miss Brown as a rock ahead, some timorous persons might, in nautical phrase, have 'stood off and on' until they were middle-aged, or even worse; but when Richard made up his mind to do anything, he was one of those who take the bull by the horns. If he came to grief and was

tumbled over, that was one to the bull, and then he got up and tried again. In the present case he encountered little difficulty at first. When he told Bella that he loved her, in spite of all her aunt's teaching she believed him. This was probably due to the fact that in discoursing of such matters Miss Brown had dealt with Man in the abstract; and to Bella, Richard Merryweather did not represent an abstract idea. A stipulation that, so far as her aunt was concerned, there should be nothing clandestine in their proceedings was alarming; for that Miss Brown's consent could be obtained off-hand was incredible, and not to be expected. He would have preferred to get it over, and inform her of the event when the mischief was done; but when he found Bella's scruples insurmountable, a happy thought occurred to him, and he suggested that they should request the vicar to open the ball for them.

'We are related, you know,' he explained. 'He's a sort of an uncle of mine, and one of the best old fellows in the world. Besides, he's her pastor; so perhaps she'll listen to him, when she wouldn't listen to you or me.'

CHAPTER II.

I.

THE Reverend Theophilus Doubleday sat by the open window of his little parlour, the bowl of his churchwarden glowing within, while the shadows gathered without. A placid serenity pervaded him. To be satisfied with one's lot was a guiding principle in life with the vicar, and, as he occasionally indulged in a Latin quotation, he might, in his present tranquil mood, have recalled '*Fortē tua contentus abi*' ('Content yourself with what you have'). The stars were beginning to twinkle in the liquid depths of the clear summer sky; a nightingale preluded from an orchard close at hand; the soft breeze which 'gently kissed the trees' at once soothed and refreshed. How, at such a moment, could he dream that there was trouble in the air, and that a plot had just been hatched against his peace of mind?

Suddenly a step was heard on the garden walk, and a voice exclaimed, 'There you are, uncle! I thought I should find you at your evening pipe.'

'Is it you, my dear Richard?' responded the vicar. 'Come in. You know your way.'

'Rather!' answered Merryweather, who, indeed, seemed very much at home, for when he entered the room he walked straight to a cupboard, and returning with another churchwarden, seated himself near the vicar.

'Now, my dear uncle,' he said, 'I hope you are at leisure for a little conversation.'

'Surely, my dear boy. Let us season our indulgence in the narcotic herb with any discourse you please. It need not be without profit.'

continued the unsuspecting vicar, pointing his little moral, 'because it is an idle moment with us, for

When the smoke ascends on high,
Then we behold the vanity
Of worldly stuff,
Gone with a puff.
Thus think, and smoke tobacco.'

'Very true, uncle; but it isn't about that sort of thing I wish to talk just now. Though I certainly want to consult you about a rather serious matter.'

The phrase 'serious matter' sounded somewhat alarming.

'I hope, Richard,' said the vicar, 'that you have not been getting into any kind of trouble.'

'Not a bit of it,' answered Richard cheerfully. 'I'm only thinking of getting married.'

'Of getting married!' exclaimed the vicar, gazing at him in amazement. 'Only thinking of getting married!'

'Yes,' he replied. 'That's all.'

'But, my dear fellow, marriage is a very serious affair.'

'I know it is. I said so just now.'

Richard struck a match, lit his pipe, then, leaning back in his chair, went on: 'You see, uncle, my view is this. If a young fellow has the means of supporting a wife, he cannot do better than settle down into a quiet, respectable married man.'

'But, my dear boy,' responded Mr Doubleday, slightly alarmed for the second time, 'surely you are quiet and respectable already.'

'Certainly I am,' answered Richard, with a laugh, and a frank confidence in his own respectability which was distinctly reassuring; 'and I think a man who is respectable has as much right to a wife as a man who isn't.'

'You are perfectly right—that is, if a suitable partner can be found for him.'

'Or if he can find a suitable partner for himself.'

'Certainly—certainly! And now, my dear Richard,' said the vicar, his curiosity overcoming his surprise, 'who is she?'

'Suppose you make a guess, before I tell you.'

'How can I make a guess? It is probably some one in your own neighbourhood.'

'Quite right, if you mean Dredgefield. This is my neighbourhood now, you know.'

The vicar's mind roamed for a moment among the rustic maidens of his parish, and came back unsatisfied. 'Really, I am quite at a loss; and, to speak the truth, I am not sure but that a young man with your advantages might—might'—

'Might not do better elsewhere?'

'I confess (without intending to depreciate any of the young women I can think of) that such was my meaning.'

'Well, I have no wish to go farther and fare worse—which I might easily do. Bella Croft is a charming girl, and capable of making an excellent wife for any man as fond of her as I am.'

'Bella Croft!' cried the vicar. 'I never thought of her.'

'Well, now the murder's out, what do you say?'

'Really, I hardly know *what* to say. You have taken me so completely by surprise. She is a very good girl. Quite a superior young woman for her class. If you are satisfied, and have no wish to look higher, I see no reason—no,' reflected Mr Doubleday, 'I do *not* see *any* reason why you should not be very happy with her.'

'My dear uncle,' said Richard, smiling, 'her class is my class—I have no wish to look higher—and I *mean* to be very happy with her. So all that is settled.' Leaning back, he looked upwards to the stars, which were now showing more and more numerous every moment. The song of the nightingale came from the farther side of the tall hedge which separated the little orchard from the garden. Richard could not help pausing a while to contemplate the happiness of which he felt so confident; and the vicar (interested though he was in the subject they were discussing) was relapsing into silent enjoyment of his peaceful surroundings, when his nephew, returning from the stars, suddenly exclaimed, 'And now comes another question. Bella's aunt is a dragon.'

'Miss Brown is certainly a person of decided character,' admitted the vicar, as if decision of character was a dragon's strong point; 'but she is an excellent woman in her way, and has a good heart.'

'Though she wears an uncommonly tough pair of stays over it; eh, uncle?'

'Really, Richard,' cried the vicar, a little shocked, 'what can I possibly know about Miss Brown's stays?'

'I mean her metaphorical stays.'

'Oh,' said Mr Doubleday, recovering himself. 'Of course that is quite another matter.'

'You see,' Richard went on, 'Miss Brown is a deadly enemy to marriage. She thinks we should remain as we are until we all die off, and leave the world fit to live in because there isn't anybody left alive in it.'

'I think even Miss Brown would scarcely go so far as that,' replied the vicar, with a smile.

'Anyhow,' said Richard, 'she's always crying down matrimony, and crying up single blessedness—bless her!' (which meant just the same, and did not shock any one). 'I wished Bella to marry me first, and tell her aunt afterwards; but she wouldn't hear of it.'

'She was right—perfectly right!' said the vicar emphatically.

'Then I wanted to go straight off to Miss Brown, and have it out with her; but Bella thought that too risky. So we hit on a third plan—an excellent plan; and what do you think it was?'

'I am sure I cannot tell.'

'Well, it was about the best way out of the

difficulty any one could have imagined. We fell back on you !'

'Fell back on me !' cried the vicar.

'That's it. We want you to tackle Miss Brown.'

The vicar dropped his pipe, and broke it, but was too much agitated to heed the mishap. 'You want me to tackle Miss Brown !' he gasped. 'To—tackle—Miss—Brown !'

'Yes. *That's* the plan we hit on,' cried his breezy nephew.

'But, my dear boy—upon my word, I—Miss Brown is an awful woman ! I have lived in this parish five-and-thirty years,' protested the vicar, 'and never met her equal. A good woman—a thoroughly good woman, but of so unyielding a temper, she would not hesitate to put down the bishop himself.'

'And sweep the floor with him ?'

'No, no ; I'll not go so far as to say that. But she would suppress him—she would suppress him.'

'Well, you must not let yourself be suppressed. You must march boldly up at the head of your invincible arguments, as a soldier marches up to a battery.'

'But, my dear boy,' replied the old gentleman, with a nervous chuckle, 'I am a man of peace, not a man of war ; I cannot help thinking that a little patience on your part—a little judicious tarrying for some favourable opportunity'—

'Come, uncle, you are not going to desert me in my difficulty ? Don't say that.'

'Desert you ? Certainly not. But the course of true love never *did* run smooth. We have the authority of Shakespeare for that.'

'I know we have. A fellow in *A Midsummer Night's Dream* says it. Lots of things in this world are pretty rough ; but that's no reason why we should leave them to smooth themselves.'

Mr Doubleday considered it creditable in his nephew to know where the quotation came from, and he could not but agree with the latter part of his remark. For a brief instant it occurred to him that he might have suggested it was more the business of these two young persons to smooth out their own difficulties than to trouble him ; but he dismissed the thought as unworthy.

'Well, my dear Richard,' he said, 'I have little hope I can be of use ; but I'll do my best. I fear it is a task beyond my powers—a perfect labour of Hercules ; but you have appealed to my friendship, and I shall not be weighed in the balance and found wanting. As one of our old divines says, "friendship is the allay of our sorrows, the discharge of our oppressions, and the sanctuary of our calamities."'

'Well put ! He must have been a capital fellow. Who was he ?'

'The pious and learned Bishop Taylor, commonly known as Jeremy—his Christian name being Jeremiah, which, in the original Hebrew, signifies "Exalted of the Lord,"' explained Mr Doubleday, with gentle superiority. This time he was not altogether displeased that on his (the vicar's) own special ground his nephew was more of an ignoramus than in the matter of profane literature. These 'little things,' if not absolutely 'great to little man,' count for something.

(Continued on page 444.)

WHAT THE HOUSE IN JAPAN TELLS THE PASSER-BY.

By H. J. BLACK.

PASSING along a street in Europe or America you will not, in the vast majority of cases, be able to obtain the slightest information about the men or the women who reside in the houses. With the exception of a professional brass plate here and there, a number on the door is all.

But in Japan we do things differently. According to police regulations, the entrance to every residence must have a small wooden tablet affixed to it, bearing thereon the name of the street and the number of the house, and another tablet, called *shosatsu*, on which is written the name of the responsible householder.

The *shosatsu* is generally a board two and a half or three inches broad by six to seven inches in length. At better-class houses it is often of white china, the writing being burnt into the glaze. These tablets can be ordered at any shop where crockery is sold, and cost something under a yen (two shillings) according to size. Many people pay a high sum

to have the name inscribed by some specially expert penman, so that the beauty of the characters may attract attention and admiration. Another form which is considered very *chic* is a tablet made of some valuable wood, carved so as to leave the characters in relief.

On moving into a new house the first thing to do is to see that the law is complied with and that the *shosatsu* is fixed on the gate (if the house boasts one) or over the front-door. The name on the *shosatsu* is not always that of the actual head of the household. It is the name of the person in whose name the house is registered and who is responsible to the police or other authorities ; it is often that of an infant child, a younger brother, or other relative.

Marriage customs in Japan differ much from those of other countries. At a wedding, the ceremony of bride and bridegroom drinking the '*San-san-ku-do*'—three times three are nine—cups of *saké*, or, as has now become 'fashionable

of late years, the performance of a ceremony at some Shinto shrine, though considered binding among the people, is not demanded, or recognised, by law. A wedding is not necessary, and very often none takes place. A notification to the ward or district office with request that the bride's name be entered in the family register is all that is needed, and she at once assumes her husband's name; or, in the common case where the groom is married into the bride's family, *he* is notified as having become her husband, and takes his wife's name.

Though the marriage ceremony has taken place with all formality, and the man and the woman are regarded as husband and wife, the registration is sometimes neglected, and the wife continues to bear her maiden name (this because a wife cannot hold property or money, and there can be no marriage settlements). In such cases the marriage is not legal, but can be made so at any time by simply notifying that the marriage took place on the date on which it actually did. At the same time, an apology for remissness is in order. A small fine—seldom more than five yen (ten shillings)—will be inflicted, and the marriage becomes legal.

A man of the upper middle class, known to the writer, was married over forty years ago. He is a speculator with many irons in the fire. It was deemed safer that the house and the property should be in his wife's maiden name, so as to be out of reach of creditors should he come to grief. Children were born, and entered in his family register as love-children, which made them his legal issue. Time passed, until last year the wife fell sick and it was thought she would die. The husband thought it would not be right that she should be buried under her maiden name, so hastened to make the necessary notification, and she for the first time took his name.

Such cases seem strange to a Western mind, but here in Japan they are frequently met with, especially among the middle and lower classes. Therefore many houses bear women's names on the *shosatsu*.

Sometimes, though rarely, the names of other inmates are placed over the door, but there is no police regulation about this, except that boarding-houses have to place their boarders' names outside for all to see.

A person fortunate enough to possess a telephone always has the number proudly displayed over his entrance—generally a small black-lacquered metal tablet with the figures in white. Near this will often be observed a quaint, usually round-shaped, enamelled or painted tin disc, about three inches in diameter. This is the fire insurance mark. Every fire insurance company has its own special metal plate, which is at once nailed to the lintel when a house is insured.

There are always several small pieces of paper pasted over the door; these are placed there by the police. One is to certify that the periodical

Oshoji, or 'Great Cleaning,' has taken place; and perhaps another tells us that the sanitary conditions are satisfactory. What, however, others stand for is known only to the police themselves. That they give secret information about the inmates is certain.

Noticeable over the entrance of many houses are sacred papers bearing the name or the form of some deity. Among those most frequently seen is that of the wolf. These come from a temple situated on the summit of Mount Kumana in Joshu, and are supposed to be a protection against burglars. Another bears a rough picture of two *Nio* (kings), guardians of the gates of many a Buddhist temple. These are to prevent evil spirits from entering the house. A paper with the name of the fire-god, *Akiha-sama*, protects against fire. These and many other charms are to be procured for a small sum at this or that celebrated temple, but there are also home-made charms. A piece of red paper bearing the name of the ancient warrior *Tametome* will keep smallpox from the house. The story goes that when *Tametome* was exiled to an island he prevented the evil spirit *Hosokami*—smallpox god—from landing, and on that occasion so frightened him that the name alone of the doughty soldier is enough to make him keep his distance.

A *shamiji*—a flat wooden spoon used for serving rice—nailed to the door is a preventive of colds. During the late influenza epidemic a paper inscribed with the words 'Hisamatsu is out,' or 'Hisamatsu does not reside here,' was often to be seen pasted over the door. *Hisamatsu* and *O Somé* were lovers who lived many years ago. They were parted by cruel destiny, and ever since their spirits have been seeking for each other. It is believed that *O Somé* brings a cold wherever she enters in her search for the loved and lost one—hence the announcement that he is not within.

The impression of a child's hand, made by blacking the palm with Indian ink and pressing it upon white or red paper, will preserve the child from various kinds of sickness. A sprig of holly nailed to the lintel at the *Setsubun*—a movable festival falling generally in February, when every Japanese adds a year to his or her age, keeps away demons and all evil influences. Belief in charms differs greatly in different places, but the few mentioned will give some idea of their nature. Smile not at the superstition! Remember, even in the British Isles a horse-shoe is supposed to 'bring good luck.'

Formerly it was the rule that if there was a well upon the premises, the fact had to be proclaimed by a square board marked with the character for well—*ido*. This was to show where water could be obtained in the event of fire in the neighbourhood. This regulation may yet be in force in country places, but, owing to water now being laid on in pipes, it has fallen into desuetude in the cities.

Many people belong to some Buddhist or Shinto

koju—society or cult—and if so the fact is announced by a small sign. The most common is that of the 'Fujiko'—Children of Mount Fuji. It can easily be distinguished by the outline of the peerless mountain with the summit painted red. Another, with the mystic *Manji*, , in red, is the sign of the cult of the Buddhist saint Kobu Daishi, founder of the Shigon sect and inventor of the Katakana characters. A tablet bearing a sun-wheel, also in red, denotes the society of Kwannon, goddess of Mercy. It is not necessary to be able to read—a glance at any symbol will tell the passer-by to what cult, if any, the inmates belong. There are many other societies, too numerous to mention. Their chief object is to collect a small sum monthly from the votaries, so as to enable them to send one or

more members each year on a pilgrimage for the benefit of all. And sometimes, in case of necessity, a portion of the fund is used to help a brother in distress.

Conspicuous, also, may frequently be seen the Red Cross, proclaiming that the householder subscribes to that world-wide institution.

When a son is absent, serving in the army or navy, his name is often written up over the entrance; and when he returns, the information is added that he now belongs to such and such an association. A red mark, standing for *yama* or hills, and three wavy lines, representing waves, appropriately denote the navy.

The subject is by no means exhausted, but enough has been said to show that a stroll along a street in Japan may be full of interest and amusement to the most casual observer.

THE PARTS MEN' PLAY.

By ARTHUR BEVERLEY BAXTER, Author of *The Blower of Bubbles*, *Merric Gentlemen*, &c.

CHAPTER XIX.—EN VOYAGE.

FROM a sheltered position on the hurricane-deck Austin Selwyn watched the curtain of night descending on England's coast. Portsmouth, with its thousand naval activities, was already lost to view off the ship's stern; and the Isle of Wight was but a dark margin on the water's edge.

Not a light was to be seen on shore. Like an uninhabited island, England lay in the mingled menace and protection of the sea, while unseen eyes kept their endless vigil.

The vibration from the ship's engines told him she was gathering speed. Impatient of the six days that must elapse before harbour could be reached, he walked to the front of the deck and watched the officers on the bridge peering into the darkness ahead.

When he retraced his steps he could no longer distinguish land. Two searchlights playing on the surface of the water revealed a cruiser steaming silently out to sea.

A feeble star appeared in the sky.

Mid-ocean.

A clear winter sunlight touching the green, swirling water with strands of yellow gold; a wind sweeping the ship's decks, blowing boisterously down companion-ways and along the corridors; a few shimmering snowflakes from an almost cloudless sky; everywhere the vastness of ocean.

And the ship buffeting its way towards the New World.

Mid-ocean.

The City of New York.

Anchored down the bay just after sunset,

Selwyn watched the great metropolis as her form was vitalised with a million lights. From the ship's side it seemed to the eyes watching the birth of New York's night that the buildings had come to the very water's edge to gaze into its depths and see their own reflection.

Here and there in the outline of great buildings a mammoth structure raised its head above all others, losing itself in the foam of light that floated mist-like over the city's towering majesty.

For more than two hours Selwyn remained motionless in the thrill of patriotism. The burst of light challenging the reign of darkness was a symbol to him. The Old World was crouching in darkness, fingering and fearing the assassin's knife. But America was the Spirit of Light.

How many times, he thought, emigrants must have looked on just as he was doing! How many times that sight must have brought hope to weary, discouraged souls that never thought to hope again!

To the idealist returning to his own country, New York was not a citadel guarding the entrance to a Nation, but a gateway opening to the Continent of Opportunity.

CHAPTER XX.—THE GREAT NEUTRAL.

I.

ONE afternoon a tall, heavily built young man entered his house on 128th Street, New York, and after divesting himself of his coat and hat, rubbed his hands in genial appreciation of his own hearth and the exclusion of the raw

outside air. He was dressed in a gray lounge suit, a clerical collar alone denoting his vocation.

'There's a gentleman in your room, Mr Forbes,' said his housekeeper, appearing from the kitchen. 'He said he was an old friend, and would wait.'

'What's his name?'

'Mr Selwyn, sir.'

'Austin Selwyn? By George!' Taking the stairs three at a time, the energetic clergyman burst into the library and advanced with both hands outstretched. 'For the love of Pete!' he ejaculated most unclerically. 'How are you, my boy? Let me have a look at you. Still the same old Sel, eh? A little thinner, I think, and not quite so much hair—humph! Sit down; have that easy-chair; tell me all about yourself. Well, well! This is an unexpected treat.'

The Rev. Edgerton Forbes, who had been looking Selwyn over after the custom of tailors about to offer sartorial advice, ceased his inspection, and shook hands all over again.

'Edge,' said Selwyn, speaking for the first time, 'you can't imagine what your welcome means to me.'

'My dear boy, you never doubted its warmth?'

'Yes I did, old man—after what I've been writing.'

The athletic clergyman laughed uproariously. 'I suppose you're a dyed-in-the-wool Englishman now, and want your cup of tea. Well, I'll join you.—Mrs Perkins.' Going to the door, he gave the necessary orders, and returned, rubbing his hands, and venting his surplus energy in a variety of hearty noises expressive of pleasure at seeing his old friend.

'Now, start at the beginning,' he said, 'and give me everything. The semaphore's up, and there's a clear track ahead.'

'But I want to know about things here first.'

'After you, my son. Put it over now. By the way, that's a nasty scar on your head. How did you get it?'

In a few words Selwyn traced the course of events which had led to his crusade against Ignorance, a crusade which had in an inexplicable way turned particularly against England. He spoke of Doug Watson's letter with its description of the slaughtered German boy, and he told of the air-raid in the moonlight, the climax to his long orgy of idealism. He touched lightly and humorously on his hospital experience, but not once did he mention the inner secret of his heart. To the whole recital Forbes listened with a genuineness and a bigness of sympathy which seemed to belong to his body as well as his mind.

'That is pretty well everything,' said Selwyn. 'I have come back here, humble and perplexed, to try to get my bearings. There have been two men financing my stuff, and they must account to me for the uses to which they have put it. Edge, I was sincere. Not one word was written but I put my very life-blood into it.'

The arrival of tea put a temporary stop to the author's self-revelation, and his host busied himself with his hospitable duties.

Selwyn passed his hand querulously over his face. The clergyman looked at him with a feeling of pervading compassion.

'I was going to ask about Gerard van Derwater,' said Selwyn. 'How is he?'

'Van's very well. He is in the Intelligence Division right here in New York.'

'I heard he was engaged to Marjory Shoreham.'

'Yes—he was. They broke it off a few weeks ago; or, rather, she did.'

'I am sorry to hear that,' said Selwyn earnestly. 'I always liked her immensely, and I was glad that poor old Van had been the lucky suitor. You remember how I used to say that he always carried a certain atmosphere of impending tragedy, although he was never gloomy or moody about it.'

'Well, Austin, I think the tragedy has come.'

'I must see him,' said Selwyn. 'In coming back here, you and he were the two I wanted most to meet. I knew that neither of you would withdraw your friendship without good reason; but also I knew you would tell me bluntly where I stood. Why did Marjory break off with Van?'

The clergyman told what he knew, and at the conclusion of the story Selwyn rose to his feet.

'I must see Van at once,' he said. 'There's more in this than appears on the surface. If you will give me his number, I'll find out when we can get together.'

Receiving the necessary information, Selwyn went downstairs to the telephone, returning in a couple of minutes to the den.

'I just caught him,' he said to his host, 'and I am going to his rooms at nine to-night.'

'Good work. Now sit down and tell me about the English. You'll find me the most attentive audience you ever had.'

II.

It was theatre-time when Selwyn left his hotel and walked over to Broadway. That diagonal, much-advertised avenue of Gotham was ablaze with light. From shop windows, from illuminated signs, from office buildings, street-cars, and motors, the carnival of theatre-hour was lit with glaring brilliancy. Women in all the semi-barbaric costliness with which their sex loves to adorn itself of a night stepped from limousines, with their tiny silvery feet twinkling beneath the load of gorgeous furs and vivid opera-cloaks; while well-groomed men, in the smart insignificance of their evening-clothes, guided the perilous passage of their fair consorts from the motor's step to the pavement.

Momentarily reduced to the democracy of pedestrianism, they would lose themselves in the

surging mob of passers-by—shop-girls on their way to a cinema; rural visitors shocked and thrilled with everything; keen-faced, black-haired Jews speculating on life's profits; sallow-faced, lustrous-eyed girls hungry for romance, imagining every begowned woman to be an adventuress, and every man a Prince Charming; here and there an Irish policeman proving that his people can control any country but their own. Of such threads is woven the pattern of New York's theatre-hour on Broadway.

From sheer inability to stem the traffic, Selwyn stepped into a doorway. On the opposite side of the street a theatrical sign announced that *Lulu* was 'the biggest, most stupendous comedy of the season.' He wondered what constituted largeness in a comedy. Surely not the author's wit? Before he could formulate a solution of the mystery, a great overhead sign suddenly ignited with the searching question,

DO YOU CHEW SWORDSAFE'S GUM?

Hastily detaching his mind from the biggest, most stupendous comedy of the season, he stared at the interrogation of the gum company. It suddenly disappeared, however, and then he saw that, like the goblins who chased the small boy who was lost, the business interests of New York had assumed a violent interest in his personal habits. What underwear did he buy? Did he know that Hotdoor's shaving-soap was used by 76 per cent. of the entire manhood of America? There was only one place humanly conceivable where lingerie could be purchased; to prove it, the illuminated signboard promptly showed a lady in a costume usually confined to boudoirs. To equalise the immodesty of the sexes, a near male neighbour, at a height of two hundred odd feet, did an electrified turn by putting on and taking off a pair of trouser-suspenders.

DO YOU CHEW SWORDSAFE'S GUM?

That was the question. What importance could a mere war have in comparison with that? Blinking in the glare, Selwyn left the doorway and made for Madison Avenue, where Van Derwater's rooms were.

The clocks were just striking nine when he reached the number he wanted, and a negro servant led him upstairs. As Selwyn entered Van Derwater rose from his chair and greeted him with a restrained courtliness that was gentlemanly to a degree, but had an instantly chilling effect on the visitor. It was the room the owner used for lounging or reading, and the only light was the shaded one on the table.

Van Derwater had just passed thirty, but the premature thinness of his hair in front, the listless droop of his heavy shoulders, and the bluish pallor about his firm jaw contrived to make him

appear older than he was. There was a kindliness in the wrinkles about his eyes, and his mouth, though solid, was not lacking in indications of intuitive understanding. It was perhaps the formality of his bearing, the stiffness of his body from the hips, that gave him the air of one who belonged by right to a past and more ceremonious age.

Although Van Derwater encouraged his guest, after the exchange of greetings, to talk of his voyage and its attendant experiences, Selwyn was aware that he was placing a cold impersonal wall between them. His old friend was interested, courteous, intellectually even cordial, but Selwyn knew he was being kept at a distance. He forced the talk to old intimacies—recalled the game when, together, they had crossed Yale's line in the closing moments of the great Rugby match—brought back a host of joint experiences, trivial in themselves, but hallowed by time.

Van Derwater remembered them all. For each one he had the slight smile of his mouth and the quizzical weariness of his eyes, but when the conversation would droop after each outburst of reminiscence, he would not make the least attempt to lift it up again. Finally, being convinced that nothing could come of so bloodless a meeting, Selwyn dropped the impersonal mask.

'I was mighty sorry,' he said, 'to hear that you and Marjory have broken off your engagement.'

'It was her wish: not mine.' His voice was deep and rich, but almost monotonous in its lack of inflection.

'I was talking to Forbes to-day,' went on Selwyn tenaciously. 'He had been to see Marjory.'

'Yes?'

'Marjory told him that you didn't care enough for her to go overseas. I should think she would realise that such a matter concerns you only.'

'Not a bit of it.' For the first time the other's manner showed signs of vitality. 'It means everything to her. She wants to feel that the man she marries is big enough to go and help France. I admire her for it. I wish there were more women with her character.'

Selwyn shifted his chair uneasily. 'But—I don't understand,' he stammered. 'You told her you wouldn't go.'

'Well, what of it?'

'Look here, Van,' said Selwyn vehemently, 'we have been friends for many years. I came to you to-night because my whole career is at a standstill. I want to tell you everything—I must do it—but I can't as long as you withhold your confidence. It isn't curiosity on my part—you know that. I want to bring back the old sense of understanding we once had.'

'You haven't changed,' said Van Derwater, an inscrutable smile playing about his mouth.

'You always had a habit of piercing people's moods, no matter what defence they put up. But if you want candour, I'll tell you frankly I am sorry you came here this evening. I knew that it would be difficult to keep from hurting you, and for old-times' sake I didn't want to do that. As you know, I have never made friends. You and Forbes were the nearest thing to it, and I suppose you two meant more than I would ever care to admit. You might ring the bell over your head. The fire needs more coal.'

As the negro obeyed his master's instructions and stoked the fire into vigour the two friends sat without speaking. Selwyn was mute with apprehension of what he was to hear; the older man was dreading the words he had to utter. To certain strong natures it is more painful to inflict than to receive a wound.

'If you want my story,' resumed the host after the servant had left the room—'and as you are concerned you have a right to hear it—this is how it goes. I went into the diplomatic service. Then I met Marjory. I needn't say what that meant to me. For the first time, I think, I knew what living was. Shortly after came the war. At first I thought that if America remained neutral as a country, it was not up to individuals to quarrel with that attitude. Then came the *Lusitania*. I wanted to go over at once, but hated to suggest it to Marjory. One night, though, to my delight, the plucky little girl mentioned it herself. I hurried back to Washington and offered my resignation, but the chief urged me to remain three months longer, saying that I was absolutely necessary in the reorganisation of a certain branch of the Intelligence Division in New York. To cut the story short, months and months went on, and they refused to release me. As a matter of fact I was directing an investigation into German foreign diplomacy that was of so delicate a nature I dared not mention it to Marjory. At its conclusion I went to Washington and demanded that they let me go. I gave my exact reason. The chief said he would give me a reply in a week, but I told him that no matter what he wrote I would go at the expiration of that time. It was while I was waiting for the answer that Marjory said it rested with me whether or not the engagement was to be broken. I told her that I should be able to state my position in a couple of days. Well, the letter came. Perhaps you had better see it. You can read it to yourself.'

He went to his desk, and searching among the papers, produced a correspondence-form bearing an official stamp. He handed it to Selwyn.

'WASHINGTON, November 2, 1916.

'Personal and Confidential.

'MY DEAR VAN DERWATER,—As a boyhood friend of your father's I have been most anxious

to accede to your request for release from your present duties. I may say that, in my desire to do the fairest thing by you, I went so far as to place the facts of the matter before the President himself. He agreed with me that your services entitled you to every possible consideration; but he also pointed out that the intimate knowledge of our secret diplomacy which you have gained marks you as too valuable a man to let go lightly. I finally secured his consent, but an hour later he sent for me again. It was to talk over a new enemy that has arisen in this fight of the present Administration to weld the conflicting elements of our nation into a single-thinking whole. I refer to the ultra-pacifist section which has grown so large recently.

'You told me once that you knew this fellow, Austin Selwyn. I am sorry to set friend against friend, but his influence over the cultured and pacifist elements has to be met sternly and at once. We cannot take personal action against him, because he is within his rights as a citizen of a neutral country, but nevertheless his writings are proving as strong a disrupting force—stronger, in fact, than many of the clumsier methods employed by subjects of belligerent nations.

'Word has reached us that in all probability this nation will be faced shortly with the most momentous decision of the war. Therefore I must insist that you take charge of the anti-disruptionist propaganda. I shall be in New York next Wednesday, and will discuss with you the methods by which we can stem the tide of disloyal pacifism as exemplified by this man Selwyn.

'We have no hold over you, my boy; but in the name of this great Republic which is struggling against such odds for unification of her national life, I bid you remain at your post. I know that the son of my old friend Colonel Van Derwater will not question an order.—Yours faithfully,
A. WALTER GALLEY.'

As Selwyn finished the letter a flush swept into his cheeks and his jaw stiffened with his old fighting mannerism.

'This is infamous!' he cried hotly. 'Do you accuse me of disloyalty to my own country?'

'I do,' said Van Derwater calmly.

Selwyn's fists clenched with fury. 'Van,' he said, his voice quivering with suppressed passion, 'I may have been blind—I can see where I have injured you and many others—but when you or Galley say that I have been trying to disrupt America, you lie. There is no one more passionately devoted to his country than I.'

'Which is your country?' said Van Derwater.

Through the dim light of the room the eyes of the two men met. Selwyn's were blazing like hot coals; Van Derwater's were cold and steely.

'What have I done,' said Selwyn, twice

checking himself before he could trust his voice, 'but tried to show that war is wrong—that men without quarrel are killing each other now—that every nation has contributed to this terrible thing by its ignorance? What is there in that which merits the name of traitor?'

Van Derwater shrugged his shoulders, and taking a book from the table, idly studied its cover. 'Since the war began,' he said, his tones calm and low, 'the United States has been trying to speak with one voice, the voice of a united people. It was the plain duty of every American to aid the Administration in that. Instead, what have we found? Pro-Germans plotting outrage, and pro-Britishers casting slurs; conspiracy, political blackmailing, financial pressure—everywhere she has looked, this country has found within her borders the factors of disruption. We have fought them all. We have refused to be bullied or cajoled into choosing a false national destiny. At the moment that we seem to have accomplished something—with Europe looking to us for the final decision that must come—you, and others of your kind, contrive to poison the great educated, decent-thinking class that we always thought secure. Your cry of "Peace—peace—at any price let us have peace," has done its work. Consciously or unconsciously, Austin, you have been a traitor.'

Selwyn rose furiously to his feet. 'This is the end of our friendship,' he said, with his voice almost choking, and his shoulders chafing under the passion which possessed him. 'Your chief has chosen to name me as a reason for keeping you in America, and so it is I who have come between you and Marjory. For that I am sorry. But when you question my loyalty to America—that is the finish.'

Van Derwater had also risen to his feet and with the utmost courtesy listened to Selwyn's

outburst. More than ever there was a mystic atmosphere of the Past in his bearing. He might have been a diplomat of the sixteenth century bidding adieu to a thwarted enemy plenipotentiary.

'Austin,' he said, with the merest inclination of his head, and his arms hanging wearily by his sides, 'we live—in difficult times.'

With an angry gesture, Selwyn left the room, and taking his coat and hat from the negro, went again into the street.

Closing his study door, Van Derwater moved slowly to his chair, and lifting his book, opened it. For a long time he gazed at the open page without reading a line. 'Difficult times,' he murmured.

III.

Still in the grip of uncontrollable fury, Selwyn stamped his way through the streets. Colliding heavily with a passer-by, he turned and cursed him for his clumsiness. He cherished a mad desire to return to Van Derwater's rooms and force an apology by violence. He had expected criticism, reproach, even abuse—but that any man should brand him treasonous!

He spat into the gutter, and a sound that was almost a snarl escaped from his throat. He stopped, irresolute, and the wound in his head burst into a violent pain. He leaned against a post until the agony had passed, and once more he made for Broadway. At the sight of his face glowing-red with passion, girls tittered and men drew aside.

Crossing the road, he stood to let a street-car pass, its covered wheels giving an odd resemblance to an armoured car, when an extra burst of light made him look up.

It was the gum advertisement again.

(Continued on page 438.)

NATURAL HISTORY NOTES.

THE FEELINGS OF INSECTS.

ACCORDING to the sentiment put into the mouth of Isabella by Shakespeare in *Measure for Measure*,

The poor beetle, which we tread upon,
In corporal suffrance finds a pang as great
As when a giant dies.

Your friend the beetle-collector, however, tells you a story of this sort. On one of his beetle-hunting expeditions he captured a remarkably large and fine specimen. He *killed* it in the usual way, and sticking a big pin through it, fixed it in his cabinet along with a few others. On the cabinet being opened a few days afterwards, the big beetle, with the pin still sticking through it, was walking about quite lively. And it had eaten up all the others!

Then there is the story of the wasp. It was feeding in a pot of jelly, when, either accidentally or on purpose, it was cut through at the waist. Unmoved by the loss, it went on calmly imbibing jelly, which, of course, it was now able to do *ad infinitum*.

The following story of a dragon-fly is told in the Transactions of a certain natural history society. Like the wasp above mentioned, it had been cut in two at the waist, and being unable to balance itself, could not fly. The naturalist supplied it with the missing part neatly made of paper, and it flew away as if nothing had happened.

Another naturalist witnessed this little transaction. A spider had caught a daddy-long-legs, and while it was devouring the front half of its capture the other half calmly pursued its occupation of laying eggs!

Crabs are not insects, but the following narrative of three crabs may perhaps not unsuitably be added here. It is related by the Rev. J. G. Wood. A crab was hard at work devouring a smaller crab, when a larger one came along and began to devour the devourer. Crab number one went calmly on with its meal until there was not sufficient of it left to continue the operation!

A WONDERFUL SLUG.

We are all familiar with a number of slugs, a big black one, a small gray one, and others. If we are gardeners we are too familiar with them. But there is another slug which probably not one person in a thousand has ever seen, and the reason of this is that it spends most of its time underground. It is busily engaged in hunting earthworms, which it pursues with great ferocity through their subterranean retreats. Having captured a worm, the slug draws it 'all alive' into its mouth by means of a series of curved and barbed teeth. After a heavy meal of earthworms it becomes lethargic, and remains quies-

cent for a while. Then it starts afresh in pursuit of more earthworms.

It seems a little strange, perhaps, at first sight that if we want to learn about slugs we should have to go to a book on shells—*Our Country Shells and How to Know Them*, or something of that sort. As a matter of fact, however, every slug has its shell. Only, it is very small, and concealed by that part of the animal known as the mantle.

The *Testacella*, as our wonderful slug is called, has a larger shell which is quite visible. It is ear-shaped and stuck on over the hinder part of the animal, which it serves to protect. In very cold weather this slug makes itself a sort of coat of particles of earth cemented together with its slime. In this it rests securely till conditions are more favourable.

The recent floods in the Thames valley seem to have interfered with the underground abode of some of these slugs. And not long ago about a hundred of them were taken by a gentleman in one garden where they had come to the surface.

There are two species of *Testacella* known in Britain.

THE AMAZING MANUSCRIPT.

By J. HURST HAYES.

I.

YOU will remember, of course, how magnificent was the success of the great International Publishers' Congress of 1968, held in the Megaladium Music Hall in London, as the only building big enough to contain the vast assembly of publishers. It was at a *soirée* given at the Hotel Splendide by Sir Bantam Bancock, the distinguished jam-manufacturer, that this most interesting incident occurred. The night was hot, the *soirée* was crowded, and a tired publisher, Dixon by name, made his way from the reception-room into a subsidiary refreshment-room and sank fatigued on to a couch. He lighted a cigarette and glanced at the only other two occupants of the room, who were fellow-rob-publishers, friends of his. 'This Congress will be the death of me,' said Dixon. 'I'm dead-beat.'

'It's absurd to laboriously turn night into day,' commented Musgrave, who barred split infinitives in MSS., but used them in conversation. 'Luckily, I'll soon be out of it all. I don't mind telling you two that in a month's time I am retiring.'

'Retiring?' Dixon looked up amazed.

The third publisher, who wore a small imperial gray beard, was half-French, and ran a thriving business in the Rue Tronchet in Paris, turned a quick head. 'But—that is curious. So am I!' he said.

'And—and I!' exclaimed Dixon.

'Most extraordinary!' remarked Musgrave. 'The heads of three of the oldest publishing-houses in Europe retiring at the same moment! There will be a convulsion in the trade. May I ask, Dixon, *why* you are giving up?'

Dixon went to the door, which was slightly ajar, and closed it. 'Well, you are both friends, and I don't see why you should not know. I speak to you in absolute confidence.'

'Of course.'

'I am not the wealthy man I dare say I am imagined to be,' Dixon began. 'I have deliberately published too many interesting failures for that. But in a very short time I expect, indeed I am certain, to have enormously increased the small fortune I have made. To-morrow morning my great *coup* is coming off—the greatest literary *coup* of the last hundred years.'

Bénier, the French publisher, looked at him suspiciously. '*Coup*? What *coup*? ' he asked.

'The publication of the most remarkable book that has ever appeared. No, don't look like that. I am stating a mere fact. Let me give you the history of the book, and you can judge.' Dixon looked contentedly up at the ceiling. 'One day in the year 1918 my father, then head of the firm, called me into his *sanctum sanctorum* and spoke as follows: "Ernest, I am about to entrust you with a secret. By the time it is possible to reveal it I shall be dead, but you or your son will be alive to profit by it." He pointed to the safe. "In that safe, in a green-coloured box, is a manuscript which I received

yesterday, and which I perused all last night. It is a world's masterpiece, absolutely epoch-making. It is the work of a common English soldier, an ignorant man, with the Belgian mud of the trenches still on him, but in self-revelation, frankness"—

Musgrave rose from his chair excitedly. 'I won't hear another word you're saying, Dixon,' he exclaimed. 'You're making a fool of me.'

'What do you mean? I am making no fool of you.—My father continued: "Yesterday this soldier came into my office. He was slightly wounded, his arm bound up, and he was on short sick-leave from the front. He threw the manuscript down on the desk there, saying, 'There's a book about fighting for you, and it tells you what war and fighting really are. I'm sick o' the trash you read in magazines. Publish this, and it'll make people think a bit before they start another war.' The only stipulation he has made—a curious enough one—is that the MS. shall not be published before 1968—that is, until he himself is dead. 'In fifty years' time men will have forgotten and want to start scrappin' again. Publish this and I'm damned if they will!' he said. Ernest, the manuscript is amazing—elemental, direct. Every sentence a clod of mire flung against a wall and sticking. It isn't like writing. It is just as though one were in the fight one's self, seeing the bestial sights, smelling the vile smells"—

Bénier had risen and was standing before Dixon. His voice was curiously strained.

'Dixon,' he said, 'I do not wish to lose my temper, but you know quite well that you are describing the very book I am bringing out next Friday. It came to my father in practically the circumstances you have described. It is called *La Guerre et un Poilu*, and is written in French. Who has given away my secret of course I don't know, but'—

Bénier felt a hand on his shoulder, and Musgrave addressed the two, an angry look on his face. 'Given away *your* secret?' he laughed. 'I don't know what the little scheme is between you two. Humorous, no doubt; but for the moment I don't appreciate the humour. In a fortnight I bring out on an astonished world *How Men Die Fighting: The Astounding Diary of a Lance-Corporal in the Great War of 1914-18*. The genesis of the book you have fairly accurately described. The writer of it was killed near St Quentin'—

'Near La Fère.'

'On the contrary, by a shell at Cambrai,' said Dixon. 'A sergeant in his regiment wrote to tell me.'

The three men were all on their feet, forming a voluble triangle in the centre of the room, when a quiet, gentlemanly voice from the doorway suddenly remarked, 'You are all three wrong, gentlemen. The author wasn't killed at all.'

The publishers, rather shamefacedly, drew apart and glanced at the doorway, to see their host, Sir Bantam Bancroft, standing there with a genial smile on his face.

'I'm sorry, Bancroft,' Musgrave remarked. 'We didn't notice you. We were discussing a point—of common interest.'

'Of uncommon interest,' said the jam-manufacturer. 'I've been in the room for the last three minutes, and you—discuss—so loudly.'

'Then you heard what we said?'

'I did; but as a matter of fact I didn't need to, because I knew all about it beforehand.'

'But that's impossible!' exclaimed Dixon.

'Let me show you that it isn't. I'll take the precaution to lock the door, and the wild rabble without can discuss copyright laws to their hearts' content. Do sit down, and do smoke.'

He passed across a box of cigars as they collapsed into chairs.

II.

'You won't mind my saying it, Bancroft,' said Bénier, a little brusquely, 'but I do not see that you have any *locus standi* in this matter.'

'I want to convince you that I have. Listen to me, please.' Sir Bantam rolled the end of his cigar comfortably in his mouth and began. 'I am seventy-one years of age now, but once I was only one-and-twenty. At that time I was a schoolmaster in a Gloucestershire village, with an intense hatred of the Great War and a fondness for a whole host of food commodities which were not to be had. In that year I was conscripted. I had flat feet and deplorable eyesight, but in those latter days of the war, to have feet and eyes at all was an asset of national value.'

'Won't your guests be expecting you?' Dixon asked, with a yawn.

'They must wait till I become interesting to a few of them here,' said Bancroft. 'I had another asset, invaluable to myself, if not to the army—a large stock of imagination and a capacity to spell and write ordinary simple English. At the base camp in France, where I was sent after various short sojourns in camps in Great Britain, I made use of that asset. My job in the army was to look after two Sowyer stoves and to appear busy when I wasn't. My spare time I passed in a Y.M.C.A. hut composing on their notepaper what I believe three experienced publishers have declared within the last ten minutes to be an epoch-making masterpiece.'

'In Heaven's name, what do you mean?' cried Musgrave.

'Precisely what I say,' answered his host, in a louder, more aggressive tone. 'I wanted money badly, and saw a way of making it. Local colour was at hand by the barrowful. Wounded Tommies who had been through hell in the trenches—all their chatter went down afterwards on Y.M.C.A. notepaper. touched up

a bit, but never toned down. Oh, the language was lurid and elemental enough.'

Dixon shuffled uneasily, and Bancroft went on: 'One copy I got put into French and touched up by a *poilu* who was convalescing near Havre, and who did me the kindness to die just when it was completed. Armed with the others, I stormed the offices of your fathers, Dixon and Musgrave, on a seven days' leave which I got at the end of six months.'

Bancroft laughed heartily, and Musgrave exclaimed, 'I don't believe a word of this!'

'I think you do,' said Bancroft, 'but you needn't if you don't want to.—The interviews were amusing, and I've often wondered if the stage wasn't really my *métier*. I was splendidly dressed for the part: arm in a sling, gas-helmet, London mud on me—which is as good as Belgian any day—and one or two odd German trophies. I don't wonder your fathers were deceived.'

'But if it was money you were after, why didn't you get it published then?' asked Dixon.

'How could I? The Censor wouldn't have allowed it; little slips I must have made would have been noticed. I'd have been spotted. Above all, I shouldn't have been able to bind to secrecy three publishers and get spot-cash money out of each of them.—I got a hundred pounds from your father, Dixon, didn't I?'

'I don't remember the amount.'

'You got a hundred and fifty from mine,' said Musgrave.

'And from Bénier père for the copy posted from Havre pretty nearly the equivalent in francs, addressed to me at the house of my French collaborator. Oh, it was great!'

At his merry chuckle Bénier went up to him and shook a rather melodramatic fist in his face. 'Host or no host of ours,' he said, 'you're a rogue, Sir Bantam Bancroft.'

'A scoundrel!' added Dixon.

'Harsh words,' commented Bancroft; 'yet from the proceeds of my little ruse I was enabled the following year to start my fruit-farm, and to become—well, what I am.'

'I suppose you see what this means to us—to me,' said Dixon. 'It means that to-morrow I put the firm's name to a colossal fraud. I cannot possibly stop publication, and I—I shall be the laughing-stock of the publishing world.'

'Let us consider if that is inevitable,' said Bancroft; 'and do please sit down again.'

III.

Bancroft paused a moment, and then went on: 'Supposing now the actual situation were as follows: A jam-manufacturer, knighted for his philanthropy in the past and reputed to be rich, is in reality, through foolish speculation, very hard put to it to find a few thousand pounds to tide him over a crisis in his affairs. In his youth he has perpetrated a mild literary fraud; and one night, when he is in his sere and yellow

leaf, he is the host of three eminent publishers, from whom he learns that the fraud is on the point of being consummated. He proposes the following course to them: that of the three manuscripts only one shall be published; that the profits—I venture to think enormous—shall be divided among the three; and that the jam-manufacturer, as a slight reward for keeping his mouth shut, shall receive the sum of five thousand pounds.'

'Do you really imagine we would do such a thing?' said Musgrave, turning a glance of contempt on the speaker.

'Can you stop the publication of your copy of the MS.?' Bancroft asked Dixon.

'It's too late. You know I can't.'

'So that you will net the whole profits, and poor Bénier and Musgrave, who cannot publish duplicates of it, will'—— He threw up an expressive hand.

Dixon will, of course, appreciate our position,' said Bénier, a little nervously. 'The book is as much ours as his. I quite see he can't stop publication—but'——

'He'll do the proper thing,' Musgrave added.

'And that is?' asked Bancroft.

'Share the profits,' said Musgrave sullenly.

The jam-manufacturer looked inexpressibly shocked. 'What! share the profits of a fraud?' he said.

'It's not my fault I am publishing it first,' said Dixon.

'Gentlemen, your morals are collapsing,' commented Bancroft. 'And let me tell you, if you do publish that book—except on my very moderate terms—I'll let the whole press know that the night before it came out you were perfectly well aware that it was a fake, and the work of a man who had never seen a cartridge fired in anger in his life.'

'Of all the scandalous tricks!' said Musgrave.

'And what can I possibly do—now?' exclaimed Dixon.

'Do! Go to the telephone here, ring up the Associated Press, and tell them to have inserted underneath the critique of the book in each paper a note to say that the book has just been discovered to be a fraud.'

'You know I can't do that. A pretty fool I'd look! In a fortnight perhaps'——

'When you'll have sold about twenty thousand copies and made a nice profit. You'll appear a nice honest publisher if I tell the public that in my letter. No; you can choose—the telephone or my silence and my terms. The book's worth anything. It's a gold-mine, and you know it.'

Bancroft walked across to the buffet at the end of the room, and the three publishers drew together. He heard them discussing in low, earnest terms, and he hummed a pleasant tune to himself, conscious of a certain aloofness from their proceedings. At the end of three or four minutes they came towards him, and Musgrave

remarked, 'We'd be fools to trust to your silence.'

Bancock laughed. 'At the same moment that you gentlemen hand me the cheque, I will hand you a signed statement declaring precisely for what services I have received the cheque,' he said. 'That should ensure my silence, I think.'

Again they drew aside and spoke together. Again they came forward. Dixon made himself their spokesman. His eyes were on fire. 'Bancock,' he said, 'you're just about the biggest rogue unhung. But you've got us in a corner, and know it. You—you shall have your cheque to-morrow morning.'

Bancock helped himself to some fruit salad made from fruit from his own farm. He laughed contentedly. The three marched to the door, and Bancock opened it for them. The sound of a band came from the corridor. 'Delightful musicians those Russians, aren't they?' he remarked.

Bancock went into the empty room again before rejoining the throng. Picking up a napkin from the table, he wiped his hands on it and looked up at the ceiling.

'Now, supposing I really *had* written that manuscript,' he murmured.

CUBA AND ITS MARKETS.

OPPORTUNITIES FOR BRITISH ENTERPRISE.

By C. N. BARHAM.

THE level lands of Cuba vary in altitude from 10 to 300 feet above sea-level. The island is traversed by a range of hills and mountains, the greatest altitude of which is attained by the Sierra Maestra Range, which commences at the eastern end of the island and extends to Cape Cruz, with an average elevation of 3500 feet.

The island lying just within the northern tropical zone, the climate of the low-lying coastlands is that of the torrid zone, but a temperate climate prevails in the interior. Rain falls, more or less, every month of the year; but the wet season proper is from the beginning of May to October. Winter, which prevails from November to April, is the dry season. The mean average temperature of January is 70.3° F., and that of July 80.4°. The mercury rarely falls below fifty in winter, or rises above ninety in summer. The average annual rainfall for the past thirty years has been fifty-four inches; the prevailing winds are the north-east trade winds, which blow with a velocity of eight miles an hour for about 300 days in the year. Tornadoes frequently originate in the Caribbean Sea and travel in a north-westerly direction through the Yucatan Channel. These tornadoes occasionally ravage the western end of the island, but are not experienced in the east.

Habana, the capital and principal city of the Republic of Cuba, is representative of the life and industrial conditions in the country. The city is the headquarters of banking, railways, and coast and transoceanic navigation; it is also the centre of the larger and more important commercial and industrial enterprises, although these extend their operations over the entire island. The city, which dates from 1515, is one of the earliest towns established by Europeans in the Western Hemisphere. The city proper—the old city—was founded on three coral-reefs, and its distinguishing features are the narrow streets,

which were evidently constructed for strategical defence.

Habana was formerly a centre of fever, owing to these narrow streets, crowded buildings, lack of drainage, disregard of the laws of sanitation, and an inadequate supply of water. Most of these drawbacks have now been overcome, largely in consequence of United States efforts and influence, with the result that Habana is one of the healthiest cities in the world, boasting of good paving, a satisfactory sewage system, and an abundant supply of good water.

The most important source of wealth in Cuba is the sugar industry, which has for many years furnished a considerable percentage of the exports. In 1915-16 the production of sugar on the island amounted to 3,006,624 tons, and as the Central Powers can no longer supply the world with this commodity, and our own West Indian supply is limited, the Cubans practically control the market. High prices have stimulated production, and provided owners with capital for the erection of mills and the installation of new machinery. These mills are constructed of steel frames and concrete, or of reinforced concrete, and are roofed with corrugated iron or asbestos lumber, thus defying the white ants, which were destructive to the old-fashioned wooden mills.

A general impression prevails among those who do not possess an intimate knowledge of Cuba or of the trade conditions obtaining there that the island is under the domination of the United States in commercial matters, and almost exclusively buys from and sells to that country. This is a mistake. Although United States influence is powerful, there are indications that it is to an extent on the wane. Cuban buyers, who during the war found it either advantageous or necessary to obtain supplies from their great neighbour, are now inviting competition from abroad, because of their inclination to use certain

types of machinery and material, and because, as a rule, credit is more generous and better organised.

The Cubans pay more attention to quality than they formerly did; hence better-class materials find a readier market than lower grades. In the recent extensive new installations of sugar machinery, and in the improvements now being made in the mills, purchasers act on the principle that quality counts for more than first cost. If, then, British suppliers will gain the confidence of importers by giving them exactly what they demand, a profitable market may be secured. The necessary steps must, however, be taken at once, or the United States will not be the only competitor in the field; for signs are not wanting to show that Germany will make strenuous efforts to regain its overseas trade. The works of Krupp are already turning out immense quantities of machinery, and awaiting opportunities for supplying it on favourable terms.

In the past British goods were beaten in Cuba and in Latin American markets generally by the Germans, not because German goods were preferred, but because British manufacturers too often attempted to impose their wares upon the market, instead of trying to meet the demands, as the Central Powers assiduously did; and the result was that Germans and Austrians undersold British goods, supplying inferior materials, which, however, met the immediate market. At the same time, Cubans preferred British goods, and while the rate of increase in the trade with the United States exceeded the rate of increase with Germany, it was lower than in the trade with the United Kingdom. For example, between 1912 and 1913 the trade with the United States in steel and iron goods increased roughly by 20 per cent.; the rate of increase in the trade with Great Britain was roughly 40 per cent. in the same commodities.

In 1914 there was a tremendous fall in the United States trade in steel goods with Cuba. In 1915 German trade had ceased, British trade had fallen one-half, while imports of French steel and iron dropped by over 66 per cent., and the United States had the market to itself, but showed little advance on the business done in pre-war days. It is unnecessary to labour the point; the figures for practically every trade indicate a strong but not an increasing United States influence, and a fairly ready market for the products of other countries.

The demand for new sugar-mills has accentuated the need for structural steel and iron. Investigations show that during 1915 fully 90 per cent. of the structural steel imported into Cuba was used in connection with sugar-mill construction. Now that conditions are becoming normal, there is likely to be an increase of trade in that direction, and the following figures, which have been collected privately, but which have received official approval, may be of interest.

During the period commencing 31st July 1914 and ending 31st August 1916 exactly 298 individual grinders for Cuban sugar were sold. Allowing five grinders to a group of the complete grinding unit, about sixty complete sets were installed. Each of these sets of five, complete with a crusher, cost over £5000. In new mill construction the crushing machinery and rolls usually represent from one-sixth to one-fourth of the cost of the plant when ready for operation, and it is estimated that one-fourth of the sixty complete grinding-sets were installed in new mills in which their cost represented one-sixth of the finished plant. The total new investment of these fifteen mills would, therefore, be about £460,000. Another fourth of the complete sets were installed in mills where the cost of the grinding-set would roughly represent one-fourth of the cost of work done on the plant, and the investment on these fifteen plants would amount to some £300,000, making a total for the thirty plants of at least £760,000. The value of the balance is not estimated. However, the mills with these thirty new grinding-sets, on a basis of 400 tons of steel per mill, used approximately 12,000 tons of steel. It is calculated that a similar amount was used in making extensions and necessary changes to house those machines which were installed in mills already established. This would show a total of 24,000 tons of structural steel-work in the period of twenty-five months for which the records were kept; and it must be remembered that this steel was principally imported. There is the market, but although Cuban buyers may be favourably disposed to consider the offers of British suppliers, they cannot afford to pay higher prices than those quoted by United States exporters.

SUMMER'S TRIUMPH.

COMES the radiant summer-time;
Sorrow's past, and pain;
Fairest things are in their prime;
Summer comes again!

Where the land lay numb with frost
Blossoms sweet we find;
Joy returns we thought was lost;
Hope awakes within the heart;
Friends have met that thought to part;
Soft the breeze that blows—O wind,
The distance beckons; hope's before;
Anguish lies behind!

See where gloomed the thunder-cloud
Throned the sun in might;
Vanquish'd terror; dread's dispelled;
Shades of storm and night.
Where the sunlit vapours crowd
On heav'n's loftiest parapet,
High the gracious bow is set.

Soft the wooing south winds blow;
Fair the flowers are springing;
And, oh, how does the heart o'erflow
At the voice of the children singing!

Chambers's Journal

SEVENTH SERIES

THE RIFLE-THIEVES.

By C. G. NURSE.

I.

THE stolen rifle is to the Pathan 'what the horns are to the buffalo, or what deceit is to the Bengali,' if one may be permitted to paraphrase a well-known passage in Macaulay's *Essays*. Across the border a good weapon will fetch at least its weight in rupees; and cartridges, or even their empty cases, are sold there at many times their original cost. The orders regarding the care of arms and ammunition in India are very strict, and any infringement of the regulations is severely dealt with. But the demand for modern rifles among the transfrontier Pathans is so constant that the military authorities and the police are kept continually on the alert to prevent their being smuggled across the border. A fine of five hundred rupees is exacted from the battalion or the company concerned in case of a rifle being lost, and if a rifle-thief is captured he usually receives a long term of imprisonment.

Rifle-thieves resort to all sorts of devices. One of the commonest of these is for a man to strip himself to his loin-cloth, grease his body well, and sneak into a tent or a guardroom during the night, in the hope of securing a much-coveted weapon. It is dangerous work, as, if the intruder is detected, he may pay for his temerity with his life; but such attempts are frequently made, and are occasionally successful. Various safety arm-racks have been devised, with the result that rifle-stealing has become more difficult of recent years; but as a successful night's work may bring in more than a year of honest labour, men are always to be found who are ready to take great risks in the hope of success. The chief hunting-grounds of rifle-thieves are, of course, the stations on or near the north-western frontier, but regiments quartered several miles inland are, especially if they contain a Pathan element in their ranks, by no means immune from their attention.

II.

Some years ago I was stationed at Jubbulpore, in the Central Provinces, in command of a native regiment, which consisted of Punjabi Mohammedans, Sikhs, and Pathans. Jubbulpore is some 800 miles from the frontier, and, as the Indian railway police are tolerably alert and efficient, it would be no easy matter to take a rifle such a distance without detection. I had, therefore,

no particular anxiety regarding the eight or nine hundred rifles for which I was officially responsible, more especially as I knew that the regulations for the care of arms were duly carried out. I was consequently somewhat taken aback when my adjutant came to my quarters early one morning and said, 'I am sorry to disturb you, colonel, but I have just received a report that a rifle has disappeared from the quarter guard.'

'What company is on guard?' I inquired.

'One of the Sikh companies.'

'All right. I'll come down to the lines with you as soon as I am dressed, and we will see what we can find out about it.'

The loss of a rifle necessitates a number of reports, chiefly by telegram, to various authorities, and I decided that before reporting the matter I would satisfy myself that the rifle had really been stolen, and not merely hidden away. The Indian native soldier has, with all his virtues, a few little weaknesses, and one of them is that, if he can get into trouble some one against whom he has a grudge, he will not hesitate to do so, even at some risk to himself. There had been a little ill-feeling among the Sikhs about some recent promotions, and I thought it quite possible that some one might have hidden the rifle in order to spite one of the N.C.O.'s of the guard. The Sikhs, like other folk, have their failings, but rifle-stealing is not one of them; they hold themselves aloof from the Mohammedans, and hate the Pathans especially. The Sikh is in many respects the Scotsman of the East; he fights well, has strong religious feelings, likes his 'wee drappie,' and is careful of his money. But he has all the Oriental love of intrigue, and often evinces considerable jealousy of a more fortunate comrade, even if he belongs to his own race.

When I reached the quarter guard, my suspicion that the rifle had been hidden away was strengthened when I found that the havildar of the guard was a recent promotion named Bhagwant Sing. He was a fine, black-bearded man about thirty years of age, and had received advancement over several of his seniors owing to his smartness and general capacity. An inspection of the quarter guard showed that the lock and the chain used to fasten into the arm-rack the rifles of the men not actually on sentry-duty were in good order. It was the part of the

havildar to keep the key in his possession, and either he or the naik should, at every relief of the sentries, unfasten the rifles of the new relief, and lock up those of the men coming off duty. When I questioned him, the havildar seemed a little nervous, and I thought that some of his replies were unsatisfactory.

The missing rifle belonged to a sepoy named Sakat Sing, and I consequently inquired, 'What were Sakat Sing's hours of duty?'

'He was on sentry from midnight till 2 A.M.'

'Then he would come on duty again at 6 A.M.?'

'Yes, *huzür*; it was at that time that he reported that his rifle had disappeared.'

Sepoy Sakat Sing was a young man of perhaps a couple of years' service, well set up, but a bit of a rustic. From his replies to my questions I felt convinced that he was concealing something, but whether he was trying to shield the havildar or himself I could not for the moment decide. The examination of native witnesses is always a tedious matter; but I was fully accustomed to weigh their evidence, and after examining and cross-examining the men of the guard, I came to the conclusion that there had been some neglect as regards locking up the rifles at the time of each relief, and that the men coming off duty had merely placed them in the arm-rack until they were again required.

One fact emerged—namely, that the rifle had certainly disappeared between the hours of 2 A.M. and 6 A.M. Whether it had been actually stolen remained to be proved, for none of the witnesses had seen any unauthorised person in the vicinity of the guardroom. I was still inclined to the theory that it had merely been hidden somewhere; but, in any case, if it had been stolen, the thief must have a very good knowledge of our regimental routine. I therefore decided to have a thorough search made of the lines and their environs, and ordered the 'Fall in' to be sounded, as by this time the ordinary hot-weather parade was over. When the men assembled on the parade-ground, I called up the native officers, explained matters to them, and gave the necessary instructions. There was no lack of energy in carrying out my orders, as the loss of a rifle concerned the whole regiment, and if it were not recovered every man would have to contribute, in proportion to his pay, to make up the Government fine. Moreover, the desire for advancement is very strong in the ranks of a native regiment, and every sepoy felt that if he were fortunate enough to discover the lost rifle, it might lead to the first step on the ladder of promotion. The lines were carefully searched, wells were dragged, and even the precincts of the regimental mosque and *dharma-sala* (Sikh temple) were examined by Mohammedan and Sikh native officers respectively. But the rifle was not discovered, and I felt compelled to discard my theory of its having been concealed in favour of the alternative one of theft.

III.

The regimental hospital was a substantial brick building, situated about a hundred yards from the nearest portion of the lines, and surrounded by a barbed-wire fence, consisting of three strands, rather wide apart. This fence, though sufficient to keep out wandering cattle, would not prevent the ingress or egress of a man, though any one attempting to pass through it would risk tearing his clothes. The N.C.O. detailed to search the hospital brought me a single native shoe, of the pattern worn in the Punjab, which he said he had found beside the fence, and also a piece of cotton material which had been impaled on the barbed wire close at hand. I examined the shoe, which, though slightly worn, was in too good a condition to have been thrown away intentionally, and placed it with the piece of material in the regimental office. I did not think that they could have any bearing on the case, but it did not seem advisable to neglect any possible clue.

It was the middle of the hot season, and after spending a long morning investigating the case, and getting through my ordinary routine work, I returned to my bungalow about 1 P.M. thoroughly tired. My orderly, a Punjabi Mohammedan sepoy named Mahomed Khan, while assisting me to divest myself of my sword-belt in the veranda, asked for leave to go for a few hours into the native town. I gave him the required permission, and he said he would be back in the evening. Mahomed Khan was a curious and interesting personality. Standing about six feet three, spare but muscular, he was, in spite of his thirty-eight years, one of the most active men in the regiment. He was among the most efficient of the regimental scouts, and his natural intelligence was of a high order, though lack of education had stood in the way of his promotion. In the evening he returned, and asked to speak to me in private.

'Well, Mahomed Khan, what is it?' I inquired.

'*Huzür, nit pukra*' ('Your honour, I have caught a thread'—that is, found a clue).

'What do you mean?' I asked.

'Sahib, I have found out something in connection with the rifle that disappeared. Have I your permission to tell the tale?'

'Without doubt. But a story is better told sitting than standing. Be seated.'

Mahomed Khan squatted on the floor close to my chair, and proceeded as follows: 'The sahib has had much trouble to-day about the case of the rifle, and I thought that I would try to help in the matter by doing some investigation on my own account. There is in the bazaar a small tea-house, which is kept by an old Punjabi woman. The heart of a man often hankers after the special food of his native country, and a good many men of the regiment, both Punjabis and Pathans, frequent the tea-shop from time to

time. I went there this afternoon, and, as I arrived early, there was no other customer in the shop, so I began talking to the old woman, whom I have known for a long time. When her tongue began to be loosened I mentioned the names of some of my acquaintances, and asked if they had been there lately. Then I asked her if there were many Pathans among her customers, and she replied that a few came, and I got her to name some of those that she knew. One of the men named by her was Mahomed Hâyat, who took his discharge before your honour got the command.

"But," I said, "he left the regiment some time ago. Is he still here?"

"The old woman replied, "Oh yes; he came in for some tea this morning, and I noticed that he had on only one shoe. He had, moreover, cut his wrist, and I bound it up for him. Those Pathans are always up to some mischief!"

"I did not say any more, fearing to rouse her suspicions, and as soon as I had drunk my tea I came here to report to your honour."

"That may be of some importance," I said. "I suppose you have heard of a shoe having been found near the hospital this morning?"

"Yes, sahib; and that is why I hastened back, so that your honour might give an order for the arrest of Mahomed Hâyat, who was always a bit of a scoundrel."

"Not so fast," I said; "we have no proof against him, and, moreover, the shoe found near the hospital was a Punjabi shoe, and not of the shape usually worn by Pathans."

"Huzur, many Pathans wear Punjabi shoes when they are away from their own country, as shoes of the Pathan pattern are difficult to obtain in India."

Mahomed Khan seemed to be proving himself a regular Sherlock Holmes; but natives love gossiping, so I cautioned him to say nothing to any one about what he had found out. I then went down to the lines to see if I could ascertain why Mahomed Hâyat, if he were really concerned in the theft, should visit the hospital. I determined to take into full confidence the subadar major, a fine specimen of the best type of native officer, who was thoroughly able and trustworthy. I told him what Mahomed Khan had reported, and he confirmed the statement that Pathans often wear Punjabi shoes when away from their own country. He remembered a man named Mahomed Hâyat, who had formerly served in the regiment, but admitted that he knew nothing against him. As regards the question why he should visit the hospital, he reminded me that the N.C.O. in charge of the hospital stores for that month was a Pathan named Zaidulla.

Although, so far, we had no actual proof against any one, the facts already ascertained gave us a fairly satisfactory framework on which to base our plans. The only train for the north left about 7 P.M., and we at once sent down

to the station a couple of sepoy, who knew Mahomed Hâyat by sight, with orders that if he appeared on the platform they were to inform the railway police, with a view to having his baggage searched. But the subadar major inclined to the opinion that the rifle was still secreted somewhere, and if so I deemed it probable that the thief would make no attempt to remove it until the hubbub caused by its disappearance had subsided. It seemed quite likely that if Havildar Zaidulla had had any hand in the matter, it might be secreted somewhere in the hospital, where he had a separate room. To make a special search then would certainly have the effect of putting him on his guard, and we therefore decided to have the hospital compound watched for the next few nights. I gave the subadar major a free hand to select men for the purpose, and next morning paid a visit to the district superintendent of police, and arranged for a detective to shadow Mahomed Hâyat.

IV.

Meanwhile the regiment was engaged in scouring every likely place in the country surrounding the lines, in the hope of discovering the lost rifle. When I returned to the regimental office, Major K., the second in command, greeted me with the news that it had been found. His genial face beamed with satisfaction as he imparted the welcome information, for he had served twenty years in the corps, and its honour was as his own. It appeared that some of the sepoy engaged in the search had noticed a spot in the dry bed of a watercourse where the surface showed signs of having recently been disturbed, and, pushing sticks into the sand, came across something hard, which turned out to be the lost rifle. This they brought to Major K., who, with great good sense, caused the sand and gravel to be replaced carefully over the spot where the rifle had been found, and left a couple of men to watch the place from a distance, with a view to arresting the thief should he come to remove his booty.

An additional fact had come to light which helped to account for the shoe found near the hospital fence. On the day when the theft of the rifle was discovered, two men of the regiment came to the subadar major and stated that, after having answered to their names at the evening roll-call on the previous night, they had gone to visit some friends in the cavalry lines (they had probably been gambling), about half a mile distant. When returning in the early hours of the morning, in order to be present at reveille, on passing the hospital compound they had noticed a man getting through the fence. As soon as he saw them he took to his heels, and disappeared in the direction of the bazaar. They had said nothing about it at the time, as they did not wish to call attention to the fact that they had absented themselves without leave

during the night; but when they heard of the discovery of the shoe, they came forward voluntarily, in the hope that their disregard of orders might be overlooked in return for the information they could give.

I sent for my most trustworthy Pathan native officer, and questioned him regarding Mahomed Hāyat, who, I learned, when he was in the regiment, had been a friend of Zaidulla. The native officer seemed much surprised to hear that Mahomed Hāyat was now living in the bazaar, as he felt certain that, on taking his discharge, he had returned to his own country.

During the course of the day I had a visit from the detective whose services had been placed at my disposal by the district superintendent of police. He informed me that Mahomed Hāyat was still in the native town; that he was not, so far as could be ascertained, doing any work; and, further, that he was wearing a new pair of shoes, and had his wrist bound up. Although I was now convinced that he had been concerned in the theft of the rifle, the evidence at my disposal would have been quite insufficient to secure his conviction, and the exercise of patience was, therefore, necessary. The watch on the hospital and the place where the rifle had been discovered was consequently continued for the next few nights, all details being left to the subadar major. I carefully avoided mentioning the matter of the rifle to the other native officers and men, hoping to give them the idea that I was quite satisfied with the recovery of the weapon, and thus conceal the net that was being spread. A few days later, when I arrived at the lines, the subadar major reported as follows: '*Huzūr*, Mahomed Hāyat is a prisoner in the guardroom, and I have placed Havildar Zaidulla under arrest.'

I inquired what had happened, and he called up the N.C.O. who had been placed in charge of the men detailed to keep the hospital under observation. The N.C.O.'s story was as follows.

'Last night, at about midnight, I was sitting under the banyan-tree outside the regimental office, watching the hospital, according to orders. It was bright moonlight, and I saw a man coming towards the hospital from the direction of the bazaar. He entered the hospital compound, and went to the door of Havildar Zaidulla's quarters. The door was opened, and he went inside, and remained there for nearly an hour. Meanwhile, with two of the men under me, I had taken up a position nearer the hospital, and when the man came out we followed him.'

'Did he come out alone?' I inquired.

'Yes, *sahib*, he came out alone, and proceeded along the road towards the cavalry lines. We kept him within sight, and followed him to the dry watercourse where the rifle was found a few days ago. He commenced to dig in the sand, and we closed upon him and captured him.'

'Did he make any resistance?' I asked.

'He struggled a bit, but we were three strong

men, and the men watching the spot also came up, so he had no chance to get away. We lodged him in the guardroom, and reported to the subadar major.'

The evidence against Mahomed Hāyat seemed now pretty conclusive, but as he was no longer serving as a soldier he was not subject to my jurisdiction. I consequently handed him over to the civil police, and consulted the native barrister who acted as Government prosecutor as to whether there was sufficient evidence to connect Havildar Zaidulla with the case. He informed me that the evidence was quite insufficient for this, and I was reluctantly obliged to concur in his opinion.

The police search of the room in the bazaar occupied by Mahomed Hāyat resulted in the discovery of a shoe, the fellow of the one which had been found near the hospital fence, and a *pairan* (native shirt), the sleeve of which was torn, and corresponded with the piece of material which had been found on the barbed wire.

Mahomed Hāyat was duly placed on trial before the civil judge, convicted, and sentenced to two years' rigorous imprisonment.

As regards Zaidulla, there was not a shadow of doubt in my mind that he had played a leading part in the business, but, in the absence of sufficient evidence against him, I feared that I should be obliged to retain him in the regiment. The discovery, however, of a Government ball-cartridge in his kit when it was examined gave me the opportunity of trying him under military law for a breach of the regulations. He was convicted, and duly sentenced to a term of imprisonment, which sentence involved his dismissal from the army.

V.

Three or four weeks later I attended a garden-party at the house of the commissioner, where I met the officer in charge of the jail. He asked for a few words in private, and said, 'I have in jail here the man who was sentenced for rifle-stealing, and also Zaidulla, your late havildar. When I went my rounds the other morning, the latter asked permission to speak to me, and after recounting his grievances, threatened that as soon as his sentence expired he would have his revenge on you.'

'He certainly got a heavy sentence,' I said; 'but it must be remembered that a cartridge may mean a man's life.'

'Of course; but he evidently bears you a grudge in the matter, and I thought I should give you warning. If he remains in jail here, he will, while employed on gang work, have frequent opportunities of seeing the other man, and, as they are both Pathans, it is quite likely that they may concoct some plot. I propose to transfer him to the jail at Nagpur, and should advise you to be on your guard when his term of imprisonment expires.'

I thanked him for his warning; but both prisoners were safe in jail for some months, and there was no necessity for immediate action. Later on I wrote to the police-officer at Nagpur, informing him of the circumstances and the date on which Zaidulla's sentence would expire, and asked him to have Zaidulla watched when released, and let me know his movements. My regiment shortly afterwards took part in some manoeuvres, and before we returned to headquarters I received a telegram to the following effect: 'Zaidulla has been released from jail, and left this morning, having taken a ticket for Jubbulpore.'

At the end of the manoeuvres we returned to our station, and I at once set about making inquiries, through one of my native officers, as to whether anything had been seen or heard of Zaidulla. I was informed that he was living in the native town, but that he had not appeared near the regimental lines, and probably had an idea that his presence in the neighbourhood was not suspected. I knew that, owing to the Arms Act, he might have a difficulty in obtaining a weapon, but nevertheless the next two or three weeks was by no means a comfortable time for me. My house was situated about a mile from the Mess, and the road passed through some disused barracks, which would easily afford concealment to evil-doers. I took the precaution of carrying a loaded revolver when out alone at night, and always slept with it under my pillow.

At last I got tired of the situation, and deter-

mined to take the bull by the horns, so I sent a trustworthy sepoy into the bazaar, with orders to find Zaidulla, and invite him to come and see me. Whether my messenger used any wiles, or whether the habit of discipline was too strong for Zaidulla, I never ascertained; but he duly presented himself at the regimental office, stood at attention, and saluted me as if he were still under my command. I sent for the native officer of the company to which he had formerly belonged, and told him to bring before me all the N.C.O.'s and men who had been on friendly terms with Zaidulla. When they were assembled I addressed him as follows: 'You scoundrel, you are here for no good purpose. I know the reason of your return here, and have been aware of your movements ever since you left jail. If you kill me, what does it matter? There are fifty others to take my place. But you have about 800 miles to travel to reach your home, and if you commit a crime, and are not captured *en route*, the arm of the British Government is longer than you think. Your own brother would probably sell you for a hundred rupees. The game is up, and the sooner you realise it the better. The best thing you can do is to return to your own country and cultivate your bit of land.'

Zaidulla took my advice. I had him shadowed till he left Jubbulpore, a day or two later, with a ticket for Peshawar, and I never heard anything more about him. Mahomed Hayat was still serving his sentence when I left India on retirement.

THE VICISSITUDES OF SURNAMES.

ANY one whose name does not fall within the common rut of the 'Smith, Jones, and Robinson' type is only too well aware of the fact that there seems to be hardly any limit to the variations of spelling to which a name may be subjected by those to whom it is unfamiliar. It is, perhaps, one of the weaknesses of human nature that such tampering is usually resented, as if unfamiliarity with the name implies, somehow, lack of knowledge or appreciation of the personality of the owner.

Errors of this kind, however, are made in good company. The signatures to the plays of Shakespeare read 'Shakspe,' a fact which the supporters of the claims of Bacon have not omitted to use as an argument in favour of their contention that Shakespeare was too illiterate to have been capable of their authorship; whilst even the great Sam Weller was slightly ambiguous in his preference for spelling his name 'with a "wee."'

As a matter of fact, the present-day form of most names is purely accidental. Before the nineteenth century inflicted the three R's upon all of us the man who could write his own name was very much the exception, and even then he

was prone to spell it phonetically, rather than according to rule. Thus, when we consider the influence of local dialect upon pronunciation, it is evident that names were susceptible of great distortions, both in form and in meaning.

A good example of this is found in the name 'Black,' which one naturally presumes to have been applied to, or adopted by, a family of marked swarthy complexion. As a rule this presumption is correct, but in some cases the derivation is from the Anglo-Saxon word *blæc* or *blād*, which meant 'white' or 'pale,' the original meaning being still retained in the words 'bleach' and 'bleak.'

Hardly any name has been immune from change at one time or another, but saints' names seem to have been especially liable to maltreatment, particularly when the prefix is followed by a vowel. The well-known Tooley Street, in London, was originally St Olave's Street, and it is not difficult to imagine the stages through which it must have passed in the slurring speech of the Metropolis before it crystallised into its present form. In the same way the dignity of 'St Aubin' has been lost in the comparatively

commonplace 'Tobin;' whilst 'St Audrey' has degenerated into the word 'tawdry,' applied to a class of cheap and pretentious goods which were the feature of the old St Audrey Fairs.

One cannot but regret the constant tendency to sacrifice the original forms of names for the sake of ease, for nearly every name has a meaning

and associations which are worthy of preservation. There is many a fine old name effectively buried beneath the commonplace of modern spelling, and to be told that the prosaic name 'Codlin' is all that remains of the romance and vigour of 'Cœur de Lion' convinces us that such a tendency may be little short of criminal.

THE PARTS MEN PLAY.

CHAPTER XXI.—A NIGHT IN JANUARY.

I.

NEXT morning, when Selwyn left his hotel, a few desultory snowflakes were falling through the air, and moistly expiring on the asphalt pavements. It lacked a few minutes of nine, and the thousands who man the machinery of New York's business were hurrying to their appointed places. People who had to catch trains were hurrying to stations, and people who had nowhere to go were hurrying still faster. Taxi-cabs were rushing people across the city, and other taxi-cabs were rushing them back again. The overhead railway was rattling and roaring its noisy way, the surface cars were clattering and clanging through the traffic, and every half-minute the subways were belching up cargoes of toilers into the open air.

New York was in a hurry.

All night the great engine of a million parts had lain idle, but morning was the signal that every wheel must leap into action again, driven by the inexhaustible army of human souls. Hurry, noise, clamour, greed, fever, progress. . . . Another day had dawned!

Crossing Broadway to reach Fourth Avenue, Selwyn could not repress a smile at the stricken glory of the great Midway. The illuminated signs that had searched the secret crevices of the mind, and had aided the iridescent foam seen from the harbour, looked tawdry and vulgar, like a circus on a rainy morning. Even the theatres, with their sign-borne superlatives, were garish and illusion-shattering. There was almost an apologetic air about the bill-boards proclaiming their nightly offering to be the 'biggest ever.'

Selwyn began to resent that word 'biggest.' One of the sad things about America is that she started out to make language her slave—only to find that it is becoming her master.

Entering a great office-building, he consulted the directory-board, and was swooped up to the twenty-fourth floor in a non-stop elevator. Finding the room of his literary agent, he went in, but a young lady told him Mr Lyons was in Chicago.

'It doesn't matter,' said Selwyn. 'I shall see him when he returns. But I want a couple of addresses. Have you the file of letters to me? Austin Selwyn is my name.'

The young lady was gratifyingly flustered at

the announcement, and by her haste to produce the required letters indicated the esteem in which her employer held the author.

'It was early last September,' said she. 'Mr Lyons mentioned two names—a Mr Schneider, who purchased foreign rights of my stuff; and some one who wanted me to lecture—yes, that is the letter. Could you give me the addresses of these gentlemen?'

She wrote them on a card and gave it to him. 'Mr J. V. Schneider,' she said, 'is in the Standard Exchange Building, just one block below here; and Mr C. V. Benjamin is on 28th Street, in the United Manufacturing Corporation.'

Thanking her for her courtesy, Selwyn left the office, and going directly to Mr Schneider's place of business, sent in his card. He was ushered through a large room where a dozen typewriters were clicking noisily, and reaching the private office of Mr Schneider, found himself in the presence of a small, crafty-faced man, whose oily smile and air of deference did not harmonise with his eyes, which were as shifty and gleaming as those of a rat. He shook hands with his visitor, and then clawed at the papers on his desk with moist fingers that were abnormally long.

'Vell, Mister Selwyn,' said Mr Schneider gutturally, 'to vot do I attribute dis honour! Have a cigar—sit down.'

'May I break the rule of your office?' said the author, indicating a sign on the wall which read: 'NIX ON THE WAR.' 'If you will be so kind, I want to speak of matters not far removed from that subject.'

Mr Schneider shifted his cigar to the corner of his mouth, and laughed immoderately.

'Ha, ha, ha!' he roared, leaning forward, and thrusting a long, dirty finger into Selwyn's chest. 'That is vot I call mine adjustable creed. For most peoples vot gom' here—Nix. But for fine fellers like you'—

With a greasy chuckle, he mounted his chair and turned the sign about. On the reverse side there was a coat-of-arms, and the words: 'DEUTSCHLAND ÜBER ALLES.'

'Vot you tink?' grinned Mr Schneider, speaking from the altitude of the chair. 'Goot, ugh!' He turned the thing about and stepped down again, wringing his hands in huge enjoyment of

the whole thing. 'You can spik blainly, Mister Selwyn,' he went on amiably. 'Ve unnerstan' each odder, *hein?* Von't you smoke one of dem cigars?'

'No,' said Selwyn. He looked at the little man for about ten seconds, then, crossing to the wall, wrenched the sign away, nail and all.

'Here, here,' protested Mr Schneider, backing warily to the door, 'vot for you do dis? Vot you mean, you great big fourflusher?'

The young man eyed the sign and then the German's head, apparently with the idea of bringing them together. Mr Schneider further developed his plan of retreat by taking a grasp of the door-handle.

'That's for people who say, "Nix on the War,"' said Selwyn, breaking the sign in his hands as if it were made of matchwood. 'And this is for your damned Deutschland!'

He broke the remainder over his knee, and threw the pieces on the flat desk, upsetting an ink-bottle, the contents of which dripped juicily to the floor.

'But ain't you,' said Mr Schneider, in a voice that was almost a squeal—'don't you got no respect for Chermany? Only yesterday der ambassador, he tole me that after the var, for all you wrote to help der Faderland, der Kaiser, himself, vill on you bestow'—

Before the speaker could acquaint the author with the exact nature of the honour in store for him, Selwyn had seized him by the coat-lapels, and was shaking him so violently that Mr Schneider's natural talent for double-facedness was developed to a pitch where an observant looker-on might have counted at least five of him vibrating at once.

'You dirty little hound,' said Selwyn, without relaxing in the least the shaking process, 'if you ever use my name again, or send out anything written, or supposed to be written, by me, I'll'—

For once words failed him, and lifting the little man almost off the floor, he deposited him violently on his own desk, in the midst of the pool formed by the ink.

'Nix on the war!' snorted Selwyn defiantly, putting on his hat. He was going to add a few more crushing remarks, but, altering his mind, went out, slamming the door so violently that all the typewriters engaged in sending out German propaganda were startled into an instant of silence.

As for Mr Schneider, he sat still amidst the wreck of his desk, pondering over a famous definition of war given by an American general named Sherman.

II.

Without waiting to catch the driver's eye, the impetuous idealist overtook an empty taxi-cab, and jumped into it.

'United Manufacturing, 28th Street,' he called. 'Make it fast.'

On arrival at his destination he found that Mr C. B. Benjamin was the president of the United Manufacturing Company, which—so a large calendar stated—was the biggest business of its kind in the universe. It had more branches, more output, more character, more push than any other three enterprises in America.

Mr Benjamin was in, but could be seen only by appointment, said a sleek-haired young man of immaculate dress.

'Give him that card, and tell him I want to see him *at once*,' said Selwyn, with a forcefulness that caused a look of pain to cross the young man's countenance.

'Please sit down,' he said, 'and I'll see what I can do.'

As a result of his efforts, Selwyn received a summons to go right in—which he did, going past a number of people who had various big propositions to put before the big man when they could gain his ear.

'Good-morning, Mr Selwyn,' said the president, a smartly dressed Jew, with a shrewd face and an unquestionable dignity of manner. 'You have returned to America, I see.'

'Yes, Mr Benjamin. Do you mind if I come right down to business?'

'Mind? How else could I have built up the United Manufacturing Company? Have a cigar?'

'No, thanks. Mr Benjamin, you wrote my agent that you wanted me to lecture on the fallacy of war.'

'Sure,' said the president.

'May I ask why?'

Mr Benjamin removed his spectacles and wiped them carefully. Putting them on, he surveyed his visitor through them. After that he took them off again, and winked confidentially. 'Mr Selwyn,' he chuckled, 'you ain't a child, and I see that I can't put over any sob stuff with you. I told your agent I would pay him real money for you to lecture. Well, take it from me, when the president of the United Manufacturing Company pays out any of his greenbacks he don't expect nothing for something, eh?'

'I don't understand you—yet,' said Selwyn quietly.

Mr Benjamin leaned back in his swivel-chair and cut the end of a cigar with a little silver knife. 'Business,' he said, 'is business, eh?'

'Agreed,' was the terse response. 'I am still waiting to know why you offered your money to me.'

Mr Benjamin leaned forward, and taking up his glasses, waved them hypnotically at the young man. 'Simply business,' he said. 'Same with you—same with me. You write all this dope against war—why? Because you know there's big money in it. I pay you to lecture because you can help to keep America out of the war. In 1913 I was worth two hundred thousand dollars. To-day I have ten million.

We are wise men, Mr Selwyn, both of us. While all the rest of the peoples fight, you and I make money.'

As if his bones were aching with fatigue, Austin Selwyn rose wearily to his feet, and, without comment, walked slowly out of the office. But the clerks noticed that his face was ashy-pale, like that of a prisoner who has received the maximum sentence of the law.

III.

The days that followed were the bitterest Austin Selwyn had ever known.

It is not in the plan of the Great Dramatist that men shall look on life and not play a part. It is true that there are a few who escape the call-boy's summons, and gaze on human existence much as a passing pageant, but even for them is the knowledge that there is a moment called Death when every man must take the stage.

For years Austin Selwyn had stood apart, mingling with those who were enduring the sword-thrusts of fate, as an author chats with the players on the stage between the acts. Even the great tragedy of war had served only to enrich the processes of his mind. It is true he had known compassion, sorrow, and anger through it, but they were only counterfeit emotions, born of the grip of war on his imagination.

But at last life had reached out its talons and grasped him. Every human experience he had avoided, he was now to know, multiplied. Stripped of his last hope of justifying his idealism, he saw remorse, discouragement, a sense of utter futility, the scorn of friends, the applause of traitors—he saw them all as shadows closing into blackness ahead of him.

He tried to return to England, but passport difficulties were made insurmountable. He went to Boston, only to find that those he valued turned against him, and those he detested wel-

comed him as comrade. He returned to New York, but every avenue of activity was closed to him, save the one he had chosen for himself—that of world-pacifism.

He had always been a man of strong, underlying passions, and in his veins there was the hot undissipated blood of youth; but his brain had been the controlling force in every action of his life. Hitherto he had never questioned its complete mastery; but as he pondered over his fall he knew that it was his brain that had ridden him to it. He no longer trusted its workings. It had proved rebel and brought him to disaster.

And with that inner challenge came the supreme ordeal of his life.

As rivers, held imprisoned by winter, will burst their confines in the spring and overrun the land, all the passions which had been cooled and tempered by his intellectual discipline swarmed through his arteries in revolt. No longer was the brain dominating the body; instead, he was on fire with a hundred mad flames of desire, springing from sources he knew nothing of. They clung to him by day and haunted him at night. They sang to him that vice had its own heaven, as well as hell—that licentiousness held forgetfulness. He heard whispers in the air that there were drugs which opened perfumed caves of delight, and secret places where sin was made beautiful with mystic music and incense of flowers.

When conscience—or whatever it is in us that combats desire—urged him to close his ears to the voices, he cursed it for a meddlesome thing. Since Life had thrown down the gauntlet, he would take it up! If he had to travel the chambers of disgrace and discouragement, he would go on to the halls of sensual abandonment. Life had torn aside the curtain—it was for him to search the recesses of experience.

(Continued on page 452.)

PETROLEUM.

I.

PETROLEUM is a mixture of mineral oils, spirits, and hydrocarbons, generally found in limestones, sands, and shales. Its origin is doubtful, and has given rise to much experiment and not a little controversy. Many theories have been advanced to account for the presence of this substance in the earth's crust. They naturally follow two distinct lines of thought. The chemical theory presumes the oil to be formed through the interaction of water and carbon compounds of the alkali metals, these compounds being a direct result of the intense heat of the centre of the earth. In support of this contention, chemists, by

making use of means similar to those they presume to act in nature, have succeeded in producing many petroleum derivatives in their own laboratories. On the other hand, from considerations on the character and the occurrence of oil-bearing localities, geologists have come to the conclusion that the presence of the oil is due to natural forces analogous to those forming coal—that is, to the decay of animal and vegetable matter, under great pressure and over long periods of time. The heavy demand for both the crude material and its refined products has given great importance to the question of synthetic manufacture, but so far no production on a commercial scale has been attempted.

Although distributed all over the world,

petroleum is not found everywhere in abundance. Africa and Australia produce but little; South America, whilst of great potentialities, is only in process of development. Numerous wells are worked, but the bulk of the world's supply is drawn from several large fields, of which the United States, Russia, Mexico, and the East Indies are at present the chief. In 1901 the Russian output exceeded that of the United States; but during the present century American production has gone ahead at a remarkable rate, while that of Russia has gone back. Whereas Russia accounted for 50 per cent. of the world's total petroleum production in 1901, her share in 1913—that is, before the war—was only 18 per cent., the United States having advanced meanwhile from 41 per cent. to 63 per cent. The Rumanian fields, whose yield in 1913 exceeded that of the Dutch East Indies, were, of course, temporarily put out of the reckoning by the war. The following figures show the 1917 production of the leading oilfields:

United States . . .	14,060 million gallons.
Russia	2,898 " "
Mexico	2,310 " "
Dutch East Indies . .	540 " "

Of the total yield for that year, the United States contributed 67 per cent., Russia 14 per cent., and Mexico 11 per cent. The position of the British Empire is quite good. In 1917 342 million gallons, or 2.5 per cent. of the total production, were taken from wells within the Empire. The chief British districts are (1917):

India	232 million gallons.
Trinidad	67 " "
Egypt	42 " "
Canada	900,000 gallons.

There are, moreover, large undeveloped areas in northern India, and in Canada, Egypt, Australia, and New Zealand. There is little doubt that when these localities are opened up the British Empire will be able to supply from within its own limits a large proportion of the oil it requires.

II.

That the ancients were acquainted with petroleum is borne out by the numerous references to it in early works. The Bible mentions it as a valuable means of producing fire for burnt offerings; and the Persians and the Russians well understood its medicinal properties, especially as a cure for ulcers, sores, and other external ailments. In the thirteenth century Marco Polo refers in his Travels to the popularity of the Batum oil; and later the great English voyager, Sir Walter Raleigh, described the Trinidad sources.

As would naturally be expected from its great mineral resources, the development of the oil industry has taken place chiefly in America. Until the beginning of the nineteenth century, the only method of collecting petroleum was by skimming it from the surface

of the numerous pools throughout the country, but in 1806 the brothers Ruffner bored the first well at Oil Creek, in Pennsylvania. Their example was not universally followed; fifty years elapsed before the first oil company—the Pennsylvania Rock Oil Company—was floated. Its operations were not successful. A year later certain of its members broke away from the parent company, and formed the Seneca Oil Company, a concern attended with a much greater measure of success. A boom set in; townships rapidly sprang up, and large areas were drilled (often indiscriminately). For several years the output rose, but the absence of a market caused a rapid fall. About 1865 Young introduced the 'cracking' process of refining, which, with the invention of the oil-engine, re-established the market. From that time to the present day America has consolidated her premier position. The following figures indicate her vast increase of production from 1859 to 1918:

1859	2,000 barrels (42-gallon barrels).
1869	19,900,000 "
1889	35,162,000 "
1899	57,000,000 "
1906	126,000,000 "
1918	350,000,000 "

The steady advance of American development led to a corresponding advance all over the world. Between 1880 and 1890 Sumatra, Java, Borneo, and Burma were opened. Rumania, Galicia, and Baku were extended; Mexico commenced operations on a huge scale. By 1917 the world's yield had reached the figure of 22,000 million gallons. The gradually widening application of the oil has caused explorations to be made in countries hitherto considered unworthy of development. In the early part of last year drillings were made in the Midlands of England, one bore giving some 400 gallons daily, and wells are being sunk in various parts of Scotland.

III.

There are problems of great difficulty and complexity which confront the technical chemist, but few equal those of oil-refining. Processes vary greatly on the different fields; each is primarily suited to the particular grade of substance with which it is called upon to deal. Of the numerous qualities of oil, American is perhaps the most representative; it contains spirits, oils, and solids. The crude product, as delivered from the common stock tanks of the pipe-line companies, is often mixed with suspended mineral matter, and to free it from this impurity the petroleum is sometimes filtered through successive layers of animal charcoal. From the filters it passes to the stills, generally worked in batteries of three or four, and each capable of taking a charge of 24,000 gallons.

In the stills the temperature of the charge is gradually raised through a series of stages.

The first is from 100° F. to 125° F., when the lighter constituents, chiefly consisting of impure naphtha, are driven off and collected in underground tanks. The second stage consists in heating from 215° F. to 230° F. Between these temperatures the light oils, known commercially as kerosene or paraffin, volatilise, and are condensed. Further heating from 420° F. to 600° F. causes the heavy oils to evaporate. The residue remaining in the stills is then treated in one of two ways. It is either removed for conversion into vaseline, paraffin-wax, oil-fuel, and other commodities, or redistilled under a pressure of 250 pounds per square inch. This is known as the 'cracking' process; its effect is greatly to increase the yield of paraffins and heavy oils, these being formed as a result of chemical actions induced by the pressure. The products of the first distillation are very impure; they are each submitted to another purification of a similar nature, the heating being very carefully controlled. The naphtha gives rise to petrol and the various motor spirits, the kerosenes to the numerous lighting-oils, while the heavier types form lubricating, gas, and fuel oils. In spite of this further treatment, the derivatives are contaminated with water—a substance which greatly lowers their utility and value. To eliminate this undesirable fluid, they are agitated with caustic soda and vitriol, drawn off, and, after passing chemical and physical tests to ensure a standard of quality, are stored in tanks.

The first general use of petroleum was in medicine. This has long since disappeared, the only remaining derivative now employed in pharmacy being vaseline, chiefly to form ointments and emulsions. As an illuminating agent paraffin is still used in outlying districts, but in all large towns it has been superseded by gas and electricity. The quality of coal-gas is often enriched by means of gaseous kerosene, and in the United States gas-oil is evaporated to act as an illuminating agent on a very large scale. In modern times the most important applications of petroleum to industry are as liquid fuel and as a power agent. For fuel a heavy oil is used, and to effect combustion it is heated and forced under pressure through a series of nozzles. On emerging from the nozzles it is met by a blast of compressed air, and converted into a fine spray. In this condition it is burned. With proper burners oil will give almost twice the heat of a similar weight of coal—one of the many advantages of this type of heating. A great economy of space is secured; in comparison with the old method of coaling, the filling of oil-tanks results in a saving of time and labour; heating can be accurately adjusted; there is no smoke, and constant attention is more or less unnecessary. Commercial men have not been slow to recognise this. Recently the Cunard Company issued instructions for the conversion of their fleet to oil-burners; and liquid fuel is now used

in the world's navies. Yet by far the greatest demand for oil is as fuel for internal-combustion engines. These are built to work on every grade of oil, from the delicate, high-speed aero engine using pure petrol, the lightest of the petroleum derivatives, to the heavy Diesel engine, operating on the unrefined material. As power generators these engines have many points to recommend them. They are lighter and more compact than steam plant, and cheaper to install, maintain, and run; at the same time, they are more efficient, being the nearest approach to perfection yet obtained in engine design. The influence exerted by the internal-combustion engine has been widespread; it made possible the aeroplane and the tank, and has gone a long way to solve the question of transport by road.

IV.

For many years the transport of oil in bulk was a difficult proposition, but under modern conditions the difficulties have largely disappeared. The earliest carriers were the Burmese natives, who used earthenware pots for this purpose. Incidentally, these same natives constructed the first pipe-line. Unfortunately, being of bamboo, it leaked badly, and was abandoned almost immediately after completion. About 1850 the Americans introduced the barrel system. The barrels were built of oak staves, bound with iron hoops, and coated internally with glue to minimise leakage. The weight of the barrels was almost as great as that of their contents (although they were capable of carrying forty gallons); the cost for initial construction and repairs was heavy; losses by leakage were great; consequently transport charges became excessive, and engineers were forced to look for a cheaper and more efficient mode of carriage. In 1865 the first effective pipe-line, of about a mile in length, was laid, to be followed, ten years later, by one sixty miles long from Pittsburg to the wells. By 1900 Pennsylvania alone possessed 3000 miles of line, and some twenty companies were in operation. The lines, which are really oil-railways, are divided into three classes: main trunk routes of six-inch-diameter pipe, supplied with pumps of from 600 to 800 horse-power; secondary routes of four-inch-diameter pipe, with from 150 to 300 horse-power pumps; and local lines of from 15 to 30 horse-power. Under the present system each owner delivers his oil to one or other of the companies, receiving a receipt for the amount delivered. The company in turn pumps it along its lines, through a series of stations, to the refineries, passing all into a common stock tank, from which each consigner draws the amount shown on his receipt. The distribution of the purified derivative is carried out chiefly by railway and road tank-cars, except in the case of oil intended for shipment, which is forced through pipes to the seaboard towns, and thence loaded into tank-steamers. It

is interesting to note that this system is employed in Great Britain. The oil for the navy is landed from steamers into tanks situated at Bowling, on the lower reaches of the Clyde. From here it is pumped through a pipe-line laid along the banks of the Forth and Clyde Canal to the naval base at Rosyth, from whose reserves the oil-burning British warships draw their supplies.

Similar, but greater, difficulties were encountered in shipment over long distances. The records of oil companies bear evidence of the number of ships and lives that have been lost, and the damage to property resulting from accidents to tank-steamers. Researches carried out by Sir Beverton Redwood and other eminent experts have shown that there are several essentials of construction to be observed in ships of this class. These are provision for expansion and contraction of the oil with temperature variations, for keeping the tanks full, allowing the gases to escape, and for the prevention of leakage into the boiler and bunker spaces. Experience has borne out that the great majority of dangers may be avoided by a careful observance of these conditions, and accidents are now fortunately rare. A further precaution has been taken of late years by the installation of Diesel engines as propulsive agents. Boilers and bunkers are thus rendered unnecessary, and one of the chief sources of fire is removed. In this direction, modern practice has progressed a step by the construction of tank-barges. These are ships completely fitted up as oil-steamers, but without engines. Space usually devoted to engines is occupied by tanks. The weight of the cargo which these barges may carry is greatly increased, the largest being able to hold about 8000 tons of oil. Dynamos for lighting, crew accommodation, and other necessities are fitted on board. The work of towing this type of vessel across the Atlantic is generally undertaken by a tanker. Special arrangements must be made to prevent the tow breaking in heavy weather. Should such a catastrophe happen, barge, crew, and cargo are left helpless, entirely at the mercy of the waves.

v.

The adequacy of the world's supplies of oil to meet the ever-increasing demand is a subject on which experts, though not unanimous, are fairly well agreed, the general consensus of opinion being that the outlook is disquieting. Figures for many fields are unavailable, but in 1917 the United States Geological Survey computed that there were still some 6740 million barrels in the wells of that country. The production of the United States is practically two-thirds of the world's output, and in 1917 was 335 million barrels, a quantity which is increasing annually by about fifteen million barrels. It is quite obvious that America cannot continue

to hold her present position for more than a couple of decades unless further fields be opened. In order to maintain the supply, either new fields must be exploited or a means discovered of manufacturing synthetic petroleum on a commercial scale—an achievement not yet in sight. A rigorous search for oil is being carried on throughout the world, particularly, as already mentioned, in Britain, where the results have not been very encouraging. A greater measure of success has attended the operations in Mexico, China, and Japan, and these countries are now producing large quantities.

There are many known areas which are geologically petroliferous—that is, containing formations somewhere below the surface which act, or have acted, as storehouses of petroleum; and some of these areas have been prospected time and again by geologists in the hope of discovering a spot where indications are such that a drilling test is warranted. To begin with, a geologist engaged at a high salary can only report on the 'probable' positive or negative nature of the results to be expected from drilling for oil in a given locality. He can say that petroleum exists, and he can even state the approximate depth at which it will be found; but, unless he is a good 'guesser,' that is his limit. Though there are some indications which are regarded as extremely favourable, they seem to be met with quite as often in areas which eventually prove to be not worth boring, as in those which are found to contain great stores of the valuable liquid.

The operator thus starts out on what is not far removed from a gamble. At great expense the derrick is erected, tools are purchased, and expert drillers engaged to drill a hole into the ground to a depth estimated beforehand, and through formations of which the class only is known. It is a veritable voyage of discovery, and while he may be rewarded by a strike of enormous quantities of oil at a few hundred feet from the surface, he may, on the other hand, reach the limit of his resources after drilling several thousands of feet, and have found only negligible quantities.

Of these extremes the latter is the more common, but, of course, the possibilities between them are unbounded. A great oil magnate in America has publicly stated that his estimate of the chances of success of finding oil in paying quantities in the test wells drilled in the States is one in one hundred; and if this be the case in the country where petroleum is regarded as being most widely distributed, what are the chances in less-favoured countries?

Supposing, however, that our operator has so far met with success, and has found oil in sufficient quantity to warrant him in expecting good returns on the capital invested, he can be sure of such returns only if the production is sufficiently large to discount the quality; but if

this is not the case, he may find that the quality is so poor that the petroleum is useful only for fuel, and though he has 'struck oil' he has suffered financially.

The great variation of quality in petroleum is sufficiently indicated by the values of the oils from different parts of the United States. The market quotation for Pennsylvania oils in November 1918, for instance, was four dollars, while that for the Healdton grade of crude was only one dollar forty-five cents, all other districts being quoted between these figures. (Prices are for one barrel of forty American gallons.)

Again, a well sunk in one district, and producing, say, ten barrels of oil daily, may be a very profitable property, while a well in another district, which may be of the same depth and producing the same quantity of oil at the same valuation, may barely pay expenses, because of the great differences in the cost of drilling in the two areas. The formations may even be of a similar class, but though in one case the well gives no trouble, and yields a clear hole to the drill, in the other case it proves most refractory, the walls of the hole failing to stand up, and requiring constant and ever-extending support during the progress of the work.

This support has to be provided by linings formed of steel pipes. Each lining is capable of giving protection as far as it can be carried in the hole, and when its limit of depth is reached another liner must be placed within it and carried in its turn through the succeeding formations. Every string of pipe thus used naturally reduces the size of the hole, and necessitates a complete set of tools of the right size to work within it. Pipe is also used to exclude water from the bore-hole, the foot of the string of pipe selected for this function being cemented into the wall of the hole at a suitable depth. Thus the amount of pipe, and the number of strings of different sizes required for a well, have a great bearing on the capital cost of drilling operations.

In some territories, like Oklahoma, for instance, wells can be quickly and cheaply drilled without pipe until the water horizon is reached; then the whole string of pipe required to exclude the water can be inserted in one operation, and consists of light cheap-grade pipe. But in California, where drilling has reached the highest

stage of perfection, pipe must be carried with the tools. Oklahoma wells can be completed with one or two strings, while California conditions necessitate the use of as many as six in some cases.

VI.

After proving the existence of oil in paying quantities, the next step is to provide means to raise it to the surface; for, contrary to popular supposition, all oil-wells do not yield their product of their own volition. Those that do so flow only for a comparatively short period of their producing-life, and mechanical means eventually become necessary. These are of two kinds—pumping and bailing. The former is used wherever possible, because it is cheap and efficient. The plant consists of an internally operated pump attached to the bottom of a string of tubing, generally about two inches in diameter, which is inserted into the well, extending from the bottom to the surface. The plunger and valves of the pump are raised and lowered by means of a string of rods screwed together, or by a wire rope, which works within the tubing. Wells so worked can often be left without attention, excepting that needed by the engine and the bearings; but most require periodical renewals of packing and valves in the pump, as these parts become worn and useless through the friction of grit suspended in the oil. The writer has seen wells in Burma which have run without any renewals to the pumping outfit for a year at a time, while wells close by needed fresh packing or some such renewal, involving pulling out the rods, line, or tubing, several times weekly, and in some cases every day.

Bailing is adopted in wells only where the quantity of grit and mud in the oil is too great to be handled by a pump. The bailer is a long steel cylinder, fitted with a trip valve. This is lowered on a wire rope to the bottom of the well, where the valve trips and admits the oil, which is then hauled to the surface in the cylinder. As will readily be seen, an operation of this kind carried out continuously requires a certain amount of skilled labour, and also uses more power than pumping does, consequently more fuel. Rumania and Trinidad are places where the bailer is commonly used.

THE AWFUL MISS BROWN.

CHAPTER II.—*continued.*

II.

THEOPHILUS DOUBLEDAY slept badly that night. The pledge his nephew had extracted from him (almost as painfully as if it had been a tooth) haunted him throughout the dark hours. Before departing, Richard had induced

him to believe that the happiness of his (Richard Merryweather's) life depended on him, and responsibility for the young man's future weighed upon the vicar like a nightmare. If he turned from the picture of Richard as a moody, discontented man (perhaps taking to drink, and finally, as a last resource, to suicide), he was not the less

troubled by visions of Bella Croft wandering round the village with flowers in her hair, talking incoherently, and occasionally bursting into song without the formality of being requested to favour the company. He fell asleep just as the gray dawn came creeping in, and, when he woke again, rose quite unrefreshed, with a very poor appetite for breakfast.

When the Reverend Theophilus started to accomplish his mission, the clear morning air freshened him up, and partly dispelled the terrors of the night. He stepped out briskly enough, until he came within sight of Miss Brown's house, when he was assailed by a treacherous hope that she might not be at home, and paused to exorcise it and induce a better frame of mind. The lane into which he had turned led past her flower-garden, beyond which could be seen the barns and outhouses of the little homestead.

'Really,' said the vicar to himself, 'I would rather not. I would *much* rather not. But my word is pledged; so there is no help for it.'

There *was* no help for it, unless at the expense of his conscience; and, in this respect, he had all his life kept too strict an account with himself to fail now.

The first person he saw as he drew near was Bella Croft, who was standing by the door of the house tending a rose-tree that grew up one side of the porch. Hearing the click of the garden gate, she turned. As she did so the vicar, even in his agitated condition, thought Richard might, as he himself had said, have gone farther and fared worse. Indeed, however far you travelled, it would have been difficult to find a more attractive specimen of a young English countrywoman. This fact had not previously struck the vicar so forcibly as it did now that a personal interest in her had been awakened by his last night's conversation. Like her aunt, she was tall and slim; but her figure had none of that severity of outline which, without giving Miss Brown an appearance of spareness, warned you there would be no use in trying to get on her soft side, because she hadn't got one. The look in Bella's violet eyes was straightforward and intelligent; the rays of the sun tinted her hair with gold where here and there a bright streak mingled with softer and darker shades—'shot with gold,' not 'with golden tresses' (*chrysopastos*, not *chrysoplokamos*, as the vicar would probably have explained to you in a more tranquil moment). If her nose was a trifle shorter than it might have been, that, after all, was a matter of taste. Possibly some people preferred it so, and Richard Merryweather may have been one of these. Anyway, to make up for this, her chin was neither too short nor too long, but just right. Miss Brown had a fine set of teeth, though you seldom saw them except when she spoke, for at other times she kept her lips firmly closed; Bella's lips, which were rather fuller than her aunt's, had a habit of

parting slightly—not in order that you might see her teeth were perfect and as white as ivory, but to show how ready they were to smile at the least provocation. She did not smile, however, when she saw the vicar; she flushed, and looked troubled and uneasy. Observing this, and the start she gave, he guessed she knew his business, and that her dread of the result was even greater than his own. The idea that at the moment there was somebody more afraid of Miss Brown than he was gave him courage.

'Good-morning,' he said, almost cheerfully. 'Is your aunt within?'

'Yes, sir; she is,' answered Bella. 'Will you please to step this way?'

The vicar stepped that way, and followed her into the parlour, a comfortless apartment which, like most reception-rooms in its walk of life, was rarely entered. Left alone, he listened nervously for Miss Brown's footsteps, which were soon heard: a resolute 'right—left; right—left,' in the passage without. Then the door opened, and she appeared.

'Good-morning, good-morning, Miss Brown!' cried Mr Doubleday, with the effusiveness of extreme agitation. 'What delightful weather we are having! We are really looking—I mean the country is looking—quite charming.'

Miss Brown saw he was excited, and by no means master of himself. But for the earliness of the hour, and the fact that the vicar was known to be an abstemious person, a cruel suspicion might have crossed her mind, as she returned his greeting and awaited developments.

'You will hardly guess, Miss Brown,' said Mr Doubleday—'now I am *sure* you will hardly guess why I have called on you this morning.'

'Perhaps, sir,' replied Miss Brown, with civil austerity, 'it would be better to explain without waiting for me to guess.'

This was not a snub—it was only *manner*; but Miss Brown's manner often made timid people feel that a snub was intended.

The vicar fidgeted for a moment, then rallied, and came to the point. 'I am here, Miss Brown,' he began—'eh! eh! eh!—you will think it very odd—it *is* very odd—for really, you know, I am the last person in the world any one would suspect of such an errand—but I am here as a messenger of love.'

'As a what?' exclaimed Miss Brown.

'As a messenger of love,' repeated the vicar meekly. 'Though,' he added, with another feeble giggle, 'I do not look much like Cupid.'

'No, you do not,' said Miss Brown curtly.

The vicar simply meant he was neither youthful nor blooming, but it was quite evident Miss Brown construed his remark as meaning he was not lightly attired in a pair of wings and a quiver, and that she considered such a jest unbecoming between a clergyman and a single lady. Being so painfully misunderstood, he blushed more violently than ever.

'I mean,' he endeavoured to explain, 'that as a man in the decline of life, and being unfortunately a bachelor'—

'Why unfortunately?' interposed Miss Brown.

'Well, really, Miss Brown,' said the vicar (who might or might not have had his own little romance in his own little spring-tide), 'that is—if you will allow me to say so—neither here nor there.'

'Oh, very good,' she answered; as if, in that case, he need not have said anything about it.

'I mean,' he resumed, 'that the heart—the heart, my dear Miss Brown—need not grow old. No, no; it can still sympathise and feel.'

Here the vicar paused, thinking he had made a good point; though what he had really done was to create an impression that he had suddenly become insane, and that his madness was taking the form of making proposals. His next words, however, dispelled this idea.

'My nephew, Richard Merryweather, is, I assure you, a most excellent young man. Really'—closing his eyes and raising his hands, as if he must absolutely insist upon it—'a most excellent young man.'

'I know very little about him,' she said shortly.

'I am aware of that, Miss Brown, though he has met you more than once. But, upon better acquaintance, you will find what I have said of him fully justified. I know of no young man better qualified to make a most suitable husband.'

At this Miss Brown looked slightly bewildered. It could hardly mean that this debonair young man was in reality a mercenary fellow, ready to marry a woman older than himself for the sake of her property. If any suspicion of such a nature was beginning to take possession of her, it was quickly nipped in the bud.

'Your niece is a most charming girl, Miss Brown. I know of no young woman'—feeling he could not do better than paraphrase what he had said of Richard—'I know of no young woman better suited to make the most admirable of wives.'

'Oh, that's it, is it?' said Miss Brown grimly.

'That is it, Miss Brown. To put the matter quite plainly, he has—ahem!—he has fallen in love with her.'

'Nonsense!' cried Miss Brown.

The vicar winced, like a little boy who has had his ears boxed for saying something he ought not to have said on a forbidden subject. Still, he could not allow this contemptuous exclamation to pass altogether unchallenged. 'For shame, Miss Brown! Love all nonsense! Oh, fie! fie!'

'I mean, when men talk of marrying women because they love them, *that* is nonsense. When they are young and foolish, they may think they do; and when girls are young and foolish, they may believe them. For my part, Mr Doubleday, I am an elderly woman'—

'No, no!' protested the vicar. 'Oh dear, no!'

'I am a woman advanced in life' (she was forty-three, and looked remarkably well for her age, as slim, well-featured women are apt to do), 'and,' continued Miss Brown, who had passed the whole of her womanhood in the management of her little farm, 'I know the world.'

'And I, Miss Brown,' replied Mr Doubleday, who for over thirty years had never been more than a few miles outside his own parish, 'I also know the world. In fact,' he added pleasantly, 'I am an old stager—quite an old stager.'

'I love my niece. *That* kind of love is not all nonsense.'

'I am sure it is not,' responded the vicar heartily. 'I am indeed sure of that.'

'I have striven to do my duty by her.'

'And you have done it, Miss Brown—you have done it.'

'I have always regarded it as a most important *part* of my duty to warn her against the evils of married life.'

'The evils of married life!' exclaimed the vicar. 'Come, come, Miss Brown. You don't mean that. You *can't* mean it.'

Miss Brown waved the protest aside. 'The single woman'—repeating to the vicar what she had said to her niece some hundreds of times—'is the mistress of her own fate. The married woman is the mere plaything of a man.'

'Nay, nay! Oh, dear me, Miss Brown! Really! Such a view of married life is a sadly perverted one. It really is, you know. And, after all,' the vicar continued, warming to the discussion in spite of himself, 'the single woman's existence is a poor, incomplete affair. She herself is an isolated, melancholy object; a'—Remembering where he was, Mr Doubleday stopped in confusion. Miss Brown, standing in front of him, suddenly appeared to be growing remarkably tall, while her eyes flashed down upon him with a dangerous light. 'I—I beg your pardon!' he stammered. 'Of course, in exceptional cases—ahem!—when we find a woman endowed with great force of character—of an unusually self-reliant nature—but in most instances, I think, Miss Brown—I *really* think' (after his crude blunder, he made this statement apologetically) 'the married woman's lot is the happier one.'

Miss Brown shook her head, with a contemptuous smile. She knew better, though she had never tried it; but she did not feel disposed to argue the point further or to humiliate by defeat a worthy little gentleman who had never made any woman wretched by persuading her to marry him. Moreover, at this stage of the conversation he shifted his ground, believing Miss Brown to be thoroughly practical, if she was anything.

'And then, from a worldly point of view,' said this most unworldly person, 'my nephew would be an excellent match. He would be able to maintain a wife in every comfort.'

'My niece will be provided with every comfort suitable to her station, without being beholden to any man.'

'Still, within reasonable limits, and if well employed, my dear Miss Brown, the good things of this world are not to be despised. No, no; they are not to be despised.'

'What do you mean by the good things of this world?' demanded Miss Brown. 'The flesh-pots of Egypt?'

The vicar turned red, and felt quite angry. To have it intimated by an overbearing female that he took this view of good things, merely because he said there was no harm in a worthy young couple's starting married life in fairly good circumstances, was too much. He was not one to hanker after flesh-pots of any nationality whatsoever; and a woman who had been a parishioner of his for so many years ought to have known better than to address such a remark to him. He would have liked to give her a piece of his mind; but indignation (and a modest doubt as to his being a match for her) held him speechless.

There was silence for a few moments, and then she gave him a chance to plant a little arrow in her breast—a chance of which he promptly availed himself; for revenge, if not too deadly, is sweet to the mildest of us.

'Besides,' she resumed, 'there is no need to discuss this any further; for even if Mr Merryweather cares for my niece, she does not care for him; so *that* makes an end of the matter.'

'But she *does* care for him!' cried the vicar. 'She is as much in love with him as he is with her.'

'What!'

This monosyllable was uttered in a way that made the vicar almost jump out of his chair; but, the flesh-pots of Egypt still rankling in his mind, he found courage to reply, 'Miss Brown, I have said it.'

Miss Brown went to the door. Her clear, strong voice rang through the place, startling the pigeons on the roof, and causing the lazy old house-dog to prick up his ears in the yard.

'Bella! Bella! Come here!'

III.

Bella was prepared for this summons; but she came very slowly, and presented a very shamefaced appearance.

'Bella, do you know why Mr Doubleday has called here this morning?'

Bella *was* in possession of this guilty knowledge, being an accessory before the fact; but she remained silent, and did not commit herself.

'He has come to tell me that his nephew is in—in—in—something stuck in Miss Brown's throat, but she got it out—'is in love with you.'

'Mr Richard Merryweather?' faltered Bella.

'Has he more than one nephew?' demanded Miss Brown.

'I—I don't know,' answered Bella.

Miss Brown herself did not know, so she said, 'I mean, has he more than one nephew *here*—in Dredgefield? Of course I mean Mr Richard Merryweather. Whom else *could* I mean? Have you ever suspected anything of this kind? Speak, child!' She referred to it as to a foul plot come to light.

'Yes, aunt dear,' said Bella meekly; 'he—he—'

'Don't say he has dared to tell you!'

'Yes, aunt; he has told me.'

Miss Brown glanced at the vicar in bitter triumph, as who should say, 'You see the kind of person you have been commending—the viper you have cherished at your hearth! What is your opinion of him *now*?'

Then she turned to her niece again. 'And you have been accused (wrongfully, I trust) of being in love with him.'

'I think I am, aunt.'

'You *think* you are! Good heavens, girl! don't you know your own mind?'

'Yes, aunt; I am. We are in love with each other.'

Mr Doubleday was a true Christian—one, mark you, who strove conscientiously to act up to the character; but, nevertheless, he said, 'I told you so, Miss Brown.'

Miss Brown turned upon him. A terrible outburst seemed imminent, and he began to wish himself at the farther end of his parish, or even in the next one. However, after a strong effort of self-control, she spoke with calmness—with a fearful calmness.

'Mr Doubleday,' she said, 'your nephew is a wolf in sheep's clothing, and would be a disgrace to any sex but his own; but all men are wolves in sheep's clothing, and a disgrace to their sex.'

'My dear madam,' interposed the vicar, 'think better of us. Let me entreat you to think better of us.'

'I make *no* exceptions,' she proceeded, giving the Reverend Theophilus one for himself. 'As vicar of this parish, you have sought to sow discord where it has never existed since men ceased to live beneath this roof. I compliment you on your morning's work.'

The vicar took this remark as meaning that, having perpetrated the villainy referred to, he might withdraw to gloat over it.

'My child,' he said, not without a touch of dignity, as he took Bella's hand, 'I am glad to hear you avow your sentiments without shame or disguise. You owe all duty to her who has been as a mother to you, but you have done nothing to be ashamed of or to regret. I know Richard well, and you may take my word for that.—Miss Brown, I wish you a good-morning, and a grain or two more of charity. I have no doubt my nephew will call on you himself.'

'Mr Doubleday, I forbid your nephew this

house. If he attempts to force his way in, I will not be answerable for the consequences.'

Miss Brown looked very terrible at the thought of her premises being invaded in spite of her teeth.

'You will not insult him, I trust,' remonstrated the vicar.

'I will protect my niece,' she retorted; and, with this assurance, the vicar departed.

CHAPTER III.

I.

AFTER the vicar's departure there had been a 'scene,' and Bella's eyes were red. Miss Brown had uttered some severe reproaches, but it was not until she began to apply opprobrious names to Richard that Bella ventured to speak up on behalf of her lover. Then Miss Brown said, 'Very good!' (meaning the reverse). 'Choose between him and me!'

It was at this point Bella broke down. Life at Hollybush Farm had hitherto been a modest pastoral, though the shepherds piped not as of old; for, if they *had*, Miss Brown would have been down on them like a hammer, and have hustled them round to quite a different tune. To one who had never so much as heard of Melpomene, the advent of the Tragic Muse was naturally rather distressing. Even Miss Brown herself was a little alarmed by the effect of her own eloquence; but she steeled herself, and went on.

'And *this* is my reward! I never had a daughter of my own'—here she paused, conscious of having said something slightly indecorous—'but,' she resumed, recovering herself, 'I have tended you from infancy—I mean, from childhood' (Miss Brown was as exact, to the merest trifle, as the dullest and most unimaginative of persons). 'I looked forward to your comforting my old age, and the first young man who runs after you'—

'He didn't run after me, aunt,' protested Bella.

'What! dare you tell me, to my face, that you ran after *him*?'

'No, aunt,' sobbed Bella. 'I met him at Mrs Dale's.'

'You met him at Mrs Dale's!' exclaimed Miss Brown scornfully. 'Do you mean to tell me all this has come of your meeting him there? Bella, I am not a fool. To tell me I *am* a fool is an insult.'

'Oh, aunt Hester, I never said so!'

'You said as good' (again Miss Brown meant 'as bad'). 'To tell me that what has happened this morning is the result of your meeting Richard Merryweather at Mrs Dale's is to presume I am an idiot. Yes, Bella, you met him at Mrs Dale's. I do not doubt your word so far—but,' concluded Miss Brown, with awful conjunc-

tive emphasis, 'how often have you met him since—and *where*?'

Now this was an awkward question; there could be no doubt about that. To reply to it by stating particulars would simply have roused Miss Brown to a dangerous pitch of exasperation. The best policy was one of evasion. It was emotion, not diplomacy, which caused Bella to burst into tears once more; but, upon the whole, it was the wisest thing she could have done.

Miss Brown did not like to see Bella crying. Notwithstanding the righteousness of her indignation, it made her feel very uncomfortable. She took a few turns round the room, with bent head and hands clasped behind her; and there was silence, except for Bella's sobs. At last she stopped in front of her niece, and said, in a more gentle voice, 'Look round upon the lives of the married women you know. Look at Mrs Burrows, whose husband gets drunk four or five times a week. Look at Mrs Gosling, tied to a brute of whom she goes in mortal terror. Look at Mrs Dibbs, whose husband has spent all he married her for.'

'Yes, aunt,' answered Bella, timidly venturing to hoist Miss Brown on the horns of a dilemma; 'but look at Mrs Stiles, who says that getting married was the best day's work she ever did; at Mrs Gates, whose husband is so fond of her that he'll do anything she wants; and at Mr Bullford, who has never been the same man since his wife died.'

'She *did* die!' cried Miss Brown triumphantly. 'Well, Bella,' she resumed, 'I've said all I have to say. You must choose between this young man and me. You know my opinion of marriage, and I won't see you fall into the pit while I can stretch forth an arm to save you from destruction in spite of yourself.'

With these words, she left the room; while Bella remained, to have her cry out alone.

(Continued on page 469.)

EVENING.

WHEN, silently, the dim white vale below

Twilight enshrouds,
Behind the larches' waving crests there glow
Red clouds.

From out my garden trembles on the breeze
Faint scent of musk;
There roses blush beneath the whisp'ring trees
At dusk.

The western light falls like a golden dream
Of sunset bars,
Then fades, till in the blue above out gleam
The stars.

Night comes, and now uprises a thin wisp
Of wind like breath,
While down the valley running waters lisp
Of death.

LORNA KEELING COLLARD.

Chambers's Journal

SEVENTH SERIES

AMENITIES OF WAR.

By F. J. HUDLESTON.

THE amenities of war were unknown to the ancients, who conducted their military operations on the principle of *ex victis*. It is true that the Romans, instead of killing their prisoners, spared their lives, but the ominous etymology of *servus*, a slave, which according to Justinian comes from *servare*, to keep unharmed, shows that they were actuated not so much by benevolence as by a desire for profit. (Even Grotius, the first authority on, if not the founder of, International Law, allowed that prisoners of war, and, moreover, their descendants, became the property of the conqueror.) The age of chivalry softened this harsh rule to a certain extent by the system of ransoms—for those who could afford to pay them. Prisoners the amount of whose ransom was known—Bertrand du Guesclin valued himself at 100,000 livres—were transferred like current coin from one owner to another. In the Black Prince's Letter Book there is a pleasant anecdote of a French knight, Charles, Count of Dampmartin, who at Poitiers was called on to pledge his faith to three 'captors' in succession, such was the anxiety in those days to take an opponent prisoner rather than kill him. This method of ransom, however, once led to an unhappy *contretemps*. It is related of a certain seneschal of St Dié, who at the battle of Nancy killed Charles the Bold, Duke of Burgundy, not knowing who he was, that he died of grief at the thought of the great ransom he had lost by his foolish impulsiveness.

German writers claim that it was Frederick the Great and Franklin who first, in the treaty of 1785 between Prussia and the United States, laid down rules for the humane treatment of prisoners of war. The article (No. 24) of the treaty in question begins: '*Afin d'adoucir le sort des prisonniers de guerre et de ne les point exposer à être envoyés dans des climats éloignés et rigoureux ou resserrés dans des habitations étroites et mal-saines, les deux Parties Contractantes s'engagent solennellement l'une envers l'autre,*' &c., &c. A fine and humane decision, but, to make no mention of the recent war, in 1870, before Germany had been Prussianised, there was, not far from Sedan, a '*camp de la misère,*' which was indeed cramped and unhealthy. All credit to Frederick the Great and Franklin; but

it should be added that a French authority, M. Armand du Payrat, has pointed out that they borrowed their ideas from the writings of Montesquieu and Rousseau.

But, after all, what is International Law? Have not treaties been torn up before now by signatories strong enough, and cynical enough, to do so? Kindness and courtesy on the battlefield will always be due not so much to the rules laid down by Peace Conferences and the teachings of international jurists, as to a more powerful factor—human nature.

The classic instance which will at once occur to many is the invitation of 'My Lord Charles Hai' to the 'Gentlemen of the French Guards' to fire first, as described by that picturesque reporter, Voltaire. This, it is rather to be regretted, has been proved to be a myth. What actually happened at Fontenoy was that Lord Charles Hay, of the First Regiment of Guards, stepped to the front, and raising his glass, drank from his flask to the French, saying, 'He hoped that they would stand until the English came quite up to them, and not swim the Scheldt, as they did the Mayne at Dettingen.' As Mr Charteris, the biographer of the Duke of Cumberland, admirably puts it, 'Lord Charles, with his flask, with his gesture of politeness and hat in hand before the menace of death, conjures up a vision which flutters like a plume on the pages of history.' History repeated itself in the Peninsular War, when on one occasion during a bayonet-charge, according to the engaging Captain Marcel, the French soldiers cried as they advanced, '*Hé! les Goddem, attendez-nous un instant pour le déjeuner à la fourchette.*'

But though the 'gentlemen, fire first,' story is unfounded, there are other well-authenticated cases equally interesting. For example, one would like to know the name of that gallant Frenchman who, in a charge in the Peninsula, encountering the one-armed Felton Harvey of the 14th Light Dragoons, perceived that his opponent was defenceless, and in an instant 'the *coup de sabre* was exchanged for a graceful salute.' As a contemporary writer who describes the incident says, 'Nothing on military record more manly or more beautiful than this.'

It is very pleasant to read that in 1794, after the celebrated 'No Quarter Decree' of

the French Convention directed against 'the slaves of George, the soldiers of the most atrocious of tyrants' (to quote Barère's amiable words), the men of Pichegru's army received their blood-thirsty instructions with universal disgust. According to the anonymous Officer of the Guards who wrote, in the form of epistles to 'Dearest Lucy' and other friends at home, a most entertaining account in verse (with valuable notes in prose) of this campaign, the French soldiers 'would frequently hold forth for hours, with that garrulity peculiar to their country, winding up their remarks with this good and wholesome advice: "Englishmen, go home; you have no business here; you are too honest to be leagued with Austrians and Prussians. They will soon leave you in the lurch; and as to the Hessians, the Landgrave will turn them all over to us to-morrow if the Convention offers him a *placate* a day more than you now pay him." These conversations usually concluded with our men striking up "God Save the King," and theirs "*Ça ira*" or the "*Carmagnol*." According to another contemporary historian (also anonymous) of this war, in an action on the Waal in October 1794 the French frequently called out, 'Good English! brave English!' and gave liberty to several men after they had made them prisoners, telling them it was for their bravery. The sentries were posted upon the ice, which (it was the December of a bitter winter) extended a considerable way across the Waal. The soldiers would chaff each other across the river, the French calling our men 'Jean Taureau,' 'Jack-roast-beef,' and ours calling them in plain English 'damned, king-killing, paper-money scoundrels,' and other opprobrious epithets. On another occasion a French and an English sentry had been airing their views on politics, the Englishman remarking that he would not care to be in the service of the Convention, most of their soldiers being barefooted and obliged to march without shoes. 'Ay,' said the Frenchman, 'that is very true; but how can we possibly keep shoes on our feet when we wear out so many running after you, Mr Englishman?'—a palpable hit to the 'paper-money scoundrel.'

There are many instances of amenities to be found on both sides in the Peninsular War. The Duke of Wellington himself bore witness to this. Lord Ellesmere, in his *Personal Reminiscences*, quotes the duke's account of the 'forbearance and even courtesy and kindness which regular and protracted war generates. The French vedettes, when their people were going to advance, would cry, "*Courez, courez vite! Sacré Nom de Dieu! On va vous attaquer!*"'

There are numerous references to sport in the Peninsula. The duke, as is well known, kept his pack, and there is a pleasant story of a British officer riding across country to join his regiment diverting himself on the way by shooting quail.

According to the Rev. G. R. Gleig, who, before he took orders, served with the 85th Foot in the Peninsula, the French soldiers would show him when fishing in the Bidassoa ('a capital trout-stream') the most likely pools—'genuine magnanimity' he calls this, and all anglers will agree with the phrase. So long as he wore his red coat he was perfectly safe, though within a few yards of the French sentries. He also tells us how on one occasion a British staff officer found a picket commanded by a sergeant fraternising in a little cottage with the soldiers of a French detachment, all laughing and joking together. In the *Journal du Lieutenant Woodberry* (published some years ago in French), we are told that the writer, in January 1814, at Bunloc, exchanged newspapers with an officer of the French outposts, who, hearing in the course of a friendly chat that Sir Stapleton Cotton was giving a ball that same evening, expressed his great regret that he could not be present at it, '*à cause d'une belle dame, son amie, qui doit s'y trouver.*' Dr W. H. Fitchett, in his *Great Duke*, draws a pretty picture of the outlying sentries helping each other to fasten their knapsacks and picnicking together at the outposts—'so well,' says Napier, 'did these veterans understand war and its proprieties.' General Bell, in his *Rough Notes by an Old Soldier*, tells us that British and French officers on the Nive would roll newspapers up round a stone and throw them to each other across the river. The men went further, and would subscribe coppers, which they placed in a mess-tin on a stone in the middle of the stream, the tin being returned later on by the '*bono Frances*' full of cognac. On one occasion, when the coppers had gone, but there was no cognac, a soldier named Paddy Muldoon rushed across the stream, took the French sentry unawares, gave him a clout on the head, and seizing his firelock, brought it back to the British side. For this poor Paddy was, rather hardly, court-martialled, and sentenced to corporal punishment—which, however, we are glad to read, was remitted. His defence was the very sound one that he 'didn't want to be done by any of them frog-eating fellows.'

Carter records in his *Curiosities of War* how the brigade of Foot Guards in May 1811 gave up a ration of biscuit then in their haversacks to the Gordon Highlanders, who had arrived at Fuentes de Oñoro much distressed from want of food; but a finer example of self-denial was the well-known incident of the Sepoys at Arcot in 1751, who, when famine threatened the garrison of which they formed so gallant a part, came to young Captain Clive and offered to take as their share of food the water in which the rice was boiled, saying that 'it was sufficient for their support, but the Europeans required the grain, which was more nourishing.' There was a parallel case to this nearly a hundred

years afterwards. At the siege of Jalalabad, in 1842, when Sir Robert Sale was distributing amongst the hungry garrison 500 sheep captured by a sallying-party, the 35th Native Infantry 'sent a deputation to the general, which respectfully acquainted him that animal food was less necessary for them than for Europeans, and besought him to give their portion of the booty to their gallant comrades of the 13th (Somerset Light Infantry).' There was a charming sequel to this. When the garrison later in the year made a triumphant entry into Ferozepur, the native commissioned and non-commissioned officers of the 35th invited the non-commissioned officers and men of the 13th to 'partake of a dinner which it is our wish to provide, to evince an appreciation of the kindness and cordial goodwill all of you have shown towards us throughout the dangers and difficulties we have together encountered during the campaign. We trust that the mutual good feeling will ever remain undiminished in our future intercourse, and we pray that you may be happy and live many years.' Before leaving India we must quote an anecdote, told by General Neill in his *First Madras European Regiment*, of General Sir Thomas Dallas, who, when the British were fighting the French and the Mysore forces round Pondicherry in 1781, accepted the challenge of a swordsman of Mysore, and, neither getting the better of it, 'each feeling a respect for the other, saluted and retired.' 'Dallas,' he adds, 'and his jet-black charger are yet (1842) spoken of by the old Sepoys and their sons and relations in relating the events of those stirring times—of the latter, like the charger of the great Claverhouse, as something supernatural.'

In more modern times there are instances of kindness and good nature equally pleasant to be found in the by-paths of military history. In the China War of 1840-42 it is related that a kind-hearted, if artful, mandarin in command of one of the Canton forts sent a friendly message before an attack to Captain Dundas of H.M.S. *Melville*: 'If you no put plum in, we no put plum in.' M. Bapst, in his very excellent life of Marshal Canrobert, tells us how, in the Sevastopol trenches, the French and the Russian soldiers would, at a given signal, crawl out of their shelters and stamp their feet to warm themselves during a temporary non-official truce; the Russians would put up a bottle, at which the French would fire, a hit being hailed with roars of laughter and applause from both sides. Even in the Franco-German War of 1870-71, which gave rise to many unhappy mutual recriminations and charges of barbarity and ill-treatment, there are instances of kindness to be found. General Devaureix, in his *Souvenirs*, tells the familiar story how the French soldiers, driven by hunger from Metz (like the *bouches inutiles* of *The*

Green Curve), would go beyond the outposts in search of potatoes and roots quite unmolested by the German sentinels. General Fay, in his *Journal d'un Officier de l'Armée du Rhin*, writes that on one occasion a Prussian patrol, coming across a body of these unhappy marauders, not only allowed them to continue their search for food, but generously gave them all the salt they had—there was none in Metz—and even soup and drink. He quotes a letter found on the dead body of a German soldier to his wife: '*Les Français nous font pitié, ils meurent de faim et ils viennent gratter la terre devant nous pour avoir des pommes de terre et des racines; nous les laissons faire.*' This is corroborated by Baron von der Goltz, who, writing on Metz in *The Franco-German War* (translated by the late General Sir F. Maurice), says: 'For some time a peaceable and forbearing attitude had prevailed in the front; hosts of French soldiers came out daily on the fields between the outposts to dig for potatoes, and our good-natured fellows could not bring themselves to fire at these unarmed men. "Hunger is painful," the sentries were often heard to say, as they looked on quietly at these excursions, which became even more frequent. At last the Prince [Frederick Charles] had to interfere with strict orders.'

Rivers would appear to have a softening influence. Scenes similar to those enacted on the Bidassoa and the Waal were repeated on the banks of the Potomac (presumably when 'all was quiet' along that historic stream), where the soldiers of the North and the South would exchange rude witticisms, calling each other 'ragged and shoeless secesh' and 'blue-bellied Yankees.' But the best instance in the American Civil War is that recorded in the life of that fine character, J. S. Wadsworth of Genesee—it is worth quoting in full. In the fighting on the Rappahannock in April 1863, 'one of our sergeants came to the general (Wadsworth) with a letter which he had taken from the body of a Georgia soldier. This letter was directed to the soldier's wife, and contained a ten-dollar bill of Northern money. The letter said: "My dear wife, I am going into battle very soon. I send all of the money that I have for you and the children. God knows that I wish I had more." Here the letter stopped in a way showing that the writer intended adding to it. The general took the letter, turned his horse as if to hide his action, placed two additional ten-dollar bills in the letter, and sealed it. Then he said, "Poor woman, she has done no harm, and will feel badly enough." The letter was handed to our provost-marshal with instructions to see that it was sent across the line by the first flag of truce.' And yet some say that the chivalry was all on the side of the South.

A somewhat similar anecdote is related of

Grant, who, after sending Buckner, an old friend of his, a stern message insisting on the unconditional surrender of Fort Donelson, as soon as the surrender was carried out, took him on one side with the words, 'Look here, Buckner; I fear you may be short of money before you can communicate with your friends; if so, let me be your banker, and repay me at your convenience.'

And it is not only amongst civilised or semi-civilised nations that cases of kindly feeling to an enemy are to be found, as is evident from a story told some years ago in the *Otago Daily Times* of 'The Hickety-Pip Regiment.' The 'Hickety-Pip' (which is as near as the natives of New Zealand could get to Sixty-Fifth) would appear to have been particularly popular with the Maoris during the war in that country. These amiable warriors carried their friendly feeling so far that when leading an attack upon a *pa* they would greet the 65th with cries of, 'Lie down, Hickety-Pip; we're going to fire.' The same authority goes on to

relate that the Maoris on outpost duty would occasionally suggest to the 'Hickety-Pip' pickets that it was 'too wet and cold for fighting; we'd better all go to sleep. Good-night, Hickety-Pip!'

Some years ago, in a popular melodrama of a quasi-military nature, there was put in the mouth of the heroine a beautiful, if somewhat involved, sentiment: 'A court-martial can control an army of soldiers, but it *cannot control the beatings of a woman's heart*,' a truism which never failed of its round of hearty applause—applause loud enough to drown the sniggers of the sophisticated and the loud guffaws of the ribald. Similarly it may be said that the *Manual of Military Law* provides for most contingencies, but not for the workings of a Maori-like mind.

You may search carefully all your law-books, military and international, under the heading 'Armistice—Power to Conclude; Period of Operation; Rules for Interpreting; Expiration and Operation of,' and nowhere will you find so pleasing a precedent as that of the 'Hickety-Pip.'

THE PARTS MEN PLAY.

CHAPTER XXI.—*continued.*

IV.

ONE night towards the end of January Selwyn had tried to sleep, but the furies of unrest called to him in the dark. He got up and dressed. He did not know where he was going, but he knew that his steps would be guided to adventure, to oblivion.

There was a drizzling rain falling, and, with his coat buttoned close about his throat, he walked from street to street, his breath quickening with the ecstasy of self-abandonment which had at last come to him. Men spoke to him from dark corners; women called at him as he passed; he caught faint glimmers down murky alleys, where opium was opening the gates to bliss and perdition; but, with a step that was agile and graceful, he went on, his arteries tingling in anticipation of the senses' gratification. Once a mongrel slunk out of a lane, and he called to it. It crawled up to him, and he stooped down to stroke its head, when, with a yelp of terror, it leaped out of his reach and ran back into the lane. As if it was the best of jests, he laughed aloud, and picking up a stone, sent it hurtling after the cur. Then he was suddenly afraid. The loneliness of the spot—the horrors lurking in the dark—the dog's howl and his own meaningless laughter. He felt a fear of night—of himself. He hurried on, but it was not until he reached a lighted street of shops that his courage returned, and, with the courage, his fever greater than before.

An extra burst of rain warned him to seek

shelter, and hurrying down the street, he paused under the canopy of a shabby theatre. There was one other person there—a woman. She came over to speak to him; but when she saw the mad gleam of his eyes she drew back, and, with a frightened exclamation, pressed her hand against her breast.

He made an ironic bow, then, with a smile, looked up at her, and she heard him utter an ejaculation of amazement.

For a moment he had fancied that it might be true. The likeness was uncanny! The burnished-copper hair, the silk-fringed eyes, the poise of her head, the tapering fingers—even in the scarlet of her rouged cheeks, there was a similarity to the high colouring of the English girl. What a jest of the Fates—that they should cast this poor creature of New York's streets in the same mould with her who was the very spirit of chastity!

'What a mockery!' he muttered aloud. 'What a hideous mockery!'

He was touched with sudden pity. Perhaps this woman had been born with the same spirit of rebellion as Elise. Perhaps her poor mind had never been developed, and so she had succumbed to the current of circumstance. She might have been the plaything of environment. The wound in his head was hurting again, and he covered the scar with his moist hand. Horrible as it seemed, this creature had brought Elise to him once more—Elise, and everything she meant. He wanted to cry out her name. His hands were stretched

forward as if they could bridge the sea between them.

Like a man emerging from a trance, he looked dreamily about him—at the street running with streams of water—at the silent theatre—at the woman. A weakness came over him, and his pulses were fluttering and unsteady.

A peddler of umbrellas passed, and Selwyn purchased one for a dollar.

'Won't you take this?' he asked, stepping over to the woman, who cringed nervously. 'It is raining hard, and you will need it.'

She took the thing, and looked up at him wonderingly, like a child that has received a caress where it expected a blow.

'Say,' she said, in a queer nasal whine, 'I thought you was a devil when I seen you a minute ago. Honest—you frightened me.'

He said nothing.

'Why'—there was a weak quaver in her whine, and she caught his wrist with her hand—'why, you're kind—and I thought you was a devil. Gee! ain't it funny?'

With a shrill laugh that set his teeth on edge, she put up the umbrella and walked out into the rain. And only a passing policeman saw, by the light of a lamp, that her eyes were glistening.

Selwyn remained where he was, blinking stupidly into the rain-soaked night, as one who has been walking in his sleep and has waked at the edge of an abyss.

CHAPTER XXII.—THE CHALLENGE.

I.

IT was nearly noon next day before Selwyn woke from a heavy, dreamless sleep. Both in mind and in body there was the listlessness which follows the passing of a crisis, but for the first time in many days he felt the impulse to face life again, to accept its bludgeonings, unflinching.

He was almost fully dressed when a messenger arrived with a letter. It was from Edgerton Forbes.

'MY DEAR AUSTIN,—I have been trying to get hold of you for the past week, but you are as elusive as a hundred-dollar bill. Douglas Watson has returned from the front, minus an arm, and he has asked as many ex-Harvard men as possible to meet him at the University Club. We are having dinner there to-night in one of the smaller rooms, and I want you to come with me. I'll pick you up at your hotel at seven, and we can walk over. If it is all right, send word by the messenger.—As ever, FORBES.'

Selwyn's first instinct was to refuse. He had no desire to meet Watson again just yet, nor did he want to face men with whom he had lived at Harvard. But the thought of another

lonely night arose—night, with its germs of madness.

'Tell Mr Forbes,' he said, 'that I shall expect him at seven.'

A few minutes before the time arranged the clergyman called, and they started for the club. The air was raw and chilling, and people were hurrying through the streets, taking no heed of the illuminated shop-windows, tempting the eye of woman and the purse of man. In almost every towering building the lights of offices were gleaming, as tired, routine-chained staffs worked on into the night tabulating and recording the ever-increasing prosperity of the times.

The times!

Ordinary forms of greeting had changed to mutual congratulations on affluence. Anecdotes of business men were no longer of struggle and privation, but of record outputs and maximum prices. Theatres, cafés, cinema palaces, churches, hotels—they had never seen such times. Success was in the very dampness of the air as thousands of people looked at it from the cosy interior of limousines, people who had never aspired higher than an occasional taxi-cab. The times! Dollars multiplied, and begat great families of dollars—and Broadway glittered as never before.

It is difficult to state what trend of thought made conversation between the friends difficult, but after two or three desultory attempts they walked on without speaking. As they were entering the majestic portals of the club, Selwyn was reminded of a question he had intended all day to ask.

'Edge,' he said, 'have you heard anything of Marjory Shoreham?'

'She sailed two weeks ago for France,' answered the clergyman.

They were directed to an upper floor, where they found a hundred or so guests who claimed Harvard as their *alma mater*. Although most of his old acquaintances were quite cordial, Selwyn felt oddly self-conscious. He caught sight of Gerard Van Derwater with his impassive courtliness dominating a group of active but less impressive men; and behind them he saw Douglas Watson of Cambridge surrounded by a dozen guests; but he pleaded a headache to Forbes, and sought a secluded corner, where he remained until dinner was announced.

Like all affairs where men are alone and the charming artifices of femininity are missing, there was a severity and a formality which did not disappear until the ministrations of wine and food had engendered a glow which did away with shyness. The table was arranged in the form of the letter U, with Watson beside the chairman at the head.

Towards the end of the dinner conversation and hilarity were growing apace. Men were forgetting the scramble of existence in the recollection of old college days, when their blood was like wine and the world a thing of

adventure. Mellowed by retrospect, they laughed over incidents that had caused heart-burnings at the time; and as they laughed, more than one felt a swelling of the throat. It was, perhaps, just an odd streak of sentiment (and the man who is without such is a sorry spectacle); or it may have been the memory of ideals, aspirations, dreams—left behind the college gates.

'Gentlemen.' The chairman had risen to his feet. Cigars were lit; and he was greeted with the usual applause. 'Gentlemen, we have gathered here at short notice to welcome an old boy of Harvard—Douglas Watson. He has a message which he wants to deliver to us, and not only because he is one with us in tradition would we listen, but his empty sleeve is a mute testimony that he has fought in a cause which—though not our own—is one which I know has the sympathy of every man in this room. I shall not detain you, gentlemen, but ask your most attentive hearing for Mr Watson.'

As the guest of the evening rose to speak he was greeted with prolonged applause, which broke into 'For he's a jolly good fellow,' and ended in a college football yell. During it Selwyn sat motionless, his alert mind trying to decipher the difference between Watson's face and the others. It was not only that they were, almost without exception, clean-shaven, and that Watson wore a small military moustache; the dissimilarity went beyond that. Although he was obviously nervous, Watson's eyes looked steadily ahead as those of a man who has faced death and looked on things that never were intended for human vision. It had left him aged—not aged as with years, but by an experience which made all the keen-faced men about him seem clever precocities whose mentalities had outstripped the growth of their souls.

And studying this phenomenon, Selwyn became conscious of the American business face.

Although differing in colouring and shape, practically every face showed lips thin and straight, eyes narrowing and restlessly on the *qui vive*, the nervous, muscular tension from the battle for supremacy in feverish competition, the dull, leaden complexion of those who disregard the sunshine—these combined in a clear impression of extraordinary abilities and capacities with which to meet the affairs of the day. What one missed in all their faces was a sense of the centuries.

No—not in all. At the table opposite to Selwyn was Gerard Van Derwater, whose self-composure and air of formal courtliness made him, as always, a man of distinctive, almost lonely personality.

'Thank you very much,' said Watson, as the applause and singing died away. His fingers pressed nervously on the table, and his first words were uneven and jerky. 'I needn't tell you I am not a speaker. I have a great message for you chaps, but I may not be able to express

it. That was my reason for desiring to speak to ex-Harvard men. I did it because I knew I should have men who thought like I did—men who looked on things the same way as myself. I knew you would be patient with me, and I was certain you would give an answer to the question which I bring from France.'

He paused momentarily, and shifted his position, but his face had gained in determination. A few of his listeners encouraged him audibly, but the remainder waited to see what lay behind the intensity of his manner.

'I don't want pity for my wound,' he resumed. 'The soldier who comes out of this war with only the loss of an arm is lucky. Put that aside. I want you to listen to me as an American who loves his country just as you do, and who once was proud to be an American.'

He raised his head defiantly, and when he spoke again the indecision and the faltering had vanished.

'Gentlemen, the question I bring is from France to America. It is more than a question; it is a challenge. It is not sent from one Government to another Government, but from the heart of France to the conscience of America. They don't understand. Month after month the women there are seeing their sons and their husbands killed, their homes destroyed, and no end in sight. And every day they are asking, "Will America never come?" My God! I've seen that question on a thousand faces of women who have lost everything but their hope in this country. I used to tell them to wait—it would come. I said it had to come. When the Hun sank the *Lusitania* I was glad, for at last, I told them, America would act. Do you know what the British Tommies were saying about you as we took our turn in the line and read in the papers how Wilson was *conversing* with Germany about that outrage? I could have killed some of them for what they said, for I was still proud of my nationality—but time went on and the French people asked "When?" and the British Tommy laughed.

'If I'm hurting any of you chaps, think of what I felt. One night behind the lines a soldiers' concert-party gave a show. Two of the comedians were gagging, and one asked the other if he knew what the French flag stood for, and he said, "Yes—liberty." He asked him again if he knew what the British flag stood for, and he said, "Yes—freedom." "Then," he said, "what does the American flag stand for?" "I can't just say," said the other, "but I know that it has stood a hell of a lot for two years." The crowd roared—officers and men alike. I wanted to get up and fight the whole outfit; but what could I have said in defence of this nation? America—our country here—has become a vulgar joke in men's mouths.'

He stopped abruptly, and poured himself a glass of water. No one made a sound. There

was hot resentment on nearly every face, but they would hear him out without interruption.

'The educated classes of England,' he went on, 'are different in their methods, but they mean the same thing. They say it is America's business to decide for herself, but the Englishman conveys what he means in his voice, not in his words. When I was hit I swore I would come back here and find out what had changed the nation I knew in the old days into a thing too yellow to hit back. Mr Chairman, you said I had fought in a cause that is not yours. I beg to differ. There are hundreds of Americans fighting to-night in France. They're with the Canadians—they're with the French—they're with the British. Ask them if this cause isn't ours. I lay beside a Princeton grad. in hospital. He had been hit, serving with the Durhams. "I'm never going back to America," he said. "I couldn't stand it." As a matter of fact, he died—but I don't think you like that picture any more than I do.'

Bringing his fist down on the table with a crash, Watson leaned forward, and with flashing eyes poured out a stream of words in which reproach, taunts, accusations, and pleading were weirdly mixed. He told them they should remove the statue of Liberty and substitute one of Pontius Pilate. In a voice choking with emotion, he asked what they had done with the

soul left them by the Fathers of the Republic. He pictured the British troops holding on with nothing but their indomitable cheeriness, and dying as if it were the greatest of jokes. In one sentence he visualised Arras with refugees fleeing from it, and New York glittering with prosperity. With no relevancy other than that born of his tempestuous sincerity, he thrust his words at them with a ring and an incision as though he were in the midst of an engagement.

'That is all,' he said when he had spoken for twenty minutes. 'In the name of those Americans who have died with the Allies, in the name of the *Lusitania's* murdered, in the name of civilisation, I ask, *What have you done with America's soul?*'

He sat down amidst a strained silence. Everywhere men's faces were twitching with repressed fury. Some were livid, and others bit their lips to keep back the hot words that clamoured for utterance. The chairman made no attempt to rise, but by a subconscious unanimity of thought every eye was turned to the one man whose appearance had undergone no change. As if he had been listening to the legal presentation of an impersonal case, Gerard Van Derwater leaned back in his chair with the same courtly detachment he had shown from the beginning of the affair.

(Continued on page 469.)

HABITS AND CHARACTERS OF BRITISH WILD ANIMALS.

III.—THE WATER-RAT OR WATER-VOLE.*

By H. MORTIMER BATTEN.

I.

THE water-rat or water-vole is quite a different creature from the house-rat, for whose sins this pretty and interesting little animal is often made to suffer. The water-vole belongs exclusively to the river pastures and the bank-burrows. It is often plentiful in towns where the gardens border a river, but it never under any circumstances trespasses upon the odorous runways of the odious house-rats. Living in earth-burrows around which vegetation is green, it seldom, if ever, penetrates the drains, but is a clean-living animal whose habits resemble those of the beaver.

The water-vole is very much smaller than the house-rat. Its fur is denser and deeper, its head short and blunt, somewhat like that of a guinea-pig. In fact, the animal is as blunt at one end as the other. The fur varies in shade from mole-blue to hare-brown. Occasional specimens

are quite russet. The under coat consists of fine, blue fur, so close and silken that water does not penetrate it, and the brown shades belong to the outer coat of *hair*, which is tipped with this pigment. I am inclined to think that as the animal grows older the outer coat—the hair, that is, as distinct from the under-fur—increases in length, so that the colour with which it is tipped predominates more and more as the seasons pass. Black varieties are known in parts of Norfolk, Suffolk, and Scotland.

The forefeet have only four complete toes, the thumb being marked merely by a claw. The hind-feet have five complete slender toes, between which there exists the first indication of a webbing. The tail is thickly haired. The ears are very short, and almost hidden in the deep, soft fur surrounding them. The water-vole's eyes are small and black, and regard one with a pathetic expression. Its sight is not good.

The weight of adult specimens is usually about 6 oz., and may occasionally attain 8 oz. The length of head and body seldom exceeds 8 inches. The tail varies considerably in length, but rarely

*The first and second articles in this series, dealing respectively with the Badger and the Pine-Marten, appeared in the May and June parts of *Chambers's Journal*.

reaches $4\frac{1}{2}$ inches; from $3\frac{1}{2}$ inches to 4 inches is probably about the average.

The water-voles are creatures of daylight habits, lovers of the sunshine and of the bright scenes of life. They are fond of crossing and recrossing the water by which they live, and many times, from high up in the hills, I have looked down into the valley, where the river wound like a silver ribbon across the green landscape, to see one of these little creatures, visible from an immense distance, gamely swimming across, the arrowhead of ripples clearly marking its course.

Owing to its water habits, this species has managed to survive many of its near kindred which, though sharing its habitat and being more productive, were exclusively creatures of the land. The water-vole is essentially a beast of the water, and though it does not possess fully developed webbed feet, it is, at any rate, like the beaver, clothed for a watery habitat. The young take naturally to the water almost as soon as they are born—before, indeed, their eyes are open to the light. This is evidently nature's safeguard against the effect of floods, which are the chief among the water-vole's foes. In hilly country rivers and burns are apt to rise with surprising suddenness at any season of the year, flooding out the bank-burrows, and though, as a rule, the nursery-dens are placed above normal flood-level, a spate of exceptional violence may reach the young ere their mother has time to carry them away.

It is a curious fact that though swimming comes naturally to the water-vole, while with the otter it amounts purely to an accomplishment, yet the water-vole never attains the complete mastery of the water attained by the otter. At the best it is but a poor swimmer, and compared with the otter it is a weakling and a land-lubber. When an otter is under water it swims with its whole body, like a leech, propelling itself belly upwards or in any other position convenience dictates; but the water-vole, on the other hand, swims like any other rodent. When diving, it propels itself entirely by its hind-paws, using its forepaws for groping its way, grasping here a pebble, there a twig, and so turning and steering its course with its forepaws, while its hind-paws are used solely as paddles. Some authorities state that the animal propels itself with all four paws when diving in alarm, but though I have repeatedly watched water-voles most closely I have never seen the forepaws used as paddles. Their use appears to be limited exclusively to influencing the direction of travel.

How long can a water-vole live under water? Probably no longer than a trained human swimmer. If flustered and hurried, it is unable to remain totally submerged for more than forty seconds, and, unlike the chicks of moor-hens and other water-fowl, it never hides *completely* beneath the surface. Its diving abilities are

developed just so far as to enable it to achieve concealment by diving till it has reached some point of safe harbourage, such as a bank-burrow, the roots of willows, or dense rushes. Like the otter, it will lie submerged when hunted, only its nose above the surface, taking advantage of any drifting cover, and almost invisible as its body swings with the current.

II.

The water-vole appears to be much prized as a food item by all predatory birds and animals, and for this reason it cannot be doubted that in its natural environment lies the secret of its survival. If the voles had been purely dry-land animals, they would not exist to-day; but as things stand the weasel or the stoat entering a water-vole's burrow is apt to find it empty, the occupants having escaped in the ace of time by the back exit, and so into the water, which retains no lasting scent. Similarly the hawk, striking from above, is foiled by the vole's lightning plunge, and its eyes not being trained to look below the surface, the hawk is unable to follow the course of its intended victim.

The water-vole's natural foes are many, though it may suffer little by their activities except in winter. Since it is nocturnal in its habits as well as diurnal, owls probably stand foremost among its wild enemies. An owl will spend much of its time patrolling a river or a stream where these voles exist, or in waiting silently for their appearance, perched with alert watchfulness on a boulder or in the branches. The heron also is supposed to take water-voles, and there is no doubt that this bird would very readily snap up a young vole that it could easily swallow. The adult voles, however, appear to possess no fear of the gray-coated angler, swimming boldly within reach of his bayonet bill; and as regards any extensive damage, the heron can be written off as a winter foe only. The same applies to the otter, for, though living on apparently friendly terms with the voles during the summer, an otter will make terrible inroads into their numbers in winter, when trout are so poorly conditioned as to afford little nourishment.

Next to the owl, large trout and pike probably rank as chief among this little creature's blood enemies. A seventeen-pound pike caught in the river Ken, in Kirkcudbrightshire, within a mile of Loch Ken, contained a whole family of half-grown water-voles, together with a full-grown wild duck! It almost reminds one of Harry Tate's pike, which enclosed a motor-cycle, a sewing-machine, and part of a tree, and I would put it down as belonging to the same category of pike story if I had not been personally active in the downfall of this particular fresh-water shark.

Salmon, on their up-stream journey, do not interfere very much with the regular residents of the stream; but in winter, when on the redds,

they become ugly in character as well as in looks, and doubtless many a vole, crossing the sheet of water which he considers his, and which the salmon consider theirs, is savagely dragged down by them to be torn to ribbons in the gloomy depths.

In summer the water-voles flourish and multiply; in winter their numbers are reduced to the minimum which suffices to produce next year's normal stock. Thus, while autumn may see the water-vole population of a given stretch numbering five hundred, next spring may find only twenty mated pairs spared to maintain thereon the footing of the species; and so on season after season. In flat country they probably fare no worse than in our northern hills, for, though the floods spread over a wider area, the flood-waters are less turbulent, food is more plentiful, and, generally speaking, the cold snaps are of shorter duration.

The water-vole is seldom found at an altitude exceeding 800 feet. It belongs to the lush low-land valleys, where the growth along the water's edge is rich in seed-producing herbs and many varieties of green-stuff. Sometimes, but not often, specimens are found by mountain lochs and tarns; but, so far as I know, the animal is never resident there, and the occasional specimens seen are probably ambitious wanderers that have loved and lost, and finally lost their way.

The water-vole does not exist in Ireland.

III.

Water-voles are clannish little creatures. They live in families, and appear to be much devoted to each other. The families do not intermingle. Each little clan has its own strictly observed range, and does not trespass on the preserves of its neighbours. A boulder of rock in mid-stream may be the common property of all; but even here the clans do not associate, though all may use the boulder in passing. If a member of one clan is already on the rock and a member of another clan swims up to rest there, the first tenant immediately makes off, as though anxious to avoid a *tête-à-tête*. This I have noticed many times. Similarly, if one vole is compelled to cross the water-front of another, it does so, as far as is possible, by keeping to the water. Should it, while crossing, see the owner of the property, it at once quickens its pace almost to a stampede.

Water-voles adopt the same system as beavers of spreading the alarm by diving noisily when danger threatens. They do not, apparently, strike the water with their tails as the beavers do, but dive with such suddenness that the water closes behind them with a sudden 'plop,' which can be heard at a considerable distance. This action is instantly copied by other voles, startled by the noise, and so the alarm is spread up and down the river-bank ahead of the approaching danger. When diving ordinarily, water-voles do so in perfect silence; it is only when they are alarmed

that the suddenness of their immersion automatically creates the alarm-signal.

The water-vole's powers of multiplication during spring, summer, and autumn are not nearly so great as those of the gray rat, and naturally their rate of mortality is very much higher. The voles are strictly monogamous, and both parents are to be found with the young. The male, indeed, would appear to be an ideal parent, since he certainly helps his mate in her nesting activities and seems to possess a sense of kindly solicitude for his offspring. Probably not more than two litters, numbering from seven to nine per litter, are produced during the spring and the summer.

Whether water-voles remain mated during the winter would appear to depend on circumstances. If their home be well sheltered and secure, it is probable that the union holds good; but during winter the water-voles of our rapidly flowing brooks and rivers in the north generally live solitary lives. It would seem that when the mating bond no longer exists they very easily drift apart, and the flooding-out of their burrow may cause each to seek new quarters quite independently of the other. In winter the struggle to keep alive is so unrelenting that, whatever their intentions may be, the mated couples are liable to be mercilessly separated; though it is probable that, where circumstances favour it, a once mated couple remain mated for life.

So far as I have observed, the nest is usually situated twelve or twenty yards from the water's edge, out in an open pasture or in a wood. Generally it is underground, but so shallow that cattle are apt to tread through the roof, bringing destruction upon the family. When the young are growing, they appear to obtain a good deal of their exercise by extending the burrow in every direction, till eventually it becomes a warren, resembling a maze of mole-runs.

Not infrequently the nest is above ground, concealed by the shelter of overhanging grasses. It is a large nest, consisting of reeds cut into suitable lengths, or of any other material that comes handy. In this case the young are conveyed to the bank-burrow, soon after they are born, by their mother, who carries them in her mouth by the loose skin between their forelegs.

The bank-burrow often contains a cosy nest of which the newly born are found to be making use, but so far there is no definite proof that they are actually born there. I should say it occurs seldom, if ever. More probably they are born quite near at hand, possibly in the hollow trunk of a willow, possibly in an open nest, and are conveyed to the bank-burrow as soon as they are old enough to be carried. The dread of flood-waters is probably at the back of this guarding instinct.

Like the mole and the badger, water-voles are expert diggers. They will even construct underground subways rather than risk exposing

themselves in the open. One of these tunnels may run for a considerable distance from the water's edge up into a wood, for example, or even to a river-side garden; and, like the mouse-creeps in the grass, it is tapped by intercommunicating subways till a veritable maze is formed. What the beaver-canals are to the beavers, these subways are to the water-voles. They exist purely for the transportation of food, and their chief value is that, the animals being of daylight habits, they can venture far afield without exposing themselves to the attacks of birds of prey, foxes, &c.

The water-vole observes no rules or customs in its manner of architecture. It loves to construct its tunnels among the roots of river-side trees, so that its home is braced not only against the assaults of flood-waters, but against burrowing animals larger than itself. Generally there are one or more bolt-holes below the surface of the water, so that the occupants of the burrow can escape from it unseen, to take cover in the reeds or the bushes near. Well above the water-line the burrow is extended here and there, forming chambers sufficiently spacious for dining-rooms and bedrooms. The burrows very often become considerably enlarged by the action of water, and may finally be taken possession of by otters.

In addition to its water entrances and exits, the bank-burrow invariably has at least one exit on the land side, perhaps seven or eight feet from the water's edge. This, however, may be very little used, as it exists chiefly as a ventilator. Old burrows are often very extensive, representing, as they do, the activities of family after family of youngsters who have worked off superfluous energy by enlarging their quarters, while at the same time procuring a good deal of food by prospecting among the roots.

It will be seen from all that has been said that the water-vole stands well up in the scale of intelligence. It possesses the gift of profiting by previous experience, which is the true measure of wisdom in the wild. It has learnt by sad experience that flood-water is the most potent of its foes, and accordingly it guards against this inevitable peril in the best way it knows. It places its nest and its winter store, if such it should happen to possess, well above high-water mark. It constructs its bank-burrow in such a way that it cannot be drowned, or be frozen in during winter frosts. Realising the peril that lurks in the skies, it digs subways to its distant feeding-grounds so that it can come and go unseen. When its young are very small, surprise floods are their greatest danger, and so they are nursed above flood-line. Immediately they are old enough to move about a little the danger of surprise attacks from weasels or gray rats outweighs the danger of the flood, and so they are taken to the bank-burrow, where the water that might have drowned them is at hand

to save them. Should a flood now occur, the young are old enough to contend with it, and unless it be one of exceptional violence, the peril it presents is less than that which exists from the murderous beasts without.

IV.

The water-vole is almost entirely a vegetarian, and one can study its habits closely for some considerable time without finding a single exception to its vegetarian tastes. It lives chiefly on the shoots of willows during the spring, sitting upright and stripping off the bitter bark with its forepaws, then nibbling the soft pith within. It eats also a variety of water-plants and tender shoots of almost any kind. In autumn it eats seeds of practically any variety that comes handy, and in winter may gnaw the bark of any species of hardwood, as rabbits do—gnawing generally at the roots just where they enter the ground. Grass, daisy-roots, clover, bulbs of all kinds, and beech-mast lying on the ground appear to be appreciated items of diet, while it is very fond of potatoes and sweet chestnuts.

I have never known this creature to eat carrion. On one occasion we threw a dead hedgehog into a back-wash about which water-voles were daily seen, but there it remained, untouched by them, till the next spate bore it away. On another occasion a dead sheep, carried by the current, lodged near a water-vole burrow, and a day or two later a portion of the sheep was seen to be gnawed. Here, we felt sure, was the expected evidence; but subsequent observations proved beyond a shadow of doubt that the gnawing was the work of a gray rat. The water-vole, therefore, is of no value as a scavenger, and will even ignore the water-logged stem of a cabbage washed up near its home.

Nor is this animal guilty of raiding the redds of trout and salmon, as is so often thought. Such depredations are limited to its interesting little congener, the water-shrew.

One or two naturalists refer to the water-vole's partiality for fresh-water mussels, which it is said to eat by gnawing a hole through the shell at one side near the hinge; but there seems insufficient evidence to prove that this is the work of voles and not of shrews, which, while very carnivorous in their habits, are, moreover, very secretive. Water-voles are regularly seen close to a place where the empty mussel-shells lie about; and since the shrews are never seen there, their activities being nocturnal, the natural conclusion is that the voles are responsible. Further information bearing on the water-vole's alleged carnivorous habits would be greatly valued. Up to the present we are probably fully justified in regarding it as no more carnivorous than is the beaver.

So far as one can judge, the storage habit is less strongly developed in the water-vole than in most of its congeners—certainly less strongly

developed than in the gray rat. The muskrat and the beaver both have their stores, and it is probable that in a country of long, severe winters the water-vole would fall in line with the rest.

When winter comes many of the water-voles leave the river-banks for more sheltered quarters. They are particularly fond of small ponds nestling in woods, and overgrown with a dense entanglement of briar and berry, and here, having their creeps deep in the undergrowth, they may spend the winter unseen and unsuspected. During exceptionally cold snaps they often remain underground for days on end, and this fact would seem to suggest some kind of a store within the dwelling. In all probability water-voles, like many other creatures, hoard their stores unsystematically in various places, a little here and a little there, instead of placing all their eggs in one basket; and though we have on sundry occasions found *caches* at the water's edge, among the undermined roots of river-trees, or in the hollow trunks of the trees themselves, and though the work looked like that of water-voles, no decisive proof was forthcoming.

It is, however, very difficult to understand

how this little animal could survive a winter of exceptional severity if it had no store of some kind on which to fall back. Its diving-powers, as already stated, are not great, and it is almost inconceivable that it could keep itself alive for any length of time by procuring its food from the bed of the pond or stream beside which it lived. In some cases this might be done, but the gravel-beds of most of our northern streams must be particularly unfruitful, though many water-voles manage to winter by them. Assuredly these individuals do not keep themselves alive by diving for their food. Similarly, I have known several voles to winter by a little woodland pond, the bed of which consisted of unfertile clay thickly covered with decaying leaves. In such cases the vole that had no store would, when the earth was frost-bound, be compelled to obtain all its food from above the ground, thereby exposing itself to such perils that it would undoubtedly fall ere the coming of the spring. It is only reasonable to suppose, then, that this creature, so highly intelligent in other ways, counts among its gifts the ability to lay aside for a wintry day with a forethought more liberal than is generally imagined.

THE AWFUL MISS BROWN.

CHAPTER III.—continued.

II.

WHILE these things were occurring at Hollybush Farm, the vicar found Dick Merryweather awaiting his return at the little parsonage. 'Here you are!' cried Dick. 'Well, what's the news?'

The vicar shook his head as he sank into a chair.

'Dear me!' said his sympathetic nephew. 'I'm afraid you've had rather a rough time. Please tell me all about it;' and the vicar gave an account of his interview with Miss Brown.

'Ah!' said Richard when he had finished. 'So she's dead against me? I thought she would be. Well, Uncle Theophilus, I'm greatly obliged to you. I know you did your best, and I shall never forget it. And now,' he continued, straightening his shoulders and expanding his chest, 'I must attack Miss Brown myself.'

'I hinted that, as I had failed, you might possibly call on her yourself; and I regret to say she almost threatened you with personal violence.'

'Did she?' cried Dick. 'Well done, Miss Brown!'

The vicar glanced at him admiringly, but seemed doubtful as to the result of such desperate resolution. 'I wish you success with all my heart, Richard; but I most earnestly hope there will be no disturbance in the parish.'

'No fear of that, uncle. If Miss Brown chooses to box my ears for running after her niece, she's as welcome as the day. I sha'n't mind, so long as she doesn't box Bella's—or yours.'

When Richard said 'or yours,' he felt he might have gone a little too far, so he added, 'But, of course, she would not think of that.'

Mr Doubleday glanced round, as if to make quite sure nobody was within hearing. Then, lowering his voice, he said, in an awe-struck whisper, 'My dear Richard, it's my belief she *did* think of it.'

III.

The very next day it happened that Hester Brown and Richard Merryweather met on the road just outside the village.

'Miss Brown,' began Richard, with his usual directness, 'I understand you are strongly opposed to me as a suitor to your niece.'

Very much annoyed at being stopped by this young man, and compelled to return to a subject so distasteful, she set her lips tightly, and inclined her head without speaking.

'May I ask what is your objection to me?'

'I have no *personal* objection to you—simply because I know nothing much about you.'

'Then,' said Richard, 'may I beg you will do me the honour to know more of me, in the hope that I shall improve upon better

acquaintance? May I ask this as a great favour, Miss Brown?'

'I don't wish to know more of you,' replied that plain-spoken lady. 'You would probably not improve on acquaintance. Men don't.'

'Will you give me a chance of doing so? Really I am not a bad sort of fellow, though I say it who should not.'

'You have said a great many things you should not.'

'You mean to your niece? I am sorry I cannot agree with you.'

'It's all the same to me whether you agree with me or whether you don't.'

'I admit that I am a man,' he went on apologetically; 'but can I help it?'

'I do not say it is your fault.'

'Nor is it my misfortune in the present case; for if I were not a man, how could I hope to become Bella's husband? She could hardly marry a haystack.'

'It would be better if she could, if she *must* marry something.'

'Really, Miss Brown, I feel sure she would be happier with me, especially as she prefers me. And as for yourself, I assure you you would find me a most affectionate nephew.'

Richard must have lost his head when he made *this* remark. It filled Miss Brown's cup of bitterness to overflowing.

'Mr Merryweather,' she flashed out, 'I forbid you to speak to my niece! I shall forbid my niece to speak to you; and—and—good-morning!'

Having thrown this valediction at him like a stone from a sling (or as if it began with an 'm' instead of a 'v'), she strode past him, completely disregarding the final effort he made to detain her.

IV.

On her part, Miss Brown recognised it was war to the knife, and she was not long in deciding on her plan of campaign. Her first idea was suggested, a day or two after her encounter with Merryweather, by a drowsy yawn from her dog, who was blinking in the sunshine of the garden. He was an easy-going, portly old fellow, of no particular breed, and was called Rover because he disliked too much exercise, and seldom went far from home. When Miss Brown walked over to where he lay, he rapped his tail once or twice on the ground, and closed his eyes.

She left him to repose, and went straight off to the village carpenter, who, on the following day, sent a man to fix a notice-board beside her gate with 'Beware of the Dog' in bold black letters on a white ground. When the man had gone, Miss Brown stepped into the lane and surveyed his handiwork with so much satisfaction that Rover trotted out and had a look also. If he felt dubious as to whether he could act up to

the warning, he was not the only person who entertained doubts on the point, for at that moment Richard Merryweather came down the lane.

'Good-day, Miss Brown,' he said, raising his hat and bowing with great respect (he was really a very polite young man, and it was rather hard Miss Brown should put it down to mere impudence). 'I hope you are well this morning?'

'Thank you,' she replied coldly. 'I have nothing to complain of so far as my *health* is concerned.'

Meanwhile Richard was flattering himself in the thought that it was a good omen she did not 'make a bolt of it,' and leave him standing there alone, as she had done a few days before. It did not occur to him that she was merely tarrying to observe the effect of the newly erected notice-board.

Bending down to pat Rover, he asked, 'Is this the dog I am to beware of, Miss Brown?'

'*You?*' she answered, looking down upon him as he looked up at her. 'Who said anything about you?'

Instead of replying to this question, he patted Rover once more, and called him a 'fine old fellow.'

'He is *not* old,' said Miss Brown.

'Forgive me if I suggest he is not so young as he was.'

'We are none of us so young as we were.'

Richard inclined his head, with a gravity highly becoming a light-hearted young fellow suddenly recalled to the contemplation of serious things. Of course, he might have assured Miss Brown that *she* at least looked as young as ever; but, with a person of her temperament, this would have been a mistake.

'But, Miss Brown,' he resumed, 'if you really want a dog to protect the premises, I know of a splendid bulldog which the owner would be willing to part with. He is a capital watch-dog. You might leave your doors unbolted all night with him about the place.'

'I have no intention of leaving my doors unbolted at night.'

'At the same time, if you want a good house-dog, I can strongly recommend the one I speak of.'

'I have no doubt you know the dog.'

'Oh yes; I know him very well.'

'And the dog knows you?'

'Yes, he knows me.'

'Quite so! Thank you! I prefer my own dog,' retorted Miss Brown.

She re-entered the garden, walked into the house, and shut the door. She was not very indignant at this sample of masculine treachery, for she felt that she had had the best of the engagement, and had shown how readily she could unmask the machinations of a villain.

Nevertheless, it had not escaped her notice that Rover wagged his tail when Richard

Merryweather patted him, whereas he ought to have bitten a piece out of him. Possibly it might be as well to get an additional guardian of less amiable disposition; but, then, there were drawbacks to the presence about the place of a strange dog of uncertain temper. She thought the matter over; and when Miss Brown thought anything over, something usually came of it.

What came of it in the present instance was another notice-board, the erection of which cost her a slight twinge of conscience. In regard to the first board, there had been nothing she could not reconcile with her homely, straightforward code of ethics; for she did really possess a dog that, some years before, had pursued a boy who came to rob the orchard, and had not abandoned the chase until the culprit turned, in desperation, and picked up a stone. Still, this second notice merely said, 'Man-Traps and Spring-Guns,' which, in itself, was vague and meant nothing, when you came to think of it; unless people chose to infer that any person prowling about at unlawful hours ran the risk of being caught by the leg in a powerful gin, or complimented with a few slugs of a kind more injurious to human beings than to cabbages. What a convenient thing it would be, she thought, if her house were an old-fashioned grange with a moat and a drawbridge! For, even had she heard of Hero and Leander, she would have considered Richard too much of a dandy to try *that* experiment.

Whether he was a dandy or not, it was a pity he could not mind his own business. Naturally, Miss Brown preferred to be taken seriously; but he need not have arrived one fine morning on the other side of her garden fence, when she was giving an eye to her flowers. It looked as if any excuse would serve him for hanging about the place.

'Miss Brown!' he cried. 'I *must* speak to you! I must appeal to your humanity. Suppose, through my fault (or what you are pleased to consider my fault), some perfectly innocent person should be caught in these things which you have placed about your house?'

'Innocent persons don't come where they have no right,' replied Miss Brown.

'But, by some accident, even you or your niece might'—

'They are *man* traps,' interposed Miss Brown.

'But the spring-guns, Miss Brown! The spring-guns!'

'They are never loaded until night.'

In for a penny, in for a pound. Even when a child, Miss Brown never told fibs; and she was more angry than ever with Richard for making her feel how easily she *could* tell them when once she began. Nevertheless, it was very distasteful; so she determined to put an end to the conversation, especially as she detected a twinkle—a most impudent twinkle—in Richard's eye.

She regarded him severely across the fence. 'Young man,' she said, addressing him in a way

she considered at once hurtful to his dignity and consistent with her own, 'I believe you think there are not any guns about the place at all.'

'How *can* I think so, Miss Brown, when I have your assurance to the contrary?' motioning with his hand towards the notice-board.

'If you *did* suppose so, you would be greatly mistaken.—Robin Redyeard, come here.'

These last words were addressed to a youth of strikingly bucolic appearance, who just then emerged from an outhouse, and who was armed with an antiquated fowling-piece. He was on his way to the cornfield, his present duty being to scare birds by pretending to be a sportsman.

'Yes, missus?' he replied, as he came slowly towards her.

'Do you know this person?'

'Ay, I knows 'un. He be Measter Merryweather, *he* be.'

'Well, if you ever see Mr Merryweather on any part of *my* premises, you have my orders to shoot at him.'

'But if so be as I was to hit 'un bad, what 'ud they do to I?'

'Whatever you do will be done by *my* orders, and I will answer for it.'

'If so be as that be so, missus,' said Robin, pulling his forelock to Richard, as if promising to do him a service for which he hoped to be remembered, 'I'll shoot at 'un, if I sees 'un anywheres hereabouts.'

So saying, he departed slowly with heavy tread, an ordinary country clod. But as the townsman frequently looks less stupid than he is, the countryman is often not quite so stupid as he looks.

While Robin was passing a bush near a corner of the house a fair eavesdropper stopped him, and said, 'Oh, Robin, you won't really do it! Will you?'

After glancing cautiously round, he whispered, 'There bean't no shot in it, Miss Bella. It won't hurt nobody, if so be as they don't come close up agen it.'

Nor was this the sole proof given by this unlettered swain that he grasped the situation. Soon after, when Richard was passing a hedge-corner where one might crouch concealed from observation, a voice called to him, 'Measter Merryweather! I zay, zur!'

'Well, Robin, my lad, what is it?' said Richard, approaching him.

'Miss Brown, zur! She do give it them as don't do what she tells 'un. Ah, that she do! I don't know as I wouldn't sooner be had up at 'Sizes, rayther nor not do what Miss Brown telled me.'

'Well, Robin?'

Robin tapped his gun. 'There ain't no shot in it, but I *could* put in some old nails just to oblige.'

'Yes, Robin, if you happened to think of it.'

'Ay,' responded Robin, with a grin; 'that's just how it be. If I happened to think on it.'

'Well, here's five shillings *not* to think of it.' 'Thank 'ee, zur,' said Robin.

'And I have no doubt, Robin,' continued Richard, in persuasive tones, 'that if I gave you *another* five shillings one of these fine days, you could deliver a letter to Miss Croft for me?'

'To the young missus?' said Robin. 'Well, I bean't no schollard; but if I *knowed* it was for she, I won't zay but what I might. You see, zur, I be just the sort o' chap as nobody 'ud think it on.'

Having thus hinted at superior opportunities resulting from his well-known stupidity, the honest fellow went his way.

CHAPTER IV.

I.

BEFORE the week had gone, a thing happened which absolutely astounded Dredgefield, so that it could hardly find words to express its feelings.

One morning Miss Brown missed Bella, but was too much occupied to notice the fact particularly, and supposed her to be 'somewhere about.' Moreover, the precautions she had used seemed to have been effective, Richard Merryweather not having been seen near the place for some time. As for her own people, he was not likely to find an instrument among *them*. It was not until dinner-time, when there was still no sign of Bella, that Miss Brown began to wonder where she could be.

Just then Robin Redyeard came up to her, saying, 'Missus, I see'd Measter Merryweather a while since; but he worn't on *our* land, and I hadn't got no gun wi' me.'

'Oh, very well, Robin,' said Miss Brown. 'That doesn't matter. I only meant if he came trespassing.'

'That's what I'd somehow sort o' got into my yead. So I says to myself (says I), "You ain't got no call to meddle wi' 'un if you don't see him somewheres by the Blasted Ellum, or by the Wiggles Brook, or on our side o' the hedge by the lane-end; or if you don't come agen him round by the corner o' the old barn, or sticking of his yead in at the dairy door, as if he was arter running off wi' the milk-pails, or among the ricks i' the yard, or"'—

'Yes, yes,' said Miss Brown a little impatiently. 'There's no need to do anything if you don't see him somewheres about the place.'

'Yes, missus. It wor down by Beech Lane I see'd him this time. I were coming back from Joe Sledge's wi' the mare, as I'd took to be shod. He were standing there (Measter Merryweather were) by a coach and pair o' hosses; and he says to I (Measter Merryweather du), "Robin Redyeard," says he, "be you going back to Holly-

bush Varm?"—"Ay, sure," says I. "Where else 'ud I be going?"—"Then," says he, "you give that there letter to Miss Brown."

'What letter? Where is it?' cried Miss Brown.

'It be here,' answered Robin, producing it with great deliberation.

'Why didn't you bring it to me at once?'

'Well, missus, as I were putting the mare back i' the stable the colt got out, and it took I a rare while to catch 'un. And I'd to look arter that there mook as was i' the yard, and had to be teaken down to the fower-acre. And I says to myself, "Who be Measter Merryweather?" says I. "He bean't nobody to speak on. His business ain't got to come afore missus's wi' Robin Redyeard. Hern's got to come afore hisn's."

Miss Brown tore the letter open, and, after reading the first few words, turned the full torrent of her wrath upon the innocent bearer.

'Robin Redyeard,' she exclaimed, 'you're a fool!'

'Yes, missus,' replied Robin. 'I knows I be.'

'You ought to have brought this letter to me *at once—instantly!*'

'Ought I to ha' done *that*,' said Robin in amazement. 'Well I *du* be sorry as I didn't.'

'There! Get away with you!' cried Miss Brown. 'Go back to your work!'

Was Robin really as innocent as he appeared? Was he entirely ignorant of the fact that he had done wrong in retaining the letter for a good four hours after he had received it? On his way to his work, after leaving his mistress, he took a golden sovereign from his pocket, and, regarding it with an expression of genuine perplexity, said, 'Now I 'se got it, danged if I know what to do wi' it. I never can't spend it.'

Miss Brown went to her own room and re-read the letter.

'MY DEAR MISS BROWN,' it ran, 'I fear I shall offend you more than I have already done by the step I am taking; but you have left me no alternative. I will really and truly do my best to make Bella happy; so I cannot understand why you object to her marrying me. We hope you will forgive us both when we return.—Your affectionate nephew,

'RICHARD MERRYWEATHER.

'P.S.—I have ventured to call myself your nephew because when you read this we shall be man and wife.'

In his hurried postscript Richard completely gave Robin Redyeard away, but Miss Brown was too enraged to notice this; and, as she tore the letter into fragments (upon which she deliberately trampled), she had no opportunity of referring to it afterwards. For an hour she sat alone, with firmly set lips, knitted brows, and a face paler than usual. Then she descended to her household duties, the woman she had been, only rather more so.

II.

After an absence of three weeks Richard reappeared in Dredgefield with his bride. The first thing Bella did was to send a letter of humble entreaty, begging for her aunt's forgiveness. Miss Brown replied that, of all human faults, ingratitude and deceit were the basest and the most hateful; and that, after Bella's conduct, she threw her off for ever. 'I said,' the letter concluded, 'you must choose between him and me. You have made your choice, and must abide by it.' She refused to speak to Bella in the public street. The poor girl returned to her new home in tears, and her husband had great difficulty in comforting her with the assurance that Miss Brown would come round in her own good time if she were left alone.

During the months which followed these momentous events the expression of Miss Brown's features became grimmer, and the outlines of her person looked more rigid and uncompromising than ever. Nobody at Hollybush Farm was absolutely forbidden to speak of Bella, but every one knew her name was not to be mentioned.

Prohibited from entering beneath the roof which had sheltered her for so long, the tender-hearted girl, full of gratitude to the woman who had befriended and protected her, could not help feeling she had committed a crime in the deception of which she had been guilty. The beginning of Bella's married life was made thoroughly unhappy by the shadow thus cast upon it. Dredgefield became aware of this, as little places become aware of things which escape notice in bigger places. It knew that Bella had met her aunt more than once; that, upon approaching her with appealing eyes and gestures, she had been cruelly ignored. According to some people's notions Dredgefield might be slow, not to say dull; but it had its feelings. It sympathised with Bella, and, with all its respect for Miss Brown, considered she was overdoing it. It began to think much better of Richard Merryweather than it had ever done since he came to reside in its midst; for, feeling his wife's sorrow keenly, he looked downcast, and was not so lightsome as he had been.

But whatever the parish, the county, the British Empire, its protectorates and dependencies, might think of her, Miss Brown went her own way, unyielding, and defiant of public opinion. The gentle little vicar was outraged by her obduracy, and by her refusal to relax it when he ventured to approach her on the subject. He even went so far as to preach a sermon at her on Christian forgiveness, and Miss Brown sat it through without moving a muscle.

When the anniversary of Bella's elopement came round, however, an extraordinary thing happened. Miss Brown fell ill. Dredgefield was utterly dumbfounded, and knew not what to make of it. Several of the older inhabitants

remembered her having measles, whooping-cough, and one or two infantile odds and ends; but as a woman she had never given in to any ailment whatsoever. Dredgefield was naturally anxious to know what was the matter with her, but the doctor himself seemed unable to give it a local habitation or a name, and, when questioned, said something vague about nervous debility. At this Dredgefield opened its eyes incredulously, and shrugged its shoulders. The idea of Miss Brown having a nervous system liable to be upset by anything under the sun, from a wild bull to a boa-constrictor, was too ridiculous for words. A practitioner of the manufacturing districts might have regarded the stomach as the original cause; but the natives of Dredgefield for generations had led outdoor lives, and indigestion had never been one of their favourite complaints. If they *had* any preference in this way, it was for rheumatism. It could not have been influenza, because influenza was not yet invented; it might have been that Miss Brown, in her obstinate refusal to be reconciled to her niece, had done violence to her better nature, and that a sustained effort of this kind had finally told upon her. Anyhow, she sent for Dr Rowley, much to his, and to everybody's, astonishment.

Dr Rowley was a kindly little man, round and rosy, and a couple of inches shorter than his patient, so that it seemed quite absurd he should order Miss Brown to go to bed. She complied, nevertheless, and stayed there for several days, thinking she was getting to be a feeble old woman, not long for *this* world—which was quite a mistake, for in less than a fortnight she was almost herself again.

Dr Rowley had a kind heart, and was eager to do a little office of peace and goodwill outside his profession. He told Miss Brown that Bella had been constant in making inquiries about her. Miss Brown said, 'Oh, indeed; had she?' in tones not wholly ungracious; so he was encouraged to add that she had been anxious to come to Hollybush Farm and nurse her aunt, but that he (Dr Rowley) had absolutely forbidden it. Miss Brown stared at this, and he hastened to explain that the present state of Mrs Merryweather's own health—

'What!' cried Miss Brown, who had never dreamed of Bella's being ill.

'Oh, nothing to be alarmed about, Miss Brown,' Dr Rowley assured her. 'Only at such times a little care and—and circumspection are advisable. As much freedom as possible from all kinds of worry; that is all. The mind should constantly be diverted from—from—— However, Miss Brown, these are details in which you, as a single lady, cannot be supposed to take much interest.'

So the doctor took his departure, leaving her a good deal puzzled at first, but with the truth gradually dawning upon her.

UNFINISHED.

By G. R. GLASGOW.

ROBERT LOUIS STEVENSON, in one of those gallant, unforgettable phrases that punctuate his essays, has said that 'it is better to travel hopefully than to arrive,' but this, I think, is true only of a very vaguely sketched-out journey, when you do not particularly want to arrive anywhere, but just to wander at will. It is very pleasant to wander in byways, to follow up branch-lines into unknown places, to sail in and out of unfrequented streams, with gay fellow-travellers who do not mind where they go; but, however hopefully you may travel, such voyaging will not bring you to your journey's end; and if, like all the rest of the world, you start on the road that leads to Rome, in so far as you fall short of your initial plan, your journey remains an unfinished and incomplete attempt. You may have many pleasant things to tell of Verona; you may be able to describe in glowing language the glories of Venice, and the mysterious beauty of St Mark's; you may have stood on the Bridge of Sighs, and studied the frescoes in the church of St George and the Dragon; but you will not be able to describe Rome, or to give your impressions of St Peter's or the Appian Way. You may have gone far, but you will not have gone far enough; your journey will be a mere sketch, instead of the finished picture you intended it to be.

I have been thinking lately a good deal about unfinished work of all kinds, drawn thereto by contemplating a number of sketches, the unfinished work of a clever artist of the last generation. There are over thirty of them, mostly in faint, half-obliterated pencil; some sketchily inked in; some on good, stout paper that has defied the wear and tear of time; many just memoranda on a thin writing-pad; but all so covered with hieroglyphics—with notes of colour, of form, of possible improvements—that one saw that all were intended as merely the first steps to a coloured sketch or a finished picture. If the idea had been carried out—the pencil notes erased, and colour washed in—they would no doubt have been charming; the artist, like most of her generation, and like her 'who was cousin to Lady Jones,' painted in water-colours, and, to judge by the few framed and finished pictures left to us, she painted charmingly. It was an art much cultivated in those days when ladies would almost as soon have thought of leaving their tooth-brushes out of their holiday kits as their paint-boxes.

These sketches were given to me with a vague, half-formulated wish that I should finish them! Even now the artist could not bear

to tear up these children of her fancy, nor was she strong-minded enough to burn them—but what else can one do with unfinished work, especially other people's? It is never too late to pick up your own, and make a completed picture from memory or imagination; but no amount of guiding notes or data such as deface these drawings can for a moment make you see the place with other eyes, or enter into the spirit of it from another artist's point of view. And yet a few hours' work at the beginning, a little determination, would have turned each of these map-like scraps of paper into a more or less interesting and finished work of art.

It is very often the same with a writer. He gets an idea into his mind, and it eludes and obsesses him, whilst he faintly pursues, twisting and turning it into the channel that pleases him best—invents the thread of the story, toys with the dialogue, makes an occasional note, and determines that a start will be made next morning, repeating to himself very firmly the old saying that 'a thing begun is a thing half done.' But somehow it never *is* begun—it never gets beyond the embryo, and gradually fades away into the limbo of forgotten things. 'Any time is no time'—also an old and true saying.

A man may have great talent, he may even have genius, but if he cannot get his ideas on to paper he remains mute and inglorious to the end, for one brick laid upon the earth is worth a thousand castles in the air. He is one of those of whom 'tis said in the obituary notice: 'He did not fulfil the promise of his youth'—he leaves only unfinished work!

But sometimes, as in the suggestions in marble of Rodin or the sketches of Turner, the sketch *is* the finished work. Genius has taught such people exactly where to stop. Even so you may deliberately turn aside on the road to Rome and stand fast at Venice, instead of travelling, however hopefully, to the end of the journey; then it is Venice you will describe to an admiring audience, not Rome, and you will, after all, have accomplished something, and not merely drifted. Very likely the possibility of stopping short may have been at the back of your mind all the time; but the vague, unsatisfying journeyings without a definite object, the sketchy and quite incomprehensible hieroglyphics and notes that never grow into a picture, the ideas that never crystallise into print or show a touch of creative art—these are the sad unfinished works with which the road to some artists' hell must surely be paved.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

PORTUGAL, like every other country, suffers at present from too much politics. In times of peace and plenty, when it seemed that in spite of all human limitations and difficulties the world ran smoothly on and a measure of happiness and content was within the reach of all who sought it fairly, we would say with a smile that politics was a game, as it really was with some, though we then, unthinkingly, scarcely half-believed our saying—for at heart we held politics in some awe as a thing, after all, of transcendent importance, a system for the government and the welfare of the people, with vast ideals reaching far on towards a millennium. But now we discover, through the hazards of war and the following tribulations, that politics is a real game, and something more than a game—a deep and depressing evil from which humanity suffers, and which of itself threatens the future of the world and of civilisation. The greed of men for power, influence, authority, has more and more led them to excesses of unscrupulousness and selfishness in politics, a complete disregard of the public welfare so long as their own aims may be furthered—machinations, mendacities, every form of corruption—until the progress of peoples is arrested by this positive vice. These things, it may be said, have always existed; politics prevailed, no doubt, in the days of the Pharaohs, and we know that Rome and Athens were full of them. But in recent times, with economic and other questions assuming a greater complexity, the fever of politics has increased, and with situations less intelligible to the people than they used to be, the politicians, swarming in numbers, increasing in unscrupulousness, have taken advantage of circumstances, so that our present politics, in which there is small room for ideals, are the most dangerous that have been known. We suffer from them in Britain; they suffer deeply in France. Germany and Russia owe to a large extent their unhappy state to politics; Italy, Spain, many other European countries, the East, the Americas, all labour under this heavy load of politics, led by the hunters of selfish vanities. But it seems to one who has had occasion to make some close study of the general situation that Portugal, a small and comparatively obscure state, tucked

away in a corner of Europe where, as one might say, she is seldom seen, has laboured more heavily than any other nation in recent times under a depressing load of politics, and it is largely that which has brought her to her present unhappy position. Of course, there have been other leading contributory causes. The Bolshevik danger is great in this western part of the Iberian peninsula. Beyond doubt the emissaries of Lenin are abroad in the land, striving assiduously. I was given much convincing and authoritative information upon this point by those who knew and understood that the Russian Bolsheviks attached great importance to the capture in some measure of Portugal, regarding it as a kind of key position for them. Certainly the Bolshevik element is very strong, and it may be said that of all the European countries most likely in recent times to turn over to the Soviet system, following the example of Russia, Portugal ranks first. She has been very near it already, but the danger may be averted. In face of this menace, however, the better minds of the nation have felt afraid, and hindered in their action. Another strong contributory cause of Portugal's sufferings and disorder has, of course, been the war, but the country should not have felt the strain of the upheaval so much. Her burden was comparatively small, and though she is not self-supporting, her fields and pastures supply her with an abundance of food that would be the envy of many other states. Her contribution to the man-power of the war, if adequate, was not such as to make a vital strain upon the nation.

* * *

On the other hand, Portugal suffered immediately, and suffers still, from the vice of profiteering. While there are many poor in Portugal, while distress is in many parts acute, and we have the spectacle of a tax for the poor being levied upon every hotel bill, and even every time a person buys a glass of milk (two centavos to the escudo is the 'assistance' tax in hotels and restaurants, and it is twice as much in milk-shops and beer-halls), wealth has been piled up enormously by individuals, and, in proportion to the population, Portugal contains, as it would seem to the onlooker, a larger number of new rich than any other national community.

They flaunt their wealth ; they make some vulgar displays, and some others which are not so much vulgar as impressive. One of the general difficulties of the world at the present time is apparently to get building done. Material is so scarce, and labour is so expensive and so hard to handle, that in most countries the people are crying aloud for habitations in which to live. But in Portugal the new rich, such is their wealth, their power, and their influence, have no difficulties ; and at Estoril and Mont Estoril near by—lovely spots on the Portuguese Riviera, a few miles away from Lisbon, where there is sunshine through the winter, roses bloom in January, palms give welcome shade, and birds sing continually—they are making for themselves a place of charming villas, all with outside walls of white or creamy glistening tiles, with decorations in delicate tints and tasteful designs (these tiled houses are often really beautiful things, such as those who have not seen them have no conception of), representing the wealth and the interests of the capital city, and corresponding in a manner to Tivoli of old, or Pompeii perhaps. All these things and others have been contributory causes to the difficulties of Portugal ; but in the main it is politics that have brought the country to a desperate pass, and caused her to stop suddenly in frightened apprehension, as occurred a few weeks ago, at the sudden realisation that if things went much further on that road there would be foreign intervention, and she might for a season lose her independence and freedom of action. There had been a meeting in Lisbon of representatives of the Allies to consider what steps it might be desirable to take in certain contingencies to save their sick friend from herself and protect their own interests. Portugal has always been a land for politics, and the collapse of the monarchy let loose a flood of this vile stuff, flinging out such enchanting possibilities to every little political schemer in the land as he had never dreamt of, and few of them were sufficiently honest, had enough of the true patriot in them, to resist the temptation to achieve some degree of power, to be unselfish, to be for the country only. Parties arose, and then more parties, and parties again, and all the time the country lacked men who were strong enough for the real business of good steady government. When a party became fairly established, dissensions occurred within it because of indiscipline and the general desire for power. Each man would be himself a leader. Then the party would break up into small sections, each with its own head ; alliances would be made with other parties and other sections for the purpose of enhancing power. New parties would thus be formed, and machinations were the continual order, the country meanwhile crying out for control and some ordering of its affairs. But no ; the politicians and the parties

pressed steadily on with their selfish practices ; they hardly made a semblance of heeding the national needs ; all was politics, a multiplicity of parties, the formation of new sections, and the wild rivalries of the political gamblers. Little wonder that in such circumstances monarchist hopes should revive, and a gallant adventurer in Paiva Couceiro, something of a Bonnie Prince Charlie in his manner and attitude, should feel new hopes, and, crossing the northern border, should proclaim the monarchy again in Oporto. Once or twice a stronger man arose from the maelstrom of politics and called the country to its senses. Such a one was Sidonio Paes, the President who was assassinated some eighteen months ago. He was suspected of being too much royalist, and to this day it is a question in Portugal as to the real character and intentions of this man, whose mind is discussed upon evidences, deductions, and conjectures, as we discuss the mind and sense of Hamlet. Some say he worked stealthily for the monarchy ; others that he was a sound, though Conservative, Republican. His memory is either worshipped or hated. In February, more than a year after his death, one found continual intercessional religious services being held for the salvation of his soul ; and to such an extent did these increase, and so much were they political and dangerous, that at last the Government stepped in with a forbiddance, and said that thereafter there must be no more of them, and the soul of the departed Paes must be left to look after itself. Then, in February, his body, the coffin and all about it piled high with wreaths tied in purple ribbons, still lay in state in the old church at Belem, opposite to the tomb of Vasco da Gama. Whether he was a sound Republican or not, Sidonio Paes was a brave and an honest man, and one of the strongest that Portugal in her troubles has produced.

* * *

Near the end of last year the tricks of the politicians, and the complexities they had formed from which they could not extricate themselves, led to an amazing state of things. The neglected country was slipping to something like ruin ; the Bolsheviks, the strikers, the revolutionaries were manifesting themselves. I went to sleep in my bed at night sometimes to the sound of the crashing of bombs in the street outside, and the city was so much possessed with nerves that when a motor-car went sparking through the big central square—the Rocio—the people would give a start, and there would be a commotion as if more bombing, exploding evil were abroad. A few months before, the new President, José d'Almeida, had gathered the leaders of parties together at the headquarters of government at Belem, and appealed to them to sink their differences, abandon their parties if need be, and strive for the country's sake. It was an honest appeal ; the President himself, once a keen party man, had abandoned his party and caused it to be dis-

solved. For a day a sympathy for Portugal was stirred in the hearts of the politicians; they were moved with a little compassion for their land, and a touch of simple sincerity, of unselfishness, was felt within them. They promised to be better, and they went away from Belem to Lisbon full of good intentions. But, once contracted, the vice of politics is a hard thing with which to grapple. Soon the old fault broke out again, and it was the worse for the rest it had had, while it throve in the extremely difficult financial situation that had arisen and the desperation that it engendered. More parties were constructed, more sections; more men would be leaders; more dissensions and machinations arose. The Government fell, and, amid the mass of jealousy and confusion, the crisis thus brought about could not be met. Ministry after Ministry was tried in construction, but every attempt failed for weeks, until at last one Fernandez Costa, a good Republican and a man with some knowledge of finance, but of no considerable strength, succeeded in piecing together a Cabinet that seemed as if it might be sworn in to government and might hold together. But immediately its formation was announced there were demonstrations against it. On the day after its construction, and before it had been presented to the President and to the Parliament, a mob marched through the streets demonstrating against it. This crowd hardly knew what it did at the beginning; there is always a crowd for any sort of demonstration in Lisbon. It gathered knowledge as it went along, and so its demonstration intensified. At last the idea seized it of bearding the new Cabinet in its den. Ecstatic upon the idea, it galloped to the place where the Cabinet was sitting, making its preparations for entry into government. A deputation strode past the complaisant guards into the chamber where the Ministers deliberated, showed pistols, and demanded the resignation of Fernandez Costa and all the rest. The alternative was some shooting. Fernandez Costa accepted the situation, and in one of the most remarkable letters of resignation that a Premier ever penned he sent his abdication to the President, explaining the circumstances with as much show of dignity as he could muster. Then followed more crises, more machinations, and more intense difficulties, until it seemed that the breaking-point was reached; but at last there was a lull and a certain improvement in prospects when Colonel Baptista, a man of some determination, took the helm and gripped it firmly. In the meantime the country was overborne with strikes; the railways, the postal and telegraphic services, the telephones, had all broken down, and the land was given up to gambling on a grander scale than any country had been given up to it before. There were some sixty gambling-saloons in Lisbon, another hundred or more along the Riviera; in Oporto and all the smaller towns of the pro-

vinces the gambling evil was terrible, and there were cries of anguish from all quarters that it was draining the life of the people away; and yet at this moment the malign spirits in the land were concocting schemes by which Portugal might openly exhibit herself as a gambling country, and invite foreigners to visit her for that purpose. None too soon for her welfare did Portugal shut these places down. It was the first step towards recovery.

* * *

Let us turn from such peculiarly material considerations, troubles and doubts of the passing time, to eternal beauties, things that do not pass away. In scenic beauty-spots this western border of the Iberian peninsula is more abundant than is imagined by those who do not wander in such parts. Queen of them all is Cintra, of which the poets have chanted rapturously. One day I went to Cintra, and approached it by the road on foot. I did so in a somewhat cavilling mood, since a while before, when Cintra seemed so near, it had peevishly appeared to retreat, and there was nearly an hour of postponement of the intimate acquaintance. Consequently there was an early impression that the poets were deluders. They see and are charmed as others are, but forthwith, their imaginations aflame, they depart upon æsthetic enthusiasms of a general kind. Thus it happens that those who follow them are laden in advance with an expectancy, vague but immense, in which mood little below the standard of a Paradise could satisfy them. A glory that grows slowly, steadily, but surely, upon receptive senses, completed by a climax most superb, is hardly enough; there must be for them the quick achievement, the staggering surprise of exalted natural beauty, some gorgeous sublimity of grandeur. Of the sights of the world it has seemed to me that only one in my experience overwhelmingly seizes the artistic soul at the first glance, and that is when, as you journey up the great Niagara gorge on a sunny afternoon, the falls, in a shining distance that seems ethereal, suddenly appear on your rounding a bend. Ethereal, indeed, with gossamer vapours all about them, is just how then they seem. On this the poets have been mostly silent; few of them travelled out that way. But numbers of them proceed to Portugal, and while Byron pretended that Cintra was too splendid for his poetic pen, Southey declared that this was the most blessed spot in the habitable world. So they sang in ecstasies. Yet at first, as one strolled into Cintra on a bright spring morning, one wondered why the poets raved; for, whilst indeed one saw at the beginning that here were beauty, dignity, grandeur, and, above all, an immense variety and a fine depth of verdure, there was a cantankerous feeling that the poets, lacking judgment, had valued the scene over highly. And that, too, even though one might have been

predisposed towards it by a point or two on the first delayed admission ; for, on entering the little and ancient town in which medieval Moors and modern kings have loved to dwell, was there not a lemon-grove on one side of the road, and melons ripening on the trellised roof of a summer-house on the other, as nowhere else in these parts in February ? And passing along the winding, hilly streets, up and down which the patient pack-donkeys labour with their women-tended loads, hearing as we do the murmur of a rivulet which veritably is like a spring song of Mendelssohn, seeing a medley of the working-folks of Cintra round about a fountain, being attracted by the constant recurrence of high, smooth walls everywhere, covered with lichen, which seem to impart a peculiar strength and dignity to this place, and conscious likewise of the old Moorish palace with its strange conical kitchen chimneys towering over us upon an immediate height, we still experience a certain sense of want created by the poets.

* * *

But the effect of the charm of Cintra is gradual and quickly accumulative. There is a new and subtle revelation at each pace. A tranquil and meditative mood is essential for a proper appreciation of the glory of this spot. There should be rest, contemplation, and soliloquy by the wanderer here ; he must himself be in the poet's mood. Thus he may adventure upon the steep ascent to the heights of Penha, which in their abruptness are hidden as he wanders in the little town itself. At the summit is the famous castle, up to the time of the revolution the favourite residence of the Portuguese kings, queens, and princes, that in which they abode to the end. The journey to the heights may be made by horse-carriage, or by motor-car, or on foot, or on the back of a donkey. It is a matter for careful consideration, for this ascent, beginning at the middle of the little town, the first stage being through a narrow street, is long and steep. It may be, winding as it does, much over a mile. Compassionate folk do not ask horses, already a little tired perhaps, to make this climb for them, and the motor-car is incongruous to the surroundings and gives no space for reflection on the way, as is needed for the true appreciation and enjoyment of the time and the place. It is good to walk, and if one tarries for days and nights in Cintra and has the opportunity, this is the true way. It is better that hours should be taken for this winding mile, when the Moorish castle—not the aforementioned palace—on the twin crag opposite makes wonderment across a ravine, and in its stark barbarian grandeur poses before us as we move about, casting the view from many different points. The other way is by donkey-back, and it is recommended for its adventurous flavour and its appositeness to the

circumstances, since it is well known that the Moors rode donkeys, and after them Robert Louis Stevenson when engaged in certain travels. We should, then, ascend the Penha by donkey rather than grind and groan along that glorious path in a motor-car ; but not all who thus adventure, with only such experience of the ass for riding as was gathered spasmodically on sea-side sands in a distant childhood, have a fair appreciation in advance of the importance of preserving the centre of gravity of the human contrivance over the spine of the patient animal, and the difficulty of doing it. Good it is to go up to Penha on the back of an ass, pleasant the dainty patter of its hoofs along the moistened road, but bad that anything should detract from an intense concentration and the tendency to deep reflection. For as we climb on and round by this winding, shady, perfumed road, up the steep heights of this rock on which the palace is perched as an eagle's nest, the majesty of Cintra fills the soul. To a scene of massive verdure, viewed across depths from wooded shades, there is added that sense of solitude and eternity essential to what is truly sublime in nature. Over the walls, green lichen still, there are precipices, ravines ; and as we mount the hill, the instinct of approach to the hidden palace increases, though it is never to be seen until the last. We pass enormous boulders bordering the walk, looking as if they might have been hurled there in some mythical age when Hercules and Titan revelled in such a playground, and then, through the gates, there is a sudden lapse to the gentleness of flower-laden gardens, and we reach the palace doors.

* * *

Within the Penha palace are wonders enough, and sadnesses with them. Of the pomps and vanities of earthly poses there are morals written silently. Here is the bedchamber, with domed ceiling, of a still living queen who slept there on her last night in Portugal ; here by the bedside is the candle, with blackened wick, she extinguished as, uneasy, she sought her slumber then. There lie upon a table in an adjoining room a number of illustrated papers dated for that very week of flight ten years ago, and there are periodicals of social gossip telling of the doings of kings and queens and those concerned with them. But from this that passes, irony speaking from every point, one moves to the terrace without, and, near the golden cupola, gazes on that which does not pass away. For here is a view, so splendid in its spaciousness, that is one of the grandest the world affords. For fifty miles or more we look across a plain of Portugal, white villages glistening on many spots, Collares of the vineyards, Montserrat of the beauteous gardens near, the convent of Mafra out upon a distance, Lisbon and the Tagus, and the blue Atlantic blended into the sky

so that ships seem hanging to the heavens ; and in the foreground or the middle distance, giving strength by contrast to the rest, that recurring, awesome rock on which the Moors in their intrepidity built themselves a fastness. . . . And if Penha is in her moods, even while you gaze in

wonder, while you feel that, after all, the poets wrote but a little of the truth, she may with jealousy suddenly, in an instant, wrap impenetrable mist about you, snatching away the gorgeous scene. Then, wondering, humble, you feel fearfully and carefully for your descent.

THE PARTS MEN PLAY.

CHAPTER XXII.—*continued.*

II.

‘MR VAN DERWATER,’ said the chairman hoarsely ; and a murmur indicated that he had voiced the wish of the gathering.

Slowly, almost ponderously, the diplomat rose, bowing to the chairman and then to Watson, who was looking straight ahead, his face flushed crimson.

‘Mr Chairman—Mr Watson—Gentlemen,’ said Van Derwater. He stroked his chin meditatively, and looked calmly about as though leisurely recalling a tit-bit of anecdote or quotation. ‘Our friend from overseas has not erred on the side of subterfuge. He has been frank—excellently frank. He has told us that this Republic has become a jest, and that we are responsible. I assume from several of your faces that you are not pleased with the truth. Surely you did not need Mr Watson to tell you what they are saying in England and France. That has been obvious—unpleasantly obvious—and, I suppose, obviously unpleasant.’

He smiled with a little touch of irony, and leaning forward, flicked the ash from his cigar to a plate.

‘Mr Watson,’ he resumed, ‘has asked what we have done with America’s soul. That is a telling phrase, and I should like to meet it with an equally telling one—but this is not a matter of phraseology, but of the deepest thought. Gentlemen, if you will, look back with me over the brief history of this Republic. There are great truths hidden in the Past.

‘In 1778 Monsieur Turgot wrote that America was the hope of the human race—that the earth could see consolation in the thought of the asylum at last open to the down-trodden of all nations. Three years later the Abbé Tynals, writing of the American Revolution, said : “At the sound of the snapping chains, our own fetters seem to grow lighter, and we imagine for a moment that the air we breathe grows purer at the news that the universe counts some tyrants the less.” Ten years after that the editor Prudhomme declared : “Philosophy and America have brought about the French Revolution.”

‘I will not weary you, gentlemen, with further extracts, but I ask you to note—and this is something which many of our public men have

forgotten to-day—that at the very commencement of our career we were inextricably involved with European affairs. Entangling alliances—no ! But segregation—impossible !’

For an instant his cold, academic manner was galvanised into emphasis. His listeners, who were still smarting under Watson’s words, and had been restless at the unimpassioned tone of Van Derwater’s reply, began to feel the grip of his slowly developing logic.

‘Thus,’ the speaker went on, ‘at the commencement, our national destiny became a thing dominated by the philosophy of humanitarianism. When we had shed our swaddling-clothes and taken form as a people, the issue of the North and the South began to rise. Because of his realisation of the part America had to play in human affairs, Lincoln, the great-hearted Lincoln, said we must have war. Against the counsel of his Cabinet, loathing everything that had to do with bloodshed, this man of the people declared that there could be no North or South, but only America. And to secure that he plunged this country into a four years’ war—four years of untold suffering and terrible bravery. When, during the struggle, Lincoln was informed that peace could be had by dropping the question of the slaves’ emancipation, his answer was the proclamation that all men were free. With his great heart bleeding, he said, “The war must go on.” Philosophy and America brought on the French Revolution. Philosophy and humanitarianism brought on the war of North and South.

‘The psychology of America, which had been hidden beneath the physical side of our rebellion, took definite form as a result. The gates of the country were open to the entire world. The down-trodden, the persecuted, the discouraged, the helpless—no matter of what creed or nationality, they saw the rainbow of hope. By hundreds of thousands they poured into this country. Slav and Teuton, Galician, Italian, Belgian, Jew, in an endless stream they came to America, and, true to Washington and Lincoln, she received them with the words, “Welcome—free men.” And so we shouldered the burdens of the Past, and men who had been slaves—white as well as black—drank from the fountain of freedom.’

There was no applause, but men were leaning

forward, afraid they might miss a single word. Van Derwater's depth of human understanding, his lack of passion, his solitariness that had been likened to an air of impending tragedy, held his listeners with a magic no one could have explained. He might have come as a spirit of times that had passed, so charged with the ages was his strange, powerful personality.

'From an open sky,' he continued, 'came the present war. The older nations, knit by tradition and startled by its imminence, flew to arms at a word from their leaders. France, who had been our friend, looked to us; but what was our position? In fifty tongues our citizens cried out that it was to escape war that they had come to America. Could we tell the Jew that Russia, which had persecuted him to the point of madness, was on the side of mercy? Could we convince the Teuton that his Fatherland had become suddenly peopled with savages? Could we say to the Irishman, bitterly antagonistic to England, that Britain was fighting for the liberation of small nations? Could we ask the Greek, the Pole, the Galician, to go back to the continent from which they had come, and give their blood that the old order of things might go on?

'But, you ask, what of the real American, descended from the men who fought in the Rebellion and the Civil War? Yes—what of him? From earliest boyhood he has been taught that Britain is our traditional enemy. To secure existence we had to fight her. To maintain existence we fought her again in 1812. When we were locked in a death-struggle with the rebellious South, she tried to hurt our cause—although history will show that the real heart of Britain was solidly with the North. In our short life as a people we find that, always, the enemy is Britain. In one day could we change the teaching of a lifetime? The soul of America was not dead, but it was buried beneath the conflicting elements in which lay her ultimate strength, but her present weakness.

'What, then, was the situation? Events had outridden our national development. Whether it could have been avoided or not I do not know. Whether our education was at fault, or whether materialism had made us blind—these things I cannot tell you. I only know that this war found us potentially a nation, but actually a babel of tongues. Without philosophy and humanitarianism this nation could not go to war—and in those two things we were not ready.

'I do not belittle the many gallant men who have left these shores to fight with the Allies, but I say that in a world-crisis the voices of individuals cannot be heard unless they speak through the medium of their nationality. The question from France is not "Will Americans never come?" but "Will America never come?" When the war found the Americanisation of our

people unfinished, it became the duty of every loyal man in the Republic to give his very life-blood to achieve solidarity. Do you think we could not see that the Allies were fighting our battle? It was impossible for this nation that had shouldered the problems of the Old World not to see it—so we began the education of all our people. We could have hurled this nation into war at almost any hour by an appeal to national dignity, but our destiny was imperative in its demands. Not in heat, which would be bound to cool; not in revenge, which would soon be forgotten; but by philosophy and humanitarianism alone could this great Republic go to war.

'Yet, when this Administration looked for help, what did it find? The two races that come to this country and never help its Americanisation are the Germans and the English. They remain true to their former citizenship, and they die true to it. Gentlemen, that must not be again. America will always be open to the world, but he who passes within these gates to live must accept responsibilities as well as privileges.

'I am almost finished. For two years and a half we have fought against the disintegrating forces within our country. We have endured the sneers of belligerents, the insults of Germany, and the tolerance of Britain—and still we have fought on. Literally we were struggling, as did our forefathers, for nationhood. But let me ask Mr Watson if our psychological unpreparedness was entirely our fault. When Britain allied herself with Russia, did she give a thought to the effect it would have on the American mind? To us, Russia was the last stronghold of barbaric despotism, and yet Britain made that alliance, identifying herself with the forces of reaction. I do not say that we would have entered into a similar or any agreement with Britain, but there are alliances of the spirit far more binding than the most solemn treaties. I accuse Britain of failing to make the advances toward a spiritual covenant with the United States, in which lay—and still lies—the hope of this world.'

A messenger had entered the room and handed a note to the chairman. It was passed along to Van Derwater's place and left in front of him. He took it up without opening it, and fingered it idly as he spoke.

'A nation does not need to be at war,' he went on, 'to find that traitors are in her midst. The struggle of this Administration for unity of thought has been thwarted right and left by men of no vision, men drunk with greed, men blinded with education and so-called idealism. Mr Watson, you ask what we have done with America's soul. I will tell you what we have done for it. There are many of us in this room who have given everything we have—our time, our friends, and things which we valued more

than life—because we have respected the trust imposed on us of maintaining America's destiny. I am sorry for your empty sleeve. But let me assure you that we, also, have known suffering. Because we believe in America—*first, last, and always in America*—we have stayed here, enduring sneers and contumely, in order that when America speaks it will be like the sound of a rushing cataract—one voice, one heart, but the voice and heart of Humanity. In no other way can America go to war. And until that moment arrives I shall wear this garb of neutrality as proudly as any soldier his uniform of honour.'

He sat down, and in an instant the whole crowd was on its feet. Men cheered and shouted, and, unashamed, tears ran down many faces. With his heart pounding and his eyes blinded with emotion, Selwyn did not make a move. He could only watch, through the mist, the figure of Gerard Van Derwater with its cloak of loneliness. He saw him look down at the message and break the seal of the envelope. He saw a flush of colour sweep into the pallid cheeks and then recede again. Still with the air of calmness and self-control, Van Derwater rose again to his feet. 'Gentlemen,' he said. The room was hushed instantly and

every face was turned towards him. 'Gentlemen, I have received a message from my headquarters. Germany has announced the resumption of unrestricted submarine warfare.'

For a moment the room swam before Selwyn's eyes. The shouts and exclamations of the others seemed to come from a distance. And suddenly he found that he was on his feet. His eyes were like brilliants and his voice rang out above all the other sounds. 'Van!' he cried, 'does this mean war—at last?'

With steady, unchanging demeanour his former friend looked at him. 'Yes,' he said. 'At last.'

And as they watched they saw Van Derwater's hands contract, and for a moment that passed as quickly as it came his whole being shook in a convulsive tremor of feeling. Then, in a silence that was poignant, he sank slowly into his chair, his shoulders drooping, listless and weary. With eyes that were seeing into some secret world of their own he gazed dreamily across the room, and a smile crept into his face—a smile of one who sees the dawn after a long, bitter night.

'Thank God!' he said, with lips that trembled oddly. 'Thank God!'

(Continued on page 488.)

FISH AND THEIR EGGS.

AS a general rule fish seem utterly careless as to what becomes of their eggs and their young. They deposit their eggs, and leave the rest to chance. In the case of such familiar fish as trout, cod, pike, &c., eggs and young are freely devoured by their own kind as well as by others. There are, however, some very interesting and remarkable exceptions, in which the care and the solicitude bestowed on the young are not surpassed by any other member of the animal kingdom.

The case of the male stickleback building a nest and guarding eggs and young is well known, and need not be dwelt upon. Any one can observe it by keeping these interesting little fish in an aquarium. We wish here to call attention to some less-known, and perhaps even more remarkable, cases.

In the rivers of the country south of Hudson's Bay there is a species of chub which the Indians of those parts call *awadosi*—that is to say, stone-carriers. Many individuals seem to club together to build a *stone nest*. They carry stones to the chosen spot, and heap them up together for a common nest. Each nest contains from a barrow-load to four or five tons. The stones, which weigh from under an ounce up to a pound, are carried in the mouth. On this nest the eggs are laid.

In many cases, as with the stickleback, it

is the male fish which constitutes itself the nurse. In that quaint little fish known as the sea-horse the male has a sort of pouch at the base of the tail. Into this the female places the eggs, and they are there carried about till hatched. More remarkable, perhaps, are the species in which the males carry the eggs about in their mouths till they are hatched. During this period, in some cases at any rate, they eat nothing. Quite a number of live young have been taken out of the mouth of a male parent. Considering that so many fish devour their own eggs, it is surely a wonderful triumph of instinct that the parent who has made his mouth his nursery should be able to refrain from swallowing eggs or young—especially after fasting, as he apparently must, for several days.

The paradise-fish from China takes the eggs in his mouth, but does not keep them there. In the first place, he ejects bubbles of air which rise to the surface, and do not burst. They form a patch of lasting and tenacious froth on the surface. Then he takes the eggs in his mouth, and places them underneath the bubbles, which thus form a sort of nest.

Occasionally it is the female which takes upon herself the duty of caring for the eggs. In a species of American fresh-water fish the female, after depositing her eggs, presses the lower part

of her body over them. And then a little receptacle is prepared for each egg in a curious way. The skin under it forms a tiny cup enclosing the egg, which ultimately becomes a little stalked globule hanging down from the

belly of the fish. These curious fringes on the female fish were observed long ago, but only recently has it been learned that they are eggs. The eggs are carried about in this way till hatched.

THE AWFUL MISS BROWN.

CHAPTER IV.—*continued.*

III.

WHEN the doctor paid his next visit he was surprised to find how Miss Brown (who as a rule was remarkable for straightforward, not to say blunt, speech) contrived to get news of her niece from him without putting direct questions. It chanced he was rather busier than usual, and as by this time she was almost completely recovered from her indisposition, he felt himself justified in neglecting to call at Hollybush Farm (which was out of his way) for two or three days.

Towards the close of the second day Miss Brown was observed to grow exceedingly fidgety; next morning her nervousness had increased. About midday she heard some one raise the latch of the garden gate, and, glancing through the window, saw Richard Merryweather hurrying towards the front-door. His step was buoyant and elastic, his face as bright as the day, which was a very fine one. Richard putting a cheerful countenance upon things in general would have suggested nothing remarkable in an ordinary way; but his appearance was that of a man animated by a joy strange and new; for things, however old, are ever new unto those to whom they happen for the first time.

Miss Brown experienced a sudden sense of relief, and, simultaneously, a hardening of the heart towards him, as she went to the door to inquire his business.

'Well,' she asked, 'what do *you* want?'

If Miss Brown had regained her self-possession, it was quite evident that Richard was flurried and excited to the verge of incoherence. 'Bella couldn't rest—positively couldn't rest,' he exclaimed, 'until I promised to come and tell you it was all right.'

'Tell me, *what* was all right?' demanded Miss Brown.

'We both made sure you'd be glad to hear it. I say, Miss Brown,' pleaded Richard, '*do* say you're glad to hear it! Let me tell her you are. Dear girl! It will make her *so* happy.'

'Richard Merryweather,' she said, glancing at him contemptuously, 'what do you mean? Are you mad?'

'I think I am—just a little. I can't help it. I've been so anxious, and it's such a relief to have it over, and both of them doing famously. Dr Rowley says he never saw a finer child.'

'Oh, *that's* what's the matter with you, is it?

Well, you've no one to blame for it but yourselves.'

'Miss Brown!' (more beseeching and breathless than ever). 'At a time like this—bygones be bygones—after all she has been through'——

Hester Brown was a woman, after all, and could not help being subject to a few human weaknesses, however hard she had striven to be rid of the whole catalogue. In spite of herself, her eyes and her voice softened, though, unfortunately, she took too much for granted.

'I have no objection to your saying that I hope the little girl'——

'But it isn't a girl,' interrupted Richard.

'What!' cried Miss Brown.

'It's a boy,' he explained.

'A *boy*!'

'Yes. As fine a little fellow as ever you'——

Miss Brown fell back across her threshold, and shut the door in his face.

'It's just like him,' she muttered to herself bitterly. 'I might have known it!'

To have the door banged in his face did Richard good in a way. It pulled him up, and steadied his nerves, as a bucket of cold water might have done. He laughed gently to himself as he thought, 'She was going to give me a message of some kind, and I won't go back without one, if I can help it.'

He heard Miss Brown's voice, and guessing it came through some open window near at hand, followed the sound round a corner of the house. It was the kitchen window, and the lower sash being raised, he thrust in his head.

'Miss Brown!' he said. 'Do, please! Just a few kind words. It won't cost you much to say them, and they'll be worth a lot to her.'

Miss Brown was quite angry—first, at the sex of her new relation; next, at being attacked a second time, before a staring country wench with round eyes and an open mouth, who stopped in her work to listen. The first thing she did was to close the window with such violence that Richard had to withdraw his head rapidly to avoid being guillotined. Then she left the kitchen, and ascended to her own chamber, whither he could not follow her without a ladder. She heard his lingering step below; and, standing a little back within the room, she watched to see him fairly off the premises.

At last, slowly and with bowed head, he went down the path towards the gate. As he passed

it he turned with a longing glance, and a face so sad she would hardly have known it. When he went on again she saw how different from the brisk, eager tread of a few minutes before was the heavy step with which he was returning to his young wife and newly born child. Before he had gone far he paused, as if minded to retrace his steps and try again; but all his old light-hearted hopefulness seemed to have deserted him. He shook his head, as if he thought, 'There's no help for it!' and then she lost sight of him.

She started, as she felt something tickling her cheek. She brushed it away, like a fly, and said, 'Hester Brown, don't be a fool!' But the thought of Bella, awaiting her husband's return with a longing which was doomed to disappointment, *would* intrude itself; and, willy-nilly, Hester Brown was destined to make a fool of herself.

CHAPTER V.

I.

RICHARD had been sure Miss Brown would melt when she heard the news—the great news!—and that all would be forgiven. A sanguine temperament has its drawbacks. It may help a man over many obstacles in the path of life; but if he comes to a fence which *won't* be negotiated upon any terms whatever, his despair is proportionately greater than that of the pessimist, who, expecting nothing but disappointments, usually gets what he bargains for.

When Merryweather came within sight of his own house his heart sank as he thought of the task before him. How could he tell Bella the result of his errand to Miss Brown? How could he comfort her when she knew? Should he hasten back to Hollybush Farm, and once more entreat her, or upbraid her with her hardness, and try to move her that way? Move her! Could anything move her? And that poor girl lying there, anxiously expecting his return with the message she was longing for! Good heavens! What was he to do? For the first time in his life this good-natured fellow found the world out of joint. In his despair he clenched his hand and struck his forehead; then he strove to calm himself, and make the best of this bad job.

Suddenly, as he looked back along the road, he gave a great gasp of astonishment. Round a far-off bend, a tall, vigorous woman was coming rapidly towards him with swift, powerful strides. There was no mistaking Miss Brown, though he could scarcely credit his eyes, even when she stood in front of them.

'Have you seen her yet?' she asked.

'No; not yet,' he answered, still regarding her with amazement.

He thought she looked greatly relieved, as they walked on together without another word; for Richard's heart was too full for speech, and Miss Brown was rather out of breath.

When they came to the house she stopped and said, 'Don't you think she ought to know I am here, before we meet?'

'Miss Brown,' broke out Richard, in unbounded gratitude for the turn things had taken so unexpectedly, at the very acme of his despair and desperation, 'she will be overjoyed—it will do her more good than all the—this really *is* kind of you—I am deeply'—

'Answer my question,' commanded Miss Brown.

'Yes,' said Richard. 'It will be such a surprise that I think—I really *do* think it would be better for her to know you are here before she sees you.'

'Then,' replied Miss Brown, pointing sternly to the door, 'go and tell her!'

II.

'It's wonnerful!' said Farmer Dobbs, a day or so after, when he and his cronies were assembled at 'The Load of Hay.' 'It's downright wonnerful! Who'd ha' thought as he'd ha' worked a reg'lar miracle wi' that there baby, and wi' a woman like Miss Brown?'

'Worked a miracle wi' a baby?' sneered Giles Jobson. 'It worn't him nor it worn't the baby. Him and his baby! It was Miss Brown as thought she'd do it, and did it; just as she thought, for the last twelve months, as she wouldn't do it, and didn't.'

'Well, she's been there pretty reg'lar ever since,' said Dobbs.

This was the truth, for regularly, once a day, Miss Brown called to see her niece—which was much for such a busy woman. When Bella was up and about once more, her visits became less frequent; but there was no sign of their ceasing altogether. Miss Brown might fancy she despised herself for consenting to a reconciliation, after holding out for a whole year; but she could not conceal the fact that she was a happier woman for her weakness.

Dredgefield agreed with Farmer Dobbs in thinking it wonderful, but Miss Brown *was* Miss Brown; so there was no more to be said.

III.

What would Dredgefield have thought if it had witnessed a little incident which happened when Bella's baby was three months old? One day, when Miss Brown was present, Richard held the infant in his arms, and, uttering certain parental inanities, swung it gently to and fro in front of her. She looked on in grim silence until, during one of these oscillations, its head seemed to go dangerously near the edge of a good solid table that stood in the centre of the room.

Then she started up. 'Tut, tut!' she cried in angry alarm. 'Give it to me!'

And she took it! *Miss Brown actually took the baby*; and, what is more, she did not give it up again until she rose to go, when she restored it to its mother with a caution against masculine incompetence.

Bella laid it asleep in its little cot and accompanied her aunt into the garden, to take leave of her.

'I'll be very careful, aunt,' she said. 'Perhaps Dick is a little clumsy with baby. But, aunt dear,' she added coaxingly, 'isn't he a good fellow?'

Miss Brown hesitated. She had yielded so much already that she found the words difficult to say; but they came at last. '*He might be worse.*'

'Dick!' cried Bella, after Miss Brown had gone. 'Dick!'

He ran out. 'What is it?'

'What *do* you think? I asked Aunt Hester if you weren't a good fellow, and she said you might be worse!'

'Hurrah!' shouted Richard, almost loud enough to wake the baby. 'I *knew* she would come round!'

THE END.

THE MONTH: SCIENCE AND ARTS.

A PRINTING-PRESS FOR THE OFFICE.

IN many large business-houses there is an almost constant demand for printed forms of one kind or another, and sheets which are typewritten and duplicated would often be printed if suitable apparatus were available in the office. Such apparatus is furnished by the 'Multigraph,' by means of which type can be set up and printed from by any one of average intelligence. The basic part of the machine consists of a small rotary printing-press, which may be either turned by hand or driven by a small electric motor, the electricity being obtainable by connection with an ordinary electric-light plug. The type is very short, and is cut to fit into dovetail grooves in segments which can be quickly attached to the printing-drum. It can be set by hand or by a semi-automatic device to be described later. In its simplest form the machine may be used for printing or reproducing typewritten letters by means of a broad ribbon which is large enough to cover the complete body of type. When driven by an electric motor, and, therefore, being run at a much higher speed than when turned by hand, the 'Multigraph' is fitted with an automatic paper-feeding device, which holds 500 sheets and stops the machine when the feeder is empty. Another useful accessory is an automatic platen-release, which prevents the type from printing on the platen when the supply of paper fails. Other attachments include an 'ink-fountain' and a set of rollers for using printing-ink of any colour, and for facilitating printing from electrotypes; also a device for printing facsimile signatures at the same time as letters, an electro of the desired signature being inked in a special colour by a separate mechanism. The semi-automatic setting-up of the type in the segments is accomplished thus. In the machine for effecting it, the type is carried in a grooved drum, and the segment to be filled is mounted with its grooves opposite those in the drum.

Across the top of the machine is a bar marked with the letters of the alphabet in various types. This bar is provided with a sliding indicator, which is moved by means of a hand-wheel by the left hand of the operator, while the right hand manipulates an operating-key. Having set the indicator to the letter wanted, the operator turns the key, which slides the letter from its groove in the type-drum to the corresponding groove in the segment. The operation is performed quickly, a smart man or woman being able to set up eighty words a minute. The complete outfit includes a printing-machine and the apparatus for setting the type; but, for use where space is limited, a machine is also sold in which the printing and the type-setting devices are combined. With this machine, however, the setting of type cannot be carried on while printing is proceeding, as is the case with the separate machines. The printing-machine will produce forms, circulars, or letters at rates up to 4800 an hour, and it is said to save 40 per cent. of the charges made for printing such matter.

AN IMPROVED EARTH-AUGER.

When fencing is put up, it is necessary to dig for the posts a series of holes, varying in depth from two to three feet. These holes need be only just large enough to take the bottom of the posts, but if dug with a spade they must be much bigger at the top to enable the operator to get at the bottom, the result being that the posts are supported in the main by loose, freshly-filled-in earth. With the 'Empire' earth-auger, however, holes can be bored of exactly the right size, so that the posts are held rigidly in position by undisturbed, firm ground, while the labour involved in digging the holes is vastly reduced. The auger proper is fitted with two hard steel blades, one of which can be opened to shake out the earth when the auger is full. It is turned by a vertical spindle terminating at the top in a wooden crossbar; in fact, the tool

closely resembles that used for boring wood. The implement is made in two sizes, one of which can be adjusted to cut holes from five to eight inches in diameter, and the other to cut holes from eight to fourteen inches across. Each size has a maximum cutting-depth of three feet six inches.

A NEW CHURN FOR THE HOME.

In these days of high prices it is not surprising that in many households the cream is skimmed off the milk and made into butter. Where the quantity is very small the churning is often done in a bottle or a jar, but for larger quantities small mechanical churns are obtainable. Most of these involve the turning of a handle, which, by means of gearing, rotates a vertical stirrer. Recently, however, a simpler form of home butter-churn has been placed on the market. This consists of a cylindrical vessel, made of tin-plate, nine inches high and six inches in diameter, into which the cream is poured. Right up the middle of the vessel is a perforated wooden partition, dividing it into two equal parts. Fitting exactly into each of these halves is a perforated, semicircular, wooden plunger, fastened to the bottom of a long wooden rod which serves as a handle. These rods or handles pass through holes in the lid (also of tin-plate) which forms the top of the churn, and is held firmly in place by fasteners connecting it with the container. The butter is made by lifting up and pressing down each handle alternately—one up, the other down—so that the cream is first forced by one plunger through the perforations in the centre partition, and is then forced back again so quickly by the other plunger that the cream is always kept in motion. The working of the plungers, while very easy, thus gives the maximum amount of agitation to the cream, and the butter forms comparatively quickly. The churn is made in three different sizes, which are capable of dealing with $3\frac{1}{2}$, 5, and 7 pints of cream respectively.

SOME PARTICULARS OF THE 'BIG BERTHAS.'

Among the more sensational incidents of the Great War, few excited greater interest than the bombardment of Paris by abnormally long-range guns from a distance of over seventy miles. Until recently particulars of these guns and their mountings were withheld by the Allied Governments, but lately they were published in the *Journal of the American Society of Engineers* and quoted in *The Times Engineering Supplement*. It will be remembered that the shells which fell in Paris in 1918 were comparatively small, being only $8\frac{1}{4}$ inches in diameter, and all gunnery experts agreed at the time that they must have been fired from an enormously long gun. This proves to have been the case, the 'Big Berthas' having a length of no less than 118 feet. The monsters were made from worn-out 38-cm.

(15-inch) naval guns, which were bored out and fitted with rifled tubes having the correct diameter for the $8\frac{1}{4}$ -inch shells. These tubes, however, were much longer than the old guns, which measured 56 feet, the new length being $98\frac{1}{2}$ feet. Even with these long barrels it was not possible to give the shells enough speed to carry them to Paris, and extension pieces, measuring 19.7 feet, were added, making a total of just over 118 feet from breech to muzzle. The weight of the old guns was increased from 68 to 142 tons by the new tubes and extensions. A velocity of from 4760 to 5090 feet per second was imparted to the shells during their passage through these long barrels, but the pressure at the breech was not appreciably above that usual in naval guns—about 20 tons per square inch—the speed being produced by the continuous pressure throughout the long length. Before these guns were brought into use it was thought that no increase in range could be achieved by increasing beyond 45° the angle made by the gun with the ground—the angle of elevation, as it is called—but 'Big Berthas' were given an elevation of 55° . Each shell weighed 264 lb., and measured about 19 inches in length, but the latter figure was approximately doubled by the addition of a false cap to reduce the air resistance to a minimum. It is considered probable that each of these guns was worn out after firing fifty rounds, but the tubes were thick enough to stand reboring to $9\frac{1}{2}$ inches, and subsequently to $10\frac{1}{2}$ inches. In fact, during the last stage of the bombardment $9\frac{1}{2}$ -inch shells were coming over. Seven of these guns were made and used, while three were in course of construction at the Skoda works in Austria when the armistice was signed. It was here that a commission of ordnance officers investigated the big guns in the spring of last year. An emplacement for a 'Big Bertha' was found near Château-Thierry in August 1918 after the German Army had retired. This consisted of a base measuring about 35 feet in diameter, with a turn-table $28\frac{1}{2}$ feet across, which was supported on 112 8-inch steel balls. Mechanical means were provided for pointing the gun in the right direction, and for giving it the necessary elevation.

GETTING UNDER A MOTOR-CAR MADE EASY.

Few owners of cars care to lie on their backs on a muddy road under the body of their car to adjust or repair parts of the mechanism; yet such operations are not infrequently necessary. To enable them to be carried out with a minimum of discomfort, an American inventor has devised what he calls an 'Auto Crawler,' which consists of a curved trough, mounted on swivelling castors, to fit the back of the operator, so that he can move himself easily into the required position. As described in the *Scientific American*, the trough is built up of wooden slats, is provided with a detachable head-rest, and is

collapseable, so that it can be folded up into a small compass and stowed under a seat.

AN UNPUNCTURABLE PNEUMATIC TIRE.

The problem of inventing for bicycles and motor-cars a pneumatic tire that will not puncture must have occupied some of the best brains in the world at one time or another, and many inventors are still at work trying to solve it. Whether the 'Rapson Unpuncturable Tire' will prove to be a satisfactory and final solution remains to be seen, but two out of the four fitted to a Rolls-Royce car have recently stood up to a road-test of over 5700 miles without being punctured, while four previous tires of the same kind were run on the same car for 11,000 miles without being pierced. The outer cover of the Rapson tire is very similar in form to that ordinarily used, but the air-tube is much smaller and thicker than is usual. As in the ordinary tire, the air-tube is next the rim, except for the thin parts of the cover, which fit into the rim-grooves. This arrangement leaves between the air-tube and the cover a considerable space, which is partially filled by what the inventor terms 'a deflector,' made of rubber. The inside of the 'deflector' fits closely round the air-tube, while the outside is fluted in what may be described as the longitudinal direction, forming three ribs and four channels. Ribs on the inside of the cover fit into the two side-channels, leaving one rib directly over the tread, with an air-channel on each side of it. Holes are also made round the 'deflector' under each rib. According to the inventor, if a nail penetrates the tread of the outer cover, it is turned to one side by the 'deflector,' instead of passing straight through into the air-tube. In any case, only an unusually long nail could cause a puncture, owing to the great thickness of rubber to be passed through. Most experts agree that the Rapson tire promises well, and the makers are showing their confidence in its future by arranging to manufacture it on a large scale.

FROM THE EARTH TO THE MOON BY ROCKET.

It is somewhat surprising that the rocket, which has been a familiar feature of firework displays for so many years, should have remained *in statu quo* so far as efficiency of propulsion is concerned. This lack of progress has recently been demonstrated by Professor Robert H. Goddard, who has been trying experiments with various forms of rockets at Mount Wilson Observatory, California, U.S.A. No doubt cheapness of production rather than efficiency has been aimed at in the ordinary firework type of rocket, but apparently improvements could be made which would enable these projectiles to rise to much greater heights than they do at present without any increase in their consumption of explosive. Professor Goddard set himself to work at this problem with a view to producing a

rocket capable of exploring the earth's atmosphere at great heights. He consequently devoted his attention primarily to improving the means of propulsion. With a nickel-steel combustion-chamber, fitted with the most efficient form of discharge-nozzle, the professor has obtained speeds of discharge of nearly 8000 feet per second, with a calculated efficiency of 64 per cent. These figures are a vast improvement on the firework or signal rocket, from which the gases issue at a rate of 1000 feet per second, with an efficiency of only 2 per cent. From a rocket fitted with the new form of nozzle, and containing a number of charges which will be ignited in succession, some remarkable results are anticipated. For instance, with a total weight of 3.6 lb., including recording-instruments, the new rocket is expected to reach a height of 35 miles, while nearly 438 miles would be attained with a weight of 12.3 lb. Naturally any records secured by the instruments would be destroyed if the latter were allowed to fall without being checked, 'but,' says *Popular Science Siftings*, 'control of the speed of descent calls for only a simple arrangement of tiny parachutes, adding practically nothing to the weight carried.' The results of the experiments made so far have given rise to the suggestion that with a rocket carrying a sufficient weight of explosive it might be possible to reach the moon. Rough calculations indicate that a rocket with a weight of 1274 lb. would proceed to a point beyond the control of the earth's gravity, when it would go on until it came within the influence of another body—say that of the moon—if proper precautions were taken.

THIEF-PROOF DEVICE FOR MOTOR-CARS.

It is common knowledge that large numbers of motor-cars are stolen, and many thief-proof devices have been invented to check this nefarious practice. Not all of them, however, ensure absolute security, but the device known as the 'Camelok' is calculated to defeat the most expert car-thief. It consists of a lever which locks down over the foot-brake pedal, thereby locking the brake hard on. When out of action, the lever is held in a vertical position by a laminated spring. All the chauffeur or the owner has to do to render the car thief-proof is to press down the lever with the foot and snap it into the lock, when it can be opened only by a key specially made to correspond with that particular lock. With the foot-brake hard on, it is impossible for an unauthorised person even to tow the car away, let alone drive it off. The application of the lever prevents a car from moving when stopped on the steepest gradient. Made in oxidised steel, the 'Camelok' (which weighs slightly under three pounds) is neither in the way nor unsightly, while it enables an owner to leave his car unattended with perfect confidence. Each is fitted with a high-class, brass lever lock, and, as has already been implied, no

key will fit any lock but the one for which it was originally designed.

A FRAGRANT YET POWERFUL DISINFECTANT.

Their peculiarly distinctive smell and the possibility of their staining articles with which they come in contact have long been objections to the more extended use of disinfectants. These drawbacks have, however, now been overcome, and there has recently been placed on the market a substance which is not only a disinfectant six times as strong as ordinary carbolic acid, but is an agreeable perfume as well, for it consists of the essential oils and attars of flowering plants combined with a most powerful germ-destroyer—formaldehyde. A unique feature in this fragrant germicide is that the watery solution of formalin has been combined with the essential oils to form a clear solution without the aid of spirit, so that the compound consists almost entirely of these two ingredients, forming a concentrated solution which necessitates dilution with water to the extent of forty times its own volume. Thus diluted, the preparation is distributed by means of a very fine spray, which not only carries the disinfectant into the most remote corners of the room, freeing it of all airborne germs, but permeates the apartment with the particular perfume—pine, lily, lavender, lilac, May-blossom, wallflower, carnation, or briar-rose, for example—which makes the greatest appeal to the lady of the house. Moreover, any one present inhaling the fine particles of spray thus laden with essential oils is strengthened in his powers of resistance to the attacks of infectious germs of any kind, for essential oils, when sprayed into the air, stimulate the germ-resisting power of the mucous membrane lining the nose

and the throat. Another good feature of this preparation is that it is a valuable protection against insects, compelling house-flies and other small but undesirable inmates to remove from the area in which it is used.

A NEW METHOD OF RAISING SUNKEN VESSELS.

There has recently been patented a device for raising sunken ships which bids fair to be highly effectual. The principle underlying the invention is the firing into the vessel of a novel form of grip. This, after penetrating the hull, automatically opens out two extending arms, which firmly grasp the plates. The grips are discharged from a special gun by means of compressed air. After being loaded on the surface, the gun is submerged to the level of the vessel, and is then fired by electricity, magnetic power being employed to keep the muzzle of the gun pointing towards the vessel. The gun can be raised to the surface again and reloaded as often as is necessary. When a sufficient number of grips have been placed in position, the vessel, if it is not at too great a depth, can be refloated by means of the cables attached to them. If, however, the water is too deep to permit of this, specially constructed cylinders are slid down the cables, and compressed air is pumped into them until they are buoyant enough to raise the vessel. 'It is stated,' says *The Nautical Magazine*, 'that offers to purchase the patent have already been made by several shipping and salvage companies.'

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE FAITHFUL HEART.

By FREDERICK TILSLEY, Author of *Cheerio*.

I.

CHARLES HENRY PORSON, but recently returned from foreign lands, glanced wearily about the principal thoroughfare of the dreary but select suburb that was his home, and swore softly under his breath. Less than two years ago the place of his birth had seemed a very desirable place indeed, but now he regarded it without enthusiasm.

'What a hole!' he muttered with intense disgust. 'What a dreary, lifeless hole! The war that changed the face of Europe was evidently not big enough to make any appreciable difference in the old home town.'

He produced his cigarette-case and flicked it open.

'I have just purchased cigarettes from the same elderly tobacconist who used to serve

me seven years ago, and he doesn't look a day older.'

He searched for matches, and then shivered as a gust of wind chilled the back of his neck.

'The same fat barber who mutilated my hair and the King's English simultaneously in '14 repeated the performance yesterday, confound him! He appears, however, to have engaged a fresh lather-boy; but, then, he never could keep the same boy for more than two weeks.'

Finding his matches at last, Charles lighted a cigarette.

'The same red-faced tram-driver has just cracked the same hoarse and hoary joke with the same red-faced butcher as he passed the shop, and that tired-looking lady across the road pushed that same creaking bassinet about this same street when William was still German Emperor. The contents of the bassinet are

probably different, but they make a very similar noise.'

He smiled and raised his hat.

'That tall, blonde girl who is dressing the window of The Largest Millinery Establishment smiled at me in just that way before the war. She has put her hair up, to be sure, and the fine dark eyes are not so shy as they used to be. Probably she powders her nose every morning and keeps company with a manly warehouseman every evening, but otherwise she is very little changed. Immediately opposite me I see the dear old church in which I was christened—the clock is seven minutes slow, as usual.'

Resuming his cigarette, Charles noticed that the same policeman upon whose evidence he had been fined for joy-riding on his first motor-bicycle years ago had paused near the bank, and was now regarding him a trifle suspiciously.

Charles grinned.

'P.-C. Brown has noticed me talking to myself, and is now mounting guard over the bank in case I attempt to hold it up with a loaded revolver. Splendid fellow, it's a shame to disappoint him, but I'm afraid I must—for one thing, I've no revolver. And now here comes the same old downpour of rain. What a hole! One of these days I shall pack up and clear out to South America or the west coast of Africa, or somewhere.'

Neither South America nor the west coast of Africa being immediately available, however, he turned up the collar of his coat and moved gloomily in the direction of a near-by picture-palace, which advertised a *matinée* for that afternoon. Near the entrance he paused in order to inspect a highly coloured poster which depicted a large young man in a very blue suit, who, with an expression of concentrated gloom in his protruding eyes, was carefully steering an expensive motor-car over a steep cliff.

THE FAITHFUL HEART!

A soul-stirring drama of love and hate, in five parts, featuring George F. Jackson; produced by Charles B. Johnson and Henry J. Sampson; written by James L. Dobson; Photographer, Cyrus K. Bragson, read Charles H. Porson, and shuddered.

He paused irresolute for a moment, glancing wildly about as though seeking some avenue of escape, and then, an extra damp gust of wind assisting him to make up his mind, sighed and accepted the inevitable.

II.

The entertainment had already begun, and the fifty-second episode of a serial that was unspeakable in every sense of the word drew to a thrilling close as a uniformed attendant, armed with an electric torch of dropsical proportions, guided Charles through that throbbing darkness which is peculiar to the cinema, and deposited him in a seat. The villain of the serial having

disposed of the heroine for still another week by carefully suspending her by the hair over a vat of boiling acid, to the accompaniment of suitable music from the orchestra, a brief interval was announced, and when the lights went up Charles seized the opportunity to glance about him.

Evidently the afternoon *clientèle* of this particular cinema was not extensive, for the audience appeared to consist principally of a few elderly ladies, several young children, and, in the very next seat to Charles, a girl of perhaps twenty-three years of age. He noted with considerable satisfaction that the seats in their immediate vicinity were none of them occupied, and thought how pleasant it would have been if only he had known her.

'I'm not particularly keen on bobbed hair,' he reflected, 'but I would much rather talk to her than follow the agonised throbs of "The Faithful Heart."'

Watching her furtively from the corners of his eyes, he saw that she was possessed of a sallow, futile sort of prettiness that might with luck survive three years of married life, and then—

And then she turned her head lazily and looked at him. Charles drew a deep breath.

'Good-afternoon,' he said calmly. 'I'm sure I've seen you before somewhere.'

'I think you are mistaken,' she answered, and looked straight before her again. Her voice was cold, but not sufficiently so entirely to suspend operations.

'I know I can't prove it,' admitted the persistent Charles, 'but I'll swear I'm not mistaken.'

Convinced by his tone that he really meant what he said, she turned again and regarded him with rather small but very blue eyes.

'You may have seen me before, but I am quite sure we have never met.'

Charles nodded.

'That's all I claimed,' he pointed out.

'Do you live here?' she inquired, after a short silence.

'In between wars, yes. I was born some years ago within a stone's-throw of this place, and christened in that old church across the road. Why should I deny it?'

She laughed rather pleasantly.

'How many wars have you been in?'

'Only one up to the present, but I'm still under thirty. Have you lived here long?'

'For the last—let me see—six years.'

'Since you were seventeen, in fact,' murmured the daring Charles, and a moment later found himself gazing blankly at the back of a neatly bobbed head surmounted by a small, black-velvet hat.

'Judging from the position of her head, that short, straight nose of hers must be elevated at a most alarming angle,' he reflected ruefully. Then

his brow cleared, and he grinned cynically. 'It's all right; she's only pretending to be offended in order to give me the opportunity of noticing how attractively that short hair curls about her neck.'

'Don't you think George J.—I mean George F. Jackson rather jolly?' he asked aloud, feeling vaguely that this was the correct sort of question to ask in a cinema. She thawed immediately and turned sparkling blue eyes on him.

'Rather,' she answered enthusiastically. 'Isn't he a splendid actor—and so good-looking in a—*a natural way*?'

Charles suppressed a groan.

'And so—*er—faithful*,' he suggested solemnly.

Her lip curled disdainfully.

'You are being cynical now, and I dislike cynical men intensely—there's no excuse for them.'

'Oh!' said Charles faintly.

'What right have men to be cynical? The world is theirs to do as they like with.'

Charles became apologetic.

'It's the weather,' he explained. 'I wasn't born cynical, you know, but a damp atmosphere always affects me this way. Seriously, I don't think I am going to like the principal attraction of this entertainment; I have a sort of presentiment that the heart mentioned on the Futurist poster outside will prove as feeble as it is faithful.'

'You can sneer,' the girl answered quietly, 'but there *are* faithful hearts in the world, and there are men and women who are worthy of trust.'

'A confirmed sentimentalist, evidently,' thought Charles. 'I'm quite sure I've met her before, if only I could call the occasion to mind.'

'It's not so much the faithfulness as the publicity I object to,' he said contritely. 'I consider it rank bad taste on George's part to make a public exhibition of his faithful and probably lacerated organ. But there, these Americans always were lacking in restraint. Do you know, I'm absolutely certain we have met before. I'd even bet on it.'

Another brief thaw set in, and the girl showed her rather large but very even teeth in a complacent smile. This young man was obviously sincere in his belief that he had met her before; also, he was very obviously falling in love with her. She felt rather sorry for Charles. It was, of course, very wicked of him to fall in love with her on such short notice and without a proper introduction, but, being a broad-minded girl, she was able to make allowances. Girls, even the most prudish and engaged of them, are seldom indignant with a man who has had the good taste to fall in love with them. She sighed, and removed the glove from her left hand. Charles, noticing the engagement-ring, understood the trend of her thoughts imme-

diately, and sternly suppressed a momentary inclination to laugh aloud. When she was quite sure he thoroughly appreciated the significance of the ring, she spoke again.

'Yes,' she said softly, 'there *are* faithful hearts.'

Charles stared fixedly at the ring, and removed his tongue from his cheek.

'Tell me about *him*,' he whispered hoarsely.

She gave him a sympathetic glance, and pulled her glove on again. Charles knew instinctively that he was being felt sorry for.

'There is very little to tell,' she said.

He gave her a peculiar glance, and then averted his eyes quickly.

'But tell me that little,' he persisted, 'and then I will relate a story. We will call yours "*The Faithful Heart*."'

'Don't be silly! There is really nothing to tell. Dick and I have known each other for years and years, and in our case the path of true love has run smooth. We have had no short quarrels and long estrangements, and I am convinced we never shall have, for we were made for each other. Our love has burned like a steady flame, and I am very, very happy. When he had to go out to France, our faith in each other upheld us through those terrible years of suspense; but I prefer not to talk of that—the memory is still too painful.' She dabbed at her moist eyes with a tiny handkerchief, and Charles nodded understandingly, for he was profoundly moved.

'A short but beautiful story,' he said gravely. 'You have done much to restore my faith in mankind. Thank you for telling me. And now, if you care to hear it, I will tell you my story, which may be called "*The Great and Extensive Love*." Being a sort of a war story, it is hopelessly out of date, and if you would rather not hear'—

'Tell me,' she interrupted quickly. 'We still tolerate hundreds of war films produced by people who knew nothing about the war.'

He nodded.

'That is perfectly true.'

She gave him an encouraging smile, and composed herself to listen.

III.

'I spent the first year of the war in England on special Government work,' began Charles. 'There is no need to bore you with details of this special work, and I mention it at all only because carrying it out obliged me to make a weekly journey down to town. After I had been making this journey for about four months, something rather interesting happened. Alighting from the train one morning, I found that a large crowd had broken through the barrier at the end of the platform, and upon making inquiries I was informed that a battalion of Royal Fusiliers had just left for an unknown destina-

tion, and that their friends and relatives had insisted upon giving them a genuine British "send-off." Amongst this crowd I particularly noticed a pretty little girl. She was weeping very bitterly indeed, and at her throat was the cap-badge of the Royal Fusiliers.

"A mere child," I said to myself. "But, heavens, how she must have loved him!"

Charles paused for a moment; but the girl, who was now sitting with her face averted, maintained silence, and he continued.

"Two weeks later the incident was repeated. On this occasion I was accompanied by a friend, who was able to tell me that a company of Royal Engineers had left for an unknown destination that same morning—you see, his next-door neighbour was amongst them, so he knew all about it. As we passed down the crowded platform my friend drew my attention to a pretty little girl who was weeping very bitterly indeed, and at her throat I noticed the cap-badge of the Royal Engineers. "Quite a kiddie," said my friend sympathetically. "A mere child. But, heavens, how she must have loved him!"

Charles paused again as the girl at his side uttered a little exclamation, and then, pretending not to have noticed the interruption, went on.

"Well, in the months that followed, this incident repeated itself time and time again. Sometimes the departing troops were infantry, sometimes artillery, and sometimes cavalry, but always that broken-hearted, faithful little girl came to see them off with the current cap-badge at her throat. It was getting on towards Christmas when my father died suddenly. The shock made mother so ill that for a time I thought I was going to lose her too, and you may be sure that my frame of mind at this time was not an enviable one; so, when the Medical Corps went away, I made my unhappiness an excuse to speak to the weeping little girl, who, of course, came to the station to see them off, and in this way we became acquainted. . . . When my own time came, weeks afterwards, she—she was waiting at the station. . . . Heavens, how she must have loved us!"

There was a short silence, and then the girl spoke.

"Perhaps that—that girl was acting from a sense of duty," she said in a painful whisper. "Very young and romantic girls sometimes get strange ideas, and it is quite likely she had no feeling beyond ordinary friendship and gratitude for the magnificent sacrifice they were making, for any of those boys—perhaps they were lonely boys from distant towns, boys who were miserable because their relatives and friends were far away. But what's the use? You are a cynic; you will never understand."

"You are making a great mistake," answered Charles gently. "It is because I am a cynic

that I am able to appreciate the wonderful thing she did at its true worth. Perhaps the best memory a boy could take out there with him was that of a waiting English girl—a little friend who would miss him. That he might never see her again mattered but little—only the memory mattered."

The girl turned and looked him in the eyes.

"Do you think I—I ought to tell Dick your story?" she asked quietly.

"Certainly not," he answered sharply. "I forbid you to do anything of the sort. It's my story, and you are the only one who has ever heard it. I—I shall never tell it again. I dare say Dick's a very fine fellow—handsome, manly, faithful, and all that sort of thing; but I am sure he would look upon the heroine of my story as an outrageous little flirt, and that would make me very angry. You see, it takes a cynic to appreciate the heroine of my story, and—well, whoever heard of a cynic named Dick?"

She turned away again with a little sigh of relief.

Charles echoed her sigh.

"I have one regret," he said.

"Wh—what is that?" she asked unsteadily.

"I never gave her a cap-badge. I quite intended to leave one with her when I went away, but the agony of parting drove the matter completely from my mind." He drew the tarnished ornament from his vest-pocket as he spoke. "If she still collects such souvenirs, she is very welcome to this." He sighed again. "But very likely this little heroine of mine has grown up into a dignified young woman, and thrown all her cap-badges away, and"—

The girl leaned towards him.

"And?"—

"And become engaged to some Dick or other. But—but I'd like her to have this, somehow. I don't know why, but I would."

The lights went down again. Soft music stole through the darkness, and Charles smiled as he felt her breath on his cheek. He smiled again as gloved fingers lightly touched the back of his hand, and the badge was taken from him. Then the darkness began to throb, and the title of the play flickered weirdly on the screen:

"THE FAITHFUL HEART!"

•• TO CONTRIBUTORS.

- 1st. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

SEVENTH SERIES

A DAUGHTER OF THE DOPPERS.

A SOUTH AFRICAN TALE

By E. A. THOMAS.

CHAPTER I.

THE sun, which had driven all living things to cover, was setting behind the Doornberg in flaring colours. Its rays, deflected and broken up by the summit of the cloud-crowned mountain, spread fan-like to the distant heavens, only to be lost half-way in formless vapour. Below, the earth trembled in pure delight at its release from the brazen grasp of the retiring tyrant, while the karoo bushes, stirred by the first gentle flow of the evening breeze, waved a welcome to the twilight.

There was no sign of life at the homestead. The doors and the windows—effective barriers against the intense heat—were tightly closed. The ragged blue-gum trees lined up in front of the *stoep* awaited the coming breeze with boughs exhausted and listless, while among the *katdoorns* which barred one side of the house against intrusion numberless sparrows were clamorously contending for the less thorny roosting-places.

At the rear of the house, and at no great distance from it, old Jan Klopper, Ta'antje, his wife, and their two children were patiently awaiting by the kraals the return of the sheep from the veld. Clouds of white dust in different directions marked the approach of the animals. The dead silence of the expanse was shattered by the tinkling of the bells of the *kapater* goats leading their detachments home, the shrill bleats of the lambs mingling with the deeper notes of the oldsters. Nearer the homestead a soaring hawk set the hens cackling in alarm. The rapacious intruder—usually strenuous in the struggle for existence—had indulged in a siesta during the intense heat of the day, but was now out on business. Ta'antje, marking the depredator, turned without a word from her husband's side and proceeded towards the homestead, intent upon the protection of her chickens.

As the sheep arrived they were counted into their respective kraals by Oom Jan with the unfailing accuracy born of years of practice. His habitual imperturbability was only slightly disturbed when two or three jumped the bar together; but he never failed to include the

correct number in his reckoning. Whenever the result disclosed the fact that an animal was missing, he scored the record on the herd's back with a pliant *sjambok* and deducted the value of the sheep from the 'boy's' wages. Oom Jan never doubted his count. He was sure of his figures, and acted promptly.

On this occasion there was no punishment parade, the count having proved true; so Oom Jan, accompanied by his children, proceeded to the dam to inspect the water—always an important and anxious duty; after which, the short twilight having come to an end, he sauntered off to the homestead and to supper.

Oom Jan was a good specimen, physically, of the race to which he belonged—the race which has sprung from the fusion of the Dutch settlers and the French refugees of the Cape. Tall, fleshy, huge-shouldered, broad-chested, with a face deeply browned by the ardent rays of the karoo sun, health had given him her richest gifts, and had furnished him with apparently impenetrable armour against the onslaughts of time and disease. His face reflected the melancholy quietude of his surroundings, and determination and obstinacy were written large upon it. The pervading expression was an Ah Sin-like simplicity, which, together with the great white beard, had been known to gain the owner the confidence of a Jew *smouser* (pedlar).

He and his wife were Doppers—that austere sect which looks upon most of those things commonly supposed to make life bright and enjoyable as so many snares set by Satan for the entrapping of souls. Music—other than the dreary psalm-tunes of their Church—is sinful, and dancing too great an abomination to be even spoken of. Their one and only fashion of dress is fixed and immutable as Table Mountain, and any departure from the unwritten law, however simple in execution, marks the offender out for censure by the elders of the Church. The name which this sect bears is popularly supposed to have been bestowed because of the peculiar manner in which the art of hair-dressing is practised among the male members. A basin sufficiently

large for the purpose is placed—cap fashion—on the head of the person to be shorn. The hair showing beneath the rim of the basin is trimmed off until no more is visible. The vessel, or 'dop,' is then lifted off and the full effect of the operation is disclosed. The result is somewhat mop-like, no doubt, but the procedure employed is at once easy and convenient, and, moreover, always fashionable. Being odd and inelegant only in the eyes of those not of his sect (for whose tastes he has no reverence), the Dopper cares little for outside criticism, and is perfectly happy in the approval of his own people.

Unlike the majority of Boer women—who are generous to a degree to their husbands—Ta'antje had presented her lord with two children only, a boy and a girl, who were now sixteen and fourteen years old respectively. Up to this period—notwithstanding the fact that Oom Jan was reckoned rich among his neighbours—the children had remained in darkest ignorance of the great world they lived in. A trip to Vaalbos at *Nachemaal* time was an unforgettable event in their sombre lives, poor as the experience was. On these occasions they learned to shake hands in the limp Dopper fashion, and their knowledge of worldly things, adapting itself to the subjects which made conversation interesting to their elders, was limited to the state of the veld, the prospects of rain, and the mysterious diseases which so persistently attacked the sheep. Now and again they heard of the railway-train that swept across the veld with headlong speed; but their stunted minds failed to grasp so marvellous a fact as vehicular traffic without the aid of a beast of burden. The fire, smoke, and uproar characteristic of the monster were features which made it easy for them to acquiesce in their father's oft-expressed view that such things were the work of Satan, to be avoided, and to be spoken of only in whispers. The 'bogey-man' had not penetrated into the karoo, but a fitting substitute was found in the locomotive; so that a threat to send them from home in the railway-train invariably cut short their most rebellious moods.

Nachmaal was to them an enjoyable time, and they usually proceeded to Vaalbos with their parents several days before the Sunday appointed for the solemn Sacrament. *Ooms, tantes, and nichtjes* flocked to the village in numbers, arriving in all sorts and conditions of vehicles, from the aristocratic spider drawn by shaggy, long-tailed karoo ponies, to the tented ox-wagon with its yoked and lumbering team. The young bloods, resplendent in new broad-brimmed felt hats, black coats, and lavender-coloured trousers, cantered into the village on showy horses bedecked with huge saddle-cloths of gorgeous hues. Others, in folding-hood carts drawn by dapper Paarl horses, performed the *Engelse draai* ('English turn') in

true breakneck style in front of the Commercial Hotel, to their own gratification, and to the admiration of their friends on the *stoep*.

In the evening, when fires were lighted near those mobile mansions of the African veld—the half and full tented ox-wagons—outspanned on the outskirts of the village, the children, accompanied by a 'boy,' would wander forth, unknown to their parents, to witness the unholy joys indulged in by those who were not of their sect. The gray-beards seated around the fires, and the matrons in groups by the wagons, discussing familiar subjects, offered no attraction to them; but the young people engaged in dancing had for them a fascination they were unable to resist. The children watched, open-eyed and breathless, the couples going through the maze of figures of the *drie-voor-uit* to a tune squeezed out of a weary-toned concertina by a bearded veld expert. They were sinning, and they knew it; but the indulgence in forbidden pleasures had the same attraction for them as it had for city folks, so the risk of punishment was cheerfully faced.

We left Oom Jan and the children proceeding to supper, to which the insistent tones of Ta'antje's voice was now summoning them. The meal proceeded sedately for some time, and not a word was uttered. The idle prattling of children was never heard in this solemn house. They dared not speak unless spoken to by their elders, and so they sat gravely staring at each other until the meal ended. After prayers a *balie* of water and towels were brought in by the Hottentot servant. Oom Jan and Ta'antje washed their feet and passed the vessel to the children, who performed their ablutions and then trooped off to bed.

'Antje,' asked Oom Jan, 'why does not Miss Vermooten come here now?'

'Because,' replied Ta'antje solemnly, 'she says she cannot teach Steenie from the Bible any more. The child knows everything. I heard her the other day telling the herd "boys" the story of Samson and Delilah—and quite correctly. Miss Vermooten says that you must either get Steenie other books or send her to school.'

'Why should I send her to school, and why should she have other books? The Bible was the only book I learned out of, and it was good enough for my father before me. A Boer's wife can do without learning of worldly things. It makes them sinful.'

'That is true, Jan,' agreed Ta'antje. 'And now let us go to bed.'

CHAPTER II.

STEENIE was up before the sun next morning, and assisted her father in his duty of seeing the sheep off to the veld.

Oom Jan loved her—there could be no doubt

about that; but with it all he was somewhat afraid of her. She was so different from the rest. The great brown eyes, set in a freckled face crowned by fair sun-bleached curls, spoke to him as her lips never could. Whenever he flogged a 'boy' he saw remonstrance and reproach in them, and knew that she disapproved, so that it came about that before inflicting punishment he involuntarily but silently consulted her, seeking in her beautiful eyes the disapproval he feared.

When breakfast was over she wandered across to the kraals. There her father was talking to a stranger, a battered, weary-looking man clad in a soldier's old overcoat, torn moleskins, and *veldschoens* (hide shoes) almost soleless.

'Can you speak Dutch?' she heard her father inquire. 'Because we cannot understand any other language here.'

'Yes,' replied the man in the Taal, 'I can speak and write Dutch. I am a schoolmaster. I taught Van Zyl's children at "Uitkomst." I will teach your children,' he pursued eagerly, 'if only for food. I am destitute.'

'Why did you leave Van Zyl?' came from Oom Jan.

'The children were old enough to be sent to Cape Town to complete their education,' replied the man.

'How old are they?'

'A little older than that little girl,' said the tramp, pointing to Steenie.

'Van Zyl and his wife are good old people. How came it about that they sent their children away to learn things a Boer's child does not require to know? The customs of our people are altering for the worse—and Piet Van Zyl too, of all men!'

'But,' said the broken-down schoolmaster, 'Van Zyl now knows the value of education. He has been ill, and Dr Bray spoke to him about the children. The old order of things is passing away. Education'—

'Education!' interrupted Oom Jan. 'Why do you harp upon it? What has it done for you? I know no book beyond the Bible, and yet'—and Oom Jan looked around at his thousands of *morgen*, and then contemptuously at the tramp.

The man winced. His face, weak and drink-sodden, was yet refined and intellectual in character. He turned lamely away. Oom Jan's glance, following the retreating figure, encountered Steenie's eyes. He saw in them something which impelled him to call the wanderer back.

'You may stay here,' he said sharply. 'But, look here, nothing but the Bible, you hear; nothing but the Bible!'

The man seemed to divine intuitively that the little girl was responsible for the change in Oom Jan's attitude, for as he turned his look of gratitude was not directed at the burly form

before him, but towards the forlorn little figure standing expectantly by the kraal wall.

From that moment he was Steenie's slave. She led him quietly and unobtrusively to the house, where he shed his rags and donned a corduroy suit. His appearance thereby was changed for the better, and an observer would have placed him as being a man of gentle birth; but the air of self-depreciation and humility, born of a hunted and bibulous life, clung to him like a garment that he had not shed with his rags.

It was a miserable enough post—he knew all about it; he had served on other farms in the same capacity. The last resort of the wretched, 'Cape-smoke' stricken ne'er-do-wells who roam the southern veld, the last post before the nameless grave is reached—a dog's life; but it was infinitely preferable to the footsore trudge, the scorching sun, and the karoo-bush couch. So he was content.

He could not do much with Gert, the boy, for whom the outdoor life had too many attractions; but Steenie progressed slowly but surely under his guidance, until her voracious appetite for acquiring knowledge could no longer be satisfied with the literary matter available. It was then that the forbidden fruit was tasted. She begged him to teach her the English alphabet. He gave way. He had now no will apart from hers, and, the fatal plunge having been taken, they drifted, by easy transitions, on to spelling and reading, and so to *Ebb Tide*.

What remote sentiment or reminiscence of past happiness had induced the old tramp to encumber himself on his aimless wanderings with that particular volume of Stevenson's was known to himself alone. It can but be recorded that it brought great happiness to the girl. This first dip into the beautiful sea of English literature astonished and charmed her. She was shocked by the blasphemies of the Cockney, but the bright and beautiful world disclosed to her eager eyes by the dirty little book compensated for all. Attwater naturally appealed to her, he shot so well; and at sundown she would sit on the *stoep* gazing at the clouds embroidering the horizon, wondering whether they rested over the distant coral island with its waving palms and snow-white shores.

About this time Dr Bray, the district surgeon, called at the farm on his way to the railway station. The momentous secret was imparted to him by the old tramp, for the girl knew *Ebb Tide* by heart, and new English books were required. Dr Bray spoke to her, and was struck by the intelligence which brightened her freckled face; while the English speech, with its quaint accent and guttural enunciation, both surprised and amused him. He was a man of refined and cultured tastes, and he had not, on his previous visits, been too favourably impressed

by this stockingless *veldschoen*-shod little creature. Indeed, he had scarcely noticed her, for he had a horror of *kapjes* (sun-bonnets) and *veldschoens* and slovenly *voerchitz* (printed calico) dresses. But here was a revelation. There were possibilities in this brown-eyed little girl he had never dreamed of.

'Would you like to go to a big school to be taught properly? There are many subjects you have not even heard of! Mathematics, the geography of the world, music, painting, and ever so many more things. You will become a clever woman and teach others, so that your life may be a useful one, and full of interest.'

Steenie only half-comprehended what was said to her, but what she understood flushed her eyes with brightness. She could only say, 'Please, doctor—yes, please—but father will not hear of it.'

'I'll speak to him,' said the doctor.

Steenie jumped from the *stoep* and ran towards the sheep-kraals as if she had committed a serious offence and feared punishment. She entered one of them, and peeping over the wall, awaited, with bated breath and beating heart, the result of the good-natured doctor's mission.

In the meantime Dr Bray had entered the house. He found the old people in the *zit kamer* (sitting-room) solemnly drinking coffee, and plunged at once into the subject which was uppermost in his mind. 'Oom Jan,' he said, 'that girl of yours is a wonderful child. I am surprised to find how well she has got on with old Billy.'

'Yes,' agreed the old man. 'She is a good little girl; only, she wastes too much time over her lessons. I must get rid of that English loafer; he has taught the child strange ways. She sits on the *stoep* for hours and thinks—thinks. My wife is certain she heard her converse in English with the schoolmaster the other evening. She will not mind the sheep now. If she goes on like that she will end up by marrying an Englishman.'

'She might do worse, Oom Jan. I am an Englishman, you know, and really my people are not half so bad as you imagine them to be.'

'You are one of the good ones, doctor,' returned the old man. 'You are more like one of us; you speak Dutch and you understand our ways. You don't call us ignorant, lazy Dutchmen, and you don't humbug us at *Nachtmaal* time. But the time will come when this country will again be ours. Look at Miss Vermooten's map there on the wall—she showed me Oom Paul's country. Do you see that portion coloured green? That is the Transvaal!'

'Yes,' agreed the doctor; 'the whole of that portion coloured green is the Transvaal.'

'Well,' continued Oom Jan, 'don't you see? The ways of the Lord are wonderful!'

'See what?' inquired the doctor, gazing earnestly at the old man.

'There, there!' excitedly exclaimed Oom Jan, as he ran his finger along the western border-line of the Transvaal; 'don't you see it? Oom Paul's face, doctor. There is his forehead, his nose, his mouth, his beard—just as he looks, for I have seen him. See! he is gazing straight across the British territory—the Rooi Grond—it will all be his one day.'

Dr Bray's eyes followed the strong finger as it moved slowly along the border-line, and saw what undoubtedly resembled the profile of a human face. 'You have a vivid imagination, Oom Jan,' he said smilingly; 'but you must not talk sedition. You are a British subject, and I am a J.P., so we will drop the matter and talk about Steenie. You must send her to Cape Town to be educated.'

'Educated!' exclaimed Oom Jan. 'What for? To learn English ways and manners? What does a Boer's wife want with education?'

'But she might not marry a Boer.'

'She shall,' returned the old man. 'I say so; and is she not my child?'

On each subsequent occasion that Dr Bray visited the farm the battle was renewed, but he could not prevail against the spirit of obstinacy inherent in his opponent's character, and he was about to drop the matter through a feeling of sheer helplessness, when he gained an ally from a totally unexpected quarter, and the long contest was concluded in his favour.

Ta'antje, feeling restless and low-spirited, determined to pay a visit to Juffrouw Schoonraad, the wife of Oom Jan's nearest neighbour. So one bright afternoon the Cape cart was inspanned, and Ta'antje, in her short-bodied, plain-skirted Sunday gown, drove over in state. She was struck during the course of her visit with the display of airs and graces provided for her benefit by the youngest daughter of the house, who had just returned home from Cape Town, where she had been educated. Ta'antje marvelled at the number of men that flocked about the young girl—she counted fifteen saddle-horses on the *werf* (yard, paddock), and it worried her. She felt that her daughter would make but a poor show against so much brilliancy. Swallowing her prejudices, from that moment she became the doctor's ally, thus forming a combination which her husband was unable to meet with any chance of success. And so it came about that Steenie was sent to Cape Town to complete what old Billy the schoolmaster had begun.

The claim of her brother Gert in the matter of education was at least as reasonable as her own, and the old Dopper had to give way in his case also. It was arranged to send the boy to Stellenbosch, Ta'antje having decided, under the altered conditions, to have a theologian in the family.

(Continued on page 506.)

SIR WALTER SCOTT'S FRIEND AND TYRANT,
TOM PURDIE.

By ARCHIBALD STALKER.

IN July 1804 the Sheriff of Selkirkshire, pestered by Lord-Lieutenant Napier, who insisted that the sheriff should no longer be a carpet-bagger from Edinburgh, but should have a house within his own jurisdiction, took a lease of Ashestiel, which is rather 'up,' as Abbotsford is just a bit 'down,' Tweed. He was only a little while settled in his new house and farm when a poacher was brought before him on the usual charge. The poacher pleaded guilty in a talkative and humorous way of his own; he declared that he could not get employment, that he had a wife and a crowd of bairns to provide food for, and that the only way to get food was to take the grouse that were at his doors. He fairly compelled the sheriff to let him off, possibly on some formality. The poacher got the astonishment of his life when he was offered the job of shepherd on the sheriff's farm of Ashestiel. He jumped at it, and so Sir Walter Scott got his tyrant, the affectionate, proud, dour, and faithful Tom Purdie.

In 1804 Tom was thirty-seven and the sheriff was thirty-two. Scott hated farming, but in that townless region a farm was almost a necessity for him. Accordingly it was not so much a shepherd as a shepherd-manager that Sir Walter required, and Tom soon received full authority. It was also part of his duties to keep watch over the house while the Scotts were in Edinburgh, and if in the dark winter days Tom may have longed for the return of the master, Sir Walter himself has recorded that he 'pined for the hill-side and the sweet society of Tom Purdie.' And again: 'I shall be glad to be at Abbotsford, to get rid of the town, where I have not, in the proper and social sense of the word, a single friend whose company pleases me. In the country I have always Tom Purdie.'

Exactly twenty years after they met, Scott, writing *Redgauntlet*, drew a picture of Tom, who was then about fifty-seven. 'His brow was not much furrowed, and his jet-black hair was only grizzled, not whitened, by the advance of age. All his motions spoke strength unabated, and, though rather undersized, he had very broad shoulders, was square made, thin-flanked, and apparently combined in his frame muscular strength and activity, the last somewhat impaired, perhaps, by years, but the first remaining in full vigour. A hard and harsh countenance, eyes far sunk under projecting eyebrows which were grizzled like his hair, a wide mouth furnished from ear to ear with a range of unimpaired teeth of uncommon whiteness and of a size and breadth which might have become the jaws of an ogre.'

Poverty, unemployment, and poaching (which included the risk of man-traps, spring-guns, and

thrashings) had soured Tom's naturally hard temper, but the air of Ashestiel and Abbotsford was a dissolvent of sourness, and Tom's bitterness became a sort of dour blitheness. He kept up some contempt for those who could not shoot or fish with credit, and was particularly angry with the biggest salmon he ever saw because it had been caught by an English guest—who turned out to be a Scot with an English accent. Tom was ever so pleased, and his face shone with delight, when any of the guests at Abbotsford whom he did not like got into trouble. When Constable, very fat and gouty, was following Sir Walter up and down the rough ground and through the terrible heather, protesting as he sweated and panted that there was no other poet on earth after whom he would dance in such a fashion, Tom was in ecstasy, lingering behind Sir Walter to enjoy the sight of Constable's efforts.

Tom took a measure of the sheriff that nobody else took. He was the sheriff's man. His heart swelled when the collar of his coat was grasped by his master, whose increasing weight was accompanied by a more painful limp; his pride was to be with the sheriff, and he claimed an interest in the very novels—'our buiks' he called them. But out of doors he was the elder brother, much more experienced in everything, and the sheriff was to be instructed. Even when he had to give way to Sir Walter, it was clear that he did so in order not to give offence, and that he continued to believe his own opinion and his own way much better.

For a long time Tom was confined mainly to the shepherd's job, but it is plain that he disliked it. Scott loved to have him when walking, and after the removal to Abbotsford, and as the young woods grew, the shepherd was gradually transferred to the woodlands. The sheriff's lameness increased greatly after 1819, and the sturdy shoulder became a necessity. 'What a blessing there is in a man like Tom, whom no familiarity can spoil, whom you may scold and praise and joke with, knowing the quality of the man is unalterable in his love and reverence to his master! Use an ordinary servant in the same way, and he will be your master in a month.'

When walking in rough weather Tom carried Scott's plaid, and told long, long stories, dating perhaps twenty years back, about hits and misses with the gun. When the sheriff developed rheumatism Tom insisted that their walks on cold, windy days must be by the sheltered ways, even though his master pleaded for the exposed braes and hills. They must have looked like a tall and a small brother as they wandered through the

woods and the heather. When Lady Scott issued her decision that the sheriff's clothes were getting shabby, the white hat, the green jacket, and the breeches were given to Tom, and the sheriff got a new suit, so that Tom must have seemed another sheriff, more alert, browner, and smaller. The fact that the one was tall and the other short would have given a tailor some concern, but probably it did not worry Tom.

As the woods of Abbotsford grew the sheriff's joy was to thin them with his forester. Both wore belts, and in the belt of each were an axe, a chisel, a small saw, and a hammer. If it was a big job, requiring the help of the labourers, the sheriff spent the day with them, and all were invited to supper at Tom's cottage. But even during the years that Tom was shepherd his occupation was broken by the claims made on his time for fishing and shooting excursions with Sir Walter, and with numberless guests who had to be entertained while Sir Walter was busy at 'our books,' for odd jobs about the house, and for many miscellaneous affairs out of doors and in. He was after the sheriff's own pattern, eager to be abroad, a good shot, a good fisher, a phrase-maker, strong in prejudice, and hardy as the heather. His brother was considered the best fisherman in the district, and Tom was as critical as he.

It was an incident in Tom's career as a shepherd that was responsible for Sir Walter's constant references to himself in his journal as S.W.S. The morning after that on which the news of the baronetcy reached Abbotsford, Tom was not to be found in any of his usual haunts, and he remained away all day. The other shepherd and he spent the whole day marking the sheep with an additional letter to signify 'Sir,' so that the beasts that had been marked W.S. now bore S.W.S. Tom also ordered one of the masons who were busy on Abbotsford to carve the S. on the stones that marked the boundary between Abbotsford and Kippielaw. This item of calling a mason from his work is one indication among many of Tom's authority.

The marking of sheep was very much in the manner of Tom's signpost. For the convenience of guests and strangers he erected in the woods of Abbotsford a signpost, and with his own hand painted on it: 'The Rod to Selkirk.' This brought him great fame, as Mr Polly's sign of 'Omlets' on the river brought much custom to the little inn.

Until he became pained with walking Sir Walter never rode on Sundays—not from any scruple about the day, but because he considered that a horse was no less entitled than a man to a weekly holiday. His 'Sunday pony,' as he called him, was Tom, and the sheriff laid heavily on Tom's coat-collar with his left hand. Tom was as joyful as a proud steed when the sheriff got him in his grip, and no easy grip it was. It was on a Sunday, and it was with Tom, that perhaps

the most beautiful recorded incident in Scott's life happened. There was a little dispute between Tom and him about the thinning of a hedge at Huntlyburn. Sir Walter had given some directions or advice that had not been attended to, for Tom was neither to be convinced nor directed. When they moved on it was no longer Tom's collar that Sir Walter had a hold of, but Constable's, and Tom dropped gravely behind.

They approached a gate, and Tom sprang forward to open it.

'Give us a pinch of your snuff, Tom,' said the sheriff when they had passed through, and his face, which had been vexed, cleared up.

Tom's mull was brought out, and this time when they moved on it was again his 'Sunday pony' that Scott had. When they came to the house, Sir Walter, Constable, and Lockhart sat down on chairs outside, and Tom, who ought to have taken himself off, lounged about. At length he asked the sheriff to give him a word in private, and the two stalked off into the garden. Scott reappeared alone, and his face was one smile of delight.

'Will ye guess what he has been saying now? Well, this is a great satisfaction. Tom assures me that he has thought the matter over, and *will take my advice* about the thinning of that clump.'

An exquisite relationship between master and man! The man, dour, opinionative, hard-hearted, and utterly unconcerned at disobeying his master when he thought the master was wrong, but appalled at the least estrangement; the master, an expert, ruffled for a moment at disobedience, but whole-heartedly banishing the matter from his mind and resuming his familiar ways in a moment, without any submission on the one hand or rebuke on the other. And Tom's way of putting it!

As the years passed episodes like this must have been plentiful, for Sir Walter has recorded that Tom generally contrived to be master. 'Now and then I am restive, and insist upon my own way; then comes the tug-of-war. Tom retreats, and reappears in about two or three hours with "I'm thinkin' whether ye're no richt in this matter, and I'm no sure I'll no tak' your way."'

Evidence abounds that Tom thought much more of his own skill than of the directions his master gave him, the master whose pride it was that he had had the best teachers and had read all the best books on planting. 'Tom is very costive about trees,' complained Sir Walter to Laidlaw, 'and talks of only 300 poplars. I shall send at least double that number. Don't let Tom forget hedgerow trees, which he is very unwilling to remember. He thinks he is saving me money when he is starving my projects, but he is a pearl of honesty and good intention.'

Tom had a half-bred pointer which he called Di Vernon when she pleased him. Di became an exceptional favourite with him, and he went

about boasting of her cleverness. If he stayed longer than he should have stayed at the public-house and mixed just one more tumbler than he ought, Di, he declared, was accustomed to jump up, take him by the sleeve, and howl. When shaken off she had more than once fled home and brought Mrs Purdie, whom, of course, there was no resisting. We know that Abbotsford was the home of marvellous men and dogs, but this story nevertheless exhibits Tom in the guise of a romancer, and it is to be hoped that his discourses with the sheriff were not so barefaced.

When the wild cramps came in 1819 one of the attempts at treatment was a scalding bath. Immediately the cramps came on, Sir Walter was stripped and flung into the bath, and smallish Tom was there with his sinew and strength to heave and hold the great bulk of the sheriff—'like a hauled saumon,' he muttered grimly as he struggled with him. I am sure that in his agonising pain the sheriff summoned a smile in appreciation of Tom's excited comparison.

Tom was free of the house inside as well as of the woods and hills outside. No matter how ceremonious the occasion, or how many people were present, it was a rule that when Sunday dinner was over Tom came in to drink long life to the laird, the lady, and the company, in whisky or wine as his taste varied.

In March 1826 he was definitely released from all shepherding and miscellaneous farm-work, and was made forester—a great day for Sir Walter and Abbotsford when the woods definitely had their keeper, and no less of a day for Tom, who loved the woods, and loved better the company of the sheriff. Morning after morning thereafter Tom's place was outside the window of the south-looking room in which the sheriff wrote. Time and again, playing with his own axe and with the sheriff's, Tom would pass the window, not a whit more eager for his master to appear than Scott was to go out. Often Sir Walter's sore physical trials made the allotted task of writing a burden; on such days Tom had the longer wait, and sometimes, indeed, waited in vain. At other times his persistence in hanging round the window fairly coaxed the sheriff to let the heavy task go hang. Sometimes, if he thought that time was up and that 'our books' were getting too much attention, he stood and stared in at the window till Sir Walter came.

'Our books' provided him with an occupation that was little in keeping with poaching or pony-personation. He was librarian of Abbotsford, actually in full charge of the books, and did not hesitate to remonstrate with any of the household or of the guests who marked any book or disarranged the shelves.

Tom had twenty pounds a year from the sheriff, probably a large salary a hundred years ago. His shepherd's perquisite of a certain number of sheep was worth, perhaps, as much

again, and no doubt Mrs Purdie shared in the good things of the house. Tom was much respected by the cottars and the workmen because he had saved a hundred pounds, and because his fine Family Bible had cost him seven pounds. Remembering these and other titles to regard, Tom developed a certain ceremoniousness that showed appreciation of his station. When he went out to fish or to shoot with any of the family or with visitors he would not on any account go in his working-jacket, but made a point of changing into the green jacket which he regularly inherited from Sir Walter.

Reading the Waverley Novels Tom declared the greatest of his comforts, for whenever he was off his sleep, as sometimes happened, he had only to take up one of the novels and he was drowsy before he had read two pages. This gave much joy at Abbotsford, and Sir Walter frequently repeated the story.

Tom's prejudices were his own, and bore no taint of resemblance to his master's. There were few men whom Sir Walter admired and loved as much as Sir Adam Ferguson, but Tom detested him, and lost no opportunity of dealing him sharp cuts. When Sir Walter obtained a knighthood for Adam, Tom was openly indignant. 'This will take some of the shine out of us,' he said. Skene was a great favourite, and Tom used to give him private and confidential wrinkles about salmon-fishing, 'which he thought nobody knew but himself,' wrote the ungrateful Skene.

Sir Walter found in him 'a Scotch slovenliness which leads him to see things half-finished without pain or anxiety.' This is a gift. A ploughman who can stop in the middle of a furrow; a clerk who can endure a littered desk; a housewife who can stop for a cup of tea while the house is topsy-turvy—and the millions of the rest of them—how quiet of mind, how vacuous, how enviable! And Sir Walter, whose tasks were gigantic, and who could not rest when he had a job on—how he must have despised, fretted at, envied Tom, whose mind was unhastened by anything on earth! Consider the deaths of both of them. The contrast is the same contrast as their lives provided. Old Tom had mentioned a sore throat, but absolutely nothing else. He had been out the previous day with Sir Walter and had got soaked, but no attention had been paid to that small item. He rose in the morning, and whether he felt ill or well he made no complaint, but sat down, laid his elbow on the table, put his head on his hand, and, absolutely in silence and without apparent pain, died. His family thought he had drowsed, and went to and fro for an hour or two before they tried to awake him. This was Tom's death, on 29th October 1829—three years before his master's. This was euthanasia, but Sir Walter's sufferings we know.

'There is a heart cold that loved me well,' said Sir Walter. 'I have seldom been so much shocked;' and again, 'Though I am on most

occasions like Edward Bruce, who used not to make moan for others, and loved not that others should lament for him, yet on this occasion I have felt very acute sorrow. I was so much accustomed to the poor fellow that I feel as if I had lost feet and hands, so ready was he always to supply the want of either.'

Tom lies in Melrose churchyard, near the

church, under a stone erected by Scott. Surely never was an act of human generosity so richly rewarded as Scott's reclamation of Tom. And it would be difficult to parallel the twenty-five years of comradeship between these two men, one a distinguished man of letters, familiar with kings and powerful men all over the world, and the other a rough peasant.

THE PARTS MEN PLAY.

By ARTHUR BEVERLEY BAXTER, Author of *The Blower of Bubbles*, *Merrie Gentlemen*, &c.

CHAPTER XXIII.—THE SMUGGLER BREED.

I.

ON an April evening, in the fateful year 1918, a certain liveliness could have been noted in the vicinity of Drury Lane Theatre. The occasion was another season of opera in English, and as the offering for the night was *Madam Butterfly*, the usual heterogeneous fraternity of Puccini-worshippers were gathering in large numbers.

Although the splendour of Covent Garden (which had been closed for the war) was missing, the boxes held their modicum of brilliantly dressed women; and through the audience there was a considerable sprinkling of soldiers, mostly from the British dominions and America, grasping hungrily at one of the few war-time London theatrical productions that did not engender a deep and lasting melancholy—to say nothing of a deep and lasting doubt of English humour and English delicacy.

In one of the upper boxes Lady Erskin had a small unescorted party. Lady Erskin herself was a plump little miniature who was rather exercised over the dilemma of whether to display a huge feathery fan and obliterate herself, or to sacrifice the fan to the glory of being stared at by common people. With her was her sister, the wife of a country rector, who assumed such an elaborate air of ennui that any one could have told it was her first time in a box. Between them was Lady Erskin's rather pretty daughter, and behind her, with all her vivid personality made glorious in its setting of velvety cloak and creamy gown, was Elise Durwent, enjoying a three days' respite from her long tour of duty.

The lights went out, and with the rising of the curtain the little drama of tenderness and cruelty, expressed in the medium of heart-gripping harmonies and climaxes, held the stage. From the distance, *Butterfly* could be heard approaching, her voice coming nearer as the typical Puccini progressions followed her ascent. There was the marriage, the cursing of *Butterfly* by the Bonze, and the exquisite love duet, so full of passionate *abandon*, and

yet shaded with such delicacy and beauty. At the conclusion of the act, where the orchestra adds its overpowering *tour de force* to the singers', the audience burst into applause that lasted for several minutes. It was the spontaneous gratitude of hundreds of war-tired souls whose bonds had been relaxed for an hour by the magic touch of music.

'Do you think the tenor is good-looking?' asked Lady Erskin of no one in particular.

'Who is that in the opposite box, with the leopard's skin on her shoulders?' queried the rector's wife.

'I think *Butterfly* is topping,' said Lady Erskin's daughter. 'I always weep buckets in the second act.'

'I should like to die to music like that,' said Elise, almost to herself.

II.

Close by a communication-trench, Dick Durwent stood shivering in the cool night-air. He was waiting to go forward on sentry-duty, the remainder of the relief having gathered at the other end of the reserve-trench in which he was standing; but though it was spring there was a chill and a dampness in the air that seemed to breathe from the pores of the mutilated earth. A desultory shelling was going on, but for a week past a comparative calm had succeeded the hideous nightmare of March and early April, when Germany had so nearly swept the board clean of stakes.

He heard the voices of a carrying-party coming up, and suddenly he crouched low. There was a horrible whine, growing to a shriek—and a shell burst a few yards away. Shaken and almost deafened, Durwent remained where he was until he saw an object roll nearly to his feet. It was a jar of rum that was being brought up for issue. He lifted the thing up, and again he shivered in the raw air like one sickening of the ague. Quick as the thought itself, he put the jar down, and seizing his water-bottle, emptied its contents on the ground. Kneeling down, he filled it with rum, and leaving the jar lying at such an angle that

it would appear to have spilled a certain amount, he hurriedly joined the rest of the relief warned for duty.

Dick had been on guard in the front line for an hour when he received word that a patrol was going out. A moment later they passed him, an officer and two men, and he saw them quietly climb over the parapet which had been hastily improvised when the battalion took over the position. They had been gone only a couple of minutes when pistol-shots rang out, and the flares thrown up revealed a shadowy fight between two patrols that had met in the dark. The firing stopped, and Durwent's eyes, staring into the blackness, saw two men crouching low and dragging something after them. He challenged, to find that it was the patrol returning, and that the one they were bringing back was the officer, killed.

The trench was so narrow that they could not carry him back, and they left the body lying on the parapet until a stretcher could be fetched.

Dulled as he had become to terrible sights, the horror of that silent, grotesque figure began to freeze Dick Durwent's blood. A few minutes before it had been a thing of life. It had loved and hated and laughed; its veins had coursed with the warm blood of youth; and there it sprawled, a ghastly jumble of arms and legs—motionless, silent, *dead*. He tried to keep his eyes turned away, but it haunted him. When he stared straight ahead into the dark it beckoned to him—he could see the fingers twitching! And not till he would creep near would he be satisfied that, after all, it had not moved.

'Sherwood!' He heard a quivering voice to his right. It was the nearest sentry, an eighteen-year-old boy, who had called him by the name given him by Austin Selwyn, the name under which he had enlisted.

'What's the matter?' called Durwent

Without his rifle, the little chap stumbled towards him, and, dark as it was, Dick could see that his face was livid and his eyes were wide with terror.

'Sherwood,' whimpered the boy, 'I can't stand it—I've lost my nerve. . . . That thing there—there. . . . It moves. It's dead, and it moves. . . . Look, it's grinning at me now! I'm going back. I can't stay here—I can't.'

'Steady, steady,' said Durwent, gripping the boy by the shoulder and shaking him roughly. 'Pull yourself together. Don't be a kid. You've seen far worse than this and never turned a hair.'

'I can't help it,' whined the boy. 'There's dead men walking out there all over. Can't you see them? They whisper in the dark—I can hear them all the time. I'm going back.'

'You can't, you little idiot. They'll shoot you.'

'I don't care. Let them shoot.'

'Where's your rifle? Get back to your post.

If you're caught like this, there'll be a firing-party at daybreak for you.'

'I don't care,' cried the lad hysterically. 'They can't keep me here. I'm going'—

'Here'—Throwing the young fellow against the parapet and holding him there by leaning heavily against him, Durwent felt for his water-bottle and withdrew the stopper. 'Drink this,' he said, forcing the mouth of the flask between the boy's lips. 'Take a shot of rum. It will put the guts back into you.'

The young soldier choked with the burning liquid, and tears oozed from his eyes, but the chill of the body passed, and with it the chill of cowardice. With a half-whimper, half-laugh, he forced a silly, coarse jest from his lips. 'Where did you get it, Sherwood?'

'Never mind,' said Dick. 'Come on now. Back you go—and stick it out.'

III.

The second act of *Madam Butterfly* was in progress.

With the sure touch of high artistry, both composer and librettist had delineated the result of Pinkerton's faithlessness—a faithlessness that was obvious to every one but Cho-cho-san, who still believed that her husband would return with the roses. Firm in her trust, she pictured to Sazuki the day when he would come, 'a little speck in the distance, climbing the hillock'—how she would wait 'a bit to tease him and a bit so as not to die at our first meeting'—ending with the triumphant assurance (born of her woman's intuition, which, alas! proves so frequently unreliable) that it would all come to pass as she told. She *knew* it.

And so to the visit of the American consul, who tries to tell her that her husband has written that he has tired of her—she, poor soul, reading in his words the message that he still loves her. Then the final tableau of the act with Butterfly, her baby and Sazuki standing at the Shosi facing the distant harbour where his ship has just been signalled. Softly the humming of the priests at worship ceases, and the curtain descends on what must always remain a masterpiece of delicate pathos—a story that will never lose its appeal while woman's trust in man lends its charm to drab existence.

'The tenor didn't come in at all in that act,' said Lady Erskin.

'Really,' said the rector's wife, fixing her lorgnette on the opposite box, 'that person with the leopard's skin looks absolutely like a cannibal.'

'I'm just swimming in tears,' was the comment of Lady Erskin's daughter.

Elise said nothing; nor did she hear them speak. Her heart was fluttering wildly, and her hands were clasped tightly together. She had heard a far-away cry—and the voice was Dick's.

IV.

The raw air of the night, the dread of that loathsome, silent thing, the haunting terror of the boy's eyes a few minutes before, the whine of shells, all bored their way into Dick Durwent's brain. He began to tremble. With every bit of will-power he fought it off, but he felt the fumes of madness coming over him.

For days on end he had had no rest. In the Fifth Army *débâcle* of March his battalion had been one of the first to break, although remnants had fought as few men had ever fought before; and when they had been reorganised they were moved back into the line, undermanned, ill-equipped, and branded with disgrace. It was the culmination of three years' service at the front, and his nerves were at the breaking-point. Mounds of earth ahead of him, and gnarled, dismembered trees, began to take the ghostly shapes that the frightened boy had told of.

Mumbling meaningless things, he reached for his water-bottle and poured a mouthful of rum down his throat. It set his heart beating more firmly, and his blood was no longer like ice in a sluggish river. He replaced the stopper and resumed his watch, but every fibre of his body was craving for more of the alcohol. With set teeth he struggled for self-control, but every instinct was fighting against him. He took another sip, then a long draught of the scorching liquid, and leaned against the parapet. He pressed his hot face against the damp earth, and burrowed his fingers into it in a frenzied effort for self-mastery. Again he drank, and his mouth burned with the stuff. His head was swimming, and he could hear surf breaking on a rocky coast. The dead man was grinning at him, but death no longer held any terrors for him. He raised the bottle in a mock toast and drank greedily of the rum again.

The pounding of the waves puzzled him. He could not remember that they were near any water. But more and more distinctly he could hear the roll of surf dashed into spray against the shore. . . . It was strange. . . . Once more he pressed the bottle to his lips, and it set his very arteries on fire. Yes. Over to the left he could see the glimmer of the ocean. There was a light; some one was beside it. It was Elise! She was giving a signal. That was it—the smugglers were landing their contraband, and she was signalling that all was clear.

He looked over to the dead man. The corpse was rising to its feet. It had all been a hoax on its part—it was an excise-officer. His eyes were fixed on the light, too. His men would be near, and they would capture Elise—and afterwards the smugglers, led by their great-grandfather. He would have to warn her. He couldn't shout, for that would give everything away. He would crawl near to her first.

He finished the rum, draining the bottle to

the last drop, and started to creep along the trench, his heavy, powerless limbs carrying him only inches where his imagination made it yards. He looked back once. The dead man was following him. It had become a race between himself and a corpse. He kept his eye on the light. He could see Elise quite plainly. She was looking out towards the sea.

Feeling his muscles growing weaker, and fearful that the dead man would overtake him, he struggled to his feet and clapped his hands to his mouth.

'Elise!' he yelled. 'Elise!'

And with the roar of surf in his ears, he sank to the ground in a drunken stupor.

V.

The last act of *Madam Butterfly* was ending. The cruel little story wound to a close with the return of Pinkerton and his sympathy-uninspiring American wife, and then the suicide of Butterfly—the logical, but comparatively unmoving, finale to the opera.

But Elise neither saw the actors nor heard the music. With her hands covering her eyes, she had been listening for the voice of Dick. She could hear it, distant and faint, growing nearer, as if he were coming towards her through a forest. There was in it a despair she had never heard before. He was in danger—where or how she could not fathom—but over the surging music of the orchestra she could hear the voice of Boy-blue crying through the infinity of space.

The opera was over, and there was a storm of applause that developed into an ovation.

'The tenor isn't really handsome, after all,' said Lady Erskin.

'I think the women of to-day are shameless,' said the rector's wife, casting a last indignant glance at the box across the theatre.

'I feel a perfect rag,' said Lady Erskin's daughter. 'Good heavens! Elise, what's the matter?'

'Nothing. I—I don't know,' Elise answered, looking up with terror-stricken eyes. 'I'm just overwrought. That's all.'

'You poor dear!' said Lady Erskin. 'You shouldn't take the opera so seriously. After all, it didn't really happen—and I have no doubt in real life the tenor is quite a model husband, with at least ten children.'

VI.

'Drunk,' said the company commander, stooping over the prostrate body of Dick Durwent. 'He was all right when he took over. Where did he get the stuff?'

'Smell that, sir,' said the subaltern of the night, handing him a water-bottle.

'Humph! This looks bad. Have him carried to the rear and placed under arrest.'

(Continued on page 501.)

THE ATMOSPHERE OF THE AMAZONS.

By ANTHONY CLYNE.

TO understand the atmosphere of the Amazons, the nature of the South American jungle, it is not sufficient to digest geographical or other scientific text-books. These will furnish data, but they will hardly bring before one's mind the spirit of the jungle in all its vastness, silent and sombre, yet teeming with strange life. The first book one should read is Bates's *Naturalist on the River Amazons*. Although written sixty years ago, it is as true to-day of the nature of the Amazons as then, and only in such unimportant details as the tiny inroads of civilisation upon the vast jungle—details which can easily be corrected by any geographical treatise on South America—is it out of date. Time makes little impression there. The Amazons are as they were countless years ago.

For many people, as civilisation extends its sway, so romance fades from the conquered territory. To them it is the wild wastes of tangled growths—miles upon miles of country where man appears utterly insignificant, a pigmy amid the vastness of nature, his civilisation of trifling extent and power—which arouse within them the undefinable sense of romance. For such, the immense basin of the largest river in the world and its great network of tributaries remains, and will remain for many years, a land of mystery, exercising unique fascination over their minds.

Henry Walter Bates had been a manufacturer of hosiery, like his father, and Alfred Russel Wallace had been an architect and a land-surveyor, when in 1848 they sailed together in a trading-vessel to Pará, having little money, but hoping to sell their collections when made. They spent four years in the Amazons together, and then Wallace left to sojourn in the Malay Islands for eight years, there to make his marvellous collection of geological specimens and formulate the thesis of natural selection, which Darwin was independently discovering. Bates remained for eleven years in the Amazons, succeeding in reaching a point 1400 miles up the river, and discovering over eight thousand new species of insects.

The jungle of tropical America is lonely, still, sombre. A mystery profound broods over its interlacing boughs and the yellow waters of its great rivers. It is an undisturbed wilderness of nature. H. G. Wells has captured its spirit in his short story, *The Empire of the Ants*. 'They were six days up the Amazon, some hundreds of miles from the ocean, and east and west of him there was a horizon like the sea, and to the south nothing but a sandbank island with some tufts of scrub. The water was always running like a sluice, thick with dirt, animated with crocodiles and hovering birds, and fed by some inexhaust-

ible source of tree-trunks; and the waste of it, the headlong waste of it, filled his soul. . . . And the weather, like everything else in this amazing new world, the weather had no human aspect, and was hot by night and was hot by day, and the air steam, even the wind was hot steam, smelling of vegetation in decay; and the alligators and the strange birds, the flies of many sorts and sizes, the beetles, the ants, the snakes and monkeys seemed to wonder what man was doing in an atmosphere that had no gladness in its sunshine and no coolness in its night. . . . This forest was interminable, it had an air of being invincible, and man seemed at best an infrequent precarious intruder. One travelled for miles amidst the still, silent struggle of giant trees, of strangulating creepers, of assertive flowers; everywhere the alligator, the turtle, and endless varieties of birds and insects seemed at home, dwelt irreplaceably—but man, man at most held a footing upon resentful clearings, fought weeds, fought beasts and insects for the barest foothold, fell a prey to snake and beast, insect and fever, and was presently carried away.'

There are some wonderful descriptions of the brooding silence and gloomy loneliness of the Guiana forest by James Rodway, the botanist. There is *Green Mansions*, by that poet-naturalist, W. H. Hudson. Of that country between the watershed of the Guianas and the Amazons, André wrote in 1902 in *A Naturalist in the Guianas*. Then there is *Jungle Peace*, by William Beebe, which has recently been published, the latest and a worthy contribution to the literature of the subject. All these help us to realise the strange fascination of the jungle. To most it would offer no attractions. Unlike the jungle of Africa, it provides no big game for the adventurous explorer seeking the thrill of a lion or an elephant at bay, and huge trophies of his prowess. But over those who feel the spell of the South American jungle its power is irresistible. Its limitless, unbroken gloom, its infinite variety of life, absorbs them, subdues them.

The floods and rapids of the swirling yellow Amazons, or the black sluggish waters of the Rio Negro, with sun-baked islands where the alligators sleep, flowing through deep gorges where the shadowy silence crushes the mind of man, the daring intruder, or between marshes where herons and gulls are continually hovering; the innumerable myriad-coloured butterflies of unearthly beauty; the immense colonies of venomous, almost intelligent, ants; the light-coloured, long-tailed cuckoos; the flocks of parrots; the great red and yellow macaws flying across at morning and evening uttering their hoarse cries; the secluded villages, far apart, walled in by

impenetrable dark forest, where dwell the weird native tribes, melancholy and grotesque and simple and reticent as their jungle prison, scattered sparsely and precariously amid the profusion of other living things—all these combine to create for some travellers an inescapable attraction, not unmingled with fear. They feel the menace of nature, altogether vast and incalculable, to their puny strength; a brooding threat that lies close over the tangled jungle, and, like the hot vaporous mists, over its rivers and stagnant lagoons. But they must enter the shadows, for something beckons.

Conan Doyle, in *The Lost World*, has a fine description of a journey through the great Amazonian forest under the menace of an unseen enemy. As the boats pass through its mysterious fastnesses, the explorers hear a peculiar deep throbbing in the air, rhythmic and solemn, now faint and scarcely audible, now louder and harsher, coming and going fitfully. The native servants call it drum-talk. It is the drum-talk of the Indian tribes watching their progress every mile of that long journey, patiently waiting for some chance to kill them. Sometimes the drums beat quickly, sometimes slowly, sometimes in obvious

question and answer, one far to the east breaking out in a high staccato rattle, and being followed after a pause by a deep roll from the north. There was something indescribably nerve-shaking and menacing in that constant mutter, which seemed to shape itself into the very syllables of the half-breed, endlessly repeated, 'We will kill you if we can. We will kill you if we can.' No one ever moved in the silent woods. All the peace and soothing of quiet nature lay in that dark curtain of vegetation, but away from behind there came ever the one message from our fellow-man. 'We will kill you if we can,' said the men in the east. 'We will kill you if we can,' said the men in the north.

It is not only the human tribes that are menacing. Nature herself seems frowning there—the inscrutable, silent, threatening frown of her illimitable jungle. A subtle, evasive sense of imminent danger pervades the depths of the wilderness. Nature is as treacherous as the traitor half-breed Gomez, who plans their destruction; as savagely cruel as the Indians. And yet the Amazons allure some as no other land has ever done. It is all beautiful in so strange a fashion, beautiful beyond words.

AN OLD TIMER'S YARN.

By R. G. ARCHER.

I.

ALTHOUGH the greater portion of southern Ontario has now been cleared and cultivated, there remain many large areas of comparatively poor land which still retain their virgin garb of spruce and pine. Such is a belt of country, some forty miles wide, which reaches southward from the vast primeval forests of the north almost as far as the town of Kingston, at the lower end of the great lake. Here and there amid the monotonous succession of low pine-clad hills and sombre lakes one may find a little township whose inhabitants have won independence and homely comfort; but, generally speaking, there is little in the land to offer any hope for future development.

Knowing this, I was very much surprised, when travelling there some years ago, to find such names as Silver Creek and Eldorado, calling to mind old schoolboy tales of lost treasure and of adventure; and being curious to know their origin, I made inquiries among the local people, with the result that, after several disappointments, I heard the following story.

II.

Long ago, before the white men had pushed northward from the shores of Lake Ontario, and while the red men still ruled the land, there lived in the settlement of Kingston an old trapper

named Dan Brynn. He was a small, wiry man, with a rugged gray-bearded face which did not belie his reputation for hardihood and daring. In the pursuit of his calling Brynn was wont to venture alone where the other whites dared go only in large parties. In other respects also he was a noted character in the settlement.

One day, when making some purchases in the local store, he created a sensation by offering in exchange for his goods a small lump of pure silver, though in what manner he had come by it he refused to say.

The news of this incident spread rapidly through the settlement, for traces of silver had already been found farther east, and there were many who believed that in the vast unknown territories to west and to north many a rich deposit awaited the lucky discoverer. All efforts failed, however, to induce the old trapper to reveal his secret. To inquiries, entreaties, and bribes he gave the same reply: 'I got it honest, an' more 'n that it ain't for no man to know.'

And so, for a while, the matter rested, and gradually the first surge of excitement abated; for as time wore on it became obvious that if Dan Brynn did possess a treasure, it must be a very small one, as it was only on rare occasions, when he went to the store to buy a stock of tobacco or some necessity which his simple life required, that he ever produced any of the precious metal.

As he grew older Dan gradually gave up trapping, and spent most of his time in Kingston, leading a quiet life, and seldom travelling very far from his shack. But in spring, when the south wind blew soft from Lake Ontario, and the snows melted beneath the strengthening sun, the old adventurous spirit seemed to revive within him, and when at length the last drifts had disappeared from the hollows he would take his gun and his pack and vanish for a few weeks into the vast wilderness of woods and lakes which lay to the northward of the settlement.

In this way two or three years slipped by, until one spring he fell sick, and for over a month was unable to leave his shack. It was not a serious malady, but in view of his advancing years his friends strongly advised him to abandon his annual trip to the woods, or at least postpone it until his strength was fully restored. The old man was not to be persuaded, however; it would do him more good, he said, to have another touch of his old life than to remain idle in his shack; and a week later, one beautiful morning in May, he once more shouldered his pack and took the north-bound trail.

It was only to be expected that in the rough-and-ready band of trappers and traders who formed the bulk of the community men could be found whose principles were not of the highest order, and who were prepared to undertake any shady venture for the sake of personal gain.

One of these was an individual called Mullan, who was never known to have done a single day's work unless sheer necessity drove him to it—and that, as it happened, was not often. Most of his time he spent in a liquor-shanty, drinking and gambling, both of which he did with such skill and judgment that he rarely rose from a table the loser.

Unlike most people, his interest in Brynn's silver had not waned with the passage of time, and from the beginning he had kept a close watch on the old man's movements. The result was a growing conviction that somewhere in the woods Dan had a secret *cache*, on which he drew from time to time to replenish the small stock he was supposed to have in his shack.

Had his courage been at all proportionate to his cupidity, Mullan would have followed the old trapper alone; but, then, he was no bushman. To his imaginative mind the great silent forest seemed always gloomy and full of menace, and not for all the silver in the world would he have ventured alone into its unexplored depths.

He had not far, however, to look for a suitable partner. Among his associates was a big, dissolute trapper of some forty years of age, a man of considerable skill and experience, who might have done well had he chosen the right path in life. Kedge—for such was his name—readily agreed to Mullan's proposal. He had no objec-

tion to looting Brynn's *cache*, if such a thing existed, any more than he had to taking a valuable animal from another man's trap; and so it came about that when Brynn set out from the settlement, these two, keeping a safe distance in rear, followed on his trail.

III.

The old trapper made good progress, and speedily covered the five miles of open grass-land that sloped gently upward to the dark line of the forest-fringed horizon. In contrast to the solid, wall-like aspect they presented from a distance, the trees, which varied considerably both in size and in species, now appeared broken in outline and irregular in growth. Isolated clumps and long ragged strips reached forward like outlying reefs and projecting headlands of a rock-bound coast. Gradually, however, these clumps and strips grew larger and wider, until finally they joined forces in the silence and shadow of unbroken forest.

There was nowhere the faintest sign of a track, and the heavy undergrowth of bushes and saplings made progress in any direct line extremely difficult. But during the whole of that day and those which followed Brynn never once appeared in doubt. With that instinctive knowledge of distance and direction possessed by those who lead a forest life, he pushed steadily onward, and though forced at times to make detours, tended always towards a course which was very nearly due north.

The density of the bush, though hindering Brynn, made the work of Mullan and Kedge comparatively easy, as it enabled them to keep track of their quarry with scarcely any risk of detection. As long as he was on the move they kept well behind, but when he halted to take a meal, or choose a camping-ground for the night, they closed up, for it was on such occasions that they wished to observe his every movement.

As they advanced, the character of the country over which they passed began to change. The forest-bed, which had hitherto been mossy and tolerably level, became hard and uneven, and gradually rose into a succession of low ridges and hummocks. These new obstacles would have added considerably to the difficulties of the journey had they not been entirely free of undergrowth. This circumstance was due to the rock, which, approaching so near to the surface of the soil as occasionally to expose itself in jags and boulders, prevented the growth of bushes and deciduous trees, permitting only of the presence of hardy pines. The last-named, though always continuous, did not grow thickly, and revealed between their sombre, tapering forms patches of blue sky, and occasionally from higher places glimpses of rough rolling country that grew ever more rugged and jumbled as the eye travelled northward.

IV.

For four days Brynn continued steadily on his course, but on the fifth day he began to slacken his pace, and cast about, as though seeking some trail or definite mark. Several times he halted, and finally, towards the close of the afternoon, he turned aside and ascended a steep pine-clad hill, whose scarred forehead overlooked a deep lake full of shadows and beautiful reflections.

Suppressing their excitement, Mullan and Kedge, who throughout the day had kept as close to their quarry as they dared, now wormed their way up the side of the hill until they were within fifty feet of the summit.

So far Brynn had committed no act which threw the faintest light on the object of his journey, but both men were now convinced that the climax was at hand, and that they were about to reap the reward of their perseverance.

But what they saw, far from satisfying them, only added to the mystery, and made them realise that the task they had undertaken was likely to prove a far more complicated one than they had ever imagined. Brynn was busily engaged lighting a fire, which, to judge from the quantity of green wood he kept heaping upon it and the dense column of black smoke which rose from the hissing flames, could be intended only for a signal. But to whom? Excepting those at the settlement, there were in all probability no other white men within fifty miles of them.

An hour or more passed; then far away to the westward, from somewhere amid the jumble of pine-clad hills, an answering column of black smoke rose up against the evening sky.

'Injuns, sure,' whispered Kedge as the two withdrew to a place of concealment some distance from the bottom of the hill. This piece of information, confirming as it did his own fears, caused Mullan's enthusiasm to wane considerably. Cases were not unknown in which white men had become friendly with Indians, and it was quite possible that Brynn was among the number; but, generally speaking, the tribes bitterly resented the coming of the pale-face, and short shrift was meted out to those unfortunate enough to fall into their hands.

Apart from this latter unpleasant possibility, which, so far as Mullan was concerned, was sufficient in itself to cause him to abandon the venture, there were other points to be considered. It was quite possible that Brynn's journey might have nothing whatever to do with his silver, and that he might only be paying a visit to some chief with whom he had become friendly in the past. But even if their original suspicions were correct, the mere fact that Indians were concerned in the affair at all reduced their chances of success to a minimum.

Kedge, however, with all his faults, was no

quitter, and he refused to back out of the business because it had developed an unexpected element of risk. He had outwitted redskins before, he said, and he could do so again.

Much against his wish, Mullan was forced to follow his companion's lead, for without him he would almost certainly have become lost in the bewildering sameness of the country which surrounded them.

The following morning Brynn, who had camped overnight on the hill, rose early, and at once set off in the direction in which the signal had been seen the previous evening. Kedge's surmise was soon proved to be correct, for about an hour later the old trapper was met by a young Indian, whose dress proclaimed him a member of one of the numerous branch-tribes of the Hurons. Having made signs to show that he had come to act as a guide, the lad turned and led the way through the trees.

Shortly after midday they arrived at a clearing in which stood a fairly large camp. Apparently the braves were absent on some expedition, for Brynn, whose coming seemed to cause no surprise, was received by some of the squaws, who immediately conducted him to a wigwam where food and drink had already been prepared for him.

Realising the danger they incurred by remaining too close to the clearing, Mullan and Kedge withdrew to a safe distance, to await developments and discuss what they should do.

Their position was rapidly becoming critical. At the longest their stock of provisions could not last beyond another two days, after which they would be forced to use their guns, a thing they dared not do as long as they continued to play the part of spies. Finally, after a long discussion in which the bold spirit of Kedge again prevailed over his weaker companion, they agreed to wait another twenty-four hours.

V.

It was close on sunset when the braves returned. The chief, an elderly man of powerful physique, greeted Brynn with courtesy, but no show of friendship. On the contrary, his whole demeanour was that of a man who has an unpleasant duty to perform, and after a brief conversation he retired to his wigwam, and did not reappear during the remainder of the evening.

But events were rapidly moving to a climax. The following morning the headmen of the tribe gathered together in the centre of the clearing, where presently they were joined by Brynn and the chief, the whole party squatting down in a circle according to the native custom when holding a palaver. For a few moments there was silence; then, at a sign from the chief, the old trapper began to speak.

During these preliminaries Kedge cautiously worked his way forward until he was in a posi-

tion to overhear the greater part of the conversation, which was carried on in a jargon he understood.

Brynn, it appeared, had at some period in the past rendered a great service to the tribe, and, as a reward, the chief of that time had offered to give him every year a small quantity of silver. Two conditions were stipulated, however—the first, that Brynn should never reveal the source from which he got it; and second, that he should come for it at a certain time each spring.

In the years which followed, the red men had faithfully kept their word, notwithstanding the death of their leader, who fell in an expedition against another tribe. Brynn, for his part, had so far found no reason to cavil at the conditions of a bargain so profitable to himself, but in view of the changed circumstances he now wished to put forward another proposal. He pointed out that he was growing old, and very soon would be no longer able to undertake the journey from the settlement, and accordingly he asked for enough silver to last for the remainder of his days.

To this the new chief, who hated the whites with a cordiality he was at no pains to hide, objected, saying that a bargain was a bargain, and could not be broken. In vain the white man argued and pleaded; the chief, unanimously supported by his councillors, refused to give way, and finally rose to his feet to show that the discussion was ended.

But Brynn was not to be denied. From argument he passed to threats, and declared that if the red men would not agree to a reasonable proposal, he would at once return to Kingston and raise a force of whites to attack them.

For a space the chief was silent, while a look of evil joy spread over his dark features. 'So, white man,' he hissed, 'you would break the oath you swore to us in the past? Good! We are no longer your debtors.' And suddenly snatching his tomahawk, he sprang upon the old trapper and smashed his skull with a single blow. Not content with the mere killing of his enemy, he drew his scalping-knife and bent forward to complete what was destined to be his last triumph.

Kedge, though a drunkard and a thief, still retained a degree of manhood which revolted at the horrid spectacle before him, and, without pausing to consider the consequences of his action, half rose from his hiding-place and fired at the sinewy form of the stooping warrior. At such a range it was almost impossible to miss, and the savage, with a choking cry, collapsed across the huddled form of his victim.

In an instant the whole camp was in an uproar, and the headmen, recovering from the first shock of surprise, rushed with a yell of rage towards the place where the smoke of the fatal shot trailed through the trees at the edge of the clearing.

Kedge knew full well the fate which awaited him at the hands of the blood-maddened Indians, and at once sought refuge in flight. But the tragedy was not yet complete; even as he turned, a projecting branch struck him full in the eye, causing him to stagger and fall sideways with a crash among the branches of a young pine-tree. Confused and half-blinded, his foremost pursuers almost upon him, he knew his hour had come, and with a groan that was half a curse he drew his pistol and very wisely chose a quick road to eternity.

VI.

Meanwhile Mullan, whose knowledge of bushmanship did not fit him to act as a scout, had viewed these happenings from a distance. The suddenness of the whole affair rendered him for the moment insensible to the full measure of his own peril, but when it dawned upon him he turned and fled panic-stricken through the woods, whither he knew not.

Long after the shrieks and whoops of the Indians had echoed into silence he continued his wild career, ignorant of the fact that the savages had spent some time venting their rage and spite on the bodies of the two pale-faces, and had not discovered the tracks of another of the hated race until he was beyond pursuit.

Hour after hour Mullan struggled on until the sun sank low in the west. By this time the low pine-clad hills had flattened out, forming a level tract of forest where the trees grew so thickly that their interlacing branches and dense foliage shut out the light of the evening sky.

Darkness brought no sense of security to the wretched fugitive. Exhausted by his long flight, and unable to see a yard before him, he at last sank down on the soft mossy ground, but not to rest. Even in the company of Kedge he had hated the long forest nights; but now loneliness, and the thought that the Indians might still be on his trail, increased his fears to the limit of endurance.

Around him in the darkness all nature seemed to be stirring. Eerie rustlings and faint snappings broke the stillness, causing him to start, and peer fearfully into the gloom whence they came. But always when he looked the sounds ceased, leaving the silence deeper than before. Thus he lay for some time, a prey to all the terrors which superstition, aided by the conditions, could inspire. At length he could bear it no longer. Something in the outer blackness appeared to be taking shape and closing in upon him, bringing with it a fear that was more than mortal, and when a night-bird cried suddenly from a branch overhead he leaped to his feet and fled demented through the woods.

The light of dawn, which seemed so loath to penetrate the forest gloom, at last brought some relief to his shattered nerves, and, more

dead than alive, he collapsed by the bole of a large tree, and fell asleep.

It was after midday when he awoke, faint with hunger and thirst. Fortunately he still retained his wallet containing some dried fish, and good water was plentiful. Rough though the fare was, it restored some of his strength, and in a calmer frame of mind he began to consider his position and what course he should take.

He had no idea where he was, but he knew that if he kept facing south he was bound sooner or later to strike the shore of Lake Ontario; and after that it would be a comparatively easy task to reach the settlement. Not a moment was to be lost, and taking as best he could a line by the sun, he pushed hurriedly on his way.

Another night of dread was followed by a day of toil and hunger. His stock of food was now exhausted, and having discarded his gun in his first wild flight, nothing now remained for him but to plod on, in the vain hope of falling in with some wandering white men.

But for good or ill he had still some part to play in human affairs, for just before sunset, to his unspeakable relief, he suddenly broke clear of the forest, actually within half-a-dozen miles of the very place he had entered it but eight days before. There in front of him, in the golden light of evening, the fresh flowering grass-land rolled away in long sweeps and folds. There in the distance lay the white shacks of the settlement, and, beyond, the vast blue expanse of Lake Ontario.

VII.

Never did criminal receive an eleventh-hour reprieve with greater joy than did the hunted wretch, as with renewed strength he struggled onward out of the gloom of the forest into sunshine and safety. But though a merciful Providence had lifted the shadow of death from his path, he was still faced with the grave difficulty of explaining the disappearance of his late companion. Questions would certainly be asked, and to tell the truth would be tantamount to a confession of intended theft. His cunning brain, however, soon invented a story which would not only clear him of all suspicion, but perhaps even yet turn the scales of fortune in his favour.

On reaching the settlement, he told, in a voice genuinely broken by hunger and hardship, how he and Kedge, while wandering in the woods, had fallen in with Brynn, who was being pursued by Indians. He told of the running fight which followed, during which the old trapper had confessed that it was from the Indians with whom he had quarrelled that he got his silver; of the death of Kedge and Brynn, and his own capture and ultimate escape from the Indian camp.

In spite of his evil reputation, the evidence of his battered appearance caused this tissue of lies to be readily believed, and a strong force of whites was soon gathered together to attack the tribe. A few days later, led by Mullan, they set out for the north. But so vague was the latter's knowledge of the country that fully a week elapsed before they reached the clearing, only to find it deserted. The red men—according to the custom of their tribe—had moved their camp on the death of the chief, and had vanished into the unknown regions to the north.

Nevertheless, the white men remained for some weeks in the neighbourhood, and in deference to their hopes, named the clearing in which they camped Eldorado. But search as they would, they found neither gold nor silver, and at length, becoming disgusted with their lack of success, they broke up into small parties and returned to Kingston.

Mullan, so the story goes, continued for some time to lead his old life of gambler and cheat, until one evening, when rather more drunk than usual, he made some contradictory statements, resulting in a forced confession of the real part he had played in the events I have described. Shortly afterwards he disappeared, and it was generally believed that he met his death at the hands of some of the old trapper's friends who had more than one grudge against him.

Such is the story of Dan Brynn's treasure, and of how the township of Eldorado received its name; but whether it be true or merely an old timer's yarn, the man who related it could not inform me.

A LYRIC.

HIDDEN in a garden bower,
Fragrant with the gillyflower,
Hollyhocks and columbine,
Where convolvuluses twine
Tenderly their climbing stems,
Crown'd with azure diadems;
Where drones dreamily the bee,
Hid in floral nunnery;
Where the idle butterfly,
Winging wearily, goes by,
On the summer-scented gale,
To the orchard in the vale;
Where the lark with lyric tongue,
In the cloudless vault is hung,
Waking echoes in the wood's
Green umbrageous solitudes;
Where cool crystal fountains leap—
There alone my love doth sleep.

Where the buttercups, alas !
Flower in the tangled grass,
And the meadow worts and weeds
Overrun the path that leads
To the lychgate in the lane,
And the breezes pause again,
And the cypress shades are deep—
There alone my love doth sleep.

DOUGLAS CARSEWELL.

Chambers's Journal

SEVENTH SERIES

THE CONSTABLE OF THE TOWER.

By Major-General Sir GEORGE YOUNGHUSBAND, K.C.M.G., K.C.I.E., C.B.

I.

AFTER William the Conqueror had won the battle of Hastings he marched on London, which at once capitulated to him. The inhabitants were not, however, very friendly, as may be imagined; therefore the Conqueror decided to build a strong fortress to overawe the city. The site he chose was on the banks of the Thames, at the same commanding spot as had been selected, many centuries before, by the Romans under Julius Cæsar, the ruins of whose old fort still remained. The site which these two great commanders and invaders selected was so situated as to serve a double purpose. A fort here was admirably placed both to command the approaches by water from the sea and to overawe the inhabitants of a not too friendly town. Julius Cæsar's fort had no particular name, and was generally spoken of as Julius Cæsar's Tower, and is thus alluded to by Shakespeare. The only vestige of this tower that remains is a small portion of a brick wall, which is now covered with a tarpaulin to preserve it, and may be seen near the south-east corner of the White Tower. Whether this fragment is a portion of Julius Cæsar's Tower, or is the southern corner of the Roman wall, is a point on which antiquarians differ. Not improbably, however, it may be both; the fragment of brickwork may be the south-east corner of the Roman wall, and perchance at this south-east corner stood Julius Cæsar's Tower.

William of Normandy, with political foresight, and as a graceful concession to the conquered, instead of naming his tower after himself or any place in Normandy, decided to call it the Tower of London. He set to work to build soon after the battle of Hastings, and it seems curious to us that his architect was a prelate of the Church, Gundulf, Bishop of Rochester! The Conqueror did not use the old Roman bricks which must have been found amongst the Roman ruins in great quantities, but sent ships across to France, to fetch the white stone of Caen with which it was built. It was this white stone which gave to the central keep of the fortress its name, *La Tour Blanche*—the White Tower, as it has now been called for centuries. When the Conqueror

died, his successors, notably William Rufus, Henry III., and Edward I., improved and amplified and strengthened the fortress, till it became the Tower of London much as we now see it.

Very soon after William the Conqueror started to build the Tower he appointed one of his Norman followers to give military advice during its construction, so that it might be impregnable from all sides, and, when it was completed to the king's satisfaction, to take command of the fortress and its Norman garrison. This officer the king named 'The Constable of the Tower,' and the first to bear the title was Geoffrey de Mandeville. This Geoffrey de Mandeville was a stout soldier who had fought with William in many battles and skirmishes on the Continent, and had borne himself with conspicuous courage and resource at the battle of Hastings.

II.

Like many offices in those days, that of Constable of the Tower became almost a family inheritance. Thus we find no fewer than four De Mandevilles occupying this place of honour and distinction. Three successive occupants were father, son, and grandson; whilst a great-grandson followed in a later reign. When the first Geoffrey died he was succeeded by his son William de Mandeville, who was appointed by William Rufus. William de Mandeville was succeeded in his turn by his son, another Geoffrey, who was created Earl of Essex, that fateful title which was borne at various times by many different families quite unrelated to each other.

Geoffrey de Mandeville, Earl of Essex, after being Constable of the Tower for thirteen years, was, because of his treasonable practices, deprived of his office by King Stephen. Bursting into open revolt, the ambitious plotter was soon at the head of a formidable gang of robbers and desperadoes, who, among other places, burned and sacked Cambridge. To suppress this public nuisance King Stephen sent a body of troops, and a regular pitched battle took place between these and the followers of the Earl of Essex. In this encounter the earl himself was mortally wounded, and died at Mildenhall, in Suffolk. Then happened a very curious thing. Geoffrey de Mandeville,

having some time before committed sacrilege, had been excommunicated by the Pope, with the result that no one could be found to bury him. In this dilemma there came to the rescue the Knights Templars. During his chequered career Geoffrey de Mandeville had once been of signal service to the Knights Templars, and they in the hour of need forgot not their obligation. A party of the knights, therefore, journeyed to Mildenhall, and dressing the corpse in the robes of the Order, claimed him as a fellow-knight. They then put him into a coffin and carried him to London. When the Temple was reached a consultation was held, for even the Knights Templars dared not openly flout the Pope's excommunication. But they found a way out of the difficulty. Selecting two stout trees in the Temple garden, they slung the coffin in mid-air between them. There it remained for nearly twenty years; then intercession was made to a new Pope, and the ban was removed. The Templars cut down the coffin, and buried it outside the west door of the Temple church.

The Constable was not always primarily a man of war; in ancient days he was not infrequently a bishop, or even an archbishop, though these prelates were often of the Church militant, and could wield a sword or bestride a battle-horse with the best. Such a one was Thomas à Becket, chiefly known in history as saint and martyr. He had, however, charged with knights in battle, and had held the post of Constable of the Tower. This was in the days when no mean perquisites accrued to the Constable, as we shall see later, so that many high dignitaries were glad, by the king's favour, to add this considerable increment to their incomes. Thomas à Becket's connection with the Tower is commemorated by the fine structure known to this day as St Thomas's Tower, which was erected by Henry III., and stands as a defensive work over the great sinister arch of the Traitor's Gate. In this tower is to be found a small circular oratory, specially erected by Henry III. and dedicated to Thomas à Becket.

Another prelate who was Constable of the Tower and left a lasting memorial is William Longchamp. When Richard Cœur de Lion departed on his crusade to the Holy Land, he made William Longchamp, who was Bishop of Ely, Chancellor of the Kingdom and Constable of the Tower. With John, the king's faithless brother, scheming close at hand, the bishop thought he would take no risks, and set to work to deepen and broaden the moat of the Tower, till it reached its present dimensions. True, the bishop was not so stout a soldier as a sapper, for when John, having designs on the throne, attacked the Tower, up went the white flag, the only occasion in history on which the ancient fortress was taken by hostile forces. Besides these two prelates, at least five archbishops and several bishops have been appointed Constables.

III.

One of the greatest Constables the Tower has had was the Duke of Wellington, and he has left his name indelibly imprinted on its history. The hero of the Peninsular War, the victor at Waterloo, the great general who overthrew Napoleon, a duke and a prince, he accepted the constablership not as an empty honour or an added perquisite, but to do his best for the Tower as its titular head. It was in 1826, eleven years after Waterloo, that the duke took over office, and at once his orderly mind began to work. Constantly, clad in tight white overalls and a blue coat (the coat still hangs in the White Tower), he would mount his horse at Apsley House, and take his morning ride down to the Tower, a good seven miles' ride, much of it through unsavoury slums. There what did he find? The old Tower, through the neglect of ages, falling into decay and disrepute, great gaps in the crumbling walls, the lesser towers fast becoming ruins. Every passage and roadway within was blocked with squalid huts, mean buildings, and lean-tos. The moat was a fetid ditch into which the garrison and the inhabitants had emptied their filth for centuries. Only on the top was there a shallow layer of water, slightly freshened by the rising and falling tide, whilst beneath lay filthy slime to the depth of a man's height. Within the circle of this noisome ditch and inside the ruined walls of the Tower lived not only the garrison, but a dense population of men, women, and children who had in one way or another acquired a right to reside there. Amidst these congenial surroundings the microbes of every imaginable disease lived and flourished, and among them carried off more victims than did the axe of old. The duke took some little time to get his bearings, and, still more important, to procure money for his reforms; for, as after all great wars, there was not much money in the Treasury to spare on sentiment, or even on sanitation. But his best effort was made when he impressed Queen Victoria, so that she took a personal interest in the old Tower. Henceforth what seemed a hopeless task became, with perhaps a set-back here and there, a settled policy which was steadily carried on even after the old duke's death.

One of the first improvements to be taken in hand was the draining and cleansing of the moat. To effect this the river was shut out, a modicum of the filth and slime removed, and then six feet of dry earth and rubble were rammed in, thus making a hard, dry surface. At the same time the wretched hovels which disgraced the interior were gradually removed, and with them the superfluous population which had no duties to perform in the Tower, and were only an encumbrance and a source of disease. The restoration of the lesser towers and the repair of the broken-down walls was not allowed

to be a patchwork affair. In the person of Salvin, a first-class architect, and one imbued with the spirit of the place, the Tower obtained a true and sympathetic friend. Using the old plans and sketches of the Tower as it had been at its zenith, Salvin drew up a complete scheme of restoration. This comprehensive plan, though it took several decades to complete, has resulted in the old Tower of London being now erect and firm as ever. There was one portion, however, which needed little repair—namely, the White Tower, which stands sturdy and strong as it did when William the Conqueror first held his court within its massive walls.

The Duke of Wellington was Constable of the Tower for twenty-six years, and on his death the appointment went first to one of his old comrades, Field-Marshal Viscount Combermere, and then to another Peninsular veteran, Field-Marshal Sir John Fox Burgoyne. From that time onwards the office of Constable has invariably been held by a soldier, sometimes a field-marshal, and sometimes a general. One great name, alas! does not appear on the roll, that of Lord Roberts. So far as it has been possible to trace them, there have been about 136 Constables since the Tower was built.

IV.

The duties and responsibilities of the Constable have varied greatly during the ages, and have often been practically what the holder of the office chose to make them. An Archbishop of Canterbury, for instance, could hardly be expected to give up much of his time or attention to commanding a fortress, however important. Many Constables in early days undoubtedly lived in the Tower; indeed, there is a Constable's Tower to this day. Gradually, however, the absentee Constable who had bigger fish to fry elsewhere became the rule rather than the exception. Moreover, the Tower was no health-resort in those days, being situated amidst horrible surroundings. The Constable, therefore, decided to make his chief abode outside in a more salubrious spot, retaining only lodgings, as they were called, to serve him during his periodical visits. The last of these lodgings existed about a century ago, as is shown in an old plan, and apparently formed an adjunct to the Lanthorne Tower. Nowadays the Constable has neither residence nor lodgings in the Tower.

When he thus cut himself residentially adrift, the Constable left as his *locum tenens* the Lieutenant, and for the Lieutenant Henry VIII. built the Lieutenant's Lodgings, which still exist, though for some obscure reason their name has been changed to the 'King's House,' a manifest misnomer. Some 300 years ago the Lieutenant, taking his cue from the Constable, decided that he too would rather live outside, so he departed, and the Major took possession of the Lieutenant's Lodgings, and occupies them

to this day, and there carries on the current duties for the Constable.

The Constable's command, apart from the fortress itself, includes a battalion of the Guards and a battery of Garrison Artillery (which form the garrison), the Yeomen Warders, whose establishment is forty strong, and a large number of employees, whose work, either as craftsmen or as labourers, lies within the Tower. These are all nominally under the Constable's orders and sole control, but, as a matter of fact, many have grown to be semi-independent. Even those who have lived long in the Tower are puzzled to know where and with whom direct authority lies in numberless small matters. To illustrate this curious state of divided control, a minor case may be quoted. Visitors to the Tower interested in its history and its more important features were at one time able, with the consent of the Constable, to buy for a few pence little handbooks dealing with such parts as the Jewel House or the Beauchamp Tower. But the Treasury stopped the sale of these, because they interfered with the sale of another guide issued by the Stationery Office.

The Constable of the Tower is one of the few people in these realms who are entitled by ancient right to address the king direct. He can and does write to the king personally, and not through one of His Majesty's Secretaries of State. The Constable would not trouble the king on so small a matter as the sale of pamphlets, but he would be perfectly within his rights in doing so if he wished.

V.

The pay and perquisites of the Constable were in ancient days, when taken in combination, of considerable value. True, the actual salary was not more than £100 per annum, though that is equal to £1000 at the present day; but the perquisites were rich and rare. It was to the Constable's interest to have as many prisoners as possible in the Tower, and the higher their rank the more he profited. Thus on commitment as a prisoner a duke had to pay the Constable £20 as an entrance fee, an earl £13, a baron £10, and a knight £5, and each of these sums must be multiplied by ten to arrive at its present value.

For the sustenance of these prisoners and their retinues the Treasury made certain grants per week, and these were on a liberal scale—for a duke, 65 shillings; for an earl, 40 shillings; for a baron, 20 shillings; and for a knight, 10 shillings. The duke of those days apparently took his chaplain to prison with him as well as many servants, and this holy man had an allowance of 6s. 8d. per week; the duke's gentlemen received also 6s. 8d., whilst his yeomen were allotted 3s. 4d. All other servants were allowed 3s. 4d., all other yeomen 1s. 6d. These were the rates in the reign of Richard II., but

they were raised as gold declined in value. If the duke, or other prisoner, accepted these doles the Constable profited nothing; but if 'through pride and contempt' the distinguished captive brushed them aside, they became the perquisite of the Constable.

It was the Constable's right to stop all ships that passed up the river Thames from the sea, and to take toll from them. The procedure was for a Yeoman Warder to stand on the wharf and hold up a staff, the signal for the ship to stop and send off the Constable's toll in kind. This ancient staff is still preserved in the Warder's Hall. It is a gnarled and knotted staff some four feet in length, probably cut from an old thorn-tree. If the ship happened to be a merchantman from Bordeaux carrying wines, the Constable was entitled to two flagons of wine delivered free at the wharf. All fishing-vessels bringing oysters, mussels, and cockles to the London market, before proceeding past the Tower, had to pay their way by presenting the Constable with one maund, or large basketful, from their cargo. All vessels carrying fresh fish were allowed to make a money payment instead of paying fees in kind.

Another very valuable perquisite of the Constable was the exclusive fishing rights between London Bridge and the Tower. Nowadays this right would not be of much value, but at that time salmon and other savoury and valuable fish abounded in these waters.

Then comes a very quaint and exceedingly useful perquisite. In early days houses extended across London Bridge on both sides, making a street of it, very similar to the present Bridge Street in Bath. The only break in the continuity of the houses was opposite the stout piers which supported the bridge. Here only a frail wooden paling prevented people or cattle from falling into the river. There were no policemen to direct the traffic in those days, so that often the crush on the bridge, especially when cattle were being driven to market, was very great. Crowded and frightened, these cattle were often driven against the frail posts and rails, which would give way here and there, and plump would go the cattle into the river. All such cattle became the perquisite of the Constable, who sent out watermen to conduct them into the safe harbourage of the Tower, and thence to the Constable's kitchen. Indeed, the scandalmongers of the day went so far as to suggest that when the Constable was short of meat, and had a large banquet in view, he would send up a few varlets to London Bridge at the busiest time, there to create the necessary block and confusion, which would cause a few fat kine to fall into the river!

To the Constable also accrued all swans that floated down the Thames below London Bridge. Even now after heavy rain, in spite of the turmoil of many tugs and steamers, batches of

swans may often be seen in summer floating down to the Tower. There must have been a constant supply, for the river rushed like a torrent through London Bridge, and any swan which was taking an incautious siesta in the reaches just above the bridge was bound to be carried through, and so to the Constable's table. All flotsam and jetsam, including timber, which escaped down-stream through London Bridge was the Constable's perquisite.

Then in those rude days his floors and passages were carpeted for him. Not with carpets, to be sure, for these did not exist except as curios in kings' palaces, but with rushes. Out of every boat that brought rushes past the Tower the Constable was entitled to take as much as a good hefty varlet could clasp in his two arms.

East Smithfield, which was within the Tower liberties, and lay to the north-east, was a great centre for the drying of skins, to be used later in making jerkins and what not. On every skin there dried the Constable received a fee.

Those who have seen plans of the Tower of a time as late as the reign of Queen Elizabeth will notice that, though there is a broad and deep moat full of water, with precipitous banks round the outer edges, there are no railings or other safeguards against people or animals falling into the watery mire. On a dark night this must have been a particularly precarious vicinity. The Constable, however, had good and sufficient reasons for not encouraging the Treasury to incur useless expenditure on a protective railing, for all carts (with the goods stowed in them) which were misguided enough to fall into the Tower moat became the absolute perquisite of the Constable. Probably this was in the nature of a rough police law, to encourage the citizens to give the moat a wide berth, for a cart and its goods recovered from the slime and filth of the moat would not, as a rule, fetch much on being sold.

If the Constable lived on the spot, and collected all these perquisites himself, he became passing rich; but if, as was the later custom, he lived away, they would be farmed out, and doubtless gave rise to many abuses. Thus gradually, as the ages passed, they died away one by one, and the old staff in the Warder's Hall is the sole and silent relic of ancient days.

The Constable now receives no magnificent salary. His only is the high distinction of holding one of the oldest and most picturesque offices in the Empire, coupled with a small honorarium of £200 to cover his necessary expenses.

VI.

The late Constable of the Tower, Field-Marshal Sir Evelyn Wood, passed away only a few months ago, at a ripe old age, full of honours, and esteemed as a brave old warrior

by his king and country. His successor is an equally distinguished soldier, Field-Marshal Lord Methuen.

On the day appointed for the installation of a new Constable, all the officers of the Tower, together with the new Constable, assemble in the Lieutenant's Lodgings, which open on to Tower Green. Outside the Lodgings on Tower Green the Yeomen Warders, in their ancient uniforms, and carrying their halberds, are drawn up. On the parade-ground by the White Tower is formed up the battalion of the Guards which is in garrison. In the middle distance stands the Lord Chamberlain, accompanied by his staff, and holding in his hand the keys of the Tower. At zero, as we used to say in the war, the procession conducting the new Constable issues from the Lieutenant's Lodgings, and paces with stately measure across Tower Green. The procession is headed by the Yeoman Gaoler carrying the Axe, followed by all the Yeomen Warders and the officers of the Tower, conducting the new Constable. As the procession moves forward, it arrives in due course at the place where the Lord Chamberlain has taken his stand. The new Constable then moves to the front, and is met by the Lord Chamberlain, who, in the King's name, presents him with the keys of the Tower, thus investing him in his new office. The Constable makes a suitable reply—either a

plain 'Thank you, sir,' or a brief speech, as seems best to him. This preliminary ceremony being concluded, the Yeoman Porter steps to the front, and taking off his hat, proclaims in herald fashion, 'God preserve King George!' to which all present reply, 'Amen.' The troops at the same time present arms, and the band plays 'God Save the King.'

Next all the officers of the garrison advance, and are one by one presented to the Constable as their future chief. When this portion of the ceremony is completed the officers return to their posts, and the battalion marches past the Constable, this being their form of presentation to him. The Constable then orders the troops to be dismissed to barracks, and the original procession is re-formed and moves on. The Gaoler Warder leading the way as before, the Constable is first conducted into the White Tower, which is the keep of the fortress. He has now completed the act of taking over. He has received the keys, the command of the garrison has been handed over to him, and he is installed in the White Tower, as was Geoffrey de Mandeville by William the Conqueror all those hundreds of years ago.

It is part of Old England, and long may Old England and her ancient customs live, and long may live the Constable of the Tower of London!

THE PARTS MEN PLAY.

CHAPTER XXIV.—THE SENTENCE.

I.

ON the outskirts of a village near the junction of the British and French armies, two guards with loaded rifles kept watch at the doors of a hut. The warm sunlight of May was bathing the fields in gold, where here and there a peasant woman could be seen sprinkling seed into the furrows. Across a field, cutting its way through a farmyard, a light railway carried its occasional wobbling, narrow-gauged traffic; and outside half-a-dozen huts soldiers were lolling in the warmth of early afternoon, polishing accoutrements and exchanging the lazy philosophy of men resting after herculean tasks. Elsewhere there was no sign of war. Cattle browsed about the meadows, and the villagers, long since grown used to the presence of foreign soldiers, pursued their endless duties.

A sergeant walked briskly from a cottage in the village, and went directly to the field where lay the hut guarded by the sentries. 'Fall in outside!' he said sharply, opening the door.

Hatless, and with his dark hair seeming to cast the shadows that had gathered beneath his

eyes, Dick Durwent emerged and took his place between the guards.

'To receive the sentence of the court,' said the sergeant in answer to his questioning glance. 'Escort and prisoner—'shun! Right turn! Quick march!'

Past the lounging soldiers to the road, and on to the village, they marched. Women glanced up, curious as to the meaning of the little procession, but with a shrug of their shoulders resumed their work, and soon forgot all about it. The escort halted outside the cottage from which the sergeant had come, and he entered it alone. A minute later he reappeared, and marched prisoner and guards into the room where the court-martial had been held that morning. The three officers were sitting in the same places—a lieutenant-colonel, whose set, sun-tanned face told nothing; a captain, whose firmness of jaw and steadiness of eye could not hide his twitching lip; and a subaltern, pale as Dick Durwent himself.

As president of the court, the senior officer handed a sealed envelope to the prisoner. Not a word was spoken on either side. The sergeant's command rang out, and the noise of metal heels upon the floor was startlingly loud.

Still without a word, carrying the unread sentence in his hand, Durwent was marched back to the hut. Again the women cast curious glances, and a little urchin in a cocked-hat stood at the salute as they passed.

When he was alone once more, Dick broke the seal of the envelope, and without his face altering, except that the shadows grew darker beneath his eyes, he read the finding of the court.

He was to be shot.

He read it twice. With a long, quivering intake of the breath, he tore the thing slowly into a dozen pieces and threw them in a corner.

Walking to the end of the hut, he leaned against the ledge of a little window, and looked out towards the horizon where the great blue of the sky stooped to earth. There was the laughter of soldiers, and from an adjoining meadow came the neighing of a restive horse. The sunlight deepened, and from a hundred branches birds were trilling welcome to the promise of another summer.

Two hours passed. The warmth of early afternoon was giving way to the cool mood of twilight—but the solitary figure had not moved.

II.

Nine days had passed when a motor-lorry drew up on the road, and the same sergeant ordered Dick Durwent to take his place outside the hut with his escort. The prisoner asked as to his destination, and was told that the sentence, having been confirmed, was to be promulgated before his unit.

They had been travelling for half-an-hour when they reached a field in which Durwent saw two companies of his battalion drawn up in the form of a hollow square. Faint with shame, staggering under the hideous cruelty of the whole thing, he was marched into the centre and ordered to take a pace forward, while the commanding officer read the sentence of court-martial to the men: that Private Sherwood, being found guilty of drunkenness while on guard—it being further proved that he had obtained unlawful possession of the liquor—was to be shot at dawn, and that the sentence would be carried out the following morning.

Although his senses reeled with the shock and ignominy of it all, the prisoner's bearing showed no sign of it. With his head erect and his brow unmarred by a frown, he looked into the faces of the men whom he had lived and slept and fought beside; men with whom he had shared privation and danger; men who had been his comrades through it all. But as he searched their faces he felt an overpowering loneliness. In the eyes of every one there was horror. To be killed in battle—what was that? But to be shot like a cur in the grizzly

morning! Yet their horror, their anger, was against the military law, and was born of a fear that the same thing might come to them. It was that which cut him to the quick. It was not that *he* was to be shot the next day, but that *they* might meet a similar fate. That was the fear which drove the blood from their cheeks and left their lips parted in awe.

And then he saw a face which almost broke down his manhood, and sent scalding tears to the very brink. It was the face of the lad he had saved from deserting that terrible night. The boy's agony was for him alone; it was pleading for understanding; it was trying to tell him that he would never forget—that the condemned man would not go to his death unmourned by one human heart.

Dick looked away, but the solitude and the pain had passed.

III.

It was his last night. All evening the chaplain had been with him, offering the solace of divine mercy and forgiveness; but though he was grateful for the good man's ministrations, Durwent felt that he wanted to be alone. He hardly knew why; but there were many things to think of, things which would be remembered more easily if he were by himself. Towards eleven o'clock he made the request of the chaplain, who left him, promising to return shortly after midnight; and, with his hands clasped behind his back, Dick walked slowly up and down the hut.

His mind journeyed to Roselawn—and Elise. At least—and at the thought he struck his hands together with joy—she would never know. She would think he had died in China. For several minutes he walked without his thoughts taking any other form than that, but gradually the realisation of his surroundings began to leave him. He was roaming through the woods with Elise; they were climbing a great tree for birds' eggs; they were casting flies for trout in the stream that ran through their estate; they were riding across country on ponies that whinnied with pleasure at the feel of the soft turf. But wherever his hungry imagination painted her, there was in her face the womanly tenderness that had always been hers in their companionship.

He stopped in his walk and pressed his clenched fingers against his lips. She had always believed in him. Through all the hell in which the Fates had cast his destiny, she had been one star towards which he could grope. But now—a drunkard—a renegade soldier of a renegade battalion—to be shot! He had killed her trust! The horrors of the night closed on him like hounds on a dying stag.

Uttering a dull cry of agony, he staggered across the hut with outstretched hands—and

in the darkness his poor disordered fancy saw once more the vision of his sister's face. It was as he had seen her when, as a boy bruised by life, he had gone to her for solace. She had not changed. She could not change. Her eyes, her lips, were saying that in the morning she would stand beside him, holding his hand in hers, until the levelled rifles severed his soul and his body for eternity.

He sank to his knees, and for the first time in many years he prayed. It was a prayer to an unknown God, in words that were meaningless, disjointed things. It was a soul crying out to its source, a soul struggling towards the throne of Eternal Justice, through a darkness lit only by a sister's love and the gratitude of an eighteen-year-old boy saved from shameful death.

The commands of the sergeant of the guard could be heard as sentries were changed. Durwent rose to his feet and tried to look from the window, but the night was as black as the grave which had already been dug for him. Once more there was no sound but the wind moaning about the deserted fields.

'Mas'r Dick.'

Dick's body grew rigid. Was it a prank of his mind, or had he really heard the words?

'Mas'r Dick.'

The door had opened an inch. His heart beat wildly, and he crouched close to the crevice.

'Mathews!' he gasped.

'Sh—sh!' An admonishing hand touched him. 'Come close, sir. This is a dirty business, Mas'r Dick. If you hear me cough noticeable, get back and pretend like you're asleep.'

'But—but, in God's name, what are you doing there?'

'I'm a-guardin' you, sir. Sh—sh!'

The old groom moved a couple of paces away from the door, humming a song about a coachman who loved a turnkey's daughter. Almost mad with excitement, Dick stood in the darkness of the hut with his outstretched arms shaking and quivering. He was afraid he would shout, and bit his finger-nails to help to repress the wild desire.

'Mas'r Dick.'

In an instant he was crouching again by the door.

'There'll be a orficer's inspection,' whispered the sentry, 'a minute or two arter midnight. When that there little ceremony has took place, you and me is going for a walk.'

'Where?'

'Anywheres, Mas'r Dick.'

'You mean—to escape?'

'Percisely so, sir.'

For a moment his pulses beat furiously with hope; but the realisation of what it meant for the old groom killed it like a sudden frost. 'No, Mathews,' he whispered. 'It isn't fair to you. I am not going to try

to escape. Give me your hand—I want to say good-bye.'

For answer, the imperturbable Mathews moved off again, and, in a soft but most unmusical bass, sang the second verse about the amorous coachman and the susceptible turnkey's daughter. Dick listened—hanging greedily on every little sound with its atmosphere of Rose-lawn.

'Mas'r Dick.' Mathews had returned. 'No argifyin' won't get you nowhere. If I have to knock you atwixt the ears and drag you out by the 'eels, you're comin' out of that there stall to-night. I ain't goin' for to see a Durwent made a target of. No, sir; not if I have to blow the whole army up and them frog-eaters along with 'em. Close that door, Mas'r Dick. I've got a contrairy temper, and can't stand no argifyin' like. Close that door, sir.'

Almost crazed with excitement, Dick strode about the hut. Even if he were to get away, the chances of capture were overwhelming. But—to be shot in an open fight for freedom! That would be a thousand times better than death by an open grave. Freedom! The word was intoxication. To breathe the air of heaven once again—to feel the canopy of the stars—to smell the musk of flowers and new grass! If only for an hour; yet what an hour!

And then the chance, remote, but still within the realm of possibility, of reaching the front line, where men died like men. Of all the desires he had ever known, none ever gripped him like the longing for battle, where death and honour were inseparable.

But once more the thought of Mathews chilled his purpose. It would mean penal servitude or worse for the old groom, and he was not going to be the means of ruining him for his faithfulness. He could not stoop so low as that.

These and a hundred similar thoughts flashed through his mind, and he was no nearer their solution when the door was opened and a sergeant shouted a command. He started. For a second he thought that dawn might be breaking, and that his hour had arrived; but an officer came up the steps, and he saw with a quiver of relief that it was the nightly inspection.

'Everything all right?'

'Yes, sir,' he answered.

'Where's the chaplain?'

'He'll be back directly, sir.'

'Food all right—everything possible being done for you?'

'I have no complaints, sir.'

In the light of the lamp held by the sergeant the two men looked at each other. Without saying anything more, the officer glanced about the hut. 'That will do, sergeant.—Good-night.'

'Good-night, sir,' answered Durwent.

The officer had hardly reached the door, where the sergeant had preceded him with the light, when he turned back impulsively and put out

his hand. 'I suppose this sort of thing is necessary,' he said hoarsely; 'but it's a damned rotten affair altogether.'

They clasped hands; and, turning on his heel, the officer left the hut.

'Take every precaution, sergeant,' Dick heard him say; 'and send a runner to the chaplain with my compliments. Tell him he must not leave the prisoner.'

'Very good, sir.'

Silence again—and the crunching of the sentries' heels on the sparsely sprinkled gravel. The ordeal was becoming unbearable. Dick feared the passing of the minutes which would bring back the chaplain, and yet every minute seemed an eternity. The conflict ravaged his very soul. Was he to take the chance offered him by the strangest trick of Destiny, or remain and die like a rat caught in a trap?

'Mas'r Dick.'

The door was quietly opened. The old groom's hand fell on his arm and drew him firmly outwards. He tried to pull back, but with unexpected strength the older man exerted his pressure, until he found himself outside.

It was so dark that he could not see a yard ahead of him as Mathews, retaining his grip on Dick's arm, led him towards the road. They were nearly clear of the field, when the groom stopped abruptly, and they lay flat on the ground. It was the orderly officer and the sergeant returning from the inspection of a hut some distance off.

'Sentry.' The officer had paused opposite the hut where the prisoner had been.

'Yes, sir,' came the answer from the soldier still on guard at the other door.

'Has the chaplain returned?'

'Not yet, sir.'

With an impatient exclamation, the officer went on towards the village; and gaining their feet, the two men reached the road.

'There's a path alongside, sir,' whispered Mathews, 'and you and me is goin' to put as much terry-firmy atwixt this village and us as our four legs can do. Now, sir, we're off!'

With lowered heads, they broke into a run. Stumbling over unseen stones, lacerating their hands and faces against bushes which overhung the path, they ran on into the dark. Once a staff car passed them, and they huddled in a ditch; but it was only for a few seconds, and they were up again. Unless they were unfortunate enough to run right into the arms of the military police, the night was offering every chance of success. A barking dog warned them that they had come to the outskirts of another village. Leaving the road, they circled the place by tortuously making their way through uneven fields, until they thought it safe once more to take the path. On they ran—past silent fields—by streams—by murky swamps.

Towards dawn Dick was faint with fatigue. The ordeal of the last month had cruelly sapped

his vitality, and as he ran he found himself stumbling to his knees.

'Hold hard, sir,' said the groom, who was leading. 'Another mile or so, and you and me, sir, will breathe ourselves proper.'

Only another mile—but a mile of utter anguish. Twice Dick fell, and the second time he could not rise without assistance.

'Mas'r Dick,' pleaded the groom, 'look 'ee, sir. Up yonder hill somewheres about I knows there is a cornfield, for I have noted it many a time. We can't hide here, sir, in this stubble. Lean on me, Mas'r Dick—that's the way. Now, sir, for England, 'ome, and beauty.'

Struggling to retain his consciousness, Dick limped beside the old servitor, until, gaining the hill, they saw an abandoned cornfield. There was a roll of guns as they made their way into the field, and through the dense blackness of the night a few streaks of gray could be seen towards the east.

Without a sound, Dick sank to the ground in complete exhaustion. The groom unstrapped his own greatcoat, which had been carried rolled, and covered the lad with it. Taking a thermos bottle from his haversack, he poured some hot tea between Dick's lips, and saw a little glow of warmth creep into the cheeks.

'Now, sir,' he said, 'take a bit o' this sandwich. 'Ave another swig o' the tea. Bless my heart, sir, won't them fellers be surprised when they finds as how they ain't got no corpse for their funeral? That's better, sir. I will say about army tea that even if it ain't what my old woman would make, it's rare strong, Mas'r Dick, rare strong and powerful, likewise and sim'lar.'

'Mathews,' said Dick weakly, 'how was it—you were on guard—last night? Was it just an accident?'

'Yes, sir. Just a accident. Well, not percisely a accident neither, sir. I be what the War Office calls "a headquarter troop," and do odd jobs behind the lines. Sometimes I dig graves, and other times I be a officer's servant, and likewise do a turn of sentry-go. Well, sir, when I heard that you was a prisoner and were goin' for to be shot, I persuades the corp'l to put me on guard, exchangin' a diggin' job with a bloke by the name o' Griggs, so as not to incermode the records o' the War Office. That's all, sir. There I were, and here we be; and arter you've had a sleep, you and me will have a jaw on our immed'ate future. 'Ave a good snooze, Mas'r Dick, and I'll keep an eye trimmed on the road.'

With the same boyishness he had shown that night in Selwyn's rooms, Dick put out his hand and pressed the old groom's arm. With a paternal air, Mathews patted the hand with his own and reached for his pipe, explaining that he would steal a smoke before daylight. But the lad did not hear him. He was lost in a deep, dreamless sleep.

KING COAL: AUTOCRAT.

By IVOR M'INNES.

TO one who knows the north and the south, and who, too, is not unaware of the smokeless cities of the Mississippi valley, with their electrically driven factories and traction, a fair vision unfolds itself upon the retina of the future—a vision of a land where, from John o' Groat's to Land's End, no smoke-laden air pollutes, and no belching chimneys or disfiguring ash-dumps blot life out of grass-lands and beauty from the landscape.

That time is still in the 'sometime, never,' stage. As Mr Asquith said during his election campaign at Paisley, 'Coal is an article of prime necessity to our industries as a whole, . . . till some new form of motive-power is discovered and developed.'

So, till the day of cable-carried power sets in, folk must put up with coal, and our country, from the midlands to the north, must remain scarred by coal-pits and shrouded in smoke—though, perhaps, of less noxious quality than in those early days of the thirteenth century when, to quote from an ancient document, 'the smell and smoke emitted from coal became so offensive to the nobility and gentry that they remonstrated against it as a nuisance, and obtained a royal proclamation prohibiting coal to be used.' But the Act must have been very much of a dead letter, or, discovering coal on their own estates, the gentry and the nobility may have decided to put up with the inconvenience and pocket the profits—a process that seems to have grown rapidly popular, for in 1306, one finds, 'prejudice gave place to utility, and coal became in general requisition,' notwithstanding that 'in this, as in every other article of public utility, monopoly was extensively practised, the comfort of the many being forced to give place to the interest of the few.'

So, after all, profiteering is no new adventure. Neither is that twin-evil which flaunts itself hand-in-hand with profiteering—an artificial scarcity created by the withholding of supplies. Happily (as to-day also) there were not wanting those who—this time to quote from a seventeenth-century record—sought 'to defeat the combination of dealers in coal.'

What a little world it is, after all! And how certain, as well as circumscribed, is the orbit of thought's cycle! Only in recent months, in chronicling the death of Mr James Rowlands, the Member of Parliament for Dartford, Kent, it was recorded that 'in the summer of 1917 he propounded a scheme under which local authorities would be given power to buy and store coal in the summer months, in order that it might be sold in winter to householders who had no storage

accommodation, or not sufficient money to buy early in large quantities.'

'To defeat the profiteer'—that has been the cry all through the history of coal. It is with no great surprise, in consequence, that one observes that this 1917 plan was anticipated a year before the Fire of London; and with greater success, for the proposal was embodied in an Act of Parliament. (It would be interesting—would it not?—to find out if the Act has ever been repealed.) In the year 1665 an Act was passed 'that the poor might be constantly supplied with coals in times of scarcity,' and local authorities were 'ordered to purchase and lay up yearly' a store of coal for the purpose. In the City of London, for instance, the various Livery Companies had 'between Lady Day and Michaelmas to lay in stocks' which, in dear times, were 'to be vended in such manner and at such prices as the Lord Mayor and Court of Aldermen should direct by written precept.' The Merchant Taylors, thereby, had to stock 750 chaldrons (a chaldron is 25½ cwt.), the Grocers 675 chaldrons; and in this way each of the fifty-six Livery Companies had to hold stocks, on a sliding scale, down to the Glaziers and the Basketmakers, with six chaldrons each, and the Woolmen, the Fletchers, and the Bowyers, three chaldrons each.

While thus the City Companies became 'the granaries of Joseph' to the extent of over 9500 tons (7460 chaldrons), the profiteer was kept under a strict eye. The Justices of the Peace—from the reign of Charles II. to the days of William III.—had power, 'if any retailer of coals shall refuse to sell at the prices fixed by the J.P.'s' (there we get control, by the way—no! there's nothing new under the sun), 'to take a constable to force entrance, to sell the coal at proper rates and deduct their costs' before settling with the recalcitrant. If short weight were detected, 'forfeiture of all the coals in stock or double the value thereof' was the penalty.

From the 'back of beyond,' too, of the centuries comes another sidelight reflecting to-day. In the year of the Great Fire, Pepys tells in his Diary that coal was three pounds three shillings per chaldron. In April of a year later, because of the Dutch war, prices mounted up to four pounds four shillings per chaldron, and a couple of months later, by June, a leap was made to five pounds ten shillings per chaldron.

So after all, in the eternal fight between the profiteer and the powers that be, the profiteer seems always to have come out with more money than credit.

A DAUGHTER OF THE DOPPERS.

CHAPTER III.

AFTER Gert had left the train at Mulder's Vlei (where the line to Stellenbosch branches off), Steenie was seized with a depressing sense of loneliness which speedily reduced her to a state of misery, and ultimately to tears. Surrounded as she was by strangers, her inexperience and her vivid imagination conjured up evils and dire forebodings which she vainly endeavoured to allay. Sombre and uninteresting as her life on the farm had been, the love she bore her parents remained to torture her with home-sickness, intensified by regret. She remembered that the old people had consented to her leaving for so long a period, and, in particular, to her being educated at Cape Town, with a sacrifice of principles and prejudices ingrained in their natures—how deeply Steenie knew only too well. As the train neared Salt River, on the outskirts of Cape Town, her grief gave way to wonderment. The miles of closely packed houses, the huge vessels on the calm waters of Table Bay, and the motley crowd on the station platform filled her with amazement. But, above all—the sea: the sea that she had dreamed of through numberless hot karoo days, her fancy filling the pulsating veld with cool blue water. Here it was to look upon, to feel, to taste if she wished; but with it all there was something lacking—she missed the coral islands and the palms of her dreams.

Dr Bray's sister, a kindly, buxom, trust-compelling woman, met her, and took the girl to her home, because it was evident that in order to save the child the humiliation she was bound to feel should she enter the school dressed in her quaintly cut garments, a thorough inspection and revision of her wardrobe was necessary.

At first Steenie made few friends at the seminary. Her shy, wild manner repelled most of her class-mates; but soon the innate sweetness of her disposition and her evident desire to stand well with everybody won over most of them, so that at the end of her first term she was quite popular. She was, moreover, devoted to her studies, and the quiet resolution she displayed in overcoming the difficulties which beset her path, intensified as they were by her former training and habits, won for her the respect and admiration of her teachers. As her knowledge increased, and as her views of life and its mysteries broadened, she found that she was involved in a perpetual contest between her early prejudices and the results of her larger experience. She, who had first insisted that clothing and hats were merely for protective purposes, came to see, in harmony with the views of her sex, that adornment was the first necessity, utility the second. The *kappie* and

the *voerchitz* dress that had formerly satisfied her were now abhorrent in her eyes, and as time went on she became a devotee of smart hats and frocks. With it all she never lost the sweetness of her disposition. The instinct of her sex—to look nice—was always with her, but to vanity she was a stranger. Her tastes were effective but simple.

Many things she saw and heard in Cape Town were both pleasant and unpleasant to her. The overdressed women in the streets were an endless source of wonderment. The sudden dropping of the mask of religious observance inside the church for frivolous gossip and empty laughter outside the building jarred on her—it was so different from the solemnity of a Vaalbos Sabbath. Her riper experience and knowledge of human nature partly excused the frivolities of some of the women, but the whole problem was disconcerting, while at the same time it appealed to her keen sense of the ridiculous.

'It is really funny,' she said to one of the teachers, 'how different from country people town folks take religion. In the country the influence of the service is sustained until the congregation reach their homes, but here the worldly chatter starts at the very church door. When I see these girls crowding out, eagerly scanning the faces of the crowd for their respective Jacks, and volubly talking of the last dance or theatrical performance, the whole thing strikes me with the force of a farce. They are like so many sheep issuing from one of father's kraals, and the impulse to stand at the church door and count them out as he does is almost irresistible.'

Steenie visited her home once only during the four years she was away. That was when she had been at school for a short period only, at a time when the call of the veld was clamorous and insistent, and home-sickness punished her; but she returned to the new life with at least contentment, and with a keener longing for the unravelling of the mysteries of knowledge still unknown and untouched.

Love of music, latent in most South Africans, broke into passion, and the concerts in the City Hall were an unending source of delight to her. The grand organ, pealing through the mighty church she attended, awoke in her the passions which the quiet veld had nursed, and so she dreamed of vague things—of love still unrealised, and of ambitions to be satisfied. She was peculiarly susceptible to the influence of sweet sounds, and would sit quite contentedly for an hour listening to the expert performances of a couple of coloured gentlemen on the guitar and the concertina. She weaved romances around the weird music and sickly sentimental songs, and

dreamed of *Ebb Tide* and Attwater, and of poor Billy the tramp, who had introduced her to her hero, and who was now buried in a corner of the little *begraaf-plaats* on the farm.

She enjoyed to the full all that Cape Town had to give her, but was conscientious with it all in regard to her studies. Her very simplicity of mind and character was the keynote, and she revelled in the enjoyment of small pleasures. She joined lustily in the chorus of the South African College song, bawled by iron-lunged football victors at the seminary gates, but found it in her heart to pity the vanquished. The lame, the blind, and the halt in Adderley Street found her ever their best patron, and she bought in pity from the old *koesijster* seller blinking over her sticky wares in Church Square, and surreptitiously transferred her purchases to an epileptic match-vender who plied his trade in the vicinity. She was never embarrassed, because she was never self-conscious; and one of her greatest charms, which appealed to teachers and friends alike, was her clear-eyed innocence.

It was as if the purity and simplicity of the veld had taken possession of her personality, disarming the sophisticated and strengthening the pure.

Her one trouble was her brother Gert. His letters to her plainly showed that theology palled on him. He told her that he was not 'cut out' for a minister of the Gospel, and that he thought 'the Service' was more in his line. To that end he was preparing for the next Civil Service examination, which, he intimated, he hoped to pass before she left school. She thought of poor Ta'antje and her ambition, and worried about it; and of her father, who had sacrificed the dearest wish of his heart, only to lose the son who should have farmed, in the ordinary course of nature, his thousands of *morgen*. Who would farm at Koodooskop when Oom Jan Kloppe was laid with his fathers? She urged upon Gert to go home and take up their father's burden. Would he like to see the old farm pass to a stranger? But Gert was obdurate. The high collar and the cigarette of modernism had fastened themselves upon him, and he scorned the farm.

Later she heard that he had passed the examination, and had been appointed clerk to the Civil Commissioner of Vaalbos. She was thankful, in her simple way, for this one mark of the favour of Providence. He would, she thought, be near the old people, which fact would serve partly to blunt the disappointment she conceived they had both experienced.

Then her turn came. She was twenty, and must homewards. The freckled, diffident veld child was another creature now. The glorious eyes had gathered knowledge which had left the heart pure and undefiled. The freckles about the cheekbones were but so many emphases of beauty, and the bright hair, capricious of shade,

reflected more intensely the early nursing of her splendid karoo sun.

'I am going home, yet away from home,' she said to her teachers at parting, and so she left them, loved and regretted, with the farewell cheers of her friends in her ears, and tears of regret in her eyes that blurred the last glimpse of the seminary gates which had sheltered and fended her for four happy years.

CHAPTER IV.

OLD Jan Kloppe of Koodooskop was seated, one warm afternoon of December, in an ancient arm-chair placed well within the shadow cast by a gable of his homestead. The mournful quiet of the karoo oppressed the house, and the veld, burdened with the shimmering heat, stretched trembling to the distant horizon. The white road leading to Vaalbos through the atrophied bushes was partly blurred by a single cloud of dust, shifting each moment nearer to the homestead. Presently the hoof-strokes of a horse roused the old man from the lethargic state into which he had fallen. Rising reluctantly, he walked, red handkerchief in hand, round the corner of the gable to the front of the house, where he arrived simultaneously with the horse. The rider proved to be a Hottentot 'boy' who had been sent to Vaalbos for the post. The farmer, scarcely noticing his perspiring dependent, laboriously climbed the steps leading to the *stoep*, and stopping at a window, drummed an alarm on one of the panes.

'Antje,' he roared, 'the post has arrived!' He heard a movement within, and presently the upper half of the front-door was opened, disclosing the *kapje* enframed visage and exaggerated bosom of his wife, whose feelings, indexed by her face, were seemingly unruffled by the near prospect of news from the outer world.

The Hottentot handed the post-bag to his master, who extracted from its depths a solitary letter, which he offered to his wife with the air and expression of one handling a noxious thing.

'Wife, here is another of them! I can smell that it comes from Steenie. I am afraid that our poor child has departed from the ways of our dear Lord.'

Ta'antje took the pink, highly scented missive with a sniff indicative of the strongest disapproval, and turning, entered the house; while Oom Jan, after a curt dismissal of the post-rider, returned to his chair in the shade of the gable to await, with habitual patience, the news the letter contained.

The news was momentous. Ta'antje's usually stolid face showed that plainly enough.

'Jan,' she said almost breathlessly, 'she is coming home. She will be here to-morrow, and writes that the cart must meet her at the station at ten o'clock.'

They were both strangely and powerfully moved out of the solemn placidity of their usual mood. They looked at each other almost in fear. They had not seen her for some years, and how, they wondered, had time used her? Would she come back to them the same simple God-fearing child they had parted with, or had Cape Town spoiled her for the Lord?

Steenie arrived in the evening just as the herds were driving in the sheep. She called out pleasantly to the men, and they waved a welcome to her. The little native location near the homestead turned out to give her a greeting. The innumerable dogs that infested the farm raced beside the cart, and created a barking uproar which caused a lurking jackal a mile away to run, in dread, to shelter. The Hottentot driver, alive to his important duties, urged the horses into a gallop with howls and whip-strokes, and with a marvellous turn, brilliantly executed, brought the team to a standstill.

Steenie bounded up the steps leading to the *stoep*, where she showered kisses and caresses upon the two old people. She marvelled at their coldness, for she did not know that the change in her appearance had frozen them with wonder and dismay. They saw that the much-freckled, slovenly child they remembered so well had disappeared for ever, and in her place beheld one of whom they were almost afraid. They noticed that her joyful ejaculations were in the English tongue, that she dressed like the magistrate's wife, and that her hands were soft and white. The freckles had mostly disappeared, and her skin, though somewhat sallow in hue, was soft and clear like a baby's. She had grown taller, and her figure, rounded and pleasing, was yet somewhat slender, and infinitely graceful. They noticed that her teeth were white and shiny like a Kaffir's, and that her hair, beautiful in its several shades, was arranged in an outlandish fashion which the hat crowning it scarcely concealed.

She had not been long with them before her parents both fell under her influence. Steenie did things which were rank heresy in their sight, but they made no demur. She attacked the *zit kamer*, and every article which in her eyes was odd and fantastic was ruthlessly removed. Some were sacred in the eyes of the old couple, and had been carefully preserved since their marriage. They contented themselves with secret lamentations, but offered no opposition. The gaudy antimacassars, the knitting of which had been the old wife's sole accomplishment in early youth; the black-and-white porcelain dogs sitting on their haunches with expectant air; the worsted mats; the collection of imitation fruit which deceived nobody—all these were consigned to inglorious obscurity in the *zolder* (loft); while in their place appeared tasteful ornaments,

pictures and prints—and, above all, a piano. There had been a warm contest over the last-named article, for the introduction, or the contemplated introduction, of so worldly a thing into their home was a glaring sin in the eyes of the old Doppers; but Steenie carried her point, and it was purchased. She raided the house, and everything that was bizarre and shabby was condemned, and ousted by articles in better taste and of greater comfort, so that the neighbours wondered at the weakness of her parents. The latter, moved by the increased convenience and brightness, ceased lamenting, and soon gave all she did their secret approval, until, like the king, she could do no wrong. Their affection for her increased daily, but it was liberally mixed with reverence, for she was a creature beyond their comprehension, so that they marvelled at the goodness of the Lord in permitting them to be the parents of so wonderful a child.

Steenie had been home for three weeks when Dr Bray first called. He had chosen a bright Sunday afternoon for his visit, and he noticed, not without amusement, as he drove across the *werf*, a number of saddle-horses hitched to the blue gums and the *kat-doorns*.

The *zit kamer* was crowded with young men, silent, awkward-handed, and fantastically dressed, and in their midst a charming young woman talking animatedly in Cape Dutch! So great was the surprise and wonder called up by Steenie's appearance that the doctor's greeting was awkward and constrained; but she, with the tact of a city-born lady, had him at his ease in a moment.

'I am so glad to see you again,' she said, 'and to be able to thank you for all you did for me.'

'Any personal services deserving thanks at all,' he replied lightly, 'are those rendered by Miss Steenie Klopper to herself. My claim is so insignificant that I withdraw it in pure shame. I wonder what poor old Billy would have said had he been spared to see you as I see you to-day.'

She flushed faintly; the implied suggestion could not be mistaken. 'What would I give to see him and thank him?' she said warmly. 'To think how small a matter may seriously affect one's future! I can see him now pleading at the sheep-kraal with my father. Honourable, upright, good as gold, yet with one spot in his character which, like the flaw in a diamond, spoiled the whole. Can some men not help drinking, doctor?'

'Heaven only knows, Miss Klopper,' he replied. 'I—'

'Oh, don't call me Miss Klopper!' she exclaimed; 'it sounds strange and cold from you.'

'Well, Steenie, then;' but in saying it he felt unaccountably shy and uncomfortable. 'He loved you,' he continued, 'and from the moment

you left Koodooskop he was a changed man. The old craving came on; or was it, perhaps, that his interest in life had departed? He drank, Steenie—drank heavily; and’——

‘But how did he procure drink?’ she interrupted.

‘Well,’ he answered slowly, for her eyes, radiating truth, looked full into his, ‘I think—well, you know that your father missed some of his sheep, and signs of the slaughtering were found on the veld, and the skins traced to the dealers in Vaalbos. I regret, more than I can tell, that it was conjectured that old Billy had employed a “boy” to take in the skins and obtain brandy in exchange.’

‘Their conjectures were wrong,’ Steenie broke in heatedly. ‘He was incapable of a crime. Father has just told me that Plaatjes and his Bushmen are again in the district. Father has lost fifteen sheep lately, and two Bushmen arrows were brought in. They were the thieves, I say. Poor old Billy! You did not believe it, doctor, surely?’ she queried.

‘There is no direct evidence of it, and for your sake I should like to believe the best of him.’

‘Why for my sake?’ she questioned. ‘Because I defend his memory?’

‘No,’ he replied, ‘but because I think a man who loved you as he loved you was incapable of robbing your father. I was in at the death,’ he continued irreverently, at which her eyes flashed displeasure, ‘and his last thoughts were of you. He gave me this for you. I thought I would bring it over.’

He handed Steenie the old familiar volume, thumb-soiled and dog-eared, and tears—so many sacrifices to memory—rose in her eyes.

‘*Ebb Tide!*’ she exclaimed. ‘Dear old Billy, he knew that in my case it was the head-waters of the river of knowledge. But, doctor,’ she continued, caressing the old book, ‘you haven’t answered my question yet. Can some men not help drinking to excess? Is there such a thing as heredity? Are the sins of the fathers visited on the children?’

‘They are, I think,’ he replied. ‘If one can inherit the physical, then why not the mental, characteristics of one’s parents.’

‘How contented with life I shall be, then!’ she said. ‘Look at my parents; no trouble beyond sheep diseases or drunken herds. No problems of modern life to face; nothing but religion and contentment.’

‘The problems will come for you,’ he replied. ‘There is one;’ and he pointed to the young men who had left the room, and who were now assembled on the *werf*.

‘Time and other *nichtjes* [young women] will solve that for me,’ she answered smilingly.

‘What about the diamond-mine?’ Steenie asked, after a pause.

‘Oh, the diamond-mine! Yes, of course. You know all about it, I suppose? The last drought forced your father to look for water, and in digging a well near the little fountain by the Klip Kopje, his men struck yellow ground, and then hard rock. This rock I take to be what in Kimberley is called “blue ground.” The formation is very peculiar, and I obtained a reluctant consent from your father to take expert advice. My brother Walter is now at Klipdam. He knows all about diamondiferous ground, and I have written to ask him to come to Vaalbos. When he comes we shall be enlightened.’

Bray went frequently to Koodooskop after this visit—so frequently that it became evident, even to himself, that he was setting Steenie a problem to solve. She looked forward to his visits. He was clever, and a gentleman, and his society brightened the dull monotony of her daily round. When he asked her to be his wife she consented, but without any outward display of emotion. Love had not touched her; but of this she was apparently in ignorance. Her liking and respect for Bray were deep and sincere enough; and as her parents approved, and her world applauded, she was moderately content and happy.

POWER OVER FIRE.

By REGINALD B. SPAN.

I.

IN the Biblical records we read of an instance of miraculous delivery from a fiery furnace of three men who were cast therein. Not only did they come out alive and uninjured, but not a hair of their heads was singed nor a thread of their garments burnt. In these days such an occurrence would sound incredible—nay, impossible. Comparatively few people are aware that many of the miraculous feats recorded in the Bible

have in a (perhaps) lesser degree been performed in modern times, and that power over the forces of Nature has not been confined to any one period of the world’s history. Faith—absolute, implicit faith—is the great essential for all magical operations. To possess this faith one must first obtain knowledge of a particular kind; one must learn something of the tremendous forces which lie behind nature—latent and dormant, but ever ready to be called into action by an application of the proper means. Moses, before he became a

miracle-worker, was 'learned in all the wisdom of the Egyptians,' and *that* knowledge was power indeed.

Power over fire was exhibited by the saintly martyrs to a remarkable degree. It is questionable whether the flames which consumed their frail bodies caused any suffering, so implicit was their sublime faith in their spiritual Master. Cranmer, who placed his right arm in the flames until it was entirely consumed, apparently endured but little suffering. Dr Boissarie, in his work on 'Lourdes,' tells how Dr Dozous saw Bernadette, the 'Seeress of Lourdes,' hold her hands in a flame for fifteen minutes without the slightest pain or scorching; nor did the fire mark the flesh in any way. He took an exact record of the time by his watch. This miracle is known at Lourdes as 'Le Miracle du Cierge.' Mr Daniel Dunglas Home, the famous Scottish medium, one of the greatest wonder-workers of modern times, who was an adept in many ways where magic is concerned, possessed this power of averting the natural consequences of fire on material substances. His remarkable experiments in power over fire were witnessed by many well-known people, amongst whom were Sir William Crookes (the eminent scientist, and late President of the Royal Society), Mr S. C. Hall (writer and lecturer), Dr Robert Chambers (the well-known *littérateur*, and joint founder of the firm of W. & R. Chambers), the Earl of Dunraven, and Lord Crawford and Balcarres. At many meetings were these exhibitions of power over fire manifested by Mr Home—generally at the houses of his friends—and no preparation whatever was necessary, nor were any chemicals or drugs resorted to to render the operator immune, Home always claiming that the protecting agency was psychical, or spiritual.

The following is a typical instance. On the 9th of May 1871, at the house of Sir William Crookes, F.R.S., Home gave a special exhibition for the benefit of the great scientist, who had proclaimed his intention of giving the matter a thorough scientific investigation, in the presence of the most expert and reliable witnesses, amongst whom were Dr Wilkinson, Messrs S. C. Hall and H. Jencken, the Earl of Crawford, and Lord Dunraven.

Home's hands were first carefully examined by Sir W. Crookes, who was perfectly satisfied that they had not been chemically 'prepared;' then, a large and blazing fire having been made up, Home, without the slightest hesitation, plunged his hands into the centre of it, and after holding them there for a few moments, began to stir the red-hot coals until his hands were well into the hottest part and the flames licked his wrists. He then selected a red-hot piece of coal as large as an orange, and almost enclosing it in his bare hands, blew into the small furnace thus formed until it was white-hot (like a blacksmith's fire)

and little flames flickered over and licked his fingers.

Coming into the centre of the group of witnesses, he extended his hands for them all to examine closely, and exclaimed in a voice of rapt reverence, 'Is not God good? Are not His laws wonderful?'

Home then handed red-hot coals to some of those present, promising them immunity from scorching, and none of them was burned. This feat of handing on the 'power over fire' to others did not, however, *always* succeed, as Mr Andrew Lang related an instance of a friend of his, a clergyman, whose hand was badly blistered after receiving a red-hot coal from Home. Probably on that occasion the 'conditions' were not good, and consequently the 'power' was inefficient; or the fault may have lain in the mental attitude of the clergyman, at the back of whose mind there probably existed the idea of 'diabolical agency.'

Home concluded that *séance* by taking handkerchiefs from those present and wrapping red-hot coals in them. On being examined afterwards the handkerchiefs showed not the slightest sign of burning or scorching. Sir William Crookes took them at once into his laboratory in the adjoining apartment, and after carefully testing them, found that 'they had not been chemically prepared to resist the action of fire.'

The instance of Mr Home taking some blazing coals from a fire, placing them on the head of Mr S. C. Hall, and drawing that gentleman's long silvery locks over them is very well known, but may bear brief repetition here. Mr Hall was seated near the fire, and was unaware of Home's intention, until he heard him say, 'Keep perfectly still, and don't be afraid; it won't hurt you.' Home then placed some red-hot coals he had just picked from the centre of the fire on the crown of the old gentleman's head, and quickly covered them with the long gray hair. Not a hair was singed, nor was there any trace of scorching, and all that Mr Hall felt was a pleasant sense of warmth.

Home was a remarkable man, and his 'power over fire' was but one of many wonderful powers. He was born near Edinburgh in 1833, was educated in the United States, travelled over a great part of the world giving exhibitions of his powers, and died at Auteuil, in France in, 1886.

II.

Though 'power over fire' is exceedingly rare amongst civilised nations, it is not so amongst the natives of those countries which have not come under the control or influence of European civilisation—'savages,' in other words. The Fijians, the Maoris, the Hindoos, the Malays, the natives of Polynesia, and the less civilised Japanese are all acquainted with the 'power over fire,' which forms one of their religious

rites. The Red Indians of North America, when in their primitive natural state, were experts in this line, but they have long since lost all their old powers and tastes. They are a broken race, apathetic and indolent, caring for nothing so much as 'fire-water' and cards—which tastes they acquired from their white brothers—and are quite content to sit for hours basking in the sun, smoking, wrapped in gaudy blankets and gloomy meditation. So different from the old times when they were a high-spirited race, of tireless energy, indomitable courage, and stoical endurance—and, we may add, relentless cruelty! Then they lived very close to nature, fully cognisant of its occult powers, and acquiring somewhat of those powers in their own natures. It was a common occurrence for these men to walk on red-hot stones and pass naked through fiery furnaces without manifesting any sign of pain, or indeed being burned by the fire. The writer has come much in contact with the Red Indians of the Far West during expeditions in quest of the precious metals in Colorado, Arizona, and California, and has conversed with the few who had some knowledge of English. An old chief once told him that the secret of the marvellous stoicism, or indifference to pain, of the Red Indians lay in a peculiar mental condition which, by constant practice, could be brought to a high state of perfection, being induced, at any time, by a kind of self-hypnosis. The seat of all sensation lying in the brain, it is the brain, therefore, which must be numbed to annul the sensation of pain, and this can be done by a certain mental process known only to the 'adepts.' When this condition was induced, red-hot irons could be applied to the body without any unpleasant sensation being produced. The face of the adept at such times took on a stone-like rigidity, due to the absence of life and feeling in the brain.

In the *Journal of the Polynesian Society* (Wellington, New Zealand, March 1899) Colonel Gudgeon, British Resident at Rarotonga, gives an account of a Fire-Walking ceremony which took place amongst the natives of Rarotonga, and in which he and three other Englishmen participated. The performance consisted in walking through an 'oven,' over a number of flat stones (twelve feet in diameter) which had been heated for hours in a furnace. The distance to be traversed was twenty feet, and it had to be done barefooted. The furnace was lighted at 5 A.M. on 20th January, and at 2 P.M. the *tohunga* (or priest) told Colonel Gudgeon that everything was ready for the ceremony, and they accordingly proceeded to the oven. The *tohunga* and his *taura* (pupil) began by chanting a short invocation; then the priest took a branch of the ti-tree shrub and struck the edge of the oven three times, and, followed by his pupil, deliberately stepped bare-

footed on to the scorching stones and walked slowly across. The two men then walked back again. The *tohunga* next approached the Englishmen, and handing the ti-tree branch which he carried (like a magician's wand) to Mr Goodwin, said shortly, 'I hand my *mana* [power] over to you; lead your friends across.' They did not 'half like' it, but could not show the white feather before the natives, so sat down and took off their boots and socks, and otherwise prepared themselves for a 'hot reception.' Mr Goodwin, armed with the magic ti-branch, led the way, followed by Colonel Gudgeon, Dr George Craig, and Dr William Craig. They stepped out boldly—though Colonel Gudgeon had considerable qualms, as the soles of his feet were particularly tender. They all got across safe and uninjured except Dr W. Craig, who disobeyed one of the injunctions, and (like Lot's wife) looked behind him. He was badly burned, and was laid up for a long time after. Colonel Gudgeon, in speaking of this experience, stated: 'I can hardly give you my sensations, but I can say this, that I knew quite well I was walking on red-hot stones and could feel the heat, yet I was not burned. I felt something resembling slight electric shocks both at the time and afterwards, but that is all.' To test the heat of the stones, half-an-hour afterwards Colonel Gudgeon threw a branch on to them, and in a few seconds it caught fire. Later on two hundred natives (who had been given the 'power') walked across with bare feet, and not one was burned, though the stones were still intensely hot.

III.

Interesting accounts of the Fire-Walking ceremony are given in Mr Basil Thompson's *South Sea Yarns*; and in *The Transactions of the New Zealand Institute*, vol. xxxi., there is a remarkable account of a Fiji Fire-Walking ceremony by Dr T. M. Hocken, F.L.S., which was read by him before the Institute of Otago in May 1898. The performance, which took place on the tropical island of Fiji, was witnessed by Dr and Mrs Hocken, Dr Colquhoun, and the Hon. Mr A. Duncan (a member of the Fijian legislature). In this case the natives took three days to make preparations for the affair. The furnace for heating the stones was kept burning fiercely for forty hours before the ceremony, so as to have the stones at a white heat; and large supplies of food were collected for the great feast which always comes after the fire-walking. The almost nude Fijians walked the white-hot basaltic stones without any previous incantation or religious rite. They passed round the oven in single file, leaving by the way they came in, the leader being in the furnace just thirty seconds. Directly the last man had emerged, great bundles of hibiscus-leaves were thrown on to the stones, and the

oven was at once filled with steam from the burning vegetation. A native magistrate named Jonathan, on being questioned about the matter by Mr Walter Carew, the English stipendiary magistrate at Fiji, stated that he had done fire-walking, but had no idea how it was effected, and that he never felt any heat. Mr Carew considers that *faith* in an extraordinary degree has some sort of magical influence over the fire-walker. In the *Polynesian Journal* it is stated that an Englishwoman—Lady Thurston—laid her handkerchief on the shoulder of one of the fire-walkers. It was there only a moment or two before being withdrawn by means of a long stick, but it was scorched through. On another occasion an English magistrate, who was looking on, threw a handkerchief on to one of the stones in the oven just as the first of the native performers was stepping in. The natives proceeded unscathed, but the handkerchief was burned before the last man had crossed the pit—and yet they stepped on or over it.

Some of these ovens, or pits (in which lies the fiery furnace), are described as being four feet deep, circular in form, like a great dish or basin, gradually sloping down to the centre, the bridge of stones across the centre being about thirty or thirty-five feet long. The bottom of the pit is filled with firewood and great logs; the stones are fixed above; the fuel is ignited and the fire kept burning for from twelve to forty hours; and then, when the flames are blazing up through the cracks between the stones and all is red-hot, the natives pass over. Photographs of the Fire ceremony in the South Sea Islands have been taken by Lieutenant Morné of the French Navy. Miss Tenira Henry, a resident of Honolulu, in a letter to *The Polynesian Society's Journal*, stated that her sister and her sister's child walked over the hot stones at a Fire ceremony in the Uum-Ti (an account of which was published in that journal, vol. ii. p. 108). This was the only instance on record of a woman (and a white woman, too!) having performed this feat. It is a well-known fact amongst fire-walkers that to hold the hand of one of the performers acts like a charm, giving absolute protection from burning.

The Prince of Wied, in his work *Reise in das innere Nordamerika* (Coblenz, 1839), describes the Fire ceremony amongst the Red Indians of the Far West, as he had himself witnessed it in the early times of American settlement. Heated stones were not used at those performances, but great fires were built, and the Indians rushed into the midst of the flames and danced on the glowing embers.

In India and Japan the secret of 'power over fire' has been preserved in certain families (being handed down from father to son) through many generations. In the nineteenth century there was a family of this kind in

Spain which possessed the power of walking through fire uninjured. The secret of how it was done had been carefully kept for generations, the initiated one being obliged to take a sacred vow not to reveal it to any one outside the family.

In *Les Annales des Sciences Psychiques* for July 1899 there is a paper by Dr Pascal, entitled 'Les Dompteurs du Feu,' in which he describes the Fire ceremony as he had seen it at Benares, India, in October 1898 and February 1899. The performance was of the nature of a religious rite, as prayers were uttered and holy water was used. The natives passed over red-hot stones above a fiery furnace. On one occasion (in February 1899) three of the Hindoos came into collision through one of the stones giving way, and they fell into the fire, but came out unharmed—not even their garments being singed. Mr Basil Thompson, in *South Sea Yarns*, describes the pit through which the Fijians passed as being 'filled with a white-hot mass shooting out little tongues of white flame,' and says that a bridge of evenly laid hot stones spanned the centre, on either side of which little flames shot up and played round the feet of the performers. The feet of the natives were examined directly after their exit from the pit, and were found to be cool and unscorched; nor were the fringes of dried ti-tree worn round their ankles affected by the fire—though, as a rule, it catches fire at once. The fiery 'pit' at Fiji was very similar to that used at Benares—at the other side of the world.

Fire-walking originated in India, and is an extremely ancient rite. A case is recorded in the *Tāndya Brāhmana* of the *Samaveda*, of two Brahmin priests who exhibited their superior sanctity by 'power over fire,' and walked through fiery furnaces without being burned or having a hair singed. That story dates back to 800 B.C. There are still earlier records than that in India, probably surpassing in antiquity the Bible narrative of Shadrach, Meshach, and Abednego.

DAWN BY THE ROADSIDE.

O WE have climbed the highway
That winds by the ringing seas,
And we have tramped the byway
That skirts the woodland trees.
There little birds awaken
On boughs by breezes shaken,
When earth by night's forsaken
At the rising of the sun.

We'll break the backs of mountains,
And haunt their purling streams;
By sleepy courts and fountains
We'll weave our morning dreams.
When clouds of night to westward fly,
And we to eastward day descry;
When dawn creeps up the saffron sky,
Then our wayside joy's begun.

W. M. PARKER.

Chambers's Journal

SEVENTH SERIES

OUT OF THE BOLSHEVIKS' CLUTCHES.

By LYDIA YAVORSKA (PRINCESS BARIATINSKY).

PART I.

I.
I WAS playing Bernard Shaw's *How He Lied to Her Husband* in a theatre on the Nevsky Prospect. The applause had not yet died away when I saw in the wings the figure of a well-known Bolshevik. He was not in a typical Bolshevik turn-out—that is, high boots, *sovdepka* (a khaki blouse cut in a specially modish way), and leather belt—and anywhere in civilised Europe you would not have taken him for a Bolshevik, for he was small, quiet, and dressed in an ordinary tweed suit. Nevertheless, he was a well-known, indeed a noted, Bolshevik, being the director of the eastern department of the Commissariat of Foreign Affairs in Moscow, and a member of the 'Central College,' or group of three, that manages all the business of that institution.

I had known the man before the revolution as organising secretary of a society formed with the object of combating German influence in Russia, under the name of the 'Society of the Year 1914.' Strangely enough, after the revolution he declared that the society had been only a mask under which to attack the monarchy, that the war must be stopped, and that the Germans were our best friends; and he attempted to convert the society into a republican club exclusively for soldiers and workmen, since, according to him, the *bourgeois* and the *intelligentsia* must be eliminated from consideration altogether.

The subsequent history of the society was brief but exciting. Its president and his supporters, who had been busy in counterming the Hun for the two preceding years, were resolute not to allow it now to be twisted into a jumping-board for his benefit, as was the obvious intention of our former colleague, V., so suddenly converted into a Boche-Bolshevik; and at a series of general meetings we put up the stiffest fight we could. This was not easy, for V. called in outside aid, packing the meetings with Bolshevik agents, and even once ejecting a committee meeting with the help of bayonets. By dint of energy, however, beating up every member we could, and talking-out the patience of the professional meeting-breakers, we won through, to the extent of driving V. and his Germanophil supporters out of the society; but, as every one

who knew Petrograd in the summer of 1917 is aware, to combat German influence was in the given circumstances an impossibility, short of spending millions; and the people who had millions to spend had not the faintest notion of how the millions ought to be spent. As an example of this, it may be mentioned that while the sailors of Cronstadt had their pockets stuffed with German money, and Bolshevik agents were distributing roubles, cigars, and vodka at the front with lavish hand, the Allies pinned their faith to a pictorial Easter card, sent for distribution from England—and several weeks late at that. The card, it is true, was pretty, and pleased the soldiers; but what chance had it against our enemies' more practical persuasions?

At the last general meeting of the Society of the Year 1914 I had applied a very hard word to V., and I confess to experiencing a slight tremor when he now came forward to greet me. I had, of course, followed his career on its upward path, and had seen him one or twice in the street in Moscow; but here we were now, face to face. Would he remember? That he remembered I have no doubt, for his intelligence is above the ordinary; and if he determined to seem to forget, it was probably to impress me with his magnanimity, and to pose as the benevolent despot. As the result will show, I have reason to be grateful to him, and I shall always follow his career with interest. He is a man of real ability, and may make his mark in the world—if he is not first shot.

However this may be, V. was for the moment wreathed in smiles, came to my dressing-room, complimented me on the success of the play, on the staging, on my performance, and remarked on the joy of having an evening's intellectual recreation after the strain of political work. 'I am really most grateful to you,' he said, in excellent English. 'What can I do to show it?' Without an instant's hesitation I answered, 'Get me a passport for abroad.' 'You shall have it to-morrow,' he replied.

II.

A passport for abroad. It does not seem so much to ask. Time was when to apply for and obtain your passport was a matter of simple

formality and a few days; but times had changed. Since June I had been on the watch how to get mine, but without avail. I was far too much tarred with the brush of British sympathies to be allowed through Finland by the Germans, and the Bolsheviks knew me for too good an opponent of theirs to let me out by Murman or Archangel while they were in possession. For a Russian even to get to those places, let alone have a passport to leave from them, a special pass was required, and I was warned by a friend 'in the know' that it would certainly be refused. Better, therefore, not apply, since application would give notice that I wished to leave the country.

I had got word sent to the theatre at Archangel that I was willing to play a short season there, believing that it might be possible to get away thence without a passport. This was arranged. But when the theatre applied for a pass for me and my baggage to go to Archangel, we found ourselves up against the brick wall once more. And thereby hangs a tale; for the manager, disappointed of my visit, wired to Davydov, the *doyen* of the Imperial (now State) Petrograd theatre, who was playing in Moscow, to come instead. He went, and within ten days the British had taken the town! The Bolsheviks were distressed at losing one of the chief stars of the theatrical firmament. Appeals were made to Davydov to return, coupled, doubtless, with substantial offers; but the clever old actor (much more than clever as an actor, for since Coquelin's death he is perhaps without rival in comedy) knew too well the difference between a life of order and freedom under the protection of the British flag, and life in Bolshevism*—such as it was in July 1918—with bread at thirteen roubles a pound, cheese at twenty-seven, and eggs two roubles apiece. All the blandishments were in vain; at Archangel Davydov was, and there he stayed.

After that I had tried to get away to Czecholand (as Mr Woodhouse, the excellent British Consul at Petrograd—who, it may be said *en passant*, really knew Russia and the Russian language—dubbed the vast territories under control of the Czech-Slovak regiments), and thence by way of Vladivostok; for which purpose I got a British *visa* on my passport, knowing that once there no Bolshevik foreign passport would be needed at all. But fortune intervened in the shape of a matter where life or death hung in the balance, and held me up for hard on two months; and in the course of these two months Samara was captured by the Bolsheviks, and the waterway that I had reckoned on taking was blocked. So at the beginning of winter I journeyed back to Petrograd, and continued to watch for an opportunity to flit.

By this time everything in Russia was firmly

in the hands of the Bolsheviks. The theatre was perhaps the last of the great departments of life to be brought under the yoke. Until well into the summer at least a semblance of independence had been preserved. Some nasty reminders that the stage was essentially no more free than the press or the pulpit had indeed been given to the servants of the public, as when the popular clowns Bim and Bom were arrested in the circus at Moscow for some jest made against the rulers. They barely escaped shooting, and were so frightened that for the rest of the summer they could not again appear in cap and bells.

At the time of the Bolshevik irruption into my native Kiev, the loveliest of the cities of Russia, the celebrated comedian Sokolsky, a sort of Russian George Robey, was executed for being a counter-revolutionary—in other words, murdered for saying that he was by principle a monarchist. Then a well-known *jeune premier*, named Azanchev, with whom I had acted at Voronezh, was shot in the rising at Yaroslavl. But he was an ex-officer, and therefore, of course, could not be let live by those whose boast it is to exterminate all they cannot bribe. And recently the well-known leading actor Petitpas was shot too.

Yet, on the whole, actors were well treated, being, as it were, left a little at a distance from the turbid stream of 'nationalised' life, which, when it did not rush swirling by in a bloody torrent, sank into a horrid pool 'that some did die to look on.' The Bolsheviks had perhaps a certain respect for *the* profession as the 'abstract and brief chronicles of the time.' At all events, they knew well the value of the stage as an instrument for creating impressions on the public imagination. During the summer conciliar and communal theatres were being formed, and throughout the provinces all theatres had already been taken over by the local councils, their owners and managers being summarily turned out, and the wardrobes and all other property requisitioned. Of course, all this took place without payment or compensation; and equally of course, since there is no capital to spend on renewals, and it is no one's interest to attend to things, general deterioration is in process.

The autumn and winter saw a great change in the position of the theatre. The few private managers left were gradually squeezed out, only one in Petrograd, so far as I know, surviving under the guise of a 'collective,' or what is called on the English stage a commonwealth, in which all members of the company have a share of the profits and the losses. The majority of the theatres were either turned into 'communal theatres,' or given over to pushing young favourites of some conciliar bigwig, backed by money wrung from the unfortunate private citizen, and spent without his will or without his control. The latter was in many cases very

* Russians refuse to call the state of Russia, as it is under the Bolshevik tyranny, by the name of *Russia*, but speak of it as *Bolshevism* or *Sovdepi*.

much needed, for under communal management the theatres and the returns went from bad to worse; and at the Musical Drama, the Opéra Comique of Petrograd, where, besides opera, heavy drama was also being played, the deficit amounted to six thousand roubles nightly. The theatre on the Nevsky Prospect at which I had been invited to play was under the special protection of Madame Zinoviev, but I am glad to say I never saw her; nor had I anything to do with the conciliatory influences that ruled the management. The conditions of work, however, really belong to another story, and not to that of my escape.

III.

My Bolshevik friend had said I should get my passport next day, and when next day and the day after no word came from him, my hopes sank to zero, and I began to call him black names in my heart.

It was nearly midnight on the second day when there came a ring at the door. The lady who was living with me was scared to death. A perquisition, probably! I went to the door, and asked through it, 'Who is there?' A quiet voice answered, 'Don't be afraid; it is V.' Had he chosen midnight to make a more dramatic effect, or was he really up to the eyes in consultation with the chiefs of the 'Petrograd Commune'? I do not know. Anyhow, he came in, made a light supper of the inevitable salt herring, tea, and cigarettes; and there now being no cabs or other means of locomotion at night in Petrograd, we gave him a shake-down on the sofa.

My friend did not know who V. was, and soon brought the conversation round to the almost exclusive theme of talk throughout Russia—the Bolsheviks, their Terror, and the plight of the land. 'Nonsense,' he said; 'the fact is that the *bourgeois* live much too comfortably. Look at the sheets you are getting out for me! That's luxury. And you have a separate bathroom for a household of two or three people. It's not my fault if you are having a bad time now. Ninety per cent. of the Russian nation are peasants, and why should you live better than they do?' From the point of view of the handful of Bolshevik leaders there is, in fact, every reason why no one should be allowed to live better than the peasant, or the peasant than the beggar, seeing that it is this process of levelling down till everything has reached the bottom-point of discomfort, unculture, and brutality that assures those who play on the mob's jealousy of superiority in all its forms a continuance of fat jobs and uncontrolled power.

Next morning Comrade V. and I set out for the Commissariat of Foreign Affairs, where Comrade G. received us, with the *empressement* due to my companion's position. And even as V. had said, in the twinkling of an eye a passport was granted for me to leave by Belo-Ostrov—and

what was more, an order enabling me to take forty-four boxes, with a total weight of eighty poods. This was a favour almost unheard of, for be it known that no one, even leaving the country openly and of right, is allowed to take more than two poods (seventy-two pounds) of luggage with him. How I was envied my good fortune by those who saw one possession after another being robbed from them! True, I should be abandoning much of my property; but when one is escaping from bandits, he is lucky who can save anything. The only other known to have got out with a substantial amount of luggage was Marie Kuznetsova, the noted opera singer, who, three months before, after endless difficulties and months of begging, had gone by sea to Stockholm with twenty trunks. Jewels, silver, and in general articles of value are also barred, as though the Bolsheviks feared to enrich the 'capitalist' countries of the world by the contents of travellers' portmanteaux. Of money, it is allowed to take one thousand roubles, no more, and that in 'Kerenkies'—the little square brown and pink slips (of twenty and forty roubles) that are printed by every army commissar by the hundred thousand, forged in every town in Russia, and not accepted outside Russia as money at all!

Now, I had thought it imprudent to say that I was going to the home of the arch-enemy, England, and so had asked for my passport on the ground that I was going to make a tour in America. I represented that one thousand roubles was really a very small allowance on which to get to the New World. Did the Conciliar Republic want me to be stranded on the way and become a piece of ocular evidence that the Bolsheviks thus toy with poor actors, letting them go, but not leaving them the wherewithal to live? By dint of pleading, and repeated visits first to this, then to that, institution, I got the allowance raised to two thousand roubles. It was not even enough to get to the quarantine station over the Finnish frontier! Also I got a letter from Comrade G. at Petrograd to the comrade in command of the guard at Belo-Ostrov in the following terms: 'Comrade Resembal, I recommend you Comrade Yavorska, who is strongly recommended to me by Comrade V. of Moscow!'

IV.

Armed with these papers, I had my boxes loaded on three carts at the cost of a round thousand roubles, and despatched to Belo-Ostrov from the Finland station. What a change had come over this once busy terminus! Now the long platforms stood deserted: nothing but suburban traffic, carried on with the three or four engines still in tolerable repair—these working so badly that the trains were often over an hour late on a line the total length of which is some twenty miles; and once a day a train to Belo-Ostrov with the few lucky fugitives who had leave to escape from Sovdepiä. I thought of the summer night

in 1917 when Prince Kropotkin came from England, the immense enthusiastic crowd, the excited greetings, the tired, flushed face of the old revolutionary hero, dazed by the noise; and how a wounded officer fell at his feet in a fit of hysteria, shrieking, 'Save us from the Bolsheviks! Save Russia from the Bolsheviks!' I wondered where Kropotkin was now. He was reported shot, then said to be in safety with the Czecho-Slovaks, then again to be near Moscow, arrested and then released. But, unless by chance, or until his name is published in a curt list of those murdered by decree, there are no means in Bolshevikland of finding out where a friend is.

At Belo-Ostrov I received a series of shocks. In the first place, I presented my letter of recommendation.

'Ah, so you want to see Comrade Resembal, do you?'

'Yes.'

'Well, you can't.'

'Why not?'

'Because he's no longer here: been removed.'

This was awkward. Not only was the man gone, but because I had a letter to him I had evidently become an object of dislike to his successor in office. Still worse was to come when I presented my official papers.

'These are no good—not worth twopence!'

'Why not?'

'They're signed by Lordkipanidze.'

(This personage, it should be observed, is not an English peer with a fantastic name, but hails from the land of Georgia.)

'Well, what's the matter? Lordkipanidze is the commissar!'

'He *was* the commissar, but he isn't any longer; he's made off over the frontier into Finland. That's the matter.'

There was evidently nothing for it but to return to Petrograd and apply for fresh papers to be issued.

At the Petrograd Commissariat Comrade G. was charming, greatly regretted the mistake, said that there ought to have been no trouble, because, even though Lordkipanidze had disappeared, orders signed by him while in office were valid, and procured me fresh papers with a different signature, and an authorisation to take a certain amount of jewellery out of the country into the bargain.

Off I went again to Belo-Ostrov. This time the signature was good. 'But what's this? Jewellery? An order from the Commissariat for Foreign Affairs? Nonsense! Not worth a cent! We don't care a rap for your Foreign Affairs! Why, in the name of all that is holy and socialistic, the Foreign Affairs have given you a pass for your forty-four trunks without search! Ha, ha, ha! Just you try! As for your jewels, if you get an order from the Industry and Commerce section of the Petrograd Soviet we may

consider it; but luggage *without search*! Never! A fig for your Foreign Affairs!'

I was myself witness how these elegant ruffians unearthed pearls, worth (so it was said) seven hundred thousand roubles, that were sewn into the collar of a Danish lady's fur coat. 'This'll keep us going for a month or two,' was the gleeful comment. 'Sure salaries and a bonus on top!' How the division of spoils is made I do not know, but it is certain that a fat share goes to the very practical communists on the spot.

So back to Petrograd again—this time with complaint against the comrades. The Commissariat was dumbfounded and incensed at the report of such insubordination. A lively telephonic conversation ensued between Petrograd and Belo-Ostrov, ending with G.'s, 'You will please submit to the authority of the Foreign Office. If not, I'll have you sent to the Gorohovaya;' and the receiver was put down with a bang.

Next to the Industry and Commerce Comrades, where two little Polish Jewesses received me. 'Oh, you are going away,' they chorused, on learning my errand. 'How lucky you are! How gladly we would go too! It is almost impossible to exist. How we envy you!' This was all very well, but the commissar of the section, who alone could sign the order to allow valuables to pass out of the country, was not receiving. Why not? Well, too near closing-time, or perhaps he was reading the comic paper, or maybe simply thought he had done enough for his country. The assistant-commissar, also a Jew, refused to do anything. 'No jewels out of the country,' he shouted. 'Not one!'

I was in despair, for to me time was, in lawyers' language, of the essence. Even before packing my trunks, I had received warning of a coming denunciation against me, and after my first exit, as one might say, had judged it wiser not to return to my flat, but had taken refuge at friends', so that investigations of possible informers might, at all events, be delayed. But the days were slipping by, and the danger was increasing; if I did not get hold of this commissar now, it would mean another day's delay, and then— Yet to abandon my best valuables was a bitter thought.

I was debating with myself, when one of my sympathisers whispered, 'There he is, putting on his coat.'

I made a dash for the commissar, and was in time. 'I want to go to America,' I said, naming myself.

'Very sorry to hear it,' replied the young gallant. 'I wish you every success there.'

'But I can't, unless you let me take my rings and necklaces. How is it possible for an actress to appear on the stage without jewels? You can't want a Russian actress to be put hopelessly in the shade by every one else? Do give me the paper!'

'If it depends upon me, I shall certainly do everything to keep you here. But, in any case, I have no power to do what you want.'

A long argument followed, at the end of which, to my intense delight, he consented to put his signature to the paper I had from the Foreign Office, though protesting all the time

that he had no right to do so. 'But don't tell any one,' he insisted.

'Let me sign too,' fussed the assistant, fearing to be left out in the cold, now that I had got what I wanted. My relief was great. One day saved! One day nearer to freedom!

(Continued on page 542.)

THE PARTS MEN PLAY.

CHAPTER XXV.—THE FIGHT FOR THE BRIDGE.

IT was nearly noon when the tired youth awoke. He looked wonderingly about, and there was a haunting fear in his light eyes, like those of a stag that dreads the hunters. From the north there came the sound of drum-fire, a weird, almost tedious rhythm of guns working at a feverish pace; and the near-by road was a mass of jumbled traffic. Ambulances, supply-wagons, field-artillery, lorries, with jingling harness or snorting engines—streams of vehicles moved slowly up and down their channel. At a reckless speed motor-cyclists, carrying urgent messages, swerved through it all; and in the ditches that ran alongside, refugees were stumbling on, fleeing from the new terror, their crouching, misshapen figures like players from a grotesque drama of the Macabre.

'The sausage-eaters,' said Mathews philosophically, 'must be feelin' their oats, sir.'

At the sound of the familiar voice the fear passed from Dick's face. Memory had returned, and he smiled, though his body trembled as if with a chill. 'I'm starved,' he said, 'and I have nothing with me. How long did I sleep, Mathews?'

'Pretty near seven hours, Mas'r Dick. Here you are, sir—feeding-time, and the bugle's went.'

He handed Durwent a sandwich, which the young man devoured ravenously, washing it down with some cold tea. Mathews also munched at a sandwich, and through the corn-stalks they watched the two currents of war-traffic eddying past each other. There was a roar of engines behind them, and, flying low, a formation of sixteen British aeroplanes made in a straight line for the battle area.

With a map which the groom had thoughtfully borrowed from an officer the previous day, they managed to gain fairly accurate information as to their position. By calculation they figured out that they had travelled seventeen or eighteen miles during the night, and identifying the main road on which they had come, saw that after two or three miles it would take a rectangular turn to the right, running parallel to the line of battle. Four miles to the north-west of the turning-point there was a river, and this the fugitives decided to reach that night.

'If we can locate that,' said Dick eagerly, 'it is bound to lead us into the French lines.'

'Werry good, sir,' said the groom, with an air of resignation. His contempt for maps and their unintelligibility was a deep-rooted one, but if his young master thought he could locate a river with one, he would keep an open mind on the subject until it had, at least, been given a fair trial.

'You see,' said Durwent, 'a great many of these troops on the road are French, so when we follow that route we must get into French territory.'

'Yezzir,' said Mathews profoundly. 'I won't go for to say as 'ow you mayn't be right. All the same, Mas'r Dick, when it comes to enterin' the ring with them sausage-eaters I'd rather 'ave a dozen Lancashire or Devon lads about me than all the Frenchies you could put in Hyde Park. It ain't that these here spec'mens don't 'ave a good sound heart as far as standing up and taking knocks is concerned, but they be too frisky and skittish for my likin'. I see 'em all waving their arms like as if a carriage and pair has run away; and talkin' all at once and together, likewise and sim'lar. Wot's more, they does it in a lingo that no one can't go for to make out, not even a Frenchy hisself, because I never see one Frog listenin' to another—did you, sir? Wot's more, sir, they gets all of a lather over things which is only fit for women-folk to worry on—such as w'ether a hen has laid its egg reg'lar; or the coffee, was it black enough? From wot I see as puts a Frog in a dither, I sez to myself that if you was to take him to a real hoss-race, he'd never a-see'd the finish. No, sir; he'd be dead o' heart-failure afore the hosses was off.'

Dick smiled at the tremendous seriousness of the old groom, and lay back wearily on the ground. 'We had better both turn in for another nap,' he said. 'We'll need all our strength to-night, and if we stay awake we're sure to get hungry.'

'Werry sound advice, Mas'r Dick,' said Mathews. 'But would I be persumin', sir, to ask you a favour? I got a letter yesterday from my old woman, and wot wi' her writing and me being nought of a scholar, I was wondering, Mas'r Dick, if you would just acquaint me with

any fac's that you might think the old girl would like me for to know.'

'Willingly,' said Dick, taking a sealed letter from the groom, who squatted solemnly on the ground, assuming an air of deep contemplation, as one who has to give an opinion on a hitherto unread masterpiece.

'It begins,' said Dick, with some difficulty making out the writing, which was extremely small in some words and very large in others, and punctuated mainly with 'blots'—"Dear Daddy"——

'That,' said Mathews, 'is conseckens o' me bein' sire to little Wellington.'

'Oh yes,' said Dick. "'Dear Daddy, ther ain't nothing to tell you Wellington has took the mumps and the cat had some more kittens"——

'That's a werry remark'ble cat,' observed Mathews. 'I never see a animal so ambitious. Wot does the old girl say Wellington has took?' 'Mumps.'

'By criky! I hope it don't go for to make his nose no bigger. Wot a infant he is! Mumps. Go on, Mas'r Dick—the old girl's doin' fine.'

"The day," resumed Dick—"the day afor Tuesday come last week"——

'Don't pull up, sir,' said Mathews as Dick paused to re-read the puzzling words. 'You has to take my old woman at a good clip to get her meanin'—but you'll find it hid somewere, Mas'r Dick. I never see the old girl come a cropper yet.'

With this to guide him, the reader found his place again with the aid of a blot, a half-inch square, which surrounded the first word. "'The day afor Tuesday,'" he went on, "'come last week Wellington and the rector's boy Charlie fit."'

'Werry good,' said Mathews approvingly.

"Wellington's nose were badly done in and he looks awful bad but the rector's boy"——

'Wot does she say about him?' asked Mathews, staring into space.

"The rector's boy could not see out of neither eye for 3 days."

Repressing a chuckle by a great effort, Mathews hastily fumbled for his corn-cob pipe, and placing it unlit in his mouth, continued to look into space with a face that was almost purple from smothered exuberance.

"Milord and Lady," resumed Dick, "'is just the same and Milord always asks how you was and will I remember him to you."'

'A thoroughbred—that's wot he is,' said Mathews, apparently addressing the distant refugees.

"Miss Elise was heer last week and is that sweet grown that all the wounded tommies fit with pillos to see who wud propos to her. There ain't no news. Bertha the skultery maid marrid a hyland soldier and they are going for to keep a sweet-shop after the war. Wellington

sprayed his ankil yesterday by clyming out of the windo where I had locked him in as he has the mumps."

'Wot a infant!' commented Mathews admiringly.

"I am sending you a parsil and a picter of me and Wellington. We are very lonesum, daddy, and I'll be reel glad when the war is over and you come back. It is awful lonesum and Wellington is to. This morning he cut his hand trying to carv our best chair into the shape of a horse. I am feeling fine and hope the reumatiz don't worry you no more. With heeps of love from me and Wellington, your wife, Maggie."

It was a strange contrast in faces as the young man folded the letter and handed it back. In the countenance of the groom there was a sturdy pride in the epistolary achievement of his wife—a pride which he made a violent but unsuccessful effort to conceal. In the pale, handsome face of the young aristocrat there was a whimsical pathos. By the picture conjured up in the crudely written letter he had seen his parents, his sister, the humble cottage of the groom, and the wife's faithfulness and cheeriness. He had seen them, not as separate things, but hallowed and unified by a common sacrifice for England.

For the first time since his escape Dick Durwent regretted it. He could see no safety ahead for Mathews, no matter how long they evaded arrest. Although a cool, fretful wind was blowing over the fields, the warm noon sun made his eyelids heavy.

Against the wish of the groom, he insisted upon spreading the greatcoat over them both, and in a few minutes master and man were resting side by side as comrades.

'Mathews,' said Dick quietly.

'Yezzir!'

'Give me your word that if you ever reach England you will never tell my family about this. They don't know I am in France, and'——

'Mum as a oyster, sir—that's the ticket. Werry good, Mas'r Dick. A oyster it is.'

Ten minutes had passed without either of them speaking, when Mathews partially raised himself on one elbow. 'If women,' he said ruminatingly, 'was to have votes, my old girl would run for parlyment, sure as skittles. I wonder, Mas'r Dick, if a feller who courted a girl in good faith, and arter a few years found she were Prime Minister of England—would that constitoot grounds for divorce?'

But Dick was asleep, and dreaming of days when happiness was in the air one breathed; when brother and sister had revelled in nature's carnival of seasons. After several minutes' contemplation of the uncertainty of married life, the old groom followed him into a slumber which was unattended by dreams, but did not lack a sonorous serenade.

II.

The night was streaked with tragedy as the fugitives stole to the road. The drum-fire of the guns had grown to a roar, through which there came the blast and the crash of siege artillery, shaking the earth to its very foundations, as if the gases of hell had ignited and were bursting through. Like lightning striking low, the night was lit with flashes illuminating the fields and the roads about; and shells were screaming and whining through the air, winged, blood-sucking monsters crying for their prey. Across a yellow moon broken clouds were driven on a gale that whipped the dust of the roads into moaning whirlpools.

Dense traffic moved sullenly on, the ghostly figures of drivers astride horses that whinnied in terror of the night. Not a light was shown. There were only the glimpses of the sickly moonlight and the flame-red flashes of the guns; and, unnoticed, Durwent and the groom followed beside a lorry.

Once, as they strode forward in the roar and horror of the dark, they heard the explosion of a shell that, by a trick of ill-luck, had found the road. There followed the shriek of wounded horses, quick commands penetrating the darkness. Corpses of men, dead horses, and shattered vehicles were drawn aside, and the long line that had been halted for four minutes closed the gap and moved on.

When they reached the turn in the road, they left the shadowy procession and made for the river by following a soft wagon-path that cut across the fields. For two hours they hurried on through the night's madness. More than once they were almost thrown to the ground by the terrific explosion of heavy guns that had taken up positions by the path; and by the flashes in the fields they could see the weird figures of the gunners toiling at their work of death.

As they came to the river they caught a glimpse of coloured flares not far ahead, and there came a momentary lull in the confused bombardment.

'Listen!' cried Dick.

From somewhere on the banks of the river there was the sound of rifle-fire, and the rat-tat-tat of machine-guns, like the rattle of riveters at work on a steel structure.

Following a tow-path which ran by the river, they appeared to be entering a zone of comparative quiet. Although the sound of rifle-fire grew more clear, the noise of the guns came from behind them, but to the right and the left. For an hour they ran rapidly forward, and it seemed that the tide of battle had swept to the north, leaving this area denuded of troops. They saw neither guns nor infantry, although a renewed burst of machine-gun fire told them they were nearing their unknown destination.

They had not started from their hiding-place

until nearly midnight, and as they reached a slight rise of the ground they could see that the darkness was slowly lifting with day's approach.

'See, sir,' said the groom, pointing ahead, 'yonder side o' the river to the right.'

'I can't see anything.'

'Look'ee, Mas'r Dick. Follow the river. I think that that there gray streak is a bridge.'

It was not until they had gone ahead a considerable distance that Durwent could make out a heavy bridge spanning the river, which ran with a swift current, and was more than two hundred feet in width. A blurring red was tinting the black clouds in the east as they crept along the path, when they heard a sharp challenge.

'Friends,' cried Dick, and halted.

'Stand still until I give you the once over.' An American corporal, who had apparently been running and was out of breath, came up to them, carrying a revolver, and looked closely into their faces.

'What are you doing here?' he asked.

'Stragglers,' answered Durwent, 'separated from our unit.'

'Where in Samhill is the rest of your army?'

'There are no troops back here for ten miles,' answered Dick.

The American took off his helmet and wiped his brow.

'Jumping Jehosaphat!' he exclaimed ruefully, 'do I have to marathon ten miles and back? They sure are generous with exercise in the army. Say, you guys—if you're on the level about being stragglers, and want a real honest-to-God show-down scrap, you hike over that bridge. Do you see that big tree over in the bush—can you make it out? Well, when you get across the river, just line your lamps on that tree, and after half a mile or so you'll come to a sunken road. Report to Major Van Derwater, and tell him you're the only army M'Goorty—that's me—has found so far. And tell him I'll discover the French admiral who is supposed to be bringing up reinforcements, if I have to search this whole one-horse country for him. You'd better get a move on before the light comes up, for, believe me, Lizzie, those Boches can shoot, and if ever they see you coming across that bridge you may as well kiss yourselves good-bye.'

Having delivered himself of this expressive monologue, the corporal replaced the revolver in its holster and took a seaman's hitch in his breeches. Again the machine-guns spat out, the sound seeming to be borne on the wind as the barrels traversed the air.

'Gosh!' said the corporal, 'but I'd give a year's tips to see that scrap out. They had the bulge on us by about three to one, and we had to back up to keep the line straight, but now we're holding them great. Say—we've got a bunch of bowhunks there who could shoot the wart off a snail. Some scrap—believe me. Well, so long.'

He had just started off at a run, when he stopped and turned around. 'If you ever come to New York, look me up at the "Belmont." I'm a waiter there, and I can put you wise to a lot of things. Chin, Chin!'

'Cheerio!' answered Dick, as the energetic corporal disappeared.

'I'm getting hard o' hearing,' said the old groom. 'Leastways I ain't sure I heerd him correct. Wot did he say?'

'Mathews!'—Dick turned to his servant, and his voice shook with excitement—'there's a battle going on the other side of the river, and we're to report to Major Van Derwater. By heavens, Mathews! I feel half-mad with joy. They didn't get us after all, did they? We sha'n't be shot like curs, at any rate. Think of it, old man—we've won out! They can't stop us now'—His words stopped suddenly. 'Mathews,' he said, 'you must not come. Stay here and join the reinforcements when they turn up. You have to consider your wife and little Wellington.'

For answer the groom started along the path towards the bridge, and Durwent was forced to break into a run before he could head him off.

'Mathews!' he said sternly.

'Mas'r Dick,' replied the groom, snorting violently, 'you shouldn't go for to insult me. Beggin' your pardon and meaning no disrespect, this here war is as much mine as yourn. Orders or no orders, I'm agoin' to have a howd'ee with them sausage-eaters, and as that there free-spoke young gen'l'man observed, the bridge ain't exactly a chancery in the daylight. Come along, sir—argifyin' don't get nowhere.'

Realising that further expostulation was useless, Dick followed the groom to the bridge. As they crossed it he noted that it was strongly built of steel, with supports that would bear the heaviest of weights. Gaining the opposite side, they waited as Dick took his bearings by the tree; and crossing a hard, chalky field, they stole towards the sunken road. They could hear the occasional crack of a rifle, and there was the ping of a bullet passing over their heads as they pressed on through the lightening gloom.

'Halt!'

A voice rang out, and they were questioned as to their identity. On being ordered to advance

they jumped down into a sunken road which constituted an admirable trench, and were at once surrounded by American soldiers.

'I was ordered to report to Major Van Derwater,' said Durwent.

They were asked various questions, and were then escorted a few yards to the right, where an officer was looking over the bank which hid the road.

'British stragglers, sir,' said the sergeant who had taken charge of them.

'What unit are you from?' asked the officer. His voice was calm and deep, but gave no indication as to how he felt disposed towards the two fugitives. In answer to his question Dick gave the name of his battalion, and Mathews did the same.

'How did you know my name?'

'We met your corporal, sir,' said Durwent.

'Where are your rifles?'

'Lost them, sir.'

'In what engagement were you cut off from your units?'

Dick tried to reply, but not only was he ignorant of the locality through which he had travelled, but his soul burned with resentment at being forced into lying. Mathews said nothing, and seemed quite untroubled. He was prepared to accept his young master's choice of engagements for his own, no matter where or when it might have taken place.

'I don't like this,' said the officer. 'These men are a long way from the British lines, and are either deserters or worse. Guard them closely, and if things get hot, tie their arms together so they will give no trouble.'

'Very good, sir,' answered the sergeant, preparing to lead them away; but Durwent, whose blood had run cold with dismay at the officer's words, struggled forward.

'Sir,' he cried, 'if you think I'm not to be trusted, give me a dirty job—anything. A bombing-raid, or a patrol—I'll do anything at all, sir, if you'll only give me a chance.'

'Well spoke, Mas'r Dick,' said Mathews proudly. 'Werry well spoke indeed.'

The officer, who had been about to issue a peremptory order, stopped at the sturdy honesty of the groom's voice. 'Send for Captain Selwyn,' he said. 'You will find him at the creek.'

(Continued on page 532.)

ON A 'SEA-TROUT' RIVER IN NORDLAND.

THE sun is already well 'abune the lift,' and is bathing in yellow light the dark pine-forests and surrounding mountains; but its rays have not yet entirely dispelled the sea of mist which, since eleven o'clock last night, has enveloped the river and its immediate precincts. In filmy clouds and columns, however, the vapour is

wreathing up into the blue of the sky, and ere long the roar of the foss will again be plainly audible. A 'Norskmand,' who is interested in timber, has come in from the upper valley, and brought the welcome intelligence that rain has been falling on the Swedish frontier; the first run, moreover, of sea-trout and bull-trout is due.

This Nordland river is a clean, sweet mountain stream. Unsoiled by the clay banks which so often interfere with sport on the lower Namsen and other Norwegian water-systems, it passes from source to sea down a rocky channel, interspersed here and there with deposits of gravel only.

Its formation at the mouth is singular. The river proper discharges at a right angle into a broad channel some three hundred yards in length, at one end of which there is a large brackish lake, and at the other a narrow rocky passage about half a mile long. Up through this passage the salt water from the fjord passes, filling the lake, and incidentally bringing up the migratory fish; but when the tide turns, the water accumulated in both river and lake rushes down it with great violence and renders it impassable by boats. About a mile farther up, and close to where our comfortable farmhouse stands, is the first obstacle to the ascent of the *Salmonidae*, in the shape of a foss. Here, separated from one another by a small rocky islet, are two parallel pools, which, from the middle of June onwards, always hold fish. The fall at the head of the smaller of these pools is perpendicular, and cannot be negotiated; by way of the other, although it is very rugged, all the salmon and trout bound for the upper spawning-beds pass.

A fair number of salmon ascend the river annually, but the bulk of the migrants consist of bull-trout and sea-trout, which begin to run at the end of June, accompanied by a good many grilse.

Although our season's bag—to two rods—rarely exceeds 2000 lb., the sport is most enjoyable. Practically all the fishing is from the bank, and there is always a pleasing uncertainty as to whether the next 'swirl' at the fly will be caused by a lively little sea-trout, a 'bullie' of 8 or 10 lb., or a 25-lb. salmon, its silvery coat decked with sea-lice.

To revert, however. The mantle of vapour has at length been completely removed, and the song of the river is clearly heard, the roar of the foss, the rippling murmur of the rapids; it is quite time to make a start. Among the rocks and pine-scrub that border the near side of the river there is a spot from which one can look down, without being seen, into the crystal-clear depths of the Little Foss pool. It is at first difficult to make out anything distinctly, but as the eye grows accustomed to lights and shadows, to the patches of foam which keep passing down from the fall at frequent intervals, and to the swirls and eddies of the rapid current, the forms of the fish become traceable. In two ranks, at the extreme head of the pool, lie twelve to fourteen salmon of from 15 lb. to 25 lb. apiece; they simply maintain their position and balance in the water, save when one of them, exasperated beyond control at being thus brought up all standing, so to speak, on its way to the spawning-grounds, wallows up to the surface or throws

itself wildly in the air. Over these fish the angler may throw, with all the skill at his command, every fly in his book, but he will not succeed in making one of them stir. It is otherwise, however, with the more recently arrived occupants of the pool, many of whom will, no doubt, show themselves open to conviction when a small Jock Scott, a Silver Doctor, or some such tempting confection makes its appearance in their neighbourhood.

Their behaviour, as we stare down at them, is prophetic of sport. Only the big bull-trout remain comparatively stationary; the grilse and the sea-trout are in constant motion, flitting from one place to another, or rising at some tiny object on the surface.

Close to the little indentation in the turf, formed by an eddy, where the boat lies, there is a good spot for salmon, but owing to the set of the current it is impossible to make a fly dwell over it except from the island. Thither, therefore, we row, and at the first cast after stepping ashore I hook a lively fish in very rapid water. Down-stream, of course, it goes, we following in the boat, and just as it seems about to descend the effluent rapid, it slants across to the Big Foss pool, where it is ultimately gaffed—a 23-pounder straight from the sea.

The rain announced as having been falling among the Swedish frontier mountains now begins to affect the river; there is a 'tightness,' so to speak, of the water on the rocks and stones, showing that it is rising. Clouds, moreover, coming up before a south-west breeze, are obscuring the sun, and there is, therefore, every likelihood of a good day's sport.

A heavy salmon takes the fly close by the black rock in the middle of the Big Foss pool. As soon as it feels the prick of the steel it rushes part of the way up the foss itself, as if with the intention of surmounting that formidable obstacle, comes tumbling back again through the foaming water, shakes the hook out of its jaw, and is free!

Within a yard of the same spot another salmon seizes the Durham Ranger, and, after ten minutes' hard fighting, is gaffed by Otto from the boat—a risky proceeding with no one at the oars.

The next three hours are devoted to the smaller fish, and with a 12-foot rod I secure eighteen sea-trout, averaging $2\frac{1}{2}$ lb., three grilse, and a 'bullie' of 10 lb. Considerable excitement attaches to the capture of the last-named, as, while it is being played, a lively sea-trout seizes the large Black Palmer which has been attached to the casting-line as dropper. Great is the turmoil which at once arises, each fish doing its best to get away from its fellow-victim as well as from the hook. The strain upon the tackle is severe. But Otto is equal to the occasion. Lying *perdu* alongside a big stone, he manages, with the assistance of his *tollekniv*, to sever the

dropper from the cast, so that the temporarily released fish falls into the extended landing-net, and the big bull-trout on the tail fly is left to fight his battle out in accordance with his own sweet will.

The pangs of hunger now begin to be insistent, and making our way to a favourite spot immediately above the fall, we settle down to the consumption of luncheon and tobacco. After the hard morning's work, moreover, we consider ourselves entitled to a *Middags Hvile* (post-prandial rest), and one pipe succeeds another before we make a fresh start. There are two more pools within the limits of my beat for the day, both of which seem sacred to bull-trout, but before passing up to them there is some very rough and broken water close to our feet, which, in the present state of the river, is worth trying.

The grilse are evidently running up from the fjord, as three of these lively little fish come at the fly in quick succession—but without touching the hook; then, in the middle of a foaming rapid, a salmon makes a perfectly beautiful head-and-tail rise. Without a moment's hesitation, and before I am able to exercise any restraining influence on its movements, the fish rushes downstream, and is promptly involved in the boulder-strewn torrent which constitutes the foss. Of course, the only thing to do is to follow as best I can down the ice-scoured rocks alongside, and,

although the line is slack throughout the passage, connection is maintained until, in the big pool below, some ten minutes later, Otto slips the gaff into a fine clean-run 14-pounder.

Where the river forms what is called the narrows there are always fish lying, but to get a fly to dwell over them from the bank is an impossibility. Of course, as usual, I try; and, equally of course, I miss a good sea-trout, which makes a determined effort to appropriate the 'Jock' as it is being swept out of its reach by the strong current.

There now remain unfished only the two bull-trout pools above mentioned, and donning a pair of waders, I get to work at the upper of these. It yields two fish of 4 and 6 lb., while a third breaks away with fly and cast in a snag of recent formation. At the head of the lower pool, beneath the shadow of the great cliff known as the Hawk's Rock, I hook a big 'bullie' of 15 lb., which is ultimately landed; but its struggles for freedom and peregrinations generally have been so violent and extensive as to destroy all chance of further sport, so I finish for the day.

When we reach the house, pretty well tired out, the bag is displayed for the public benefit. It consists of three salmon scaling 55 lb., three grilse weighing 10 lb., eighteen sea-trout totalling 47 lb., and four 'bullies,' 35 lb.—in all, 147 lb., from less than half a mile of water.

A DAUGHTER OF THE DOPPERS.

CHAPTER V.

THE last thunder-storm of the depressingly hot summer had growled itself into oblivion; but the pleasing effects to which—in common with its numberless predecessors—it had contributed were still apparent in the gay and 'dressy' appearance of the karoo veld.

Steenie had ridden out early one morning, the keen and bracing air filling her with such joy of life as she had never before experienced. The old, old sight of the *meerkats*, erect, like miniature kangaroos, watching her with unmistakable contempt, flushed her face with laughter. She gave the danger-signal, in the shape of a wild halloo, to a steenbok half-hidden, with extended ears, behind a neighbouring bush, and sent it in headlong flight towards the sheltering Klip Kopje. The secretary-bird, stalking along like a dismounted dragoon, gave her a wide berth, resentful of her boisterous intrusion. She galloped round the Klip Kopje, struck the Vaalbos road, and swept on towards the homestead, leaving a streaming comet's tail of white dust behind her.

She noticed several horses hitched to the trees on the *werf*, and scenting visitors, rode round to the stables and handed over her steaming animal to a waiting *Tottie* (Hottentot). With a few deft

touches she subdued her hair to order, and shaking the dust from her riding-habit, entered the *zit kamer*. Dr Bray was there, also her father—and a big, upstanding man in riding-breeches.

'Steenie,' said the doctor, 'let me introduce to you my brother Walter. He is the diamond-finder, you know.'

'I am pleased to know Miss Klopper, but the necessity for searching for diamonds is not so apparent to me now,' put in Walter Bray easily, looking into her bright eyes.

The implication made her blush, while the questionable taste, not to say impertinence, of such a speech on meeting her for the first time set her wondering. She was displeased with herself, however, on finding that no feeling of anger or annoyance rose within her; but she answered him quietly enough.

'Father will be delighted to hear that. He looks upon the indications as a misfortune, and dreads the influx of all sorts and conditions of men that would follow the discovery of a mine. There are things for which no wealth can compensate. The simple life he has always led is the best for him, and any change would bring unhappiness.'

'But it would bring wealth,' said Walter Bray.

'and the choice of the best farms in the colony would be his.'

She shrugged her shoulders. 'He is rooted here, and to uproot him is impossible. He was born on the farm'—

'What does the man say?' interrupted Oom Jan in Dutch.

Steenie told him.

'I don't want a diamond-mine,' he burst out; 'I want to live as my father did before me. That man with the false eyes is up to no good. I don't like him. Tell him to go back home.'

Steenie's eyes met Walter Bray's. The look thrilled her as no man's look had ever done. The noble figure and handsome face belonged to the hero of her dreams. She recalled *Ebb Tide*, and then Attwater. The romantic fancy for a fictitious character which had taken possession of her childhood's thoughts seemed, to her quickened senses, to transfer itself to Bray. Her fiancé dwindled into nothingness in the presence of this man, and the doctor's plainness of feature and awkward looseness of figure now came home to her for the first time.

'I cannot do it, father,' she said in Dutch. 'Would you have us known as the most inhospitable people in the district? After all, nothing may be found—so why worry?'

Dr Bray was vaguely uneasy. He could not tell why Steenie had scarcely noticed him since she entered the room. His brother seemed to absorb all her attention; but this, he consoled himself, was quite natural, as Walter was a stranger, and her evident desire was to please the new-comer and create a favourable impression. In spite of this consolatory thought, he kept watching her every look and movement—putting an unfavourable construction on each—until he found himself wishing for the end of the disturbing meeting, which, he could not but own, had been brought about by himself.

Oom Jan, after his outburst, had subsided into the listlessness which was part of his nature; but his keen eyes were watching Walter Bray as if he were sizing up an enemy. The cool effrontery of manner and the easy insouciance of carriage irritated the old farmer beyond endurance. The man's bearing was so different from the almost reverent respect accorded him by the young men of the district. He noticed that Steenie and the stranger were already on good terms. They were chatting and laughing quite like old friends, and he thought he had never seen her so animated. What kind of man was this whose words made her eyes sparkle and her cheeks redden?

'Steenie!' he called peremptorily.

She turned with a start. 'What is it, father?'

'That man must leave the farm. I don't want him here,' he answered.

'Oh, hush, father; perhaps he understands Dutch.'

'I don't care,' roared Oom Jan. 'He must go.'

'But, pappie darling, why should you be so unkind? He was invited here at your request. Let the man finish his inspection, and then he will go.'

She placed her arms around the old man's neck and tapped his lips with her soft fingers. He looked up at her. The influence of those eyes was too strong for him.

'Let him stay,' he said shortly, and relapsed into moodiness.

Nothing in Walter Bray's demeanour during this little scene betrayed in the slightest degree whether he understood what was being said. His calm assurance was undisturbed, so that when Steenie looked at him her fears were stilled, and she smiled. His predatory instincts were, however, already alive. Here was something which Providence had thrown in his way. A pretty, vivacious girl, and an only daughter; and behind that—wealth. She was betrothed to his brother, but what of that? His brother would have to take his chances in the game; and all was fair in love and war! Fraternal love was all bosh. It didn't exist where the love of money and power reigned. Animals ignored their brothers in later life, so why should not humans?

Just as his philosophy had carried him to these conclusions Ta'antje's voice was heard loudly calling for her husband. She entered the room flushed, and in an unusual state of excitement. 'Jan,' she called, 'the remains of three more sheep were found near the out-station this morning. You must go to the village and report the matter. Are you going to allow Plaatjes and his dirty Bushmen to ruin you? The vermin must be got rid of; otherwise we shall not have a fat sheep left.'

'The police have been told long ago, but they do nothing,' replied the old man. 'I must hunt Plaatjes out of my veld myself.'

'I will mention it again to the chief constable,' said Dr Bray, rising to go. 'Come on, Walter.'

Walter Bray was standing at the window, cool and erect, with his hands in his jacket-pockets. Steenie glanced at him and said hesitatingly, 'I—I think your brother had better remain here. He wishes to look at the mine early to-morrow morning, and to assist in finding Plaatjes and his men.'

'Very well,' replied the doctor curtly. 'Good-bye!'

His cart had been inspanned before she appeared on the *stoep*, followed by Walter Bray. The doctor could see that the easy self-possession of his brother and Steenie's animation spoke of anything but regret for his departure. It struck him that they looked like a married pair seeing a guest off, and the sight fretted him. Walter Bray's hands were still in his jacket-pockets, and he stood behind the girl, legs apart, with an assumed or an unconscious air of proprietorship which only served further to increase the doctor's

uneasiness, as he sat in the cart looking at them, trying to suppress the feeling of admiration which the sight called up. They were a handsome couple, and in spite of the disquiet of mind he laboured under, Dr Bray could not but admit to himself that, from a physical point of view, his brother was much his superior, and from that standpoint a more suitable mate for the girl. He remembered that she never called him anything but 'Doctor,' and that their relations as an engaged couple had been of the mildest character, so that he could not shake off the impression that she was slipping away from him.

'*Pas op* for the Bushmen, Walter,' he said, gathering up the reins.

'The Bushmen!' returned the other. 'Don't fear, old man; we shall know how to deal with them.'

The doctor's vexed mind rebelled against the term 'old man.' He imagined that it was not so much a familiar expression commonly used in regard to men of all ages, but a sly reference to his gray hairs. He repressed the feeling of annoyance, however, and said lightly enough, 'No doubt you will know how to deal with them, but take care that they don't deal out a couple of their arrows to you, for then you will have to go spades.'

'Does that imply the digging of my grave? No, thank you,' replied Walter pleasantly; 'I think I shall go diamonds, and then—hearts;' and he glanced at Steenie.

Dr Bray whipped up the horses, and left them—the girl composed and undemonstrative, save for the rich colour which instantly flooded her face at the man's speech; the man cool and equally undemonstrative, but with a gathering light in his steel-blue eyes.

Oom Jan had no opportunity of objecting to the presence of the stranger at his supper-table, but his stern and unbending demeanour during the meal plainly showed his repugnance; while his wife, adapting her line of conduct to the mood of her husband, as was her custom, was equally stiff and unbending. This did not seem to affect the conduct of the younger people—both gay and animated—whose conversation, sustained and unflagging, was proof against the ominous silence and implied disapproval of the old couple.

The morning came bright and bracing, with little cold gusts, as if the winter, with impatient fingers, laboured to thrust the summer aside. All hands were early astir preparing for the little expedition against the marauders, *Plaatjes* and his Bushmen. The early morning had seen the arrival of a small reinforcement in the shape of the two Cape policemen stationed at *Vaalbos*, whose presence the doctor's representations had secured, so that they looked quite a formidable band as they took to the veld to the left of the *Klip Kopje*, Oom Jan leading, and Walter Bray bringing up the rear, armed with a double-barrelled shot-gun. They spoorred carefully in

the direction of *Oude Post*, making a wide *détour* so as to get into the hills enclosing the out-station, near which the sheep had been slaughtered. They camped for lunch in a small kloof; but the Hottentot tracker, intent on the quarry, continued his search. The meal had scarcely ended when he returned, his flat features working with excitement. He had seen them, he said. They had started a little fire at the top of the kloof, and he had heard them talking.

'Another of my sheep, I suppose,' said Oom Jan stolidly. 'Let us trek and catch the scoundrels.'

Bray and a policeman took one side of the kloof, while Oom Jan and the second policeman proceeded up the other side, the tracker and the farm 'boys' stalking the quarry in the centre. They advanced in this order up to a point near the top of the kloof, when, as Bray and the constable issued from the bushes, a buzzing arrow passed between them. They rushed forward, and immediately the Bushmen broke cover, scuttling across the clearing like a *klompje* of alarmed guinea-fowl. Before the policeman could stop him, Bray had fired, and a gray object dropped. The rest gathered round the recumbent figure with the clicking and chattering and fantastic gestures of a troop of alarmed monkeys, but at the sight of the advancing white men scampered off into the bush.

When Bray and the policeman arrived on the scene Oom Jan and the rest were already there. In their midst a miserable object was lying, shrunken and dirty, and gasping as if to expel the reluctant spirit which still animated it. Nothing was clearer, however, than the fact that it was past praying for. Pathetically miserable the wretched creature looked, the poor head dotted here and there with an archipelago of little balls of hair, with heaving chest, clutching hands, and strange cries and clicks as of some wild animal in the presence of mortal enemies; but Bray appeared to be unmoved. Oom Jan, on the other hand, was in a state of unusual excitement.

'*Die is een vrouwe*,' he exclaimed. '*Ik is oud gewoord op mijn plaats maar zoe een elendige ding het nog nooit ge beur nie*.'

'What does he say?' inquired Bray of the policeman.

'He says,' replied the man, 'that it is a woman, and that such a thing as this has never happened on his farm before.'

'Well, what will he have?' returned Bray callously. 'If you want to exterminate a breed, you must kill the females.'

'Be careful of your words, Mr Bray. There will be an inquest,' said the constable coldly. 'It is a fortunate thing for you that *Plaatjes* shot first.'

'But I did not fire with the intention of killing this woman,' remonstrated Bray.

'That is true, perhaps; but the display of a little feeling on your part would not be out of place under the circumstances.'

Bray turned away with a shrug. Oom Jan had gone on ahead, so that when Bray arrived at the camp he found one of the 'boys' waiting to guide him back to the homestead. He rode along, wondering the while in what manner Steenie would judge him.

She was on the *stoep* when Oom Jan arrived, and ran down to meet him.

'Where is Mr Bray?' she inquired anxiously, 'and what has happened?'

'Don't talk of him,' replied the old man. 'He is an unlucky *schepseel*. He shot one of the Bushwomen. Plaatjes must have seen him with the smoking gun in his hands, and his reward will be a poisoned arrow if he does not leave the district.'

'Shot a Bushwoman! Leave the district!' exclaimed Steenie. 'But surely, father, you did not leave him alone in the veld to be murdered by Plaatjes!'

Thus was Bray judged. No thought of the wretched creature lying dead on the veld. Her concern, her fears, all her thoughts were for the slayer.

'One of the constables is with the dead woman. The other has gone to Vaalbos to report the matter. It is lucky for the Englishman that the Bushman shot at him first.'

'Dead woman,' she repeated slowly, touched for a moment; but no thought of hers could blame him. He was already blameless in her

eyes. She was blinded by a first great love, and her hero could do no wrong.

Presently he rode in, and the fine air of dejection he had assumed sat well on him. One glance at the girl and he was reassured.

'You have heard the news, Miss Kloppe! I have been terribly unfortunate. I had no idea there was a woman among them; and they began the shooting.'

'I don't blame you, Mr Bray,' she said, lifting her eyes to his. 'You were the one at whom the arrow was aimed, and your impulse to return the shot was quite a natural one. But what of the consequences? Will it be a serious matter for you?'

'I think not,' he replied, his natural air of jauntiness ousting the assumed humility. 'An inquest, you know; an inquiry before the R.M.; papers transmitted to the Attorney-General; said papers returned, stopping further proceedings on the grounds that the woman was killed by a shot provoked by attempted murder, and while she was engaged in the commission of a crime; and so on, and so on.'

And so (it may here be said) it proved. Bray suffered no inconvenience that involved anything worse than the making of two or three trips to Vaalbos; and it came about that the death of the woman was dismissed from the minds of all but one—Plaatjes, her husband.

(Continued on page 538.)

CURIOSITIES OF NATURE.

FISHES LIKE WITHERED LEAVES OR BUNCHES OF SEAWEED.

MIMICRY among animals is one of the most interesting of natural phenomena. Insects resembling bits of stick and withered leaves are familiar to all. Naturalists are acquainted with flies and beetles sufficiently like wasps and bees to deceive the inexperienced. Certain predatory insects, again, resemble flowers, and thus attract within their range flower-haunting species.

Here are two interesting examples of mimicry among fish. The first, found in Ceylon, is shaped and coloured like a withered leaf. A certain naturalist, Dr A. Willey, describes his experience of this curious fish. He was walking along the reef with a fisherman, when the latter attempted to catch a fish for him. The naturalist could not see at first what it was. The fish dodged about, and the fisherman failed to net it. Seizing the net himself, he saw what seemed to be a yellow jak-leaf gently and inertly sinking to the bottom. This being a common occurrence, he was about to turn away, when the supposed leaf righted itself, and darted off. It was finally secured, and was found to be one of those fishes commonly known as sea-bats.

The second example is furnished by the very curious fishes called sea-horses. Many long, irregular filaments proceed from their bodies, and give them a striking resemblance to bunches of seaweed. When the fish anchors itself—as it frequently does—by the tail to a plant of seaweed it seems like a part of it, and is not easily detected.

HOW THE BEETLE HELPS TO MAKE A FLUTE.

Beetles in the early stage of their existence are often great borers. They live in their food-supply, and hollow it out as they feed. In this way they drive tunnels in the trunks and branches of trees. Some of those wood-borers have been pressed into the service of man in the making of flutes and pipe-stems. It is the Sioux Indians of America who have found out that the beetle can be used in this way. Selecting a suitable stick from a tree, they remove about three inches of the pith at one end. Then they capture a beetle larva, and imprison it in this hollow. The beetle does the rest by eating its way right through, and the completion of the flute is thereafter a simple matter. A pipe-stem can be made in the same way.

THE DISCOMFITURE OF MRS JOPE.

By RICHARD CALDER.

I.

WHEN Mrs Jope recovered from what she afterwards called her 'peetrification,' she felt at once that she must not confer with flesh and blood. She must not, for example, tell Mrs Hastie, her sister-in-law—although she was quite a sensible woman—and she must certainly not breathe the matter to her bosom friend Mrs Dickie, because Mrs Dickie would contrive by hook or by crook to be at the manse before her.

'No,' as she said to herself, 'it's one o' thae things you've tae bear yer lane—of course, leavin' the minister oot o' accoot.'

When she got home and sat down by the fireside, she had to ask herself if, after all, she had actually passed through the experience. Let us see what had really happened. Mrs Jope was passing John Chalmers's door. John Chalmers's door opened almost directly into the kitchen, and John had a good voice, for he was a member of the Deacons' Court, and was in the habit of 'takin' pairt' in meetings. The words had come forth from the door with ominous distinctness. Mrs Jope positively shivered as she recalled them. There was no other way for it; her first visit must be to the manse.

Like a good Churchwoman, Mrs Jope was well acquainted with the ways of the manse, and the ways of its mistress, Christina; for the Rev. J. Anderson Philip, B.D., M.C., had not, as yet, visited the altar. She knew that he could be seen about half-an-hour before his evening meal and after his afternoon's visiting. She knew also that he could have been seen about ten minutes to one; but she knew further that by six o'clock it was the darkening, and that, therefore, there was a sporting chance of her reaching the manse without being seen by Mrs Dickie.

The click of the iron gate, some forty or fifty yards from the front-door of the manse, and the appearance of a female figure moving rapidly among the bushes, were something of a shock to the young minister, who was enjoying the twilight, in prospect of his evening meal and what he had hoped was going to be a night of quiet study. The discovery that the visitor was Mrs Jope did not mend matters. She was not exactly one of his favourites.

The Rev. J. Anderson Philip, B.D., M.C. (known to his intimates as 'Andy'), minister of the United Free Church of Cheggs, in the Presbytery of Cluthaside, was in many respects a man to be envied. As to age, he was nearer thirty than forty; he enjoyed vigorous health and the friendship of a large circle of friends. His outward appearance took the eye favourably. Although not tall, and even spare and somewhat

pale, he was quite obviously something of an athlete. As a matter of fact, in his golf club, which was a good one, his handicap was three, and it was not an uncommon thing for him to come in in the seventies, a fact which must always entitle a man to our respect. His dark-brown hair lay abundantly on a good forehead; his eyes had a glint; he had a well-shaped nose and a serviceable mouth and chin. There were ladies in Mr Philip's congregation who held that, groomed, banned, and gowned, he was the best-looking man who appeared in the Cheggs United Free Church pulpit. It is needless to add that the ladies regarded him as worthy of their most enthusiastic support in the various forms of Christian enterprise.

Mrs Jope found her minister in excellent spirits. He had done a good afternoon's visiting among people glad to see him, and he had the feeling that he had been able to render some human help to certain men and women. His forenoon's work had also been of the kind that pleased him, and, as we have seen, the prospects for the evening were favourable. If Peter Nisbet, the schoolmaster, came in for his last pipe, that would be all the better—for the minister and the schoolmaster were secure cronies. So Mr Philip had a real feeling of well-being as he took the air in the garden that autumn evening. And—who knew?—maybe Christina, in the back regions, was dealing with a 'finnan' such as his soul desired.

The forenoon's work came back very pleasantly to his mind. Mr Philip was an honours man in Hebrew, and a member of the Scottish Semitic Society. He was writing a paper on an aspect of *Deuteronomy* that was hidden even from the minds of most ministers and revealed only to critical babes. If he could show that D^r stood in a certain relation to Pⁱ, he would make even some of the members of the Semitic sit up. And he had good hope of success. So that the essay on 'Some Neglected Relations of the Deuteronomic Problem' might open up the way to—well, one never knew.

And now here was Mrs Jope—not exactly in her Sunday clothes, but in such an approximation thereto as indicated that the business was serious.

'Good-evening, Mrs Jope,' Mr Philip's voice rang out pleasantly in the gloaming as he shook hands with his visitor. 'Delightful evening, isn't it? And so mild.'

'You're right, Mr Philip; it's a fine evening,' replied the lady; 'maybe, if anything, a wee bit too mild, but we'll pay for that later on.'

'Won't you come in?'

'Thank ye; I was thinking I would like tae see ye.'

Mr Philip showed the way into the lobby,

where some golf-clubs stood accusingly in a corner, and throwing open the door on the left, ushered Mrs Jope into the darkened study, where in a moment the illuminated mantel revealed the kind of room dear to the heart of every rightly constituted cleric. The walls were lined with bookshelves. There were books on the study table in the centre of the floor; there were books filling and overflowing a revolving bookcase, books on the mantelpiece, and books on the hearthrug beside the minister's easy-chair. Expensive pictures were, of course, absent, but there were well-selected photographs, with some etchings: heads of soldiers, from Alexander and Julius Cæsar to Foch; heads of poets, from Homer and Dante to Matthew Arnold; heads of Churchmen, from Augustine to Chalmers, Norman Macleod, and Rainy; heads of great men of letters—Newman, with Carlyle in the vicinity to keep the balance true.

'Well, Mrs Jope, what can I do for you to-night?' said the minister in a tone of kindly inquiry. 'I hope that there is nothing wrong.'

'There's naething whit ye wad ca' specially wrang,' replied Mrs Jope—'at least amang oorsel's. Jope's gettin' plenty o' wark, and the young yins are steerin' aboot as usual. But there's richts and wrangs, and wrangs and richts, nane the less.'

At this stage Mrs Jope gazed with such concentrated pensiveness into the fireplace that Mr Philip concluded that the problem about to be presented to him, whatever its nature was, was on the moral plane.

'I aye said,' continued Mrs Jope, turning a dark glance on the minister's face, 'that thae folk were put forrit owre quickly. It's no that I'm jealous aboot Jope, because he's got a mant [stammer], and would rather rin awa' frae folk than see them; but wha was tae ken onything aboot folk that cam' a' the way frae Portobello? An' yet before we kent whaur we were he wis a deacon, an' she wis aye ready tae sing or recite without e'en bein' asked.'

'Excuse me, Mrs Jope,' interrupted the minister; 'of whom, may I ask, are you speakin'?'

'Of whom am I speakin'?' replied Mrs Jope. 'I'm speakin' o' the Chalmerses, of course.'

'Oh, the Chalmerses,' said Mr Philip in a musing voice—'the Chalmerses. My impression is that they are very decent people, and are certainly very willing to help in the congregation.'

'Aye, that's just it,' responded the visitor; 'they're aye ready enough tae come forrit, but I'm just here this very night tae tell you what I heard wi' my ain ears yesterday as I passed their hoose. Mr Philip,' proceeded Mrs Jope in a solemn tone, 'ye ken the laigh hoose whaur the Chalmerses bide in the Main Street. Weel, as I wis passin' there yesterday aboot hauf-past twelve, gaun hame efter seein' ma sister awa' at the station, I heard John Chalmers cry oot, "— ye, wumman, wad ye murder me?" an'

just wi' that there wis a great smash o' a plate on the kitchen floor.'

This shattering and portentous statement was followed by at least a minute's silence in the Cheggs U.F. study. It is not to be denied that Mr Philip received the words with something of a shock, for Mrs Jope, whatever she was, was reliable and intelligent.

'Are you quite sure, Mrs Jope, that you'—

'Quite sure!' interrupted Mrs Jope. 'Mr Philip, ye ken the Chalmerses' hoose as weel as I dae. Ye ken hoo the kitchen door opens at the fore-en' o' the through-gaun passage? I simply couldna hae made a mistake—an' sorry I am tae say that that's ma message to you the night, and you're the first tae hear it.'

'Well, I'm glad, at any rate, to hear you say that,' said the minister. 'You and I will keep this matter quiet until we see what is best to be done.'

At this point the gong sounded for the minister's evening meal.

II.

The sound from the gong was caused by the hand of Christina Walker, who for five minutes had been making a praiseworthy effort to discover who had been able to enter the study without her knowledge. Christina's curiosity was stimulated by the fact that the voice in the study was that of a woman, but as it went on in the flat and toneless method of the district, it did nothing to reveal Mrs Jope, so at last the lamp was lit in the lobby and the gong struck, and in a moment Mrs Jope stood on the threshold.

'Oh, Mrs Jope, it's yoursel'!' said Christina, as Mr Philip crossed the lobby and went into the dining-room. 'I didna hear ye come in. What a fine nicht it is!'

'Aye, it's a fine evenin', Miss Walker. Ye couldna ken it wis me, for the minister wis takin' the air at the door as I came up.'

There were people in Cheggs who always addressed Christina as 'Miss Walker,' and Mrs Jope was one of them. The minister encouraged the practice in a place where the use of Christian names was the rule, and where they appeared in all sorts of crude contractions. Christina herself had no objection to being called by her Christian name by Mr Nisbet, the schoolmaster; John Nith, the session-clerk; and certain ladies of an assured social status. For it would be a great mistake to suppose that Cheggs, with all its crudities and fierce democratic enthusiasms, was without a social sense.

'I hope there's nothing wrong, Mrs Jope,' said Christina.

'Oh, there's naething ye could maybe ca' wrang. But time will tell. In ony case, I had tae see the minister. Good-evening, Miss Walker.'

Mrs Jope vanished in the shadows of the garden, knowing well that she had scored on the mystery side.

In ordinary circumstances she and Christina

would have adjourned to the kitchen, but in view of the minister's pledge to silence, she felt that that would not be fitting. When Christina returned to the dining-room, she found the minister somewhat perplexed and absorbed, and disinclined to converse. The matter, therefore, had to rest so far as Christina was concerned.

Mr Philip really was perplexed, although, perhaps, not very seriously. If the Chalmerses were quarrelling in the early part of the day, was it possible to leave the factor of drink out of account? One never knew. Your victim of drink turned up in odd places. But the difficulty was increased by the fact that the Chalmerses were strong supporters of the temperance movement, and Chalmers had always seemed a very decent man.

Later, as Peter Nisbet and the minister filled their pipes for the last smoke of the day, Mr Philip spoke of the matter cautiously to the schoolmaster. At the mention of Mrs Joep's name Peter sniffed loudly. She was evidently no favourite of his.

'The whole business is very likely a delusion.'

'Perhaps,' admitted Mr Philip. 'But Mrs Joep is not an unintelligent woman, and, although a bit gossipy, is not a malicious woman; and you know the Chalmerses' house, and how the kitchen sounds could be easily heard in the street.'

The schoolmaster quite plainly was not satisfied.

'A decent man, Chalmers. He does repairs for me about the school, and he is the last man in Cheggs of whom I would say that he was fighting with a violent wife. Why, he is one of the most cheerful men in town.'

'Ah well,' said the minister, 'we can make nothing more of it to-night. It is a worry I suppose that, in due time, will resolve itself.'

All this took place on a Thursday, and on the two following days the minister had to be at his desk. He resolved that not a syllable would escape him on Sunday that would indicate the existence of any special difficulty. He must, at all costs, keep himself free from the slightest suspicion of what in Cheggs is known as a 'dig.'

The Scottish 'dig' is a highly interesting topic, if one had time to deal with it. As a matter of fact, not 3 per cent. of Scottish ministers ever dream of administering 'digs.' Nevertheless, there is a type of mind whose faith in the pulpit 'dig' as an essential part of ministerial activity cannot be shaken.

A curious thing, the 'dig.' The man who is unanimously regarded as having received it is usually quite unconscious of the fact. On the other hand, let a man receive what he regards as a 'dig,' and it will take a visit of the minister and two elders to convince him that he is under a delusion.

But there was no suspicion of 'digs' in the U.F. church in Cheggs on the Sunday of which we write. Even the sermon-tasters were more

than satisfied; while an intimation announcing a social meeting under the auspices of the British Women's Temperance Association was felt to be quite fitting, since Mr Philip himself was to preside.

Cheggs has more than its share of public-houses, and is more than generous in its support of them. Nevertheless, there is a strong temperance sentiment. It expresses itself chiefly through female activity, and nowhere with more ardour than in the meetings of the B.W.T.A. So that Mr Philip, who had been asked to preside, and a well-known temperance orator from Glasgow were faced by a huge audience when they mounted the platform of the town-hall.

People might wonder for whom the chairman was looking so carefully after perusing his programme, but fortunately no one knew. The programme certainly administered a shock. It announced that Mr and Mrs Chalmers would give a dialogue entitled 'The Clouded Home.'

'By Jove,' said the minister to himself, 'how I wish Peter Nisbet were here to-night!' But Peter Nisbet sedulously avoided temperance meetings.

Everything went swimmingly. The tea and cakes were speedily consumed, and the chairman's remarks were well received. The musical efforts were all vigorously encored, while the orator from Glasgow fairly brought down the house.

Then the chairman announced that their friends Mr and Mrs Chalmers would present a temperance dialogue entitled 'The Clouded Home.' For one instant his eye met Mrs Joep's, and he saw her start.

The Chalmerses, who seemed to express the very ideal of connubial bliss, came forward to the front of the hall amid thunderous applause. When the minister noticed that Mrs Chalmers carried something in a piece of brown paper, he knew that his moral problem was no longer in existence.

The dialogue went off with great *éclat*. It soon became obvious that the story was that of a man who was seeking to save his wife from the power of strong drink, and that the wife refused to be rescued. As the passions of the performers rose, the joy of the audience increased.

Tumultuous applause greeted the tenser passages. At last, when speech seemed almost to have failed, Mr Philip noticed Mrs Chalmers's hand go out towards the brown-paper parcel, and knew by instinct what was about to happen. Raising an old and very cracked plate in both hands, she threw it with great care, so as to strike her husband's shoulder, and then to clatter in fragments on the floor. It was the crowning moment of the evening; and when Chalmers, starting back, exclaimed in horror-stricken tones, 'Deil tak' us, wumman! wad ye murder me?' it was felt that the force of the dramatic could no further go.

Before the applause had subsided the chairman noticed Mrs Joep make for the door. She had mistaken a fragment of a rehearsal for the heart of a tragedy.

Chambers's Journal

SEVENTH SERIES

SHOOTING ACCIDENTS.

By Lieut.-Colonel Sir HENRY SMITH, K.C.B.

I.

MY grandfather was the minister of Galston, on the Loudoun estate in Ayrshire, where my father was born. The head gamekeeper answered to the name of Mike M'Cubbin, and his distinguishing characteristic was an abhorrence of haste in every shape or form. 'Plenty o' time,' he would mutter to himself—'plenty o' time.' Mike was an inveterate snuffer, but he carried no box. He had snuff loose in his waistcoat-pocket.

Loudoun was a low-country shooting—no grouse or blackgame, but partridges were swarming. When a covey rose in front of him Mike would put his hand into his waistcoat-pocket, treat one nostril, then another, to a pinch, and then kill a brace splendidly, right and left. 'An I had been in a hurry, I wad hae missed them baith,' he would chuckle to himself.

Mike never went out without a 'jeely piece,' or something more substantial in the shape of a ham or beef sandwich. 'Three or fower men cooks cairryin' on a' day, and they canna gie me ma bit sandwich, and let me oot efter the birds. Do they ever wan through their work, I wonder?' Mike would soliloquise as he sat in the servants' hall. Such was Mike in the days when my father was a boy of fifteen.

Mike's delight was to get my father to play truant from school and go out shooting with him. 'C'way, Maister Geordie,' he would shout—even as the old herd on the Pentlands would shout to R. L. S.—'c'way. The minister's at the ither end o' the pairish—we'll be back or he gets hame.'

But now we must leave Galston and Mike and go farther afield.

My father was sent to Glasgow College, where he met many boys of his own age from Ayrshire and Renfrewshire, and where he made many friendships which lasted his lifetime and were continued to me, his son.

My father was keen as ever on shooting, and used to get invitations from neighbouring proprietors; but when he became a 'placed' minister, and was appointed to the second charge of Kilmarnock, he found that to shoot was a deadly sin in the eyes of the good folks of the town in

general, and of his own parishioners in particular. He instantly resolved to abandon shooting, and never fired another shot. I was not intended for the Church, and though perhaps not a sinner beyond redemption, yet the old adage frequently holds true that 'the Lord gets the goose, but the Devil gets the goslings.'

Compelled to abandon his favourite sport, my father was still deeply interested in it and everything connected with it, and frequently of a Saturday evening it was his delight to revert to the happy days of his boyhood when, in company with old Mike, he was trudging over the heather or across the stubbles. Those reminiscences were not meant solely for my amusement—they were always leavened with some useful instructions in view of the day when I was to be entrusted with a gun.

My father, as I have already mentioned, was 'weel acquaint' with 'Glesca' and its inhabitants—notably with the Gairdner family, one of whom eventually became general manager of the Union Bank of Scotland, and another—Davie, the youngest—died this year or last, I am not sure which. Two of the Gairdners, with four friends—all wealthy men and keen on shooting—formed themselves into a 'syndicate' (the word 'syndicate' had not been popularised in those prehistoric days, needless to say), and took a long lease of 'Burnhead,' a moor on the estate of Lanfine, some twelve or fourteen miles from Glasgow. Being men of substance, who stipulated for no alterations or additions to the farmhouse by the proprietor, but undertook to do everything necessary for their comfort themselves, they were very welcome tenants.

The house formed three sides of a square. The ground floor was occupied by the farmer and his family. The first floor consisted of two rooms. The partition in the middle was removed; and eight bachelor bedrooms were built out on the heather at right angles to the house. Since those days I have been in many a shooting-lodge, but, for comfort and convenience, Burnhead I have found unapproachable. When you awoke in the morning you could hear the grouse calling under your very window. You might have crawled downstairs and shot them in your night-shirt—even as Jack Mytton crawled on

his stomach and shot wild-duck on the ice by moonlight.

I should mention that butts—constructed on the most improved design—eight in number, had already been placed within two hundred yards of the farmhouse. They were well drained (I have often stood in butts for half-an-hour or even longer up to the ankles in slush and half-frozen snow), and had a seat inside, so that the shooter could sit comfortably should the birds be long in coming up. The season I have in mind was a very forward one. Grouse had already begun to 'pack,' so it was decided to begin driving on the very first lawful day—12th of August.

All these preparations for filling bags to the brim made me a little uneasy. I'll tell you why. Some weeks before I had met a man who had spent nearly all his life in Australia. He was a first-rate shot over dogs—to that I can testify—but when stationed in a butt he fired away from morn till dewy eve, and didn't succeed in stopping one solitary bird. 'It isn't sport,' he said to me. 'Take my advice—have nothing to do with it.' I did not take his advice. Next day, with sore misgivings, I took my place in a butt on the left of the line. I was like unto the man from Australia, for I expended some sixty or seventy cartridges and never touched a feather. Next day Charles Gairdner, certainly the best shot at Burnhead—he had heard of my ghastly performance, as who hadn't?—made up to me as I was marching on, looking as happy as if I were going to the scaffold. 'Look here, boy,' he said very kindly; 'd'ye see that young chap there?' indicating a youth of some five-and-twenty summers, who, I discovered subsequently, was the tenant-farmer of the moor. 'You can't do better than have a talk with him before you take up your position.' This gave me some comfort. I said to the farmer, 'I'm blessed' (I fear the expression was stronger) 'if I understand how to stop those infernal birds. I suppose you let them pass, and then fire as they are flying away behind you.' 'No, no, no,' he replied; 'you'll never kill them that way. Look them straight in the face and shoot as they fly towards you. You're a quick shot, you tell me. Well, you ought to get in four or five rights and lefts here. Good luck to you;' and he doubled back just in time to take up his place. Before I was five minutes older I had six and a half brace—thirteen birds—lying at my feet. From that day to this I have never looked back; and now, in my eighty-fifth year, not one bird that gives me anything like a chance gets past me.

And now are we any nearer 'shooting accidents'? Vastly nearer, gentle reader.

II.

King James the Sixth of Scotland and First of England introduced the game of golf south

of the Tweed, so we are told, to civilise the savages he had annexed; and in like manner 'driving'—a pastime unknown south of Berwick-on-Tweed—was introduced into England to teach the Sassenach to shoot, for a driving shot is generally a good shot.

But *revenons à nos moutons*. Some thirty or thirty-five years ago, when driving was recognised as the way to make big bags, four men were dining together at 'The Rag'—that is, the Army and Navy Club in Pall Mall. Oliver Montague, colonel of 'The Blues'—no more popular officer in the British Army—was one. The other three were Lord Dunmore, Colonel Heneage, and—I cannot call to mind the name of the fourth, if I ever knew it. Four men should have eight eyes, but these gallant soldiers had only four—each had lost an eye in the butts. 'Poor fellows!' Well, I'm not so sure of that. It was a broad hint to them to visit the butts no more. Better stop. To lose one eye is a mere trifle compared to losing both.

Forfarshire, when you look at its position on the map, lies fairly far north; still, it is nearly all what is called low-ground shooting. It is seldom that grouse or blackgame are met with. Partridges, on the contrary, are swarming, and the 1st of September is the great festival, when friends from north, south, east, and west are invited annually for the driving. I had the following true tale on one such occasion from a Northumberland squire, an intimate friend of mine, and a most splendid and safe shot. One year, when he was standing in his butt, the long line of beaters, some two hundred yards distant, was halted by command of the head keeper. There was evidently much excitement. A crowd gathered together, and on going forward to ascertain what was the matter, my friend discovered that an old man, rejoicing in the euphonious name of Andrew Carnegie, had been shot in the left eye, the sight being totally destroyed. 'Did you find out who shot him?' 'Ah, yes; he owned up to it like a man. It was Sir Blank'—naming a well-known baronet from the county of Kent. 'Is he going to do anything for the poor old chap?' 'Well, he has given him five-and-twenty pounds, and Anra is quite delighted.' 'Sir,' said a keeper once, advancing on a sportsman in a menacing way, 'ye hev shotten a man.' 'Good God! what shall I do?' 'Gie um a shullin',' was the reply. No wonder that 'Anra' was pleased!

But to resume. Next year, on the 1st of September, my Northumbrian friend was once more standing in his butt. The line was halted, a crowd collected, and it was found that old 'Anra' had been shot again—providentially in the blind eye! The hint was sufficient for 'Anra.' He, like a sensible man, took it. 'Nae mair shüttin for me; A's had enough;' and he would sit in his

comfortable cottage from the 1st of September till every sportsman had returned to 'his own place.'

Yet another accident.

J. W. P., a banker in Newcastle-on-Tyne, rented a moor in Aberdeenshire—Corndavon, if I mistake not, was the name of the place. There were four or five butts, and an intimate friend was told off to occupy the one on the host's left. In two or three minutes grouse began to come over in great numbers. Turning round to learn how his friend on the left was getting on, J. W. P. was horrified to see him pointing his gun straight at his (the banker's) head. 'Why didn't you drop flat down on the heather?' I asked. 'Well,' he replied, 'I was fascinated or hypnotised—you know how a snake fascinates its victim before striking. I never thought he would pull the trigger.' But pull it he did, and one eye was totally destroyed, the other narrowly escaping a similar fate. By the advice of his friends, the injured man travelled straight up to London that night, and went to an oculist on his arrival. That practitioner removed the sightless eye from its socket, filling its place with a glass one; but whether it was the shock, or whether it was the discomfort caused by the glass eye, the banker never had a day's health thereafter, and passed peacefully away, by a singular coincidence, on the very first anniversary of what might almost be called his fatal accident.

Pigeon-shooting (I think I am correct in saying) was first brought into notice at Nice and Monte Carlo, large sums of money staked on the gun or the bird respectively changing hands. The late David Hope Johnstone and others greatly distinguished themselves, killing occasionally some four or five and twenty 'Blue Rocks' without a miss. But it fell to the lot of a Perthshire man, the son and heir of a member of the Upper House, to eclipse the deeds of every one, and transfer cup after cup and medal after medal to adorn the sideboard in the dining-room of his ancestral home. As a pigeon-shot he was without rival; and on the open moor, with grouse rising as fast as he could load, he was equally quick and reliable. This unrivalled sportsman, to whose skill at the traps and on the moor I have just borne testimony, was out one day to get some birds to send off to the south. His sole attendant was the head keeper, who was walking in line with him some five-and-twenty yards higher up the hill.

To make the incident still more incomprehensible, it was broad daylight—about two o'clock in the afternoon. Some eight or ten birds rose in front, but one, instead of flying forward with the rest of the covey, turned back. Raising his gun, this most reliable of all reliable shots followed it round till it came in line with the keeper's head, and then drew the trigger. One heart-rending

shriek, and the unfortunate man bounded forward down the hill, and lay silent and motionless, stone-dead. This story I had from Henry Michie, my head keeper for twelve or fourteen years. He told me the name of the man who met with his death, and also that his widow was in receipt of a large pension for the loss of her husband.

How could a shriek emanate from a man whose head was literally blown to pieces? I know of a somewhat similar case. An officer of the Rifle Brigade—Captain Blank—was shooting with our late King, Edward VII. On stopping for lunch Captain Blank handed his gun to a keeper, pushing it towards the man, butt foremost, the muzzle being pointed straight at himself. The gun went off, presumably coming in contact with something that caused it to explode, and the whole charge entered Captain Blank's chest. 'How was I shot with an empty gun?' he exclaimed, and, tumbling down on the heather, he lay—like the unfortunate Perthshire keeper—stone-dead.

III.

And now I am coming to my last 'accident,' and as I write I cannot keep the tears from my eyes, for, sad and tragic as some of my tales undoubtedly have been, this is incomparably more sad and tragic than any of its predecessors.

A boy of seventeen—we will call him Macdonald—volunteered for the front immediately on the outbreak of war in August 1914. He presented himself to Colonel W., commanding a Highland battalion, to whom he and his family were personally known, on the eve of the regiment's departure for Flanders. Colonel W., though greatly pleased with the boy's patriotic enthusiasm, felt compelled to refuse his request. 'You are too young. Go home again. This war—or I am much mistaken—will last for years. Stick to your drill, render implicit obedience to your superior officers, and come back, say, when you are nineteen or twenty. You will be in plenty of time to have a turn at the Huns then; there will be lots left for you, depend upon it.' A year afterwards the boy crossed the Channel and presented himself to Colonel W. 'Ah! you'll do now,' said the colonel; 'come along and I'll introduce you to your brother-officers, and show you what a "dug-out" is like. And mind you duck your head when I do, for snipers are unpleasantly active hereabouts.'

Young Macdonald soon made a name for himself. In any 'scrap' he was always up and doing, and so well did he behave that he was awarded the D.S.O. and the Croix-de-Guerre as well.

One bright morning he was lying in his dug-out, when he jumped to his feet excitedly. 'Next week is "The Twelfth,"' he said to himself; 'shouldn't I like to be in a butt once

more? I wonder if the colonel would give me some days' leave?' The colonel, whom he found reading the *Evening Dispatch*, fell in with his wish most readily. 'Well, my boy,' he said, 'you deserve leave—you've done uncommonly well. How long will you be away? We want you back again. There are heaps of Hun-shooting for you here yet.' 'Five or six days will be ample, and the first birds I shoot I will send over here, sir. They will remind you of home.' 'Well, then, that's settled; the sooner you're off the better.'

No happier boy ever landed on the pier at Dover than the young soldier. 'I shall soon be in a butt,' he said to himself as he jumped into the dining-saloon of the boat-train. Reaching the moor in Renfrewshire in good time, he was cordially welcomed by his friends, who had everything ready for him; and though his mother and sister lived hard by—his father was dead—he decided upon killing some grouse for the colonel before walking down to see them. Entering a butt, he stood looking out, watching eagerly for the first birds coming over him. Not one thought of danger, not one thought of misfortune, entered his head. After what he had escaped at the front, what evil could befall him here?

A shot rang out. It met him full in the face, and the gallant young boy collapsed on the heather, both eyes completely and hopelessly destroyed.

Meantime his mother and sister sat intently listening for the light, firm step they knew so well. The door opened, and a poor, helpless, blind creature was led in. 'Where are you, mother dearest? Alas! I cannot see you. I will try to be brave like Mr Fawcett, who was shot in both eyes by his father. "This must make no difference," we are told he said, and he kept his word to the end of his days. He was a young man like me, mother, and I must try to copy him. But yet I am afraid;' and the poor boy broke down and wept bitterly. But Almighty God intervened. The sightless boy caught a chill; pneumonia set in; and he was dead in twenty-four hours, a merciful release to himself and to those who loved him.

And now my 'shooting accidents' are done—my tale is told—and if a perusal of what I have written convinces only one sportsman that it is better that thousands of birds should escape than that a rash shot should imperil the life or the eyesight of a human being, I have not written in vain.

THE PARTS MEN PLAY.

CHAPTER XXV.—continued.

III.

BY a creek that trickled across the road, Captain Austin Selwyn was watching the brushwood which concealed the enemy. Beside him, lining the bank, every available man was on the alert, waiting the developments which would follow the raising of night's curtain. In the misty gray of dawn they looked fabulous in size, and indistinct.

The night in January at the University Club in New York had marked a reconciliation between Selwyn and Van Derwater. With the issue between America and Germany so clearly defined, they had both lent their voices to the insistent demand for war. At first people had been incredulous, and hazarded the guess that the young author was endeavouring to cover his own tracks; but when he enlisted in the ranks at the outbreak of hostilities, they made a popular hero of him. They spoke of him as the Spirit of the Cause—but he paid little attention to the clamour. His joy in the prospect of action, and the release from all his mental tortures, had produced in him a kind of frenzy, that crystallised into an intense hatred of Germany.

The pendulum had swung to its extreme.

Once a man animated with a passionate humanitarianism, in whom the spirit of universal brotherhood burned with an inextinguishable force, he had become a creature drunk with lust for revenge. Patriotism, Justice, Freedom—they were all catch-words to hide the brutal, primeval instinct to kill.

In the little thought which he permitted himself, Selwyn argued that the ignorance of many nations had made war possible, but only Germany had been vile enough to try to exploit it for the achievement of world-power. For that reason alone she was a thing of detestation.

His enthusiasm and quickly acquired knowledge of army routine marked him for promotion. He was given a commission, and at the request of Van Derwater was attached to the same regiment as himself. Together they had crossed to France, and were among the first American troops in action.

In the months that followed, Selwyn had revelled in the carnage and the excitement of war. He was reckless to the point of bravado, and his keen dramatic instinct drove him into unnecessary escapades where his senses could enjoy a thrill not far removed from insanity. Only when out of the line, when the

mockery and the hideousness of the whole thing demanded his mind's solution, would the mood of despondency return. But in the trenches he knew neither pity nor fear. Men fought for the privilege of serving under him, and with their instinct of euphony and love of the bizarre gave him the name of 'Hell-fire.' He gloried in the physical ascendancy of it all—in the dangers—in the discomforts. He was an instrument of revenge, a weapon without feeling.

On the other hand, Van Derwater had undergone no appreciable change. He carried himself with the same dignity and formality as in his days at Washington—except when emergency would scatter the wits of his fellow-officers, and he would suddenly become a dynamic force, vigorous in conception and swift of action. Yet success or failure left him unmoved, once a crisis had passed. His men respected but did not understand him. They wove a legend about his name. They said he had come to France wanting to be killed, but that no bullet could touch him. And even those who scoffed, when they saw him, unruffled and strangely solitary, moving about with almost ironic contempt of danger, wondered if there might not be some truth in the story.

'Major Van Derwater would like to speak to you right away, sir.'

Telling a non-commissioned officer to take his place, Selwyn followed the messenger along the road until they came to the spot which Van Derwater had chosen for his headquarters. Daylight was emerging from its retreat, and there was the promise of a warm day in the glowing east.

'You sent for me, sir?' he said.

'Yes. You might question these two British stragglers. Their story is not straight, but they seem decent enough fellows. If you are not satisfied'—

He was interrupted by an exclamation of astonishment from Selwyn, who had noticed the Englishmen for the first time.

'Great Scott!' gasped Selwyn. 'Dick Durwent!'

Dick looked up, and at the sight of the American's face he uttered a cry of relief. 'Is that really you, Selwyn? What luck! You remember Mathews at Roselawn, don't you? You can say'—

'Good-morning, sir,' said the unperturbed groom. 'This is a werry pleasant surprise, to be sure. How are you, sir?'

'Van,' said Selwyn, after shaking hands with them both, 'this is Lord Durwent's son, and the other is his groom, Mathews. I will vouch for them absolutely.'

'Good!' Van Derwater slightly inclined his head as an indication that he was satisfied. 'We need every man. You had better take them in your section and equip them with rifles from casualties.'

IV.

A few minutes later, after he had procured food for the two men, who were growing weak with hunger, Selwyn resumed his post. The heavy grass fringing the bank made it possible to keep watch without being directly exposed as a target; but beyond a desultory rifle-fire about a mile on their right, there was no indication of enemy activity.

When Durwent had been equipped with a steel helmet and a rifle, Selwyn called him over to his side, and as concisely as possible explained the military situation. In the German attack against the French forces (with which the Americans were brigaded) the line had been swept back. Deep salients had been driven in on both their flanks, but they had received orders to hold the bridge at all costs, as, if a counter-attack could be launched, it would be an enfilading one made by troops brought across the river. Relying on their machine-gun and rifle fire to overcome the Americans' resistance, the enemy's artillery had been drawn into the deepening salients; but in spite of all-day fighting the straggling line had held.

After a few questions from Durwent they relapsed into silence, gazing at the undulating expanse of country revealed by the ascending sun.

'Selwyn.' Dick cleared his throat nervously. 'I must tell you the truth. You were decent enough to stand sponsor for Mathews and me, and I want you to know everything. The major was right. We're not stragglers—we're deserters.'

Selwyn made no comment, and both men stared fixedly through the long grass that drooped with heavy dew.

'Yesterday morning,' said Durwent dully, 'I was to have been shot. I was drunk in the line, and deserved it. It's no use trying to excuse myself. I fancy my nerves were a bit gone after what we'd been through the last few months, but . . . Well, I suppose I am simply a failure, as that chap said in London—there isn't much more to it than that. By a queer deal of the cards, Mathews was on guard, and helped me to escape. It was rotten of me to let him take the chance; but it's been that way all through. Even at the end of everything—after being a waster and a rotter since I was a kid—I have to drag this poor chap down with me. Promise, Selwyn, if you come out of this alive, that you'll fight his case for him.'

Selwyn murmured assent, but he was trying to shake off a haunting feeling that was enveloping him like a mist—a feeling that everything the young Englishman was saying he had heard before. It left him dazed, and made Durwent's voice sound far away. He tried to dismiss it as an illogical prank of the mind, but

the thing was relentless. He could not rid himself of the thought that sometime in the past—months, years, perhaps centuries ago—this pitiful scene had been enacted before.

It chilled his soul with its presage of disaster. He saw the hand of destiny, and everything in him rebelled against the inexorable cruelty of it all. It was infamous that any life should be dominated by a whim of the Fates; that any creature should enter this world with a silken cord about his throat. Destiny. Does it mould our lives; or do our lives, inundated with the forces of heredity, mould our destinies? He tried to grapple with the thought; but through the pain and confusion of his mind he could only feel the presence of unseen fingers spelling out the words written in a hidden past.

'I wonder,' said Durwent, after a pause of several minutes, during which neither had spoken, 'what happens when this is finished.'

'Do you mean—after death?' said Selwyn, forcing his mind clear of its clouds.

Durwent nodded and leaned wearily with his arms on the bank. 'I tried to think it out the night before I was to be shot,' he said. 'I can't just say what I did think—but I know there's something after this world. Selwyn, is there a God? I wonder if there will be another chance for the men who have made a mess of things here.'

The American turned towards the young fellow, whose pale face looked singularly boyish, and had a wistfulness that touched him to his very heart. Durwent was gazing over the grass into the distance, oblivious of everything about him, and in the blue of his eyes, which borrowed lustre from the sun-strewn morning, there was the mysticism of one who is search-

ing for the land which lies beyond this life's horizon.

'I wonder,' repeated Durwent dreamily.

Selwyn tried to frame words for a reply, but skilled as he was in the interpretation of thought, he was dumb in confession of his faith. He longed to speak the things which might have brought comfort to the lad's harassed soul, but everything which came to him, echoing from his former years, was so inadequate, so tinctured with smug complacency. Was there a God?

The question left him mute.

'There are times,' went on Durwent, almost to himself, 'when my head is full of strange fancies—when I'm listening to music—or at dawn like this. While I was under arrest, a little French girl who had heard I was to die brought some flowers she had picked for me. When I think of that girl, and her flowers, and Elise, and the faithfulness of old Mathews, I do believe there is some kind of a God. . . . Selwyn'—unconsciously his hands stretched forward supplicatingly, and there was a deep yearning in the softness of his voice—'surely these things can't die? I haven't heard enough music. . . . There's been so much that's ugly and lonely in my life. . . . Don't you believe that we fellows who have failed will be able to have a little of the things we've missed down here?'

'Dick,' said Selwyn, hoarsely, 'I believe'—

The words faltered on his lips, and in silence the two men stood together in the presence of the day's birth. There was a strange calm in the air. The dew on the grass caught a faint sparkle from a ray of sunlight that penetrated the eastern skies.

(Continued on page 554.)

HABITS AND CHARACTERS OF BRITISH WILD ANIMALS.

IV.—THE HEDGEHOG OR URCHIN.

By H. MORTIMER BATTEN.

I.

WHAT boy who has ever camped out is unfamiliar with Milord the Hedgehog? Who has never heard his nocturnal rustling in the leaves, his loud sniffs of inquiry; and, above all, who has never experienced his unwavering partiality for the frying-pan? Have we not always to hang this universal piece of culinary equipment high in the trees, or bring it into the tent? Otherwise he will spend half the night climbing in and out of it, and skilfully contriving to mix a maximum amount of the soot of the exterior with the thin grease of the interior.

A hedgehog will eat almost anything of animal origin. Slugs of all varieties, many of which birds will not touch, are perhaps its staple diet, accompanied by every species of beetle and insect that flies or runs.

In Upper Wharfedale, near Burnsall village, I possessed a unique opportunity of studying the feeding habits of the urchin. A picturesque wood, particularly rich in animal life, extends from the moorland heights to the river-level, and is bordered on its lower boundary by a wide belt of sand, deposited by the main stream, which every creature passing between the wood and the lowland meadow must cross, thereby leaving the record of its passing.

The belt of sand is dotted over with pebbles large and small, and here black beetles of several varieties are particularly abundant, hiding during the heat of day under the shelter of the stones, so that, crossing the sand-bed, one is certain to send dozens of them scuttling in different directions.

From the signs left by hedgehogs it was clearly evident that they hunted these beetles by scent, running the trail of an individual beetle just as a hound runs the trail of a fox. When fishing at night-time I have seen as many as three hedgehogs hunting the sand-bed together, while others could be heard not far distant in the darkness. If, however, one trod out on to the gravel-stretch, where a silent approach was impossible, every hedgehog would scuttle into the wood almost with the alacrity of a rabbit. The hedgehog is, indeed, more fleet of foot than is generally thought. If one be surprised it merely twitches into a ball, making no attempt at escape, but trusting to its quills for defence; but if, on the other hand, it hears the approach of danger in the distance, and knows that there is time to flee, it will make off quite speedily to some familiar cover.

As a rule, the hedgehog is not a creature of fixed runways. It has a strictly defined home-range, which extends, probably, not more than a hundred yards in any direction from its recognised sleeping-quarters. It is entirely a creature of the night. In the day-time it ventures abroad only when warm showers disturb vast numbers of insects, causing them to creep forth into the foliage. A hedgehog will then sally out to take advantage of the feast. The only other times when it is to be seen abroad by day are when food is scarce during frosty weather and the animal is hard put to it to pick up a living, and when it is suffering from the effects of an injury.

The hedgehog's method of hunting is most remarkable for its entire lack of systematic quartering. Hither and thither the creature goes, as regardless of direction as a clockwork mouse. Now he heads north at quite a sprint, then turns west for no apparent reason at all; veering south, he noses under a dock, then continues east till his progress is barred by a wall. All the time he is munching steadily and noisily, consuming an enormous number of insects; and in this way he rids the land of many troublesome pests.

II.

A hedgehog will eat anything it can catch and hold, nor is it particular as to its method of killing. It is regularly guilty of robbing the rabbit-catcher's snares, and thereby often brings destruction upon its own head.

Hedgehogs destroy quite a considerable number of young rabbits; but I think the animal's love of warmth, and its habit of creeping into any warm and cosy nook that presents itself, is in

the first place the cause of the mischief. Finding a rabbit-stop during the absence of the mother, the hedgehog creeps in to enjoy the warmth of the nest at the end of the shallow hole. Whether or not he eats the young makes little difference. Their chances of a healthy survival are small with a hedgehog as temporary bed-mate. His first intention is not, probably, to destroy. He may already have fed, and is merely in search of warmth and sleep. The idea of eating the youngsters presumably occurs to him as an afterthought; and having gorged, he sleeps again, in all probability occupying the stop for three days or so. He may even finally make his home there.

Having once profited in this manner by the discovery of a rabbit-nest, a hedgehog quickly acquires the habit of hunting for such places. Thus a single hedgehog may make enormous inroads into the rabbit population of a given area during spring and summer. In Upper Wharfedale hedgehogs are particularly numerous, and times without number I have thrust my hand into a stop presumably containing young rabbits, to find a hedgehog occupying it. Indeed, it was the exception rather than otherwise for a rabbit nesting on a certain sandy hillside to bring off her brood successfully; usually she was victimised by the hedgehogs a day or two after her young were born, and on numerous occasions we have caught the murderer walking about with a litter of rabbit-down and other nesting materials entangled in his quills.

From the point of view of the farmer the hedgehog is of unquestionable service to man; but, unhappily, the activities of this creature are not limited to the destruction of mice, insects, and rabbits. On the game-reserve the hedgehog does little good, while it is capable of doing a great deal of harm.

So far as my own experience goes, I have never found striking evidence of the hedgehog's destructiveness to game-birds, but weightier opinions than mine amply warrant the condemnation. It is conceivable that a hedgehog, finding a pheasant's nest, would be attracted to it in just the same way as it is attracted to a rabbit's nest. The idea of devouring the clutch would not necessarily be the initial impulse; the hedgehog would first be attracted by the warmth and comfort suggested by the nest, and from this it is but a short step to the discovery of the waiting feast. And, having once feasted, the animal would undoubtedly profit by the experience, and thereafter search diligently for similar repasts.

Many naturalists are of the opinion that hedgehogs feed largely on the eggs of ground-breeding birds during the spring of the year, but this is evidently a case of individual acquirement. Where many ground-birds nest, the hedgehogs soon discover that nest-hunting is a

profitable business, but where such nests are comparatively rare the animals do not seem to learn their value.

Hedgehogs are supposed to kill snakes, but here again we have another example of the creature's tendency to try to eat anything it finds. The hedgehog does not begin with the idea of killing; it sets out merely with the idea of eating, and whether it happens to come across a worm, a snared rabbit, a snake, or a dead kitten, the result is the same. If the creature proves troublesome, the hedgehog advances its bayonets and quietly persists; and no matter what the encounter in which the animal finds itself involved, there is no ferocity or malice on the hedgehog's part. Its intention is to eat, and the creature that objects to being eaten must either defend itself adequately or get out of the way.

III.

It has been said that the hedgehog is a far more active creature than is generally supposed. One kept imprisoned in a garden was fond of climbing up the trellis-work that supported a dense creeper on the sunny side of the boundary-wall. Several times it was found there, seven or eight feet from the ground, and there in a bower of leaves it had its day-time nest. Unfortunately it died ere winter came, or in all probability it would have hibernated in the creeper.

Again, hedgehogs are prone to climb into honeysuckle or some other flowering creeper in pursuit of the bees that are attracted by the honey and the sweet perfume of the flowers.

The hedgehog's coat of spines is designed not only to protect the creature from bird and animal foes, but also as a safeguard against the effects of falls. A hedgehog has no fear of falling. A twelve-foot drop on to a bed of decaying leaves causes the animal no discomfort whatever, and may be undertaken as the ordinary course of travel. Just as a black bear, feeding in a tree, will loose its hold and drop fifteen or twenty feet, striking the earth as a closed-up ball and rebounding into safety ere its disturber has time to realise anything, so a hedgehog, finding in its route a twelve-foot drop into a quarry or over a boundary-wall, will unhesitatingly topple over, striking the earth like a ball, and remaining rolled up till it comes to rest, when it coolly uncurls and trots off in search of insects. Hedgehogs are, indeed, fond of rolling and tumbling, and their spines are so designed that even a heavy blow delivered on the business extremity does not cause them to penetrate at the roots.

I have, when rabbit-shooting, seen a hedgehog roll down from the top of the hedge-bank to the bottom—presumably as the quickest and easiest way of getting there; and doubtless, by

rolling, running, and dodging through the densest thickets, a hedgehog can cover a considerable amount of ground during its evening rambles.

The quills of the urchin are subject to the perfect control of the muscles of the skin. The skin can be moved forward so that the quills, pointing in a forward direction, protect the animal's face and head from assault while it is eating. In this way it is able calmly to devour the young of a desperate woodland mother, while the bereft parent merely brings injury upon herself by her attacks.

Apparently the hedgehog has no fixed moulting season; new quills are always growing and old ones being shed. As the animal gets old the quills become very stiff and strong, and turn grayish in colour. A young hedgehog is generally brown; an old one yellowish-gray, the quills being more distinctly barred than in youth.

Other than man and his dogs, the hedgehog's enemies are few. Among the birds of the air it has none, which appears to be amply proved by the fact that it seems quite incapable of looking up. Foxes destroy a few hedgehogs, but not many. During a hard winter a fox will scratch out a hibernating hedgehog and devour it, leaving only the skin; but such is the discomfort of the proceeding that Reynard leaves the urchin alone unless the stern alternatives be urchin or starvation. The pine-marten, though rare, is, with the polecat, the most deadly of the hedgehog's animal foes, and it is said that the polecat not only goes out of its way to destroy these creatures, but having destroyed them, eats bones and even quills without ill effects.

But the keeper with a club and with a *penchant* for killing every four-footed creature he sees, the gipsy boy, and the terrier are the hedgehog's only foes that count for anything.

IV.

By early autumn the hedgehog has become fat and lubberly, and as the weather turns colder, and the russet leaves come drifting to earth, the animal grows more and more torpid each day. Its quills are not very adequate for keeping out the wind; but its skin is strong and thick and not very sensitive to cold, and under the skin is the hedgehog's real overcoat—a thick layer of fat which resists the cold, and on which the animal subsists during its winter sleep.

I have repeatedly noticed a curious and interesting habit of this creature during the days of autumn. As soon as the wind becomes cold, the hedgehog begins to acquire an overcoat of leaves. It may be said that this is purely accidental, that it would be quite impossible for such a ball of prickles to move about when the woods are adrift with leaves without acquiring such an overcoat; but at all events, accidental or not on the hedgehog's part, it would appear to be one of

nature's provisions. As the cold weather comes, the hedgehog is to be seen running hither and thither in its coat of leaves, making as much noise as a team of foresters. Then, as the days pass and the weather becomes still colder, the hedgehog collects a second coating, and yet a third, each new covering ramming the previous one farther home, till the leaves are impaled to the very base of the quills. The work is done so thoroughly that it could not very well be due entirely to chance; and it needs to be borne in mind that such an overcoat resists not only the cold wind, but also the rain. Moreover, during the autumn, a hedgehog has been watched purposely rolling down a leaf-strewn bank, ascending, and rolling again, apparently with no other object than that of collecting leaves.

It would seem that the habit plays an important part in the history of the hedgehog's hibernation. It is the first step in the direction of denning-up. Equipped with an efficient, though artificial, overcoat, the animal very soon becomes sluggish in its habits. Its den is probably lined with leaves, and the covering of leaves on its body lessens the contrast in temperature when at intervals the animal quits its nest.

By late October the hedgehog is seldom seen abroad and is difficult to find. It remains nocturnal in its habits, but is abroad only for a short time during the night. The drowsiness of winter is taking a firmer and firmer hold; but if the earth be frost-bound, and the days bright and sunny, it may steal out for a little during the warmth of midday, though more probably it does not venture out at all.

Thereafter, till the middle of March, the life of the urchin is more or less of a closed book. Whether or not its sleep is generally unbroken throughout the long winter is difficult to say. If so, the hedgehog is rather an exception. Bats, mice, squirrels, &c., which are supposed to hibernate, take their hibernation less seriously than is generally thought. If the conditions are in any way favourable, they are up and abroad for a brief spell of activity; but certainly it would seem that the hedgehog is the most truly hibernating of all our mammals, and I am inclined to think that if a hedgehog is abroad during the winter, it was in such poor condition when it denned up that it finds itself unable to stand the long drainage on its strength. A healthy hedgehog, in perfect condition when it denned, probably does not emerge till the joyous spring calls it back to the world of activity.

v.

A rabbit-stop generally serves as the hedgehog's winter den. Into the den an immense quantity of leaves is dragged, not only forming the nest, but effectively excluding all draught by filling up the passage. On one occasion we unearthed a hibernating hedgehog. The mouth of

the small hole was so filled and made up with decaying leaves that one could never have told a hole existed there. Out of the passage we dragged at least a sackful of leaves, and when the hedgehog himself was removed he lay perfectly still, partly uncurling, making no effort at self-defence, and apparently still sleeping a deep, untroubled sleep.

A decayed tree-root may be used, and grass may function as bedding material instead of leaves. Even sheep's wool may be dragged into the nest—anything, in fact, that suggests the desirable warmth of covering. A hedgehog will hibernate in thick ivy, perhaps a few feet from the ground; and one took possession of some sacks in a corner of my motor-house, and there settled quite contentedly, though the house was in frequent use. Its habits, however, were so unclean that ultimately we were compelled to eject it. Curiously enough, it appeared in midwinter, so evidently it had been compelled to abandon its previous den.

No doubt the first call of spring finds the hedgehog community sadly reduced in numbers. Some have chosen their nesting-sites unwisely, and simply do not waken; while others, with the torpor of winter still upon them, have fallen victims to their foes.

Those that successfully sally forth with the spring, however, do so in a feeble and half-entranced condition. Nature's wakening, like nature's falling asleep, comes by degrees. The first journey forth is slow and short, for the creature is sorely handicapped by the softness of its paws. This is nature's safeguard against overloading of the stomach, the muscles of which have become weak by long inaction. A few mouthfuls of food gathered near the den, and the tenderness of its feet sends it back to cover, where its stomach has ample time to recover ere again it sallies forth—this time a little farther; and so on till its normal condition is regained.

The hedgehog does not lay up a winter store, as do mice and squirrels. Its store is on its back, and serves not only as sustenance during the foodless days of sleep, but also to exclude cold. The storage habit does not seem to exist in the case of this creature. There is no reason to think that it ever resorts to stowing food in its den or elsewhere; its method of going through life is to gorge to repletion, sleep, then gorge again. Its food is generally abundant; it will feast on carrion apart from the varieties of fresh food which are generally at hand; and, if astir during the lean nights of winter, it will visit village garbage-heaps, eat its fill, and den behind the open kitchen door if such shelter be undisputed. Normally it has little fear of man; in midwinter it has none; but, as previously stated, hedgehogs that are astir at this time are probably sick, or they denned up in poor condition.

VI.

Hedgehogs possess a fairly wide range of vocal powers. When searching for food, a hedgehog sniffs and grunts in a most fearless manner as it walks about, and if in distress, it utters a wailing sound not unlike the cry of a hare. It can sometimes be made to utter this sound, when rolled up, by turning it over and tickling its hind-feet with a twig. Also, when several are abroad together at night, they occasionally utter a bleating call of peculiar cadence; it appears to be done partly as a challenge and partly as an expostulation.

The best authorities state that gestation occupies seven weeks. The young number from four to eight, and the first litter may be born as early as the end of March. The first mating season, then, must be early in February, as soon as the creatures begin to move from their winter quarters. A second litter is produced between the middle of August and the middle of September.

According to Gilbert White, the young are born blind, and the quills, though present, are flexible and white. At the age of eight days or so the young begin to sally forth with their mother. They are then more or less at the mercy of their foes, for their quills are still so soft as to afford little protection. So far

as one can ascertain, they remain with their mother till full-grown; and even after that they probably do not wander far from the locality of their birth, as the whole family, now composed of adults, may be seen together throughout the season.

The weight does not appear to vary so much with the seasons as might be expected, though I have never had the opportunity of weighing one early in the spring. The male that denned up in my garage weighed only 1 lb. 5 oz. in midwinter. Another specimen, taken in midsummer, tipped the beam at 2 lb. 7 oz. This appeared rather a big hedgehog, and the average weight in midsummer is probably about 2 lb.

Considering the sedentary and sheltered life it leads, the hedgehog is not a long-living creature. One that had spent the major portion of its life in captivity seemed to be showing signs of old age in its fifth year; unfortunately its fondness for water ended its well-meaning, ill-doing career ere the hand of Time struck the inevitable hour. Five or six years would appear to be the hedgehog's allotted span. A hardy specimen may still be flourishing at seven, and may live to see eight. Unfortunately, hedgehogs kept in captivity usually contrive to come to an untimely end ere old age steps in, with the result that it is difficult to arrive at a definite conclusion.

A DAUGHTER OF THE DOPPERS.

CHAPTER VI.

THE fortnight that succeeded saw Bray busily engaged in testing the ground taken from the well at the Klip Kopje, which ground he pronounced promising. Accompanied by two 'boys,' he went farther afield, pitting the veld here and there with prospecting-holes, until he was startled once more by the droning hum of a Bushman arrow. This occurred near the drift of the Rhenoster River, but a prolonged search by all the farm-people failed to locate Plaatjes and his men. Bray was not wanting in courage; but a sudden, or at best a lingering, death by means of a poisoned arrow—he knew that a mere scratch would be fatal—was not a part of his Koodooskop programme. So in future he went warily.

He was now completely the master of Steenie's affections. He influenced every thought, impulse, and wish of hers, and he used his power with the unscrupulousness of a bird of prey.

Through her undying belief in him, he exploited Oom Jan to an extent others had long believed to be impossible—in despite of the frequent tears and remonstrances of the old wife. An expensive washing-machine and gear were ordered, and other costly arrangements were entered into for the purpose of testing the

ground. A fence enclosing the Klip Kopje was erected as a barrier against intruders, and negotiations with a Kimberley syndicate for flotation of the mine were initiated. Under all these inflictions Oom Jan bore himself as meekly as one of his own merino lambs, because Steenie had pleaded and Steenie had won.

Gert, her brother, who was now clerk to the Civil Commissioner of Vaalbos, was on the most intimate terms with Bray, for he could not but realise that the discovery of a diamond-mine on the farm would be to his material benefit. He therefore backed Bray in all the latter's undertakings, and went the length of lending the prospector sums of money for the ostensible purpose of procuring means necessary to the successful issue of the venture. He could ill afford it, as his salary was small and his father parsimonious to a degree, but his belief in the brilliant impostor was at least equal to Steenie's, while actuated by a different motive.

Dr Bray's visits to Koodooskop had ceased, because he had realised that the romance of his life had ended. There had not been any formal exchange of words or letters on the subject. The fact of Steenie's defection was too plain, the entire surrender of her love to his

brother too evident to need explanation. He was crushed by his loss, for his affection had the depth which is reached only in such cases as his, middle-aged and serious-minded as he was. But while his resentment of his brother's treachery was of the deepest, he yet had excuses for Steenie. He was too old for her, he told himself, and such as he could not satisfy a nature at once deep and romantic. It was impossible for her to weave a romance around his homely exterior and unresponsive manner.

His brilliant brother—outwardly, at least—satisfied her glowing imagination, which, in its turn, blinded her to the meanness and treachery of that brother's conduct. And so it was. Steenie, pure-minded and upright, incapable of wounding the feelings of a Hottentot brat, had yet wrecked the happiness of a good man, because her love so warped her judgment that she was unable to discriminate between a paste substitute and a pure stone.

'My old friend, Flinty Beck, will arrive from Kimberley with the plant next Thursday morning,' Walter Bray announced at breakfast one morning. 'You might ask your father whether he will allow the wagon to go to the station on that day.'

'What is Flinty Beck?' inquired the girl.

'An old digger from Klipdam,' replied Bray; 'a man, moreover, who fully understands diamond-mining. He will assist in putting up and working the plant. Son of a parson, fallen a little on evil days perhaps, but straight as an assegai. I was lucky to get him, as he is in great demand for jobs of this sort.'

They rode out to meet Flinty Beck, and found the wagon outspanned at the Rhenoster River drift. Steenie's first impression of this 'son of a parson' was anything but favourable to that individual, who, as they rode up, was sitting on the *disselboom* (shaft) smoking a long, dirty Kaffir-pipe. Disgust of the man was strong within her. She suppressed the feeling because there was a suggestion of disloyalty to her lover in it, but she left Walter to do the talking. The leering, loose-skinned man was too repulsive to be near to, so she dismounted and perched herself on the round-backed tortoise-stone near the water, awaiting the last trek of the wagon for home.

No man who looked at Flinty could do so without a strong feeling of aversion. One of his eyes squinted inwards, while what remained of the other protruded through the half-closed lids like a shrivelled grape. With every puff of smoke he exhaled, with every word he uttered, the Adam's-apple moved up and down beneath the loose folds of the skin of his scraggy throat like some live thing trying to break through.

There was something incongruous in the relations which so evidently existed between the two men, and Steenie was perplexed, because she judged Flinty's mental qualities by his

exterior, and to her mind, therefore, he was as imperfect in both respects as her lover was perfect.

'No ripples on our pond, I suppose?' she heard Flinty inquire.

'None at all,' responded Bray, with a glance at her; 'smooth as a pane of glass.'

Presently they spanned in and proceeded towards the farm, Flinty recumbent on the wagon, while Bray and Steenie rode in rear. They stopped at the Klip Kopje.

'What does that awful man mean by ripples on your pond?' she asked Bray.

'Oh, nothing, darling. It's a way these diggers have of expressing themselves. Evidently, my Steenie, you are not too favourably impressed with Flinty.'

'One must know him better, I suppose,' she replied. 'I will love him before I have done with him,' she continued lightly, 'for your dear sake.'

Walter Bray looked at her, and was surprised to feel the faint throb of a long-dormant conscience. He dismounted before replying, and then said, 'A heart of gold, darling; a heart of gold inside that rough casing—that's old Flinty. Now you had better ride off home. We are going to unload the wagon.' He smiled and kissed her gloved hand with studied grace, and waved to her as she rode off.

Meanwhile the oxen had been outspanned, and were grazing on the scanty herbage in the charge of the leader, so that Bray and Flinty had the ground to themselves. The latter proceeded to examine the indications, carefully scrutinising the yellow ground at the mouth of the shaft, and the gravel from the *sluit* near by. He whistled.

'What is it?' said Bray.

'No diamonds in this ground—not a carat, nor the fraction of a carat,' returned the other. 'I have seen this sort of false indication before, and therefore, friend Wally, I provided for eventualities. I brought down four sacks of gravel from Kimberley. They are in the wagon.'

'You're not handsome, Flinty, as I have more than once told you, but you have got something better than mere beauty—a damn good head on top of your scraggy neck. You have, by gad!'

'Well, Wally, old friend, when a fellow has been, as the poet puts it, everything by turns and nothing long, it spoils the outward man, but improves the inward wonderfully, Wally—wonderfully. It's the reverse with you; you have been consistently one thing all your life—a damned rogue, and so your body has not suffered much, but your brain has, and'—

'Never mind all that, Flinty,' interrupted Bray. 'What stuff have you brought?'

'About thirty carats of Kimberley stones from one-half to two carats in weight each.

Enough to salt a bigger thing than this, so that we'll have no ripples on our pond, Wally—not one. Come along, give us a hand.'

They unloaded the wagon, and in doing so deposited the parts belonging to the washing-machine on a level piece of ground midway between the shaft and the little *fonteintje* from which the reluctant water oozed; but the sacks of Kimberley gravel were carefully concealed among the bushes at the base of the kopje.

Flinty's reception by Oom Jan and Ta'antje was anything but cordial; but Flinty was clever, insidious in manner, and unscrupulous; and Flinty spoke Dutch. Long before bed-time he had overcome their hostile attitude, and had reconciled the old man to the project of diamond-mining and its promises of additional wealth. He painted the prospects in shining colours, and prophesied boldly, if mendaciously, unqualified success for the venture.

Before sun-up the next morning the two men were at work. They hauled the bags from where they had concealed them, and thoroughly mixed the contents with the mass of yellow ground near the shaft, and, after tumbling a goodly portion into the hole, proceeded to erect the washing-gear. This work took several days, and so well had Flinty's glib tongue performed its duty that Oom Jan put the seal of his approval on their operations, and appeared daily for several hours to assist and advise. A trench was dug leading from the *fonteintje* to the wash-pan, so that sufficient water was obtained for their needs.

The morning appointed for the trial washing broke clear and bright. The sun, flooding the expanse with brilliant light, drew out the subtle odour of the veld—sweet and exhilarating—so that all but the two schemers felt its influence, and thanked God for the joy of living. The whole farm had turned out to witness the operation. A washing-machine was a novelty, and the revolving rakes appeared a wonderful contrivance; so they stood open-mouthed, wondering at the cleverness of the *rooi-neks*. The 'boys' sweated at the windlass, the machine clanked and groaned, the water gurgled and splashed, and Flinty, ever on the move, paused here and paused there like a bee, passing from the windlass to the pan, and then back again, never idle, now and then winking his damaged eye at Bray with evident satisfaction. With infinite slyness he dropped something into the pan, and commanded the 'boys' to stop the windlass. The water was turned off, the gravel collected, and then all was ready for the next process.

Steenie had seated herself at the sorting-table, and looked in the action so fair and sweet that the lesser blackguard—Flinty, to wit—was for the moment flooded with thoughts of a lost home and of a sorrowing, indulgent wife. It was but for a moment, however, for his activity

once more asserted itself, and he piled the clean gravel on the table with the dexterity of an expert. She proceeded to sort the stuff with a little three-cornered piece of tin, laughingly and awkwardly glancing at Bray now and again with a swift sweep of her beautiful eyes, mutely asking for approval, and receiving it in the shape of encouraging nods; until, with a little cry of pleasure, she held a white atom in her hand for Flinty's inspection.

'Only a piece of crystal,' he said encouragingly, 'but a good sign; you're on the track of that diamond, sure enough.'

She continued her task, and presently, after consulting the man, she held a fragment aloft between her fingers and thumb, crying excitedly, 'I have found a diamond, a beautiful white stone!'

The nondescript crowd cheered so lustily that a *klompje* of springbok grazing near the kopje, startled by the unwonted sound, sprang simultaneously away, and jumped the sandy road with gigantic leaps, fleeing in dismay towards the distant rise.

Congratulations were showered on the girl, but her eyes were for one man only, and when he approached and took her hand, her complete happiness was so apparent that Flinty, observing it, once again experienced the faint, elusive feeling as of home-longing that had previously surprised him.

He relieved Steenie at the sorting-table, and found several stones, so that at the end of the process a little collection of diamonds of different sizes glinted in the rough and dirty palm of his hand. He went round exposing the spoil for the inspection of the gathering, whose delight culminated in cheers by the whites and an uproarious *jula-pijp* by the Hottentots, who speedily danced themselves into malodorous perspiration and exhaustion. Oom Jan himself was affected by the general rejoicing. He threw off the gravity of deportment which usually characterised his movements, and shouted with the rest most lustily, to the evident amazement of his Hottentot dependents, who whispered to each other, 'The old *baas* is bedondered. The stones have bewitched him.'

That night, after supper, Oom Jan, whose buoyancy of spirits had not left him, sat with Flinty on the *stoep*. After smoking for some time in silence, the latter said quietly, 'You're the richest man in the district now, Mr Kloppe. You can get sixty thousand pounds for the farm.'

'And sell it I will,' replied the farmer. 'I cannot stop here to see the place overrun with rascals and money-grubbers. I shall sell, and then buy Uitkomst, Piet van Zyl's farm of sixteen thousand *morgen*.'

'But, excuse me, Mr Kloppe,' interrupted Flinty, 'where do we come in?'

'What do you mean?'

'I mean Bray and myself; we discovered the mine for you, and all the arrangements were made by us. We must have our share, you know. It is but fair that we should. Besides, the difficulties are only just starting. You will be cheated if we do not assist you.'

Oom Jan smoked in silence for a moment. He realised that Steenie and Gert would both support Bray, so he judged it best to settle the matter without further trouble. 'How much do you expect to get from me?' he asked at last.

'Well,' replied Flinty slowly, 'do you think one-half would be too much?'

'One-half!' exclaimed the old man. 'One-half! You must be mad. One would think that you owned half the farm. No, that is not possible.'

'Say twenty thousand pounds, then, providing you sell for sixty thousand pounds,' urged Flinty. 'Only one-third of the price. You are rich, and will be richer still. Remember that you can get Van Zyl's place for six thousand.'

'Well, let it be so, in God's name,' sighed Oom Jan, rising. 'I will now go to bed.'

Flinty was unusually grave when Bray joined him on the *stoep*. 'Well?' said the new-comer interrogatively.

'It's settled, Wally,' replied Flinty slowly. 'Twenty thousand pounds for us. No ripples on that pond, but'—

'But what?' inquired the other.

'This, Wally. What is the old man going to do when the cloud bursts? You are going off with the girl, and I shall make for the Old Country. Think of the racket when the shareholders of the Koodooskop Diamond-Mining Company (that is to be) discover the real state of affairs. The old people have been good to us, Bray; we have lived on the fat'—

'Stop, man; stop!' Bray broke in. 'You amaze me, Flinty, developing a conscience at your time of life! Be easy; the old people will not stay here a day after I am married. I'll cart the whole biling lot to the coast, and farther, if necessary. Besides, how many mines, think you, have busted in the same way? Genuine ones, too. A few diamonds near the surface, and nothing below. Don't worry, Flinty; look after yourself. I'll take care of the rest.'

'But in any case there will be trouble of some sort, Wally. I see it quite clearly. The old man'—

'Oh, dry up, Flinty,' interrupted the other. 'Your mental and physical visions are about on a par. Besides, here comes the girl.'

CHAPTER VII.

THE diamonds were registered at the Civil Commissioner's office in proper form. Advices were subsequently received that the

Government had decided to send an inspector of mines for the purpose of examination and report as to the advisability of declaring the mine a public diggings. This took some time; but meanwhile the news had spread, and the fortune-seekers began to swarm to Vaalbos. Singly, in twos and threes, and then in large parties they arrived, like *aasvogels* (vultures) gathering for the feast. Sam Zastron was turning them away in scores from his hotel. Every householder became a boarding-house keeper, and when no more could be accommodated, the late-comers had to content themselves with wagons, and tents, and cheerless bivouacs under the thorn-trees lining the banks of the dry river.

Flinty did all the work, while Bray contented himself with riding about the farm in Steenie's company. The first-named interviewed innumerable people, until at last he was able to announce that a strong syndicate had been formed for the purpose of buying up all Oom Jan's rights, inclusive of the farm property, for sixty thousand pounds, to be paid immediately the mine was declared.

The day after this deal was concluded Bray and Flinty rode into Vaalbos. The former had to take out his licence; and when the pair arrived at the village, they found themselves unable to break through the thousands who were crowding round the Civil Commissioner's office. When it was understood that the original prospector wished to enter the building, way was made for the great man, because the veriest tyro at the game knew that he could not sign the list and so obtain a claim until Bray had secured his licence.

A man was talking to the Civil Commissioner as they entered the office. He turned to look at them.

'Braine, Wally, by all that's holy!' whispered Flinty.

'How are you, Mr Braine?' said Bray, advancing cordially with outstretched hand.

The man took Bray's hand with evident reluctance. 'I am well,' he said quietly. 'And the great Flinty too!' he continued.

'Yes, it's old Flinty, Mr Braine,' returned that individual. 'Once more on the war-path.'

'I hope it's a straighter one than the last,' said Braine. 'The "Vanity Prospect" was not a creditable affair, and Klipdam is not a place I should recommend you to return to at present.'

'Well, sir, what can one say?' spoke Flinty coolly. 'Prospects are the same all over the world. We think they are good, but somehow or other they never come up to our expectations. I have seen all sorts. When I was younger I prospected to be several things—a doctor, a lawyer, engineer, and what not; but I was disappointed. Mining prospects are the same. The bad are never good, the good sometimes

bad, and the moderate both, and sometimes indifferent.'

'Quite the old style, Flinty—the old style,' said Braine. 'Let me hope, however, that this particular one is in advance of the "Vanity Prospect."'

Mr Braine, the Government inspector, was a careful, prying little man of great experience. He knew every rogue on the fields, and his knowledge of diamonds was unique and complete. The demon of doubt possessed him when he saw that Bray and Flinty were the moving spirits in the affair. It may be said that his experience of their methods in the past amply justified his attitude. His immobile face, however, hung out no signals to the watching men.

'Let me see the stones, please.'

Flinty produced them. Braine made a careful examination, employing in his task a powerful magnifier. 'So! so!' he muttered. Flinty

and Bray were visibly uneasy, and they both watched Braine with anxious and perturbed countenances—in Bray's case sadly out of keeping with his assumed air of jauntiness.

'Fair stuff!' was all the comment that Braine made when he handed the stones back.

In the meantime the motley crowd of Gentiles, Jews, and heathens outside was having an uncomfortable time, and signified its impatience in various ways. Huge Klipdamers, belted and slouch-hatted, battled (with the tactics born of numberless similar experiences) for places in the front rank, bonneting well-dressed Jewish diamond-buyers and prosperous-looking storekeepers in the process. Little men, crushed almost out of shape, were shrieking expostulations to deaf ears; while a horde of natives on the outskirts of the crowd droned their deep-throated notes to the accompaniment of clashing sticks and stamping feet.

OUT OF THE BOLSHEVIKS' CLUTCHES.

PART II.

v.

NEXT morning I started for Belo-Ostrov for the third time, and this time very nervous indeed. Four days had now gone by since I first set out, and a further warning had come that the Extraordinary Commission for Combating Counter-Revolution would soon receive a denunciation against me for harbouring agents in a British plot. At any moment their emissaries might be set on my track. I looked anxiously at the station and in the train for signs of spies, but the train leaving at 1.15 arrived without incident at the frontier by three o'clock. On the platform I noticed the stationmaster, evidently waiting for something. A soldier who had been in the train went up to him, and put a packet into his hand with the words, 'From the Gorohovaya.' The stationmaster turned with a very serious face, and went into his office. Now, No. 2 Gorohovaya Street (in English, Pea Street), come to be known familiarly as the Gorohovaya, is the side-entrance of the former Prefecture of Petrograd, and the headquarters of the said Commission, which is the most dreaded body in all Sovdepiä. It looked unpleasantly likely that the packet contained something about me.

All I could do was to hasten my business as much as possible. This, however, was no easy matter. My luggage had been left in the charge of the stationmaster, a willing and intelligent man, as are almost all railwaymen in Russia. For will it be credited that at Belo-Ostrov, whence travellers are sent back over and over again, first on one excuse, then on another, no cloak-room provision at all is made for their luggage!

(For instance, a Swiss in my train was turned back because half of his thousand roubles was in so-called 'Duma money'—that is, the notes of larger values printed by authority of the Duma after the revolution, instead of in 'Kerenkies.') In consequence of this, luggage frequently vanishes altogether. On inspection, mine now proved to be intact.

Three friends had accompanied me to Belo-Ostrov—the lady with whom I had been staying, my cousin, and a bright lad, an ex-Boy-Scout, who had worked for me as assistant stage-manager. By our joint exertions we persuaded some porters, at the much-reduced charge of two hundred roubles (they wanted four hundred), to transfer the luggage from the shed. It had been locked in the former Customs House, where it would be searched by the 'comrades,' who had not even deigned to take notice of the injunctions and reprimands received from Petrograd. What master these Ariels owned I never discovered. That they had an intimate connection with the Gorohovaya was certain; they acknowledged some shadowy authority of the Industry and Commerce section, and some of the Military section of the Petrograd Soviet; but for the most part they seemed to lead a delightfully independent existence—an example, perhaps, of the principle of 'self-determination,' or simply of what had come to be called in Russia 'power on the spot.' Of one thing I am sure, that there was a liberal sprinkling of old régime secret police among them. Most of them were in sailors' clothes, and under the lead of two assistant-commissars, one a sailor, the other a Pole, they proceeded to tackle my trunks.

The proceedings lasted three and a half hours. I have travelled all over the continent of Europe and to the borders of the Chinese Empire; I have seen hundreds of Customs searches; I have been present at perquisitions under the old régime and after the revolution; but never have I seen anything approaching the way in which my luggage was handled. Everything down to the last stitch was taken out of the boxes, pawed over, and finally hurled back in a crumpled heap. Key-labels were torn off, and keys were lost. Delicate dresses were treated like pieces of sacking. Several locks were broken. In the hurly-burly it was impossible for me to follow what was being done, and my friends had been refused admittance into the place. Under pretence that he knew better than I where everything ought to go, I got leave for my stage-manager to come in; but even so, it was impossible to keep an eye on everything. Many articles surely found their way into pockets made capacious by experience. Once when I saw this openly occur, and protested, as though by way of jest, against 'requisitions,' I was answered, 'That's not requisition. When we get to requisitioning things, we'll let you know.' Yet among them were some who evidently sympathised with me, and unostentatiously tried to make the ordeal as light as possible.

My young helper proved highly useful here, chattering to the comrades, distracting their attention, and managing to put back objects that had been neatly left out as though by accident. In the end his activity aroused the suspicions of the Pole, who told him roughly to be silent, or he would be put out. How many things were taken from me I have even now no idea. Officially the gang confiscated six pounds of sugar and four of tea (the last of my household stock in Petrograd) which I had taken, knowing both to be scarce in Finland, several pieces of soap, two travelling electric heaters for water, a large silver-gilt jug, several silver spoons and two chased silver-gilt mugs, a silver sugar-basin and tray that used to figure in the production of *The Admirable Crichton*, silver presentation wreaths, all very massive and of fine work, a writing-case with silver fittings, and a number of diaries, letters, and other papers in English and Russian, that were, of course, of no political significance at all. And first of all the letters seized was one that the Commissar of Foreign Affairs had wanted me to send to his brother in America, containing purely family news. I should like this to meet G.'s eye, so that he may have it out with the comrades.

To my inexpressible relief the list of jewels was passed, with only some murmurs, and a necklace, not in the list, was undiscovered in its hiding-place of opaque vaseline. The worst was over, I thought. But suddenly, 'What's this?' and from a pile of linen were produced two

bottles of champagne. The unexpected treasure-trove of Doyen et Cie, *cuvée réservée*, set the eyes of the comrades aglow. This, if anything, was their spoil. With a show of civic indignation, they asked how I came to have the forbidden fruit. I answered, which was the truth, that a friend had pressed it upon me as a kind of stirrup-cup, but I had felt too disturbed before my journey to think of feasting; selling wine was prohibited, they knew well, and I could not give away a gift, so there was no choice but to pack it in one of the trunks, was there? 'Let us drink it now!' So we broached one of the bottles and made nine or ten glasses out of it. But before the turn of the other could come there was a diversion of anything but a pleasant kind.

VI.

At the bottom of a big basket of costumes the Pole, not to be deterred from duty by any softening temptation of the grape, had found a small, hard satin cushion. 'What's in this?' he asked. 'It's too heavy.' And without more ado he ripped it up. My heart went into my boots. 'There?' I tried to answer casually. 'Some theatrical prop, I think.' In went his hand into the flock and extracted—an excellent Browning pistol with a number of ball cartridges. When in July house-to-house search was made in Moscow for weapons, it had been entrusted to me by a colonel of artillery who had battered down the defences of Erzerum; he had an affection for his pistol as for an old friend, and begged me to take it, if I could, to England, and return it in quieter times. It had been sewn into the cushion, and had lain there ever since. I had almost forgotten its existence. And now——

A dark crowd collected. Angry voices were raised. 'Theatrical prop, indeed! That's a fine thing for a theatre, comrades! The sort of prop that'll be very interesting at the Gorohovaya, eh, comrades?' I dared not tell the truth, and knew not what to invent. Boy Scout to the rescue again! 'What nonsense! Of course it's a prop! It's used in the play *La Marseillaise*, where the Polish girl gets the Prussian officer's pistol, and makes him let the other fellow off. We had a revolver stolen in Ekaterinoslav, and after that we always sewed it up in the cushion after each performance.'

The explanation was accepted, and the brutal repacking proceeded. All was now done, and I agreed with the porters to pay—it hardly seems credible—the sum of fifteen hundred roubles to convey my boxes from the Customs to the actual barrier, where it would pass into the hands of the Finns. Fifteen hundred roubles for wheeling three trucks about fifty yards! Sheer robbery, of course! But the traveller can only submit. And the relief of getting through the search was such that one would have been willing to

pay any sum to escape. We looked round for the other bottle of champagne, but it had vanished; the comrades were determined to keep all of this bottle for themselves. No matter. *En route!*

But dare we say *en route*? Are we through indeed? 'Stop!' It is the voice of the Pole again, a voice with the rancorous note of narrow malice, eager beyond the rest to hurt a Russian woman. 'Here's a basket that's not been sealed. Not been examined at all, I declare.' His joy was obvious. The loading is stopped, and a tremendous hunt begun among the keys, which have all been put back into their box. The right key cannot be found. 'Break the lock,' I say in desperation. What else is there to do? Soon the barrier will be shut for the night, and if I am not the other side of it there will be another day of trial and trouble and ever more pressing danger. It is unbearable. 'Break the lock!' But just as this was about to be done the key was found. The box, which was full of eighteenth-century costumes, lay open. Now, whether it was an evil genius that inspired him, or merely long experience in the arts of the despoiler, I know not, but without hesitation the Pole thrust his arm down to the bottom, and thence from its resting-place under piles of silk flounces and satin coats exhumed the sister-cushion to that he had lit upon before. 'What's here?' he shouted. Useless to pretend or temporise! 'Another,' I answered, and on the word the remnants of the cushion, cut from end to end, revealed a solid Colt-automatic with its holster and proper complement of cartridges. It was the property of an English friend who had given it to me for safe-keeping when the Red Guards were searching for him.

This time all was over, I thought. My luggage would surely be confiscated and myself arrested! The gates of the Gorohovaya already yawned, in my imagination, to receive me. But, strangely enough, the discovery of the second pistol passed almost without notice. It was not until afterwards that the small chain of circumstances that had saved me became apparent to my mind. If the luggage had been arrested—and I with it—the porters would have had to repay the fifteen hundred roubles they had received, and as they were, of course, 'in' with the comrades, the latter would have suffered too. Then there would have had to be a protocol, which is Russian for a *procès-verbal*, and there would have been questions about the silver, which was worth at least nine thousand roubles. And, perhaps yet more important, the pistols would have had to be accounted for and handed over to authority; whereas if no trouble were made they would remain as the perquisites of my friends at the frontier, and two first-class automatic pistols are a gift of Providence not to be sneezed at when there is no chance of getting them from abroad, and no Russian factory that

can make them. So it fell out that the basket was repacked in silence, and the trucks of luggage were quietly wheeled off, and on to the bridge across the river Sestra, the boundary between Russia and Finland.

My friends accompanied me to the very barrier, on the other side of which were clean soldiers in neat uniforms, and a well-lit little station that seemed to promise cake and sandwiches; for, though I hardly knew it, I had had nothing to eat since breakfast. And now I had passed the barrier. I was free! It was only afterwards that I learned how narrow had been my escape. Nearly, indeed, had my fears been realised. The very next day the denunciation of which I had had warning materialised, and agents of the Gorohovaya were sent to arrest me at my flat in Petrograd. When they found I was not there, one may be sure their first step was to telephone to Belo-Ostrov to have the cage shut upon me. But they were one day too late.

As I said good-bye to my friends, my heart swelled till I seemed to choke. When should I see them again, when feel again the soil of Russia under my feet? I was going away to safety and freedom, but they must return to Heaven alone knew what fate.

'*Lasciate ogni speranza,*' all ye who remain here! That is the motto over the gate of Russia. What awaits those within it? Hunger, cold, insult, disease, discomfort, misery, grinding want, ceaseless fear; perhaps arrest, unjust imprisonment, sudden death. And no hope? Yes, there is one. One on which all educated Russia, that dying band of brothers and sisters, has fed for many a month of sickening delay. It is the hope that the Allies, for faithfulness to whose cause they have been tortured and decimated by the Germans and their agents the Bolsheviks, will at length awake and save them. But, oh, when will that day of awakening dawn?

WHEN LOVE CAME.

DID he come to me in a kingly guise,
With trappings of silver and gold?
Or came he with clatter of sabre and steel,
As a warrior brave and bold?

Did he lure me with strange, sweet melody,
In the wee, small hours of the morn?
Or came he in grief, lest my heart should refuse
A suitor so sadly forlorn?

No;—his dear strong hand took hold of my own,
His tender eyes looked into mine,
And my heart's dearest love to my love went out,
In the answer, 'Love, I am thine.'

And the touch of his hand still thrills my heart,
As it did in that bygone day,
For the love that we plighted long years ago
Is the love that will last for aye.

MARY HODKINSON.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

IT appears to be accepted as a judgment of history that the battle of Waterloo was won on the playing-fields of Eton. However that may be, in the latter days of 1914, when persons and things were brought up for new valuations, this statement was repeatedly made and emphasised, since sport appeared then to be on its defence—for the time and the effort that had been devoted to it—and to be making a plea for permission to continue. Nobody of sense and reason can doubt that sports of various kinds, more particularly games of athletic character, have served immensely for the brain, the body, the spirit, and the character of the British people, even if it is a point as to whether they have done quite so much as has been claimed, having regard to the revelations, during the recruiting periods of the war, of physical incapacity on the part of such a large section of the manhood of the nation, leading to its being declared that we are a 'C 3' people. Propaganda in its favour led to sport in various forms being permitted or tolerated during the war, even when the strain upon the country was at its greatest. But it is to be noted that, while simple games of high athletic and physical cultural value—those of a kind enormously beneficial to overstrained men and women, such as cricket, tennis, and golf—were not encouraged, even though permitted, and were often sternly discountenanced (so that those who participated in them did so in partial secrecy), full permission and really handsome encouragement were given to other 'sports,' as they were called, whose moral and physical values were not so evident.

* * *

There were three in particular of these 'sports' that were thus made exceptions to the war-rule. One of them was professional football, resulting in hundreds of thousands of people paying to stand to watch the contests between paid performers on Saturday afternoons; another was horse-racing; the third was prize-fighting, or—as those who are addicted thereto describe these fighting affairs—boxing 'contests.' In cricket, tennis, and golf no competitions of any consequence were conducted during the war

period; the communities associated with these games were in the main honestly and deeply patriotic, and sighed not over the sacrifice. In professional football there was some slight modification of matches necessitated by difficulties in travelling; horse-racing meetings, although reduced in number, were held throughout the war; and prize-fighting rose to heights of public patronage and financial encouragement it had never known before. Never was money so freely lavished on any so-called sport as on this bruising business during those five hard years of our national life. For the footballers it was said that the watching of them was the only, or the main, recreation of toiling millions who were exerting themselves to the utmost in war-work, direct or indirect. The proposition might be disputed; but let it pass at that. For the horse-racing it was put forward that such meetings were necessary to preserve the breed of horses, which otherwise would become inferior or even extinct, and that thus the mighty British Empire would be placed in danger. There must, therefore, be races at Newmarket—and not so much races as betting on them—and special trains to the scenes of these affairs when public travelling facilities were reduced to the lowest limits. A considerable arrogance was displayed by the patrons of this sport, and in the last year of the war the greatest newspapers of the land found it necessary to condemn the proposals of the high authorities of racing—persons of exalted titular distinction among them—for want of national understanding and even want of patriotism in that at the tensest crisis they would continue with their races. The authorities, amidst a howl of condemnation, had to withdraw from their position. For the prize-fighters it was said that theirs was the manliest of all sports, that it showed the Briton at his best, that it promoted all that was good in man, made him a noble and splendid creature, and was the very thing to help a country to win a war. During the five years, argument with persons associated with businesses that were thus encouraged was not practicable; the assessor of true values, the seeker of truth, the sincere promoter of good, was always cried down. Wondering upon the strange effects of war, such silent philosophers and critics per-

ceived points of difficulty in the propositions presented to them, in that, for example, ten thousand paid and watched and betted, while only two fought in a ring, and that these two only fought because they were paid for their day's or night's work at, sometimes, ten thousand times the rate that was paid to the soldiers in the field, who risked (and in so many cases lost) life or limb at their patriotic labour. Those gentle meditators and philosophers took note of many circumstances, such as that these prize-fighters were sheltered, so far as was possible, by the authorities from the risks of battle; and they felt that if the time should come when it would be suggested, perhaps, that the war on the Western front was won in the prize-rings of Holborn, Blackfriars, and Covent Garden, the sentiment should not be permitted to pass without opposition into the newer history.

* * *

We come this summer to the entry upon a new era in sport of every kind. In the midst of war it was prophesied by persons who looked perhaps too sadly upon possibilities, that after the bloody strife was ended there would be less time and money devoted to sport, that professionalism in every phase would be diminished, that people would play more than they would watch, that a certain asceticism would arise, and a Spartan simplicity and purity would enter into our games, but that in general we should work more and play less—as incidentally it was noted that the Germans had done. Those of the future were to be stern and terrible days. In many other matters than this of sport, however, and more important matters, too (one has heard mention of a League of Nations, and pious resolutions to have done with war and armies after a sad exhibition of human weakness during five years of bloodshed and mutilation and general destruction), it has been proved again that 'the devil sick' and 'the devil well' are two very different persons of highly contrasted mentalities. Led by the gambling fever, the madness of extravagance, the jazz-dancing, and the decline in political honesty and public morals, a general increase in the patronage of sport has broken out; the number of persons devoted to sport, the money lavished upon it, and, above all—for this is the root of the evil, if there is an evil in the business—the publicity given to it, were never so great as now. In every department sport enjoys this summer a super-boom. Something of this situation may properly be attributed to a natural and healthy reaction after the circumstances and deprivations of the war years. But it goes much further than that. It has become a grand obsession, a business to which more attention is given in the newspapers than to the most serious affairs of life, and especially it has become a grand commercial enterprise. How far any of this stuff is sport, and what it will have to do with the

winning of any future war, may be left to the individual determination of each critic of the times. But whatever that judgment may be, there is clearly a wide difference between this post-war sport in which people are indulging with so much enthusiasm, coaxed by commercial promoters and encouraged by newspapers, and the kind of thing that of old we associated with the 'playing-fields of Eton' and what we had in mind when we used to say that such a thing or some other was 'not cricket.' For, all too often, the contests we know to-day are not things for noble sentiments, high ideals, or fine standards of conduct. They are largely matters of vanity, publicity, money, commercialism, and often, to no small extent, of knavery.

* * *

Pure sport is simple effort with an aim and an ideal. Those who practise it, and who are the only true sportsmen, are those who play a game or follow some other sporting pursuit for its own sake, for the enjoyment and (non-pecuniary) benefit that they derive from it, and for no other reason. It follows that to maintain the strictest purity there should be no publicity, no money transactions, no professionalism. Such an absolute ideal may be difficult or impossible to achieve, but at least there might be some approximation to it, as indeed there was until a generation back, when sport flourished well, instead of, as now, when such ideals are openly neglected and even despised. The vulgar decadence of sport in these present times is due to a combination of causes. The first of them, in chronological order, is the strangulation by professionalism, which, from the ethical point of view, has ruined every sport to which it has fastened itself, exceeding the strict limitations that might be prescribed by those who understand the true meaning of sport. Really, sport and professionalism are contradictions in terms. There cannot be professionalism in any absolute sport—at least, no professionalism that goes beyond the simple necessities of instruction and assistance. The moment the professional becomes a greater, more important figure in any sport than the amateur, that sport is ended, and a simple business is established in its stead. Instead of a means of relaxation, a system for the mental, moral, and physical improvement of a community, which is an assistance and not a hindrance to the important affairs of life, there is a business to which various persons for the sake of gain are wholly and entirely devoted, which is obviously bad for the community, both economically and morally; and, on the other hand, there is a new community of idle, inert watchers established, persons who stiffen physically and become stultified mentally by concentration upon professionally performed physical feats that, from the point of view of human welfare, the betterment of the com-

munity, mentally, morally, or physically, are not of the slightest importance. Experience has proved that this watching of professional performers breeds many complaints that are opposed to the welfare of the nation.

* * *

Next among the causes of the decadence of sport come commercialism and publicity, which go hand-in-hand. Immediately upon anything gaining publicity it receives an enhanced commercial value, and it is the custom of the times to exploit that commercial value without delay by a repeating process of more publicity. The mistake is that the publicity, in the first place, is not sincere, in that it is exaggerated and exploited in a semi-sensational manner for the sake of private gain. One may freely subscribe to the declaration that in many respects the British press is the finest in the world, without suppressing the fact that there is none that perpetrates more gross and vulgar absurdities in the extensive space given to pseudo-sporting news and in its manner of treating such news. We find that even in sober journals, and in such as have the largest circulations, the prize-fighters, their doings, their thoughts, their words, even the details of their private lives, are treated more fully and more intimately than those of other personages. Artists, writers, great men of science, others of splendid achievement, may be ignored, but the people must be told what the prize-fighter eats and what are his predilections in poetry. Thus this business of bruising and blood-letting is exalted in a false and ridiculous atmosphere, and commercialism leaps to the advantage. One has found even 'the gravest journals commenting in a manner of approval and satisfaction upon the fact that 'ladies' have been seen at the ringside on these occasions, and even, at the time of a recent fight, that a large proportion of the on-lookers were 'ladies.' Those who rejoice that their mothers were not of the womanly stuff that yearned to see these fights might, if necessary, dissuade their sisters and their daughters from patronising the 'ring.' We find in the case of this 'sport' that before a fight can come to pass there must be prolonged negotiations; the cables of the world are kept engaged with the transmission of offers of 'purses,' arguments, and barterings. Eventually the fight is sold to the highest bidder, on terms that will yield many thousands of pounds to the winner, and nearly as many to the loser. In the case of a projected fight between the Frenchman, Carpentier, and the American, Dempsey, for which the negotiations have been keen and protracted, purses of more than £100,000 (one has lately seen the figure of £155,000 quoted) have been considered. For a few minutes of brutality (granted freely that much skill is also needed) the prize-fighter earns more than most clever scientists, artists, writers,

men who labour with fine intellects and honest hearts for the welfare of the community—even the most successful of them—earn in a lifetime.

* * *

And see the human and manly quality of men who are the heroes of this sport so much commended by leaders of public opinion. It is notorious that some of them shirked their war obligations in the most callous and cowardly manner. An American newspaper, referring to this forthcoming fight between Dempsey and Carpentier for the championship of the world, printed the following concerning Dempsey: 'America's greatest fighter—the hero of a few weeks in a shipyard, the hero of a few minutes in a battle with Jess Willard, the hero with fur overcoat and fat banking account, the hero of moving pictures at several thousand dollars a week, the hero of two peaceful, profitable years in the United States, while the greatest world's championship was being fought several thousand miles away! America's greatest fighter—not by several millions! The suggestion that he go to France is an insult to those old laddies of ours who, not so many kilometres from Paris, lie row on row, through rain and sunshine, never to fight or to speak again.' Other accusations have been laid against this Dempsey, further reflecting on his manly worth; but still the newspapers do not cease to advertise him and add to his commercial value. Can nothing be done to stifle this publicity and this commercialism committed falsely in the name of sport, and thoughtlessly linked with such glorious sport as that which has helped to make Britain great, such as was conducted on those playing-fields of Eton? The American newspaper from which I have quoted strikes the true note; it is a sad thing to know that the most serious, most conscientious newspapers in our country do not follow the example. Let us take an extract from a daily journal which would be regarded as the foremost of those in such a class, and one for which most thinkers have a high respect. Thus: 'M'Goorty managed by supreme skill in defence to survive this terrible round, but he took a bleeding mouth and very wearied limbs to his chair when the bell rang. Now for the thirteenth, and the most gory, round of the fight. Beckett landed four lefts on the face, and M'Goorty smashed a left to Beckett's nose, but he had to withstand a terrible battery afterwards, and was covered in blood. Just at the finish of the round Beckett dropped him on the ropes with a left, and before he could rise floored him with a right, and the bell saved the American probably from being counted out.' All this in enthusiasm and with approval! Not long ago I was travelling in Spain, and one day in Madrid read in a daily newspaper, *La Tribuna*, a long article, occupying the whole of the front page, on 'The Prestige of the Brute,' which was just an extended expression of wonder and

amazement that in the most civilised countries prize-fighters should be so much exalted. And, strangely, the same day I read another trouncing article on the same subject, and with the same point of view, in another Spanish journal of importance, which did not hesitate to link the name of the favourite *espada* of the bull-fighting ring with that of the boxers in its general condemnation, and pointed out that, while the world was doing homage to these persons, brilliant leaders of thought and literature in Spain and elsewhere were passing away to their final rest with scarcely a word of national recognition. Real, pure amateur boxing is sport, and may promote fine qualities like the others. Nothing, indeed, is said against it; but what has the commercial show and the hundred-thousand-pound fight to do with this? What have the spectators who merely watch and scream to do with this? If it be said that this prize-fighting is good for Britain, and stiffens her back, strengthens her muscle and courage, helps to make her strong in war, then sportsmen, in the name of sport, answer that such declaration is a lie.

* * *

But some may ask what is the use of making protests now, and may suggest that there is no feasible remedy. None, indeed, until Governments become conscientious, and have, besides sincerity and honest desire to do their duty, such measure of imagination and initiative as is expected from controllers in other departments of life and work. Is not the sport of a nation, good or bad, a very big factor in its life, one of great importance, involving the expenditure of an appreciable portion of the living hours of the people, much of their effort and thought, and vast sums of their money? If this is so, how comes it to be a matter that is considered too trivial—outside the scope of a Government department, even though Government controls so many things which people wish it did not control? It is in the manner and custom of thoughtless convention that it would be answered that, of course, a Ministry of Sport would be absurd. Yet, with proper ideals, and well and energetically directed (agreed that in these days of government these are impossible conditions), it might work more good for a people than half-a-dozen other departments mainly concerned in adding to expenditure and waste. Besides, we may yet find the example set us abroad. It is discovered even now that some foreign nations decide that it is unnecessary to copy Britain in all matters appertaining to sport, or even to wait for her initiative, perceiving that there is something the matter with British sport. I have seen in foreign countries how at the beginning they are fighting, as best they can, the canker of professionalism introduced into new games of theirs, the infection coming, as they say, from England. I have found

that they are playing Association football quite enthusiastically and even well in the south of Spain and in Portugal (and it is marvellous to see how much alike are all civilised men of the world when you put them into athletic garb and place them on a football-field!), but that at the very outset almost they have had certain small difficulties in the matter of attempted professionalism, which they have dealt with rigorously.

* * *

Now, some little time ago France, feeling that her newly acquired love for games of the British kind was doing her good, and had helped her in the war, determined to pursue them more thoroughly in the future, and early this year the Government voted a large sum of money for the training of French athletes and their participation at the Olympic Games. The like has been done on a smaller scale by other nations. And according to a Bill just submitted to the French Senate, having for its object the physical training and well-being of the youth of France, sport is to be made compulsory in that country. This Bill, before the Senate at the moment of writing, provides that every French child shall be equipped with a book on 'Physical Education' similar to that issued to every recruit joining the army, and all children at school must take part in sport. Such action is not many degrees removed from the establishment of a Ministry of Sport. But it is well that a Ministry of this sort should not come to establishment now. It were better that it should rise when present fevers have passed away, and life and work and government are cleaner than to-day, for such a Ministry brought into being now would go the way of others, and be but one more centre of bureaucracy. It would be opportunist, materialist, and commercial; it would praise prize-fighting, and perhaps promote it; it would encourage professionalism and all that is bad. Indeed, as some would say, evidently the men who comprise a modern Government, masters of intrigue and something worse, are the last in the world to understand the meaning of sport. They would be mystified by such a definition as that one propounded by Oliver Wendell Holmes in this wise: 'To bray little, to show well, to crow gently if in luck, to pay up, to own up, to buck up, and to shut up if beaten, are the virtues of a sporting man.' But despite the disadvantages and the discouragements, one may yet anticipate with a good hope a future of sport both clean and pure. For sport arises from nature, from the instincts, good and simple, in man. There may be strayings for a time, national escapades, contamination with foul influences of a special period, but nature has a kindly care for sport, and while there is a wind on the heath she will bring it back to its saving simplicity.

A DAUGHTER OF THE DOPPERS.

CHAPTER VII.—*continued.*

BRAY and Flinty were uneasy. The presence of Braine was disconcerting, and in spite of the fact that the negotiations for the sale of the farm had been concluded—on certain specified conditions—they felt anything but secure; so that even Bray failed to display that perfect self-possession of manner and easy grace of carriage which had so consistently assisted him in keeping (outwardly at least) the little worries of life at bay. They spanned in and drove away to Koodooskop amid the cheers of the crowd in the main street, cheerfully waving their hands in response until the thorn-trees hid them from view.

‘I don’t know what it is, Wally, but I have got Braine on the nerves,’ remarked Flinty, as they crossed the dry river.

‘And on the brain as well, I take it. But why?’ asked Bray.

‘Didn’t you notice how he looked at the stones? If he had only said something. He is the cutest beggar out. Looks like a *meerkat* with his fine-drawn snout and prying eyes. Why should he demand a trial washing, think you? Another inspector would have been satisfied with the stones we exhibited. The whole crowd will be down at the mine to see the trial, and what if’—

‘Oh, dry up,’ snapped Bray; ‘you’re getting ratty. What can he find but diamonds and decent-looking gravel? He is not infallible, let me tell you. Take that Juvenna case, for instance.’

‘What was that?’ inquired Flinty, anxious for a diversion.

‘Not heard of it? I recollect now, you were not on the fields when the affair happened. You remember Juvenna, of course, and what a mysterious bounder he was. Lived on the fat of the land without any visible means of subsistence. I.D.B., I take it; but they couldn’t trap him, and not from want of trying either. He was suspected also of illicit gold-buying at Jo’burg, through a confederate there, so that when the Kimberley police received a wire from the Jo’burg authorities that a box had been despatched from there addressed to Juvenna, they promptly sent old Braine up the line to receive it. It proved to be a biggish soap-box, heavy as blazes, and Braine, no doubt, shook hands with himself; but it was necessary that Juvenna should receive it. Braine therefore arranged by wire with the railway people to deliver the box to Juvenna at Kimberley. Sure enough, the old beggar applied for it, and took it away in a cab. Braine followed in another, and three minutes after Juvenna had entered his room, the detective followed. Old Juvy was lying on his bed.

“Where is that box, Juvenna?” said Braine quietly.

“What box?”

“The box you removed from the railway-station.”

“You are mistaken, Mr Braine,” the beggar had the cheek to say.

Braine started a search, and examined every corner and every single thing the room contained, including the bed, and found nothing.

“Go it, Braine, boy; don’t give up. A box isn’t difficult to find,” jeered Juvenna.

Suddenly Braine stooped and lifted the carpet. Juvenna rushed at him, but too late; old Braine had already covered him with a revolver.

To cut it short, Flinty, the box was found concealed under a trap-door in the floor, and on its being opened at the police-station the detective discovered the contents to be gold bars, and a good many of them. So Juvenna was lagged at last.

The evidence was conclusive, and no doubt the old scamp prepared himself for five years of the Table Bay breakwater. At the preliminary examination before the beak the facts were trotted out, with one exception—the prosecution had not proved that stolen gold had been received. A jeweller was sent for. He struck one of the bars with a hammer, and it broke into two pieces. Every bar was nothing but common brass, Flinty, neatly covered with gold paint. They say old Braine’s face was a sight. As the prosecution had not maintained their charge of receiving stolen gold, Juvenna was discharged, and Braine’s life for a time was an encumbrance to him. Juvenna had sent £4000 to his pal in Jo’burg, and the pal had forwarded brass instead of gold. Juvy lost the four thousand, but won his freedom. Now, old chap, I hope you won’t lose your nerve this afternoon; there is nothing to fear.’

‘But you don’t look as if you were enjoying the picnic either,’ ventured Flinty.

‘Never mind me, boy; you keep your end up. If I am bowled, it will not be because I failed to try my level best to keep the ball off my wicket.’

The crowd that assembled at the mine that afternoon scared every living thing from the Klip Kopje. The oldest and boldest inhabitant, an ancient *aardvark*, bald-bided with age, left his burrow in alarm and made for the open veld with ungainly strides, stopping only when he could no longer hear the shouts, cat-calls, and impromptu choruses of the hilarious crowd. The *aasvogels*, inhabitants of the top-most boulder, deserted their conning-tower, flying in ever-widening circles until they reached their other haunt, the Doornberg.

Below, the crowd had stationed themselves in a dense pack around the washing-machine, near which Bray and Flinty were ostentatiously busy, heaping up the ground and filling up the pan. A sturdy Klipdamer—champion sorter of the fields—was seated at the table, awaiting the gravel with steady imperturbability; Braine, near him, characteristically silent and watchful.

A sieveful of washed gravel was thrown on the table, and the Klipdamer, with marvellous rapidity, proceeded to separate the sheep from the goats, now and then stopping to drop a stone into a little tin at his side. Presently he arose, shook the diamonds into Braine's outstretched hand, and shouted for all to hear, 'Two carats to the load, bullies, d'ye hear? Two carats to the load, nothing less!'

'Yes,' agreed Braine quietly, 'that's what it about pans out.'

'It's all over. I am going to tell Steenie the news,' said Bray to Flinty.

'And leave me to clean up? You're a nice one. Pardon my saying so, Wally, but I thought the girl was but a secondary consideration. Is it acute "amoritis," after all?'

'It might be, Flinty, but the disease I dread most is chronic "moneyitis." Braine is now bound,' continued Bray, 'to declare the mine. Our troubles are over, thank God! Clear the rabble as soon as you can, and come home. Whisky will be waiting for you, plus a cool bottle of soda.'

The *stoep* at Koodooskop commanded a wide outlook, and the stone benches flanking it were Steenie's favourite seats. Bray was frequently away, and she as frequently on the look-out for his return, scanning the long white road to Vaalbos as an island castaway looks for a sail on the horizon. She was there this particular afternoon, every baby whirlwind playing with the dust on the long road bringing the light of expectation into her eyes, until at last there was no longer cause for doubt. First a persistent cloud streaming like a ghostly veil, and then the beloved form, sitting the horse like a knight of old. One lingering kiss in the *voorhuis*, disjointed exclamations on the part of the girl, and then Bray told the momentous tidings.

'It means Cape Town, sweetheart,' he told her. 'Your first love, you know. We'll take the old people with us, and help to open their eyes. No more dust-storms, scab, locust, and drought, sweetheart; no more of these, but love and brightness only.'

When the sun had set behind the Doornberg, they retired to the *zit kamer*, where she played and sang to him, while the light waned, until darkness came upon them, so that they could not see each other. He, stretched upon the couch—callous to sentiment and indifferent to music—weaving schemes and dreaming dreams in which the girl at the piano played no part; while she, feeling his presence like some tangible

thing, was thinking only of the words he had spoken in the hall.

They were aroused by the sound of a horse galloping across the *werf*.

'Will you get a light, mate?' he said playfully. 'Flinty has arrived.'

She left the room, and presently returned with a lighted lamp. As she placed it on the table they heard Flinty's voice outside calling 'Bray! Bray!' in tones full of excitement and alarm.

Bray rose from the couch with a nervous jerk, and, followed by Steenie, ran to the front-door.

Out of the darkness came Flinty's raucous tones: 'The game's up, Wally. Clear for all you're worth.'

'What game?'

'I shall probably never see you again, dear Wally, so I might as well take the opportunity of relieving my mind. You should have been an actor, Wally—comedy for choice. I have always thought that. "What game?" you ask cheerfully. Do you think I mean croquet or tennis, or some of those easy things we used to enjoy when we were youthful and gay? I mean something worse than that. So far as we are concerned, it means'—

'Nothing, dear old Flinty,' interrupted Bray soothingly, mindful of the girl's presence.

'It means everything,' asserted the other. 'Braine spotted the thing from the first—from the time we showed him the diamonds in the Civil Commissioner's office. After you left this afternoon he had the shaft scooped out and the ground on the surface examined—pretty closely, let me tell you. When I saw how clumsily we had mixed the stuff, it dawned on me that the game was up. Afterwards he got up and addressed that meeting, giving them his views, telling them, among other things, that the stones found were Kimberley stuff, and refusing to declare the mine. I heard mutterings and cries of lynching. They passed a resolution, and I tell you, Wally—clear. That whole bally crowd of would-be miners will be here inside of an hour. I'm off to Springbok Loop; so good-bye.'

There was a moment's silence, and then they heard his voice again.

'Two carats to the load, bullies,' he called with a laugh, and with it came the sound of a galloping horse, and Flinty was gone.

'What is it, Walter? Tell me, dearest, what does the man mean? He spoke of danger. Why should those people harm you?'

'I can bear to lose everything, even my life, but you, sweetheart—you. I'—

'Tell me, what is it?' she cried. 'There is no trouble, however great, that I would not share with you—no misfortune, however overwhelming, that could drive me from your side.'

'It's a mistake, darling, and nothing more. Braine is a villain, and hopes to reap some benefit from the attitude he has taken up. He

wishes to show that our mine is no mine at all. An old trick of his; but the men are excited and worked up, and it would perhaps be better if we left to-night.'

The mine had miscarried, but Oom Jan's thousands were behind the girl! Why should he not take what was left?

'We can get away now, Steenie darling. Get ready; I'll tell Koos to span in.'

There was no thought of refusal.

'I am ready, Walter,' she said simply.

He turned without a word and went back to the *zit kamer*. She followed, and seeing his face by the light of the lamp, read in it the fear and the apprehension of imminent danger which had now taken the place of the habitual expression of suave complacency.

'You are in trouble, Walter,' she broke out impulsively. 'Let me share it with you. Who has a better right?'

'Trouble! You are right, sweetheart; it is trouble. However, I shall do them yet. But'—

'But what?'

'I can scarcely tell you. It seems such an outrageous thing to confess to you—of all people.'

'Tell me, dearest,' she cried; 'nothing is outrageous from your lips.'

'I have no money,' he all but wailed. 'The mine has swallowed up everything; and we cannot travel without that infernally necessary evil, you know. Do you think your father will?'

'He won't, Walter,' she interrupted. 'It is quite useless asking him. It would only lead to further trouble.'

'What, in God's name, am I to do, then?'

The self-assurance had now quite deserted him, and he stood before the girl a coward, trembling and unashamed, seeing with the aid of a vivid imagination, stimulated by fear, the bearded faces around him, inflamed with the hatred begotten of disappointed hopes. He saw the men dragging his struggling body to the nearest blue gum, and—

With a despairing gesture he sank upon the couch.

She looked at him for a moment with eyes full of trouble, but with a movement of her shoulders, as if she were attempting to shake off an uncomfortable garment, turned to soothe him. Placing her hand on his head, she stooped to whisper rapidly in his willing ear, the ornament in her hair scintillating in the light of the lamp. Then, with a lingering caress, she rose and left the room.

CHAPTER VIII.

OOM JAN KLOPPER had retired early, but could not sleep. The unusual excitement to which he had been subjected by the events of the day had driven the sluggishness from his

blood, and left him nervous and wakeful. He saw again the sea of faces around the washing-gear, some giving expression to the envy which possessed them; others stern, almost forbidding, waiting for the inspector's verdict with the patience of the veld philosopher. Among so many people a number of bad characters were no doubt included, and this reflection added to his restlessness. Some of these might very well have remained at the Klip Kopje with the design of robbing him, so that he blamed himself heartily for his obstinacy in resisting Steenie's repeated requests to deposit his money in a bank instead of following the old custom of hoarding it at home.

A sound came from the *zolder* (loft). He sat up in apprehension, his first impulse being to wake Ta'antje, who was soundly asleep at his side. He listened, and presently the sound came again to vex him, as if something heavy were being dragged, with infinite caution, across the floor above. He left his bed, and dressing hurriedly but silently, tiptoed, candle in hand, out of the room.

Outside, he found the night serene and beautiful, the croaking of the frogs in the dam and the bleating from the kraals coming to him with startling clearness. Cautiously he stole round the gable to the foot of the clumsy bamboo ladder, which he as cautiously ascended. Pushing the door open, he saw a figure at the farther end of the *zolder*, and beside it a candle on the floor. Feeble as the light was, he perceived that the coffin he had provided for his last refuge, in accordance with the custom of his people, had been dragged from the corner in which it had so long remained. For what purpose? he wondered—till suddenly he realised with a shock that his savings of years had been hoarded there.

Silently he climbed into the *zolder*, with jaws set and hard, and advancing a few paces, stood erect, absorbed but alert, watching the stooping figure. Presently the unknown moved from one side of the coffin to the other, and then Oom Jan saw.

'Steenie!' he cried, softly and tremblingly, as if entreating a denial—'not you, surely; not you?'

She turned swiftly, yet without the agitation of one suddenly detected in a grave offence, and advanced, candle in hand, towards her father. He stared at her, with arm uplifted as if to strike—or to curse—but before she reached him Oom Jan fell to the floor with working eyelids and jerking limbs. Steenie held the light to his face, the tears streaming from her eyes. How much had not this poor old father sacrificed for her sake? she all but cried aloud. He had cast aside the prejudices of a lifetime so that no wish of hers might remain unfulfilled, and his sacrifices had led him to this! She made as if to kneel; but the despairing figure on the couch below rose to her eyes and blotted out the white beard before her—blotted it out for ever. . . .

The rumbling of cart-wheels and the sound of trotting horses roused the sleepy location into temporary wakefulness; while the dogs, which had barked Steenie a boisterous welcome, now growled a noisy farewell, as if they knew of her sin. Gradually the rumbling ceased, and died away, leaving the usual night-sounds of the farm, temporarily eclipsed, to assert themselves once more.

The sun was well on with his daily round the next day when Dr Bray, who had been hastily summoned to attend Oom Jan, issued from the front-door of the homestead. The distress of the old couple had unnerved him, so that he wished to get away from it all—if only for a few minutes. Gazing across the *werf* towards the Vaalbos road, his eyes marked a dust-cloud, indicating the approach of a vehicle. He noted that it advanced with unusual speed, and that a jabbering and gesticulating crowd from the location had assembled near the road to watch the novel spectacle. Descending the steps to the *werf*, he proceeded towards the road; but before he reached it the little crowd of Hottentots had scattered, and were endeavouring to stop what Dr Bray now saw was an empty cart, bounding and lurching behind a pair of runaway horses. They succeeded at last, with many howls, whistlings, and waving of coats, and when Bray arrived on the scene had already pacified the trembling animals.

The indications had pointed to a tragedy, so that the sight of blood on the foot-board only caused the doctor to hasten his movements. Jumping on the cart, he called to one of the 'boys' to join him. With a wild turn and numberless lashings, they disappeared down the road in an enveloping cloud of white dust.

They found Steenie and Walter Bray at the Rhenoster drift, the man, with drawn legs and clenched hands, staring with sightless eyes at the pitiless sun. A Bushman arrow transfixed his neck, and one fleeting glance was sufficient to assure his brother that life had left him.

Steenie was reclining upon the tortoise-stone, as if, tired with a day's wanderings, she had cast herself upon it for a long, sweet rest. An arrow-scratch upon the brow, inflamed with the effects of the virulent poison, plainly showed the doctor that her case was beyond his skill.

Tenderly he drew the hair from her forehead, and at the touch she turned her eyes, obscured by delirium, until they met his own. In sweet tones, beloved and unforgotten, he heard her murmur, 'I have found a diamond—a beautiful white stone.' A tear from his overlaid eyes dropped on her cheek, but before he could wipe it away her soul had sped; while, miles to the northward, Plaatjes and his Bushman family were making for their haunts in the eastern Kalahari.

THE END.

AN ANCIENT ENGLISH PALACE.

By EDWIN L. ARNOLD, Author of *Phra the Phœnician*, &c.

THE splendid pile of Windsor Castle dates back to early days in English history. Yet, though its gray walls and dungeons, in world-wide estimation, are the very symbol of antiquity, I have lately spent an interesting morning uncovering the foundations of what may prove to be a still older castle, one which sheltered English Courts and sovereigns before the foundations of the present building were laid.

It has always been known that Edward the Confessor, who died in 1066, nine months before the battle of Hastings, possessed a palace in the neighbourhood of Windsor. Tradition and written evidence vouched for the fact, but where the structure stood no one had ever been able to guess; not a trace of it remained visible, and for more than 850 years the green Berkshire grass kept the secret to itself. Now, within the last few months, the place, in the opinion of some good antiquarians, has been identified, and I have assisted in uncovering for the first time, after all that long interval, the remains of the quaint little chambers, crooked passages, and tiled hearths of the very earliest royal home in England.

The data we had to go on were brief and

easily stated. For one thing, the manor of Old Windsor belonged to the Saxon kings from the earliest times, and according to one account Earl Godwin, the father-in-law of the Confessor, died in the neighbourhood. In his *Chronicles* Fabian records the following incident as having happened at 'the Castell of Wynsore.' One evening at supper a cup-bearer stumbled, but recovered himself quickly, so that no wine was spilt. Godwin, who sat at the table with the king, laughed and said, 'One brother hath sustained the other,' meaning that one leg had prevented the other from falling. Edward the Confessor looked at him sternly, and said, 'So my brother Alfred should have helped me had not Earl Godwin lived.' The earl saw that the king suspected him of having caused Alfred's death, so he took up a piece of bread and answered, 'I see it has been told to you that I caused your brother's death. As a proof of my innocence I will swallow this bread; may it choke me if I am guilty of the crime!' The judgment of God at once fell on the murderer, and he was choked. Whatever the foundation of this legend, Godwin did die in 1053, after a seizure while he sat at meat with the king. Only a day or two ago I

was standing on the tiled floor where this strange incident may have taken place.

Again, in another old chronicle we are told how a blind man went to Edward the Confessor's palace at Windsor and had his sight immediately restored by the saint's intercession. Still suggestive of a royal residence are the facts that an Abbot of St Augustine's was consecrated at Old Windsor in 1061, and charters were signed there in 1065. But where? Old Windsor is now a straggling hamlet on the banks of the Thames, about two miles from the present castle, which was founded by William the Conqueror. All around are green willow-fringed fields, and behind the village stretches the vast extent of Windsor Park, crowded with ancient oak-trees, thronged with deer, but bearing no trace anywhere of ancient building or ruins. This was the problem long vexing the minds of antiquarians, and only just brought to an apparent solution.

My friend Captain Vaughan-Williams, wandering in the park one day, noticed within a right-angled square of low, grassy embankments, enclosing about half an acre of land that rabbits had turned up, numerous tiles of an out-of-date appearance. This set him thinking. Ere long he was at work with half-a-dozen diggers, and every antiquarian will appreciate the delight with which he speedily found himself in contact with a perfect labyrinth of low walls and floor foundations. The soil was clay, hardened by much fine weather; but pick and shovel made steady progress, bit by bit of the tracery of this ancient home being revealed by continuous labour; and as I write the work is still proceeding. There is no chance, unfortunately, of finding any height of wall remaining, for the place has been pillaged for ready-made building material through long ages, and the present castle itself may owe a good deal of its foundations to its humble predecessor a mile away across the oak-trees; but it will be something to add to our knowledge even the ground-plan of a pre-Norman dwelling-place of the better class. Our Saxon forefathers were no great designers in stone. They built chiefly with timber, all of which has completely perished, and, saving a few church porches or doorways, next to nothing of theirs now exists above ground. For an understanding of the architecture of their homes and domestic buildings we have to trust largely to crude drawings in the illuminated Missals of the time—with due thankfulness that even these have come safely down to us. But we know how the Roman camp was arranged, and how the Normans planned their dwelling-places, and, by inference, we can decide that any structure not conforming to either of these must in all probability be Saxon. A real Saxon palace, even in skeleton, is absolutely unique; hence the great interest—over and above any association with a striking page of our national story—which

attaches to the discovery of these isolated and long-forgotten ruins.

When work was commenced in the extreme north-west corner of the ramparted enclosure, the profusion of foundations proved quite embarrassing. We were in a region of stone cupboards, rather than the banqueting-halls and spacious chambers to be looked for in a royal residence! Some of these receptacles were not more than seven feet across by ten feet long, and the passages connecting them were scarcely wide enough for a man to pass through comfortably. But the spades which disclosed the conundrum presently found a partial explanation for it when we lit upon the corner of a flooring of red tiles, set on edge close together in the clay, in a loose 'herring-bone' pattern. A wide hearth of these tiles was presently uncovered, big enough, as Captain Vaughan-Williams said to me, 'to roast two oxen at the same time.' On the hearth lay a fair quantity of wood-ashes, which, on being carefully sifted, produced bones of deer and swine (one of the deer-bones with the marks of a knife upon it), a few fragments of coarse brown pottery, and, curiously enough, a small white flint arrow-point of an age so remote that it obviously had no direct connection with the palace itself. Here we were on the great kitchen fireplace of the building, in the presence, we could imagine by a stretch of fancy, of the remains of the very supper at which Earl Godwin had dramatically choked himself.

This fireplace also indicated that the small chambers adjoining had been designed for the staff, or as store-rooms for food and household goods. 'If this is so,' said an antiquarian who visited the diggings when they were at this stage, 'there will probably be a connecting passage leading to the banqueting-hall in a distant part of the building.' An hour afterwards we found the passage suggested by this very reasonable deduction. After several days of hard digging, the chalk and flint wall foundations suddenly ended in well-faced Bagshot corner-stones; and continuing these at right angles, we uncovered, in the north-east corner of the enclosure, the outline of the most spacious chamber revealed, the undoubted dining-hall and living-room of the establishment.

What pregnant incidents may have happened within these four walls—if, indeed, the edifice is the place it is supposed to be! It was here, possibly, that the ebbing power of the Danes finally disappeared under the persuasive blandishments of one of the most astute of early English sovereigns; and it was here that he, whom the monks named the Confessor, made those first overtures to William of Normandy which opened still another new page in our story. It may have been in this very room that Eustace, Count of Boulogne, cunningly paved the way for his kinsman's accession to the English throne; that the Confessor, pacing

up and down in implacable hatred, confiscated the estates of Godwin and sent Queen Editha to life-long imprisonment in a nunnery. Where, than in this secluded home amongst the oak-trees and the red-deer, was it more likely he should bring together that great digest of laws which gave the English their earliest experience of impartial justice, or think out those schemes of gentle government which lent a romance to the last years of Saxon kingship throughout the dark period of foreign invasion which was to come? No bigger than a modern suburban parlour, this chamber may in some ways be called the most historical room in England, and every antiquarian will wait with interest to see how far further research authenticates its claims.

The little we know of Saxon architecture suggested that outside the main buildings thus uncovered lay an open courtyard, with wood-built stalls for horses and huts for followers about it, though all such erections must, of course, long ago have passed into dust. Outside the ramparts, again, may have been a village occupied by serfs and hangers-on of the Court; and though the spot was unfortunately ploughed long ago, there is still a tradition in the neighbourhood that, previous to this

temporary cultivation, it was dotted in every direction with low mounds—no doubt marking the sites of the bondsmen's dwellings. Somewhere else must be the cemetery, a place of the greatest interest, for the Saxons were buried with their arms and shields, their gold and enamelled ornaments, their beautiful glass-ware and pottery about them; and we think we have already located the spot on a low hillock, a few hundred yards from the entrenchments, where the soil is patchy, as though it had been disturbed long ago, and grass still only grows at intervals. Here, in the shadow of the oak-trees, under the purple-flowered thistles, may be lying the great Earls of Mercia and Wessex, the friends of Hardicanute and Sweyn, thanes who had crossed swords in the north with Macbeth and Malcolm Canmore, and many others of their time, amongst their fair-haired wives and children.

Much remains to be bared, but much has been done already. The King comes down to the diggings now and then; the boys of Eton College, close by, lend a hand with pick and shovel on their half-holidays; and bit by bit this forgotten palace in the wood, this unique memorial of far-away times, is rendering up its secret to the legitimate curiosity of modern research.

THE PARTS MEN PLAY.

CHAPTER XXV.—*continued.*

V.

'THE Boches, sir! They're coming!'

The sergeant's warning rang out, and in an instant the air was shattered with battle. Protected by the fire from a nest of machine-guns, the Germans launched a converging attack towards the bridge. Waiting until the advancing troops were too close to permit the aid of their own machine-gun fire, the Americans poured a deadly hail of bullets into their ranks. The attack broke, but fresh troops were thrown in, and the line was penetrated at several points.

Van Derwater rallied his men, directed the defence, and time after time organised or led counter-attacks which restored their position. His voice rose sonorously above everything. Hearing it, and seeing his powerful figure oblivious to the bullets which stung the air all about him, his men yelled that they could never be beaten as long as he led them.

Half-mad with excitement, Selwyn repelled the attacks on his sector, though his casualties were heavy and ammunition was running low. Durwent's mood of reverie had passed, and he fought with limitless energy. Once, when the Huns had penetrated the road, one of their officers levelled a revolver on him, but discharged the bullet into the ground as the butt of Mathews's rifle was brought smashing on his

wrist. The old groom followed his master with eyes that saw only the danger hanging over him. For his own safety he gave no care, but wherever Dick stepped or turned, the groom was by his side, with his large, rough face set in a look that was like that of a mastiff protecting its young.

As waves breaking against a rock, the Huns retreated, rallied, and attacked again and again, and each time the resistance was less formidable as the heroic little band grew smaller and the ugly story passed that ammunition was giving out.

They had just thrown back an assault, and Van Derwater had sent for his section commanders to advise an attack on the enemy in preference to waiting to be wiped out with no chance of successful resistance, when he heard a shout, and bullets spat over their heads. Turning swiftly about, they saw a tank lurching across the bridge. Amidst wild shouting from the Americans, the clumsy landship stumbled towards them, with bullets glancing harmlessly off its metal carcass. Lumbering on to the road, the tank stopped astride it.

In almost complete forgetfulness of the impending enemy attack, the jubilant Americans crowded about the machine and cheered its occupants to the echo, as a small door was opened and two French faces could be seen. In a few words Van Derwater explained the situation, receiving the discouraging information

that no troops were anywhere near the vicinity. The tank had been discovered by the ex-Belmont waiter and sent on to the bridge.

'Pass word along,' said Van Derwater crisply, 'to prepare for an attack. The tank will go first, and when it is astride their machine-gun position we will go forward and drive them out of the brushwood into the open.—Messieurs, the machine-guns are gathered there—straight across, about forty yards from the great tree.'

The Frenchmen tried to locate the spot indicated, but were obviously puzzled and too excited to listen attentively. Van Derwater was about to repeat his instructions, when Dick Durwent shouldered his way into the group. Men's voices were hushed at the sight of his eyes, blazing with a mingled yellow and blue glare.

In a bound he was on the bank, and stood exposed to the enemy's fire. With something that was like a laugh and yet had an unearthly quality about it, he threw his helmet off and stood bareheaded in the golden sunlight. '*En avant, les Alliés !*' he cried. '*Par ici. Suivez-moi, mes amis !*'

There was a grinding of the gears and a roar of machinery as the tank reared its head and lunged after him.

'Stop that man, Selwyn !'

Van Derwater's voice rang out just in time. The old groom had scrambled to the bank to follow his master, but four hands grasped him

and pulled him back. With a moan he clung to the bank, following Dick with his eyes. And his face was the colour of ashes.

With their voices almost rising to a scream, the chafing Americans watched the Englishman walk towards the enemy lines. Bullets bit the ground near his feet, but, untouched, he went on, with the metal monster following behind. Once he fell, and a hush came over the watchers; but he rose and limped on. His face pale and grim, Van Derwater moved among his men, urging them to wait; but they cursed and yelled at the delay.

Again Dick fell, and with difficulty stumbled to his feet. For a moment he swayed as if a heavy gale were blowing against him, and as his face turned towards his comrades they could see his lips parted in a strange smile. Raising his arm like one who is invoking vengeance, he staggered on, and by some miracle reached the very edge of the enemy's position. There he collapsed, but rising once more, pointed ahead, and fell forward on his face.

With a roar the American torrent burst its bounds and swept towards the enemy. Selwyn leaped in advance of his men, his voice uttering a long, pulsating cry, like a bloodhound that has found its trail.

He did not see, over towards the centre, that Van Derwater had stopped half-way and had fallen to his knees, both hands covering his eyes.

(Continued on page 567.)

THE MONTH: SCIENCE AND ARTS.

THE COST OF HEAT.

AS many readers of *Chambers's Journal* are aware, the amount of heat used in cooking, warming rooms, and for other purposes can be accurately measured, the consumpt being expressed in what are known as British Thermal Units. This expression is generally written B.Th.U., one B.Th.U. being the quantity of heat required to raise the temperature of one pound of water by one degree Fahrenheit. Coal, petroleum, gas, and electricity are all sources of heat, and the amount that each will yield has been measured. Again, heat can be turned into power, and *vice versa*; so that, whichever we want, each of them has a certain value. If we bear these facts in mind, the cost of potential heat-energy in various forms, as given in the Report of the Fuel Research Board, is of interest to almost every one. This cost, as worked out for 100,000 B.Th.U. in each case, is as follows:

In good coal at 27s. per ton	1d.
In " " " 54s. " " "	2d.
In gas yielding 500 B.Th.U. per cubic foot	
—a good average quality—at 4s. 2d.	
per 1000 cubic feet	10d.

In kerosene (high-class paraffin) at 2s. 6d.	
per gallon	19d.
In petrol at 3s. per gallon	25d.
In electricity delivered for heating purposes at 2d. per Board of Trade unit	58d.

The above table should cause those to revise their opinion who still urge the use of electricity for cooking and heating, for which purposes it is not within measurable distance of coal, coke, or gas as an economical source of heat. That this view is supported by so high an authority on heat as Sir Dugald Clerk is evidenced by the following excerpt from the 'James Forrest' lecture given by him before the Institution of Civil Engineers. 'The Coal Conservation Committee,' he said, 'are quite wrong in considering that any advantage to conservation can arise from the use of electricity to produce heat by the existing means. In so far as electricity displaces gas for heating purposes, so far will the coal consumption of the country be increased.'

SIMPLE WATCHES POSSESSING MARVELLOUS ACCURACY.

Until wireless telegraphy came into vogue for ships, those responsible for their navigation were

entirely dependent upon chronometers for the calculation of their longitude, an accurate knowledge of which is necessary when finding a ship's position. What is wanted is the exact Greenwich time, and this can, of course, be signalled by wireless; in fact, clocks are now largely set by time-signals sent out from the Eiffel Tower in Paris. If the taking of time by wireless became universal in ships, the makers of chronometers would lose a substantial portion of their business; hence this form of competition has stimulated them to greater efforts towards accuracy. Moreover, airmen need chronometers which will maintain their accuracy in spite of the vibration and the big changes of temperature involved. In this connection important improvements in watches have been made by a Swiss chronometer-maker, Mr Paul Ditisheim, who, with a plain lever-watch, has recently obtained at the 'Kew' testing-station 96.9 marks out of a possible 100, a record which beats the previous best. This result has been achieved mainly by the use in the balance-wheel of a special nickel-iron alloy, whose modulus of elasticity increases as the temperature rises, and *vice versa*, thereby securing automatic compensation for changes of temperature. Except for their accuracy, these watches have little in common with the pocket chronometer, being as simple as the ordinary type of watch, although, of course, greater care is taken in their construction. Recently some of these watches were conveyed from Neuchâtel to Washington, by way of Bordeaux, and comparisons were made between the longitudes found by wireless time-signals and those derived from the times given by the watches. At Bordeaux the two readings were exactly the same, while at Washington the difference was only trifling.

AN ECONOMICAL PARAFFIN-LAMP.

Now that the price of paraffin has reached approximately four times its pre-war level, every device making for economy in the use of paraffin lamps and stoves is particularly welcome. Prominent among these is the 'Aladdin' incandescent paraffin-lamp. This contrivance resembles the upright incandescent gas-burner in being provided with a mantle, which is caused to glow and give light from a blue flame. In the 'Aladdin' lamp, however, the flame is produced from a mixture of paraffin vapour and air, in place of the gas and air supplied to the gas-burner. The lamp is of the central-draught type, with the usual draught-tube through the container. Outside the top of this tube is a circular wick; while fitting inside it is a short tube known as the 'generator,' open at the bottom, and having a top perforated with numerous small holes. The wick is carried in a tubular wick-raiser, operated by the usual rack and pinion. As in ordinary circular wick-burners, there is another tube outside the wick. A perforated burner-base surrounding the wick is provided with a hood,

which terminates just above the upper end of the wick, level with the top of the generator, where a ring aperture is left between the two. By these means abundant supplies of air are brought to the outside and the inside of the wick, through the burner-base and the generator respectively. A tall chimney is arranged above the burner to increase the draught. When the wick is lit, the flame soon makes the generator very hot, and the heat, being communicated to the wick, vaporises the paraffin. As given off, the vapour mixes with the air, and burns with a blue flame at the ring aperture. It only remains to hang a mantle over this flame to obtain a brilliant white light. In order to protect the mantle, and to facilitate trimming and lighting, hood, chimney, and mantle are made to lift off together, thus exposing the wick. With each lamp a special trimmer is provided, which is rotated over the wick, and trims off the charred portion evenly. The lamp is made wholly of brass, and has a handsome appearance. It gives a light of sixty candle-power at about half the cost for oil of the ordinary central-draught burner; in fact, the difference between the two is as great as that between the old-fashioned fish-tail gas-burner and the modern incandescent variety. Incandescent paraffin-lamps are by no means new, this type having been brought out some fifteen years ago. But the mantles of the earlier models were very fragile, and if they broke the lamps smoked. The mantles supplied with the 'Aladdin' lamp are of a very much tougher description. Another commendable feature is that the lamp is safe to handle, and cannot explode if knocked over.

NEW LIGHT ON THE CANCER PROBLEM.

Eminent scientists in various parts of the world are still studying cancer with a view to finding a cure for this fell disease. Among them is Professor Fibiger, of Copenhagen, who, according to the *British Medical Journal*, has apparently discovered the origin of cancer in certain rats brought to his laboratory from a particular sugar-refinery. Many of the rats had cancer of the stomach, and the results of the professor's experiments afford strong presumptive evidence that the disease arose from the eating of the cockroaches with which the refinery was infested. These insects were found to be the hosts of a parasitic worm of the nematode group, the female measuring four to five centimetres in length and about one-fifth of a millimetre in diameter, while the male is less than half this size. In a number of cases rats fed on these cockroaches or on the eggs of the worm developed inflammations, and also cancer of the stomach. A series of rats not connected with the first series were fed upon the eggs. Out of 116 suffering from gastric affections as a result of the experiment, 14 died within 30-44 days without developing cancer; but of the

102 remaining, 54 showed quite typical cancer of the *cul-de-sac* of the stomach. These all died, and it is interesting to note that the tumours increased in size according to the length of the period of survival after the disease had been detected. Many had multiple cancers, secondary tumours tending to occur in the lungs. Cancer of the tongue was also produced. The medical correspondent of *The Times*, who comments on these investigations, says: 'It has hitherto been impossible to produce cancer *de novo* artificially. On the other hand, this research is confined to rats, and what applies to a rat does not necessarily apply to a man. Are we to see in this investigation support of the popular view that houses infested by rats and mice are apt to become the seats of cancerous disease?'

MAGNETO ELECTRIC LIGHTING FOR THE CAR.

That a magneto on a motor-cycle or a motor-car generates far more electric current than is necessary to produce the ignition-sparks in the cylinder is well known to electricians; and the surplus energy, which would otherwise be wasted, is often employed to light the head-lamps of cars. A compact apparatus, known as the 'F.R.S. Magneto Lighting Set,' which can be applied to any motor-cycle or car, and serves to illuminate both head and tail lamps, has recently been placed on the market. It is carried in a small box, which is clipped to the top tube of the frame in a motor-cycle. This box contains a special coil for converting the magneto current into one suitable for lighting bulbs, a battery for keeping the lamps alight when the vehicle is stationary, and a three-way switch. When the motor is being started on the road, after lighting-up time, the switch is set to light the lamps from the battery, the connections being changed over to the magneto when the cycle or the car is well under way. Nothing else is required except the insulated wire connections, a coil-box, and adapters for the application of electricity to acetylene or oil lamps.

HUGE WATER-SUPPLY TUNNEL.

When New York's water-supply extension scheme is completed, that city should be safe from any risk of a water shortage for many years to come. One of the most interesting features of this undertaking is a tunnel, eighteen miles in length, through the Shandaken Mountains of the Catskill range, which will join up the new Schoharie Valley reservoir with Esopus Creek, whence the water will join the existing supply system at the Ashoken Reservoir. The tunnel measures 11 feet 6 inches in height, and has a width of 10 feet 3 inches. It is egg-shaped in section, as is usual in sewers and other built-up underground water-conduits. The hole that has to be blasted through the rock is considerably larger than the finished tunnel, as a

minimum thickness of concrete lining has to be provided for. This lining fills up all the irregularities of the surface caused by blasting; hence it is in contact with the rock at all points. Steel or wood moulds are being used. These ensure uniformity and a smooth inside surface, the latter being a most important feature if the tunnel is to carry the specified quantity of water. At the intake end the water enters by a shaft 14 feet in diameter and 174 feet deep. Seven other shafts of the same diameter are sunk along the course of the tunnel, these being provided with equipment for lowering and raising the workmen, &c. Through these likewise are carried the electric cables and the compressed-air pipes for lighting the workings and operating the machinery. They also contain large ventilating-pipes, through which fresh air is blown to clear the headings of the dust and the foul air arising from the blasting operations. These arrangements are supplemented by 'boosting' fans at intervals of about 2000 feet. Provision is made for dealing with any water met with during the excavation and construction of the tunnel. A huge Venturi water-meter, with a bronze piezometer casting nearly 9 feet in diameter, is to be installed at each end of the tunnel. The normal flow is expected to be about 250,000,000 gallons a day, but this may be increased to 600,000,000 should the Schoharie watershed produce this amount. Some idea of the magnitude of the work involved may be gathered from the fact that the longest Alpine railway tunnel—the Simplon—is only twelve and a half miles in length.

A PROJECT FOR SALVING THE 'LUSITANIA.'

In our issue for December 1919 two enormous concrete vessels, designed for the salvaging of sunken vessels, were described. Having been moored over a submerged ship, the salvage-vessels were made fast to it by numerous wire cables. These being tightened up at low water, the wreck was lifted as the tide rose, and the three vessels were towed into shallower water. A variation of this scheme, intended for raising the *Lusitania*, has recently been suggested by Mr George W. Hersey in a letter to *The Times Engineering Supplement*. In this case only one salvage-vessel is proposed, but she is to be of colossal dimensions, her proposed length being no less than 1028 feet, her width nearly 341 feet, and her height 66 feet. As with the salvage-craft previously described, she is to be built of hollow concrete blocks, each being hexagonal, and having walls 2 inches thick. The *Lusitania* is believed to be lying about seven miles south of Kinsale, in 270 feet of water, where the tide rises and falls from 9½ feet at neap-tides to 12 feet at spring-tides. Mr Hersey estimates the weight to be lifted at 30,000 tons, and he proposes to attach 800 wire cables, each capable of lifting 40 tons, to crossbars passing through the port-

holes of the sunken vessel. This number leaves a margin of 50 cables for contingencies. It is most important in operations of this nature that the strain on each cable should be the same. To ensure uniformity, all the cables are to be connected to the pistons of huge hydraulic cylinders, having a vertical stroke of 20 feet. It is proposed that these cylinders should be mounted in two double rows along the top of the salvage-vessel, the rows being 88 feet apart (the width of the *Lusitania*), so that they will pull vertically upwards. Two water-towers will supply water to the under sides of the pistons at a pressure of 20 lb. per square inch, which is enough to give the necessary upward pull. It is easy to understand that with this arrangement the strain on each cable will be equal, while if one end or side lifts more easily than the other, the pressure can readily be shut off from some of the cylinders so as to maintain equilibrium. It is calculated that the weight of the *Lusitania* will pull down the salvage-vessel by 4 feet; consequently the tide must rise to this height before actual lifting takes place. Hence the wreck will be raised clear from the bottom to the extent of $5\frac{1}{2}$ feet at neap-tides, and of 8 feet at spring-tides. Having been raised, she will be towed into slightly shallower water, and the process will be repeated again and again, until the hull is close up to the bottom of the salvage-ship. At this stage the submerged liner will be near enough to the surface for divers to make her sufficiently water-tight to be pumped out and refloated.

CHAMBERS'S INCOME-TAX GUIDE.

The recent fundamental changes made in the assessment of income-tax render of unique importance the fourth edition of *Chambers's Income-Tax Guide*, by John Burns, W.S., which will shortly be published by Messrs W. & R. Chambers, Ltd., in strong paper covers at 3s. 6d. net (per post 4s.), and in cloth at 4s. 6d. net (per post 5s.). The former editions of this book met with remarkable success, owing to the wonderfully lucid and simple manner in which the various aspects of this complicated subject

were dealt with. Both the author and the publishers have received numerous letters of thanks from purchasers, intimating that the information given in the volume has enabled them to recover considerable sums of money which they had unwittingly overpaid. The forthcoming edition is in substance a new book, necessitated by the numerous essential changes adopted by the Chancellor of the Exchequer as a result of the Royal Commission on Income-Tax. These changes affect both the ordinary income-tax payer and the payer of super-tax. While the standard rate of tax remains the same as before, the whole framework of its application is altered. Rights of relief, adjustment, and repayment are on altogether new lines. One leading novel feature is that no one is now liable for the full 6s. rate on his or her whole income, personal and family allowances being made, no matter how large the income may be. This book, therefore, now appeals to every taxpayer. As super-tax is to be payable on all incomes over £2000, instead of only on those exceeding £2500, the exposition of this subject, which is complete and thorough, is of importance to a greatly increased number. Among other matters dealt with in the *Guide* are the new limits of exemption; the abolition of abatements, and the substitution therefor of personal and marriage allowances; relief to earned income; graduation, or rate-relief; relief to wife's earned income; the new rates of 'children' allowances; the new regulations governing the 'housekeeper' allowance; the new rules for the allowance for dependent (not now necessarily all old or incapacitated) relatives; the entire rearrangement of the life-assurance relief; and the new remedy for double taxation within the Empire. The transition between the old and new systems is bound to be troublesome, and all income-tax payers will be well advised to supply themselves with the tested and approved guidance afforded by this money-saving manual.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE RIVAL PROFITEERS.

By E. R. PUNSHON.

I.

MR PETER PHILLIPS, O.B.E., signed to his chauffeur to stop, and leaning forward in the car, looked with a touch of wonder and of reverence down the long, narrow street of tiny box-like houses, all exactly resembling one another, in one of which on a momentous and fortunate day he had been born, and in one of which still lived Mary Giles.

He wondered curiously what she was doing and of what she was thinking. Not of him, he supposed, or of the splendour of the lot about to be hers. For, after much doubt and hesitation, Mr Peter Phillips had at last made up his mind.

In August 1914 the call had come to him, as to others, to join in the struggle for King and country and the sacred cause of civilisation. He had never regretted the decision to which he had then come, or the energy and the devotion

with which he had thrown his whole soul and his little business of a cycle-repair shop into the task of making munitions for others to fight with.

Nor in his case had patriotic zeal and virtue, one is glad to say, resembled that virtue which is its own reward; and though it is said that the people are not often grateful to those who serve them, in this case the people—presumably the people, or, at any rate, some one or some thing—had gratefully acknowledged Mr Peter Phillips's zeal by transforming him in the short space of four years from a poor man into a rich one.

He was now the managing director and largest shareholder in a flourishing factory formerly making shells, and to-day turning out a line of cheap goods at one time imported from Austria. Still patriotic, Mr Phillips never gave a thought to profits, or even hinted at them in the advertisements by which he demanded the support of fellow-patriots for his efforts to wrench from our enemies—peace or no peace, enemies were still enemies to the exalted soul of Peter Phillips—this trade which he was self-sacrificingly endeavouring to establish on British soil.

Still, though he never seemed to think of them, profits came, and now that his fellow-countrymen had rallied to his clarion cry and were gladly paying him half-a-crown for articles the treacherous Austrian, in his efforts to undermine the Empire, had once been willing to supply for fourpence halfpenny, he had begun to think of Mary Giles again.

In the early part of 1914 there had been, more or less, an understanding between them. It had not gone so far as formal walking out, but it was, more or less, an understanding. Certainly young Jim Jackson had been beginning to display an increasing tendency to hang about Mary's vicinity, but he was rather by way of being a ne'er-do-well; and then the war had swallowed him up with the rest of those whom duty had led to the trenches in France, as it had led Mr Phillips to a managing-directorship, a large size motor-car, and the O.B.E., presented to him by a grateful sovereign in recognition of efforts mere money—dross—but inadequately repaid.

From this large motor-car, to which stern duty had led him, Mr Phillips now descended in pomp and majesty.

'You will wait here,' he said briefly to his chauffeur.

Mr Phillips seldom gave an order in these days. He merely stated facts. He did not say to you, 'Do this or that.' He said, 'At such an hour you will be doing so-and-so.' And you were. It happened like that, like the workings of fate and predestination. So he never said to his chauffeur, 'Wait for me,' as an order, but 'You will wait,' as a simple fact of nature. A subtle point, and an interesting one

II.

It was an instance of the delicacy of mind one would naturally expect from a member of the Order of the British Empire that Mr Peter Phillips did not drive down the street in his car to alight at Mary's door. To have done so might have savoured of ostentation. She might have felt overwhelmed. Besides, the abominable paving of this steep and narrow street would have been hard on the tires of the car; and when one can spare one's own tires and a woman's feelings at the same time, one's course is clear. It is astonishing, by the way, how often Mr Phillips's course was clear—but, then, that is usually the case with great men whom doubts do not trouble.

Half-way down the street he passed a small fruiterer's, and frowned to observe that tomatoes were on offer there at two shillings a pound.

'Profiteering,' he muttered, for he knew his gardener grew tomatoes for him at a cost considerably less than two shillings a pound, and he had a good mind to buy some and report the case to the local anti-profiteering committee.

Almost the next house was the one at which Mary Giles lived, and when he knocked, she herself came to the door.

'Eh, Peter, lad, 'tis thee!' she exclaimed with a little gasp of astonishment, and then corrected herself hastily—'Mr Phillips, I should say.'

'No, no, lass,' he answered, well pleased; 'always Peter to you, I hope.'

He followed her into the little kitchen he remembered so well, though it was four years and more since he had entered it. How often he had sat there during the time of the 'understanding' that once or twice the fleeting presence of Jim Jackson had momentarily disturbed!

'Well, lass,' he said, looking at her critically, 'how's everything?'

He noted with approval that she looked as pretty as ever—prettier on the whole, indeed, for there was an added serenity and gravity in her expression. And the kitchen had still that same cosy and comfortable appearance he remembered so well, and that somehow Messrs Smart & Highprice, the well-known artistic furnishers, had failed to attain in the new drawing-room they had recently provided for him.

'Bit of a surprise, eh?' he said smilingly, as Mary still continued to regard him with great eyes of wonder.

'It is that,' she answered simply, and then she smiled, and her smile was a very fascinating one.

He decided that he had been right in coming to Mary. Of course, he might have had his pick in circles Mary had never even dreamed of, but he was not sure that, of the smart young ladies who had indicated more or less plainly that he and his banking account and his managing-directorship were not displeasing to

them, some did not in reality look down upon him as an inferior; and he felt it necessary that his wife should never be tempted to regard him as anything but her superior—as Mary Giles plainly did, for he could almost see the awe and reverence shining in her wide, clear eyes. It remained only to explain to her the meaning and purport of his visit, and this he was about to do, when Mary spoke herself.

'Why, it must be all of four years since you were this way last,' she said.

'Maybe,' he agreed; 'these have been busy times, and I've been doing my bit, my lass—I've been doing my bit.'

'Yes, I've heard,' she said thoughtfully; 'yes.'

'Been precious little else in my life lately but work,' he mused. 'There's times I've been hard put to it to find time for bite or sup.'

'I dare say it's been a hard time,' she answered sympathetically.

'Oh, it has,' he answered. 'Yes.' He squared his shoulders as one prepared to meet even greater tasks in the future. 'But now I've time to think of other things and look round a bit, and so I've come to you.'

'Am I other things?' she murmured.

But he was not listening; he was absorbed in his own thoughts. 'I dare say,' he remarked, 'you thought I had forgotten you. Well, I hadn't. Very likely you thought I was never coming back. But I'm here. Before the war, Mary, I think we pretty well understood each other, eh? Then it came, and I had to take my share in downing the Hun. Lord, where it's led me!'

He paused, reminiscent and amazed, and she watched him with increasing wonder.

'I'm a rich man now,' he resumed. 'But that's no matter.' He made a gesture as though, were it possible to ignore that stupendous fact, he would be quite willing to do so. 'But that cuts no odds,' he said, 'for I'm willing to pick things up, lass, just where we left 'em.'

'Meaning'—she asked.

'Meaning,' he said heartily, 'as you and me, lass, can be wed whenever you say the word.'

It was a wonder he did not say simply, 'We shall be married on such a day at such a place,' according to his use and wont, but he felt some concession was due to her weak womanishness, and when he looked at her to receive her gratitude, he perceived that she was laughing. Nerves, no doubt. He only hoped it wouldn't turn to hysterics. But he did not find it unnatural or displeasing that his announcement had been too much for her. On the whole, he thought it good taste on her part to be so visibly affected—and then the door opened and there came in a man, or, rather, the remnant of a man, for this one had no legs and swung himself along between crutches, and to him Mary waved her hand.

'My husband, Jim Jackson,' she said. 'You

remember Jim Jackson?—Jim, this is Mr Phillips, you know; he used to keep the cycle-repair shop at the corner.'

Jim swung himself deftly nearer, released one hand, and held it out to Mr Phillips. 'Glad to see you, Mr Phillips, sir, I'm sure,' he said; 'it's very kind of you to look us up like this.'

'Glad to see you—very glad,' echoed Mr Phillips mechanically, for once a trifle shaken—'er—er—I'm sorry, though.'

'Oh, I manage very well,' answered Jim cheerily. 'Some chaps are a sight worse off.'

'Yes, yes, of course,' agreed Mr Phillips; 'yes.'

'Been in munitions, haven't you?' asked Jim. 'I heard so, and I can tell you we were fair grateful at the front for the way you chaps at home kept it up.'

'We did our bit, I hope,' said Mr Phillips, recovering slightly; 'we did our bit.'

'And a good bit, too,' said Jim cordially. 'Why, at the end we could just about smother old Jerry. I was out there when he used to smother us, and I tell you it was fine when we could pay him back in his own coin.'

Mr Phillips, with an eye on Mary, whose recent mirth he was now less inclined to excuse, accepted this gratitude as graciously as his somewhat perturbed condition permitted, and, a little to Jim's disappointment, soon pleaded his waiting car and disappeared.

'Very good of him, indeed,' said Jim when he had gone, 'to run in to see us like this.'

'Very,' agreed Mary dryly. 'But he's only a profiteer; he's got a fortune out of the war. But for it he would still be in his little cycle-shop.'

Jim slipped his arm round her waist. 'If it hadn't been for the war,' he said, 'you might never have married me; so perhaps, after all it's me that's the real profiteer.'

REVERIE.

DUSK of the evening,
Shadows o'er all,
Sea gleaming silver,
Seagulls' wild call.

Moon on the waters,
Fast fading light,
Hush in the darkness,
Lo! it is night.

E. E. JACOBSEN.

SEVENTH SERIES

MARAZION.

By the COUNTESS OF CROMARTIE, Author of *The Golden Guard*, &c.

PART I.

I.

I HAD known the sea below the gray stone building in many moods: blue and warm as the Mediterranean, and gray as cold stone, with the great breakers foaming mountain-high into our garden, where many strange flowers of Eastern lands grew and flourished. We were a strange, select little community up there on the hill that, fringed with fir and pine, ran sheer down to the rocks and sand-dunes of the sea. Beyond us lay the open moor, with its world of heather and gorse, stretching into the far blue distance. People who knew nothing—the tame folk of the distant town—called my father a retired sea-captain of Spanish descent. But his black-browed, ear-ringed kind knew him of an older race, and of a less respectable calling. The race—‘The Blood,’ he called it—had come here to Cornwall trading in the days when Solomon was king of Israel, and had his ships manned by Phœnician sailors, by the followers of Hiram of Tyre. My mother had been of ‘The Blood’ also, and had died at my birth. Indeed, my father boasted that since our ancestors had touched Cornwall ‘The Blood’ had never been mixed.

‘Run after any man not one of us, my pretty little devil,’ he said to me once, ‘and I will cut your throat.’

And I laughed, having a curious fastidious distaste for those who were not of ‘The Blood.’

I saw very few women, but was very much at home with the men who crowded into the panelled hall of the gray house when ships were in the harbour. I used to watch and listen to them, as the fire roared up the open chimney and lit up the fierce aquiline faces, the red sashes and caps, and the sharp knives in those same sashes. They used to bring me pieces of coral and amber, and pay me hard-bitten compliments. But otherwise they took small notice of me, *even if they would fain have done so*. I saw that by intuition, and knew that it was not Western, but a strange olden sense of honour. I think my father had once loved a woman of Spain, for he gave me a white mantilla, a comb, and a soft white silken dress, which I wore upon occasions. She must have been a little woman like me, because the dress fitted like my skin.

NO. 506.—VOL. X.

All the women of ‘The Blood’ wore mantillas, and carried knives in their stockings, and were tall and stately and proud. I was tiny and slight, but proud too, though I think more easily scared than they were. I could dance the traditional dance of our people, but my father never let me dance for his guests.

‘You’re meat for their master,’ he said one day, grinning at me through his black beard.

I pulled the rings in his ears. ‘*Padre mio*, I have never grown up. Who wants a pixie-woman?’ I asked.

He looked at me gravely. ‘White as snow upon Lebanon, with lips of roses and eyes of stars; as your mother was, so are you. I knifed three men for her,’ he said.

‘God rest her,’ said I. ‘But, padre, my eyes are green, like a cat’s eyes.’

He laughed. ‘In Spain they have a song about green eyes,’ he said.

II.

Though I was delicately built, the life I led had made me physically very strong. I practically lived in the open air. Even my spinning and my needlework I did in the garden. I could walk for miles over the great moor, swim in the sea, and row a heavy boat. On Sundays we went to the church on the edge of the moor above the rocks. It was a quaint little church, and, set amid the wilderness, it was as strange as the faith of ‘The Blood’ who frequented it. Deep in our hearts we cherished a still older faith, but this was a concession to something milder, and yet something revered. The priest, a timid, gentle little man, came in for no consideration at all from his curious flock.

‘It is The Presence,’ I said to myself one day—‘The Presence that was and is and shall be the same, for ever and ever.’

My father had many strange books which I read, but that knowledge came to me from no book, and I was too shy to discuss the hidden things in my heart till the day came.

I was sitting beside my father in the church one lovely summer day, when HE came, walking with the free, light tread, in spite of the heavy sea-boots he wore. In dress he was nowise different from the rest of the folk of ‘The Blood,’

[All Rights Reserved.]

AUGUST 7, 1920.

save that the thin shirt that he wore was of silk, and his ear-rings were not brass, but gold. He carried his red cap crushed in one hand, as he came towards where we sat. He was very tall, and looked hard as whip-cord. His hair curled over his head and ears in black rings, and his face was beautiful with the sharp, stern beauty of the ancient race. I saw several old fishermen gaze at him with pursed lips. The priest choked, and the book fluttered in his hand, but then he rambled on with his prayer. I saw my father's shoulders shake as he hastily buried his head in his hands. But the stranger came on, and calmly knelt beside me. My father leant across me as we rose, and whispered something I did not hear. The other nodded, and left the church before the end of the service.

Outside we came upon one of my father's old comrades, helpless with laughter against a tombstone. 'Of all the impudence!' he gasped; 'and ten thousand warrants out for him in every port. Gosh! I shall die!'

'Who was he?' I asked timidly, as we walked home.

'Child,' said the padre, 'that was Mara Marazion, of "The Blood Royal" of our people, and, among the Gentiles, the most damned pirate from here to Wyda Sands. Far be it from me to belittle my own poor achievements, but he—God help the ship he takes a fancy to! Yet he has done kind deeds in his day, though he is young still to be making his black soul.'

So that was the first I heard of Mara Marazion, a prince of 'The Old Blood.' Everything seemed strange to me in my little room that night. It was painted white, with lovely Eastern embroideries and cushions, and odds and ends of beautiful things that the padre had acquired on his voyages. Under the window was a chest of red Spanish leather, where I kept my clothes, scented with lavender. Besides the white Spanish silk, I had several other silken garments, as well as my little russet skirt and bodice laced with leather over a white shirt, and a leather cap that I wore when I chose to run wild—which was often.

Having partaken of a bath, and loosened my hair, I sat down on the chest, and quite unconsciously found myself praying, 'Do not let them catch him. Let some woman he loves help him to keep safe. Dear God! they will hang him else.'

Then came a thundering knock at the big iron-studded oak door, and my father plunged into the room. 'Dress yourself,' he chuckled. 'He has just arrived, and I have asked a few who can be trusted to keep their mouths shut.'

So I dressed, and suddenly realised that I was trembling. The folk of 'The Blood' seemed to swarm into my father's house to-night. We danced, after we had dined, in the big oak hall—danced to the music of fiddle, harp, and

drum, and Mara Marazion danced with me all the time. Afterwards we walked in the garden by the moonlight. I learnt much of him that night, but much I already knew by a strange sort of instinct. Lawless he undoubtedly was, but with it went a rigid code of honour that was the code of our ancient world. I felt curiously familiar with his whole mind and personality; the way he walked; the way he slapped the knife in his sash to emphasise an argument; the angle of the red cap on his black curls.

Usually I was painfully shy with strangers, and expected to be more so with the redoubtable Marazion. But now—I found myself telling him things that I had never dreamt of telling any one, and then listened entranced to his stories of the sea—stories that again made my heart beat with that strange and dear familiarity. Then I heard the padre shout my name from the door, and we went in.

III.

He was staying for some days, being safe here.

Next morning I took him to see a litter of puppies in the stable. His black horse stood there beside my father's. There I learnt another thing—his tenderness for small, weak things.

'Would you like one?' I asked rather timidly. He was standing looking down at me, holding a little gray puppy under his chin. He thanked me, and henceforward the gray puppy was his—and evidently knew it, for it shambled after him wherever he went.

One day we were walking together among the rocks. The tide was out, and a long stretch of wet sand lay glittering in the sunset. The gray puppy had attacked a large piece of seaweed with great ferocity, and we laughed at him, as we sat with our backs against a great rock. I had looked up, answering some question of Marazion's, when I felt his arm go about me, and his lips fierce upon mine; and there was nothing else in all the world for me but him, and the clasp of his arms, and that light in his wild dark eyes.

IV.

'No!' said the padre. 'Not until you are done with the old Trade. I'll keep her for you, be sure of that. But while there is any chance of a capture—No! and again No! Besides, my lad, the parson will betray you through fright if you show your nose inside the church again; and this is your only refuge, save that one other you know of, till your ship arrives. Fright for me killed her mother. We'll have no more of that.'

Then Marazion spoke slowly: 'I cannot give it up yet. It would be going back upon my men. Besides, it is my life to hold men so.' He held out a hand clenched as he spoke. 'And, upon my soul, whenever I see a ship that doesn't belong to one of us, I can't keep my hands off her.'

To all my prayers and tears, and to all Marazion's arguments, the padre was adamant. There was to be no wedding till Marazion's life was safe, all over Cornwall—safe, and his crew paid off. Then he and my father ceased arguing, as is the way of our race when each is determined upon his own way, and they talked of other things—of seafaring in far lands—the old Trade, as they called it.

'My little one,' said Marazion, after that night, 'the ship ought to take me off in a week, and then'—— And I could only hide my face against him, heart-sick and trembling.

He grew reckless those days. One evening he came home laughing, booted and spurred. He had been to follow a hunt miles away. He waved the fox's brush at the padre, who gazed at him thunder-struck.

'I spoke Spanish all the time,' he said. 'They thought I was a Spanish grandee. Lord! I laughed coming home till I nearly fell off my horse.'

'You won't fall off a rope so easily,' said my father.

'No,' answered Marazion; 'but I have got the refuge you know of—if it must end there.'

For all his laughter I saw that his face had grown thin, and his eyes fiercer than ever.

v.

A day came when a member of his crew joined us—an old man with one fierce black eye and a nose like a vulture's beak. He came with a warning. The ship had come; Marazion must go, and that quickly.

The padre was away that day, and when old Seth, the man, was gone, we two were alone.

'Will you come with me? It's only an hour's ride; and then I'll bring you back,' said Marazion suddenly. 'The padre will have no need to blame us.'

'If he were to curse me,' I said, 'yet would I follow you. I would follow you through the Gates of Hell, Mara, and you know it.'

He looked down at me, and I saw that he was very pale. 'Oh, my dear!' he said, 'there are other gates that mean eternity to those of our race, and they are not easy to pass through either. Not for such as you.'

'One dreams of them, I think,' I whispered. 'Ever since the day I first saw your face here, I have dreamt of them, Marazion.'

And he took me in his arms and kissed me, saying no more. And so we rode to the cave in the rocks, ten miles away. It was like a dream of fairyland—that inner room of the great cavern, that seemed to lead to the very back of the world.

'It is wonderful!' I murmured, as the one-eyed man lit a hanging lamp of crystal that swung from the roof. Ragged scarlet curtains of Eastern stuff kept the place warm, as well as a huge fireplace in one corner, where that evening

the fire leapt and roared. Near it stood a silken divan covered with rugs and furs. There was a great stone bath in a hollowed recess of the huge cavern. 'That was built no one knows how long ago,' explained Mara, as the one-eyed man solemnly emptied a cauldron of boiling water into it and departed. The little gray puppy we had brought with us was yapping at our heels.

'I am coming to robe you presently,' said Marazion.

Robe me he did, in a soft white silk garment lined with sable, and gold-clasped at breast and waist. Over my head he flung a great rope of pearls, and he set two great pearls in my ears.

'Marazion!' I faltered.

He was on his knees fastening my white fur-lined slippers as I spoke. He sat back on his heels and looked at me. 'Well?' he said.

'Is it just to please you I have these beautiful things to-night, or is it—something more?'

'It is—a great deal more,' he answered gravely, and something in my heart answered to the strange hardness in his voice. I was full of a sudden mad joy, with a mild undercurrent of fear within that made me reckless. The rolled-up sleeve of his silken shirt showed the Sign of the Serpent tattooed on his arm. I pressed my lips to it suddenly.

'I have kept these things for you—always for you,' he said.

'I thought they were only for now,' I said timidly. 'They are beautiful. It is so wonderful to be with you;' and I hugged him like a child in my joy. I saw his lips go white, and his eyes narrow and gleam. Then he sprang up, saying, 'Come, my sweet. We must eat.'

I came to the conclusion that the one-eyed buccaneer was a magician. Certainly he cooked like one, and while we ate, and drank the Spanish wine, Marazion gave him a glass over his shoulder, as the old man stood behind the divan. 'Drink to me to-night, Seth, if you never drank to me before in all your sinful life,' he said.

The old man chuckled. 'True this time, captain,' he mumbled. 'Well—she's a fair piece of spoil—a fair piece!' And he drank.

But Marazion's eyes blazed. 'I'll thank you to keep a civil tongue between your teeth,' he growled. 'The lady is of "The Blood."'

'My mistake, captain; my mistake entirely,' said the old man, as I rose, anxious for peace, and put my hand into the old pirate's. He looked at me with his one savage black eye. 'Poor lamb!' he said. 'Poor lamb!'

Marazion was caressing the gray puppy. 'You can take him, Seth,' he said, putting him into the old man's arms.

Seth looked at him, grinning, quite unabashed. 'Yes, I thought he'd be banished to-night, poor dumb beast,' he grumbled, and departed to his own quarters in the outer cavern—grumbling still.

The great fire had sunk a little as we

sat there whispering together. The centuries seemed to have rolled back. We were just two lovers of the ancient blood, and the ancient faith, whispering of the mystery that love held for such as we. Oh Marazion! Marazion! How beautiful you were that night with the fire-shine on the red silken cap, upon your curls, and upon the deeper fire in your eyes! And when you said 'Come!' I went with you, unquestioning, to where a hidden passage led to an ancient sanctuary of our faith, in the great cavern.

Then I knew. To say that I was not afraid would be a lie. To say that I was not happy

to the edge of death would be another. I clung to the arm that was about me.

In the risen moonlight far above I saw the ancient altar, saw the clouds of incense that hid the moonlight, and I made the sign that all the folk of 'The Blood' learnt. I saw Marazion also sign himself, saw his face tense and pale in the veiled silver light. So the Oath was sworn, for ever and ever!

Then he took me home to the padre, and as we rode by the great rock that hid the cave from us, our hands clasped hard together, for we knew that parting was very near.

(Continued on page 585.)

THE TRAGEDY OF THE DRONE.

By CANNING WILLIAMS.

I WAS once lecturing to some wounded soldiers on the honey-bee, and in the course of my remarks I asked them to guess how many worker-bees it would take to weigh an ounce. 'Ten,' said one. 'Twenty,' said another. 'Fifteen,' exclaimed a third. Then a bold spirit cried, 'Fifty!' All laughed derisively. 'If you were to multiply the last guess by six,' I observed, 'you would not be far wrong.' Yes, an ounce of worker-bees consists of about 300, and the same weight of drones about 100—from which the mathematically minded will deduce the fact that the male bee weighs three times as much as his sister.

If you were to examine a strong colony of bees in the height of summer you would find a countless number of workers, a few hundreds or thousands of drones, and a queen. If you were so unwise as to look inside the same hive in the winter you would see the countless workers and the queen, but you would search in vain for a drone. What has become of the males?

Before I answer the question, I think it would be well to state certain facts connected with the economy of the hive.

As the days begin to lengthen, the queen-bee deposits worker-eggs in some of the cells of the central combs, and as the weather grows warmer, and flowers shyly peep above the sod, nectar and pollen are brought into the busy domicile in ever-increasing quantities. This stimulates the queen to greater egg-production, until, by the end of April, her output (given favourable weather conditions) may reach between two and three thousand in the course of twenty-four hours. In spite of the high mortality among the workers at this season, the population of the hive goes up at a great rate. The queen, who has hitherto neglected the drone-cells (which are usually constructed at the bottom of the combs), now places eggs in some of them, and in about twenty-four days from the time of her doing so each of the baby-drones gnaws away the capping

of its prison, and, pale in colour and weak in leg, struggles out and joins the bustling throng.

The male inhabitants of the hive are quite harmless, for they have no sting or other weapon of defence or offence; neither are they provided with apparatus for secreting wax or gathering nectar. But they are possessed of great strength, large appetites, a wonderful power of flight, and marvellous eyes. It has been calculated that the eyes of a worker contain 12,000 hexagonal lenses or facets, and those of a drone 26,000. It is impossible for the human mind to conceive the power of sight which such an amazing complexity of vision confers upon this lowly creature.

About a fortnight after his birth the drone ventures into the light of day, and tries his wings near the hive, at the same time making a mental note of its exact position. Gradually he gains confidence, until the radius of his excursions may extend to several miles. He is a born aristocrat. When the weather is dull or cold he stays at home, helping himself freely to the sweets his toiling sisters have won; but on warm days, when the unclouded sun is climbing towards the zenith, his lordship sallies forth, his trumpet hum drowning the weaker voices of the working throng. Disdaining earth, he scours aerial spaces, every nerve in his body aquiver, and those magnificent compound eyes of his, which can see in all directions, scanning the azure fields that come within his ken. He is a lover seeking his lass, a prince in search of a princess, a king who would marry and confer upon his consort the dignity of queen and motherhood. But for every princess that wants a mate there are hundreds—nay, thousands—of suitors, and little dreams he of the price he will have to pay if he secures the prize!

But let us hark back to the hive for a minute or two. It has become so full of bees, brood, honey, and pollen that the queen can scarcely find an empty cell to receive an egg. Her

thwarted mother-instinct produces in her a condition of excitement, which is aggravated by the fact that several young queens are being reared, one of which is destined to take her place as reigning sovereign. The workers, too, have also got into a feverish state, for they have difficulty in finding places in which to store their hard-won booty. At last matters reach a climax. The congested condition of the colony can be cured in only one way—by wholesale emigration. So, in the middle of a bright, warm day, the workers, throwing off for once all sense of responsibility, pour out of the hive in a living stream, until the air seems filled with bees, and one wonders how wing-room can be found for so great a crowd. Presently the queen comes out, and, having no desire for aerial capering, alights upon some object near by—the branch of a tree, for instance—and soon a number of her subjects gather round her. The cluster rapidly grows, until a solid mass of bees, perhaps 20,000 strong, depends from the bough. It is a 'swarm'—the gathering of the emigrants prior to taking wing for a new home; but before they set out on their journey the apiarist appears upon the scene and captures them.

Very few drones accompany a swarm; their instinct leads them to remain in the parent hive where the young queens are being reared. A few days after the mighty exodus I have described has taken place, the first princess emerges from her specially constructed cell. If the bees have no intention of throwing off a second swarm, they allow her to wreak her murderous will upon her sisters; the cells are torn open by the jealous creature, and their hapless inmates stung to death. For a few days the virgin queen explores the combs, rubbing shoulders with the workers and the drones, who appear to ignore her presence absolutely; and then, enticed by the sunlight and impelled by strange stirrings within her, she takes from the portals of the hive a timid view of the outside world. Presently she rises gracefully on her wings, but after a short flight returns to safety. Half-an-hour later she may essay another trip, venturing a little farther abroad. She repeats these experimental flights for a day or two, each time increasing the distance of her excursions; and then, when about a week old, and provided that the weather is propitious, she embarks upon the greatest adventure of her existence—her nuptial flight. Away she goes, in ever-widening spirals, until she disappears from human view, but not from the view of the drones, who, from all directions, go in chase of the fleet-winged damsel. Twenty, fifty, a hundred, possibly a thousand, competitors enter the race, the strongest and fleetest of them soon drawing ahead of the others, until, perhaps, not more than a dozen are in close pursuit. The princess must not exhaust her energy, because she has to return home; so, suddenly turning, she yields herself to one of the foremost suitors.

Almost the next instant the drone, having fulfilled the object of his existence, falls dying to the ground. One moment full of life, of ardour, of eager expectancy, the next suffering the agony of a mortal wound! The kiss of love followed by the sting of death!

If in the course of her wedding-flight the queen has circled back to near her starting-place, it sometimes happens that the expiring drone is just able to struggle home, as is proved by the fact that his ruptured body is occasionally discovered near the hive he left. (I have myself picked up a dead drone in this condition.) A few bee-keepers have actually seen the mating of a queen and the death of the drone, and in *The A B C and X Y Z of Bee-Culture*—an American book—several accounts of it are given by eye-witnesses whose credibility is undisputed.

While the queen is away on her wedding-trip (in my experience, it usually occupies about twenty minutes) the workers show some anxiety, and when the bride-widow returns she is met by a number of them, who immediately follow her into the hive, manifesting in their behaviour indications of delight. The one act of fertilisation suffices for the queen's life, in the course of which she may lay, at a very moderate estimate, more than half-a-million eggs.

It may be asked, 'Why are so many drones brought into existence; and why has nature meted out so cruel a fate to the "successful" ones?' Let the famous bee-student, Huber, answer the first question. 'Naturalists,' he says, 'have been extremely embarrassed to account for the number of males in most hives, which seem only a burden to the community, since they appear to fulfil no function. As fecundation cannot be accomplished within the hive, and as the queen is obliged to traverse the expanse of the atmosphere, it is requisite that the males should be numerous that she may have the chance of meeting some one of them in her flight. Were only two or three in each hive, there would be little probability of their departure at the same instant with the queen, or that they would meet her in her excursions; and most of the females might thus remain sterile.' To the second question there is also a satisfying answer. It is this: It is essential for the safety of the queen, and therefore for the prosperity of the commonwealth over which she is to reign, that her stay in the air should not be delayed. She might be blown out of her course by a sudden wind, or beaten to earth, wet-winged and chilled, by a storm of rain, or possibly fall a prey to a passing bird. The long chase of the queen, in which drones from several hives usually take part, renders in-breeding unlikely, and also tests the stamina of the competitors. These objects attained, and in view of the dangers I have mentioned, it is clearly a wise provision of nature that the process of fertilisation should be as brief as possible.

I am no authority on spiders, but I understand that the love-making of the male of certain species is a proceeding which, if successful, ends disastrously. The male spider is smaller than the female. While, like a good sweetheart, his whole attention is occupied in making love, she is stealthily engaged in weaving a web around him, and when he has finished his amours she finishes him. This may be exemplary on the principle of 'waste not, want not,' but it displays a species of low cunning, and the taking of a mean advantage over a fellow-creature when in a condition of love-intoxication, and therefore not quite at his best, which are not calculated to increase one's admiration for the female in question. But the decease of the amorous spider does not excite one's sympathy as does the sudden and painful end of the lover in the sky. There is not that tragic transition from bounding, exuberant life to agonising death. One feels in the former case that the long-legged gallant has a sporting chance to escape, but in the latter escape is impossible. Almost the same moment that brings the suitor victory brings him ghastly defeat; he provides the element which is necessary for the summoning into being of untold thousands of busy lives, and in doing so lays down his own.

The love season in the bee-world is at its height in June and July, and that also is the time of the greatest honey-flow. By August (unless the bees are located in a heather district) the majority of the nectar-yielding flowers have ceased to bloom, and therefore the daily consumption of honey exceeds the income. When this takes place the queen reduces her egg-production, and soon ceases her output entirely. The workers, who have hitherto tolerated the burly drones, allowing them to wander about at will and, unmolested, sate their hearty appetites, now grudge them their meals of precious sweets; and this feeling soon shows itself in acts of hostility. The drones are narrowly and jealously watched, and 'moved on' when they attempt to satisfy their hunger. Harried about by the implacable virgins, they herd together on an outside comb. But here they are not allowed to remain at peace, and the next resting-place for the comrades in misfortune is the floor of the hive, where they look like a flock of bewildered sheep that have been rounded up by a well-trained dog. Slowly the vitality of the defenceless males is undermined by want of food, and when this has proceeded far enough, the calculating, cold-blooded spinsters begin their offensive in real earnest. Each drone is attacked by several of them, and in his alarm he struggles towards the light, dragging his assailants with him. If he breaks free, he may try to enter a neighbouring hive; but the way to food and warmth is barred by vigilant and furious sentries, who pounce upon him and drive him off. Possibly in his search for a home of refuge he

may come across a *queenless* colony. Here he is allowed admittance, for a hive without a queen retains its drones, and even welcomes strange ones. Failing such a sanctuary—and few are they who discover one—he makes repeated and desperate efforts to enter his own domicile. But what a few days ago was his home is now the camp of his pitiless enemies. He is met with fierce opposition, and some of the more ferocious of the sisterhood gnaw at the roots of his wings in order to disable him from flying. Thus the merciless business of extermination proceeds, until every drone lies dead or dying on the ground.

Some authorities state that the workers sting the drones to death. In order to see what went on within the hive at this annual carnival of slaughter, Huber stood six hives on glass tables, and observed (by deputy, for he was blind) what actually took place. The bees in all the hives attacked the drones on the same day. 'They seized them by the antennæ, the limbs, and the wings, and after having dragged them about, they killed them by repeated stings directed between the rings of the belly. The moment that this formidable weapon reached the drones was the last of their existence—they stretched their wings and expired.' A more modern authority states emphatically: 'It is specially to be marked that the bees never sting the drones.' Maeterlinck avers, equally positively, that they do: 'Each one is assailed by three or four envoys of justice, and these vigorously proceed to cut off his wings, amputate his antennæ, and seek an opening between the rings of his cuirass through which to pass their sword.' I have often witnessed the expulsion of the males, but I have never seen them stung, and though I would not have the presumption to deny the testimony of such painstaking observers as Huber and Maeterlinck, yet I am inclined to believe that it is the exception, rather than the rule, for the workers to use their 'swords.'*

The slaughter is not confined to adult males, but if there are male babies in the hive, they are ruthlessly dragged from their cradles, and, after the sweet juices have been sucked from their bodies (could the waste-not-want-not philosophy be carried to a greater extreme?), cast out of the hive, to become the food of birds and night-prowling beetles.

Thus the law of self-preservation operates remorselessly, and the workers that a short time before tended these same infants with unremitting care are suddenly animated with feelings equally strong, but of an opposite nature.

* Since penning these words, I asked the opinion of a recognised authority on the honey-bee (the Rev. J. G. Digges, M.A.). He writes: 'Undoubtedly the drones are sometimes stung to death in the autumn, and they are immediately thrown out of the hive; but the majority are simply driven out with nibbled wings. Apparently it is only those who are unwilling to go that have to be stung.'

Love is turned into hate, and the tender nurses become cruel executioners. Cruel? Well, no, perhaps not that. It would be as unfair to call them cruel for obeying their instincts as it is to

apply such epithets as 'lazy,' 'gluttonous,' and 'good-for-nothing' to the drone which, whether he accomplishes the object of his existence or not, is alike dogged by a cruel fate.

THE PARTS MEN PLAY.

By ARTHUR BEVERLEY BAXTER, Author of *The Blower of Bubbles*, *Merrie Gentlemen*, &c.

CHAPTER XXVI.—THE END OF THE ROAD.

I.

ONE noonday in the November of 1918 a taxi-cab drew up at the Washington Inn, a hostelry erected in St James's Square for American officers. An officer emerged, and walking with the aid of a stout Malacca cane, followed his kit into the place.

It was Austin Selwyn, who, a few days before, had come from France, where he had hovered for a long time in the borderland between life and death. Although he had been severely wounded, it was the nervous strain of the previous four years that told most heavily against him. Week after week he lay, listless and almost unconscious; but gradually youth had reasserted itself, and the lassitude began to disappear with the return of strength. The horrors through which he had passed were softened by the merciful application of time, and as the re-awakened streams of vitality flowed through his veins, his eyes were kindled once more with the magic of alert expression.

Having secured a cubicle and indulged in a light luncheon, he went for a stroll into the street. Looking up, he saw the windows of the rooms where he had spent such lonely, bitter hours crusading against the world's ignorance. It was all so distant, so far in the past, that it was like returning to a boyhood's haunt after the lapse of many years.

Going into Pall Mall, he felt a curiosity to see the Royal Automobile Club again. He entered its busy doors, and passing through to the lounge, took a seat in a corner. The place was full of officers, most of them Canadians on leave; but here and there in the huge room he caught a glimpse of sturdy old civilian members, well past the sixty mark, fighting Foch's amazing victories anew over their port and cigars.

Letting his eyes roam about the place, Selwyn noticed a group of six or seven subalterns surrounding a Staff officer, the whole party indulging in explosive merriment apparently over the quips of the betabbed gentleman in the centre. Selwyn shifted his chair to get a better view of the official humorist, but he could only make out a tunic well covered with foreign decorations. A moment later one of the subalterns shifted his position, and Selwyn could see that the

much-decorated officer was wearing an enormous pair of spurs that would have done admirably for a wicked baron in a pantomime. But his knees! Superbly cut as were his breeches, they could not disguise those expressive knees.

Selwyn called a waitress over. 'Can you tell me,' he said, 'who that officer is in the centre of the room—that Staff officer?'

'Him? Oh, that's Colonel Johnston-Smyth of the War Office.'

'Colonel—Johnston-Smyth!' Selwyn repeated the words mechanically.

'That's him himself, sir. Will you have anything to drink?'

'I think I had better,' said Selwyn.

About ten minutes later, after perpetrating a jest which completely convulsed his auditors, the War Office official rose to his feet, endeavoured to adjust a monocle—with no success—smoothed his tunic, winked long and expressively, and with an air of almost melancholy dignity made for the door, with the admiring pack following close behind.

'Good-day, colonel,' said Selwyn, crossing the room and just managing to intercept the great man.

The ex-artist inclined his head with that nice condescension of the great who realise that they must be known by many whom it is impossible for themselves to know, when he noticed the features of the American. 'My sainted uncle!' he exclaimed; 'if it isn't my old sparring-partner from Old Glory!—Gentlemen, permit me to introduce to you the brains, lungs, and liver of the American Army.'

The subalterns acknowledged the introduction with the utmost cordiality, suggesting that they should return to the lounge and inundate the vitals of the American Army with liquid refreshment; but Selwyn pleaded an excuse, and with many 'Cheerios' the happy-go-lucky youngsters moved on, enjoying to the limit their hard-earned leave from the front.

'May I offer my congratulations?' said Selwyn.

'Come outside,' said the colonel.

They adjourned to the terrace, and Smyth placed his hand in the other's arm. 'Do you know who I am?' he said.

'Eh?' said Selwyn, rather bewildered by the mysterious nature of the question.

'I, my dearAmericano, am A.D.Super-Camouflage Department, War Office.' The colonel chuckled delightedly, but checking himself, reared his neck with almost Roman hauteur. 'I have one major, two captains, five subalterns, and eleven flappers, whose sole duty is to keep people from seeing me.'

'Why?' asked the American.

'I don't know,' said the colonel; 'but it's a fine system.'

'You have done wonderfully well.'

'Moderately so,' said the A.D.Super-Camouflage Department. 'I have been decorated by eleven foreign Governments and given an honorary degree by an American university. I also drive the largest car in London.'

'You amaze me.'

'As an opener,' said the colonel, forgetting his dignity in the recital of his greatness, 'I am in enormous demand. I can open a ball, a bottle, or a bazaar with any man in the country.'

'But,' said Selwyn, 'how did it all come about?'

'Ah!' exclaimed Smyth, glancing up and down the terrace after the manner of a stage villain. 'Three years ago I was an officer's servant. I polished my subaltern-fellow's buttons, cleaned his boots, and mended his unmentionables. One day this young gentleman and myself were billeted on an old French artist. When I saw those canvases, I felt the old Adam in me thirsting for expression. Before all I am an artist! I made a bargain with the old Parley-vous—a pair of my young officer's boots for two canvases and the use of his paints. Agreed. On the one I did a ploughman wending his weary thingumbob home—you know. The following day happened to be my precious young officer's birthday, and we celebrated it in style. I would not say he was an expert with his Scotch, but he was very game—very game indeed. After I had put him to bed, I determined to paint my second masterpiece: "St George to the Rescue!" I did it—and fell asleep where I sat. When I woke next morning, imagine my astonishment! I had done both paintings on the one canvas! The ploughman was toddling along to the left, and St George was hoofing it to the right, but the effect one got was that a milk-wagon was going straight up the centre. It gave me an idea. I waited for my leave, and took the painting to the War Office. I told them if they would give me enough paint I could so disguise the British Army that it would all appear to be marching sideways. That tickled the "brass hats." They could see my argument in a minute. They knew that if you could only get a whole army going sideways the war was won. I was put on the Staff and given a free hand, and in a very short time was placed in complete charge of the super-camouflage policy of the Allies. The testimonials, my dear chap, have been most gratifying. We have un-

disputed evidence of an Australian offering a carrot to a siege-gun under the impression it was a mule. There was a Staff car which we painted so that it would appear to be going backwards, and the only way that a certain Scottish general would ride in it was by sitting the wrong way, with his knees over the back. In fact, my dear sir, if the war only lasts another year, I shall reduce the whole thing to a pastime, blending all the best points of "Blind Man's Buff" with "Button, button, who's got the button?"'

Having reached this satisfactory climax, the worthy colonel shifted his cap to the extreme side of his head, and walked jauntily along with his knees performing a variety of acrobatic wriggles.

'I am most gratified,' said Selwyn, repressing a smile. 'I had no idea, when I saw you and poor Dick Durwent marching away together, that you would rise to such fame.'

'Alas—poor Durwent!' exclaimed Smyth, pulling his cap forward to a dignified angle. 'I never knew who he was until we got to France. You passed him along as Sherwood, you know. His people are frightfully cut up about him.'

'They heard of his death, of course?'

'It isn't that, old son—it's the horrible disgrace. It only leaked out a couple of weeks ago from one of his battalion, but it's common property now. The old boy was absolutely done in—looked twenty years older.'

'What has leaked out?' said Selwyn, stopping in his walk.

'Didn't you hear? Durwent was shot by court-martial—drunk, they say, in the line.'

Selwyn's hand gripped his arm. 'Where is Lord Durwent now?' he said breathlessly.

'In the country, I believe—but why so agitated, myAmericano?'

There was no answer. As fast as his weary limbs could take him, Selwyn was making for the door.

II.

It was nearly eight o'clock that night when Selwyn alighted from a train at the village where he and Elise had heard the fateful announcement of war. He walked through the quaint street, silent and deserted in the November night. Except for two or three people at the station, there was no one to be seen as his footsteps on the cobbled road knocked with their echo against the casement windows of the slumbering dwellings. Reaching the inn, he bargained for a conveyance, and after taking a little food, and arranging for a room, he went outside again, and climbed into a dogcart which had been made ready.

After three or four futile attempts at conversation, the driver retired behind his own thoughts, and left the American to the reverie forced on him by every familiar thing looming out of the shadows. There was not a turn of the road,

not one rising slope, that did not mean some memory of Elise. The very night itself, drowsy with the music of the breeze and the heavy perfume of late autumn, was nature's frame encircling her personality. He had dreaded going because of the longings which were certain to be reawakened, but he had not known that in the secret crevices of his soul there had been left such sleeping memories that rustling bushes and silent meadows would make him want to cry aloud her name.

He told himself that she must be in London, and had forgotten him—and that it was better so. But the night and the darkened road would not be denied. They held the very essence of her being, and left him weak with the ecstasy of his emotion.

At the lodge gate they found a soldier, who allowed them to pass, and they drove on towards the house. So vivid was the sense of her presence that he almost thought he saw her and himself running hand-in-hand together again down the road. By that oak he had picked her up in his arms—and he wondered at the human mind which can find torture and joy in the one recollection.

Driving into the courtyard, he told the man to wait, and knocked at the great central door. An orderly admitted him, and took him to a nurse, who offered to lead him to the wing occupied by Lord and Lady Durwent. With wondering eyes he glanced at the transformation of the rooms once so familiar to him. There were beds even in the halls, and everywhere soldiers in hospital-blue were combining in a cheerful noise which was sufficient indication that their convalescence was progressing favourably. In the music-room a local concert-party (including the organist who had tried to teach Elise the piano) were giving an entertainment, with the utmost satisfaction to themselves and the patients.

The nurse led him upstairs and knocked at a door. On receiving a summons to enter she went in, and a moment later emerged again.

'Will you please go in?' she said.

Thanking her for her trouble, Selwyn stepped into the room, which was lit only by the light from a log-fire, beside which Lord Durwent and his wife were seated. Lady Durwent, who had just come from her nightly grand-duchess parade of the patients, was busying herself with her knitting, and was in obvious good spirits. Lord Durwent rose as Selwyn entered, and the good lady dramatically dropped her knitting on the floor.

'Mister Selwyn!' she exclaimed. 'This is an unexpected pleasure!'

The American bowed cordially over her proffered hand; but when he turned to acknowledge the old nobleman's greeting he was struck silent. No tree withered by a frost ever showed its hurt more clearly than did Lord Durwent.

Although he stood erect in body, and summoned the gentle courtesy which was inseparable from his nature, his whole bearing was as of one whom life has cut across the face with a knotted whip, leaving an open cut. He had thought to live his days in the seclusion of Roselawn, but destiny had spared him nothing.

'Have you had dinner?' asked Lord Durwent. 'We are strictly rationed, but I think the larder still holds something for a welcome guest.'

'Isn't the war dreadful?' said Lady Durwent gustily.

'I had something to eat at the inn,' said Selwyn, 'so I hope you won't bother about me.'

The older man was going to press his hospitality further, but as it was obvious from the American's manner that he had come for a special purpose, he merely indicated a chair near the fire.

'You move stiffly,' he said. 'Have you been wounded?'

'Yes,' said Selwyn, continuing to stand; 'but there are no ill effects, luckily. Lord Durwent, I came from London to-day to speak about your son Dick.'

At the sound of the name Lady Durwent checked a violent sob, which was of double inspiration—grief for her son and pity for her own pride. Her husband showed no sign that he had heard, but ran his hand slowly down the arm of his chair.

And now, for the first time, Selwyn became conscious of her presence—Elise had come noiselessly into the room, and was standing in the shadows. She came slowly towards him.

'Is it necessary,' she said, with an imperious tilt of her head, 'to talk of my brother? We all know what happened.'

By the firelight he saw that, only less noticeably than in her father's case, she too had been stricken. Her rich-hued beauty, which had become so intense with her spiritual development, bore the marks of silent agony. In her eyes there was pain.

'Without wishing to appear discourteous,' said Lord Durwent, 'I think my daughter is right. My family has been one that always put honour first. My son Malcolm maintained that tradition to the end. My younger son broke it. And it is perhaps as well that our title becomes extinct with my death. If you don't mind, we would rather not speak of the matter further.'

'He was such a kind boy—they both were,' sobbed Lady Durwent in an enveloping hysteria, 'and so devoted to their mother.'

Putting Elise gently to one side, Selwyn faced her father.

'Lord Durwent,' he said, 'I was with your son when he was killed. In the long line of your family, sir, not one has died more gloriously.'

Lord Durwent's hands gripped the arms of his chair, and Lady Durwent looked wildly

up through her tears. Elise stood pale and motionless.

'It is true,' said Selwyn. 'I tell you'—

'There is nothing,' said the older man—'there can be nothing for you to tell that would make our shame any the less. My son was shot'—

'Lord Durwent'—

'—shot for disgracing his uniform. That he was brave or fearless at the end cannot alter that truth.'

'Elise!' Selwyn turned from Lord Durwent, and his clenched hands were stretched supplicatingly towards her. 'Your brother was not shot

by the British. He was killed as he went out alone and in the open against the German machine-guns.'

'What are you saying?' Lord Durwent half rose from his chair. 'Why do you bring such rumours? What proof is there'—

'Would I come here at this time,' said Selwyn desperately, 'with rumours? Do you think I have so little sympathy for what you must feel? I saw your son killed, sir. It was in the early morning, and he went to his death as you would have had him go. As you know he did go, Elise.'

(Continued on page 581.)

LEAVES FROM A CATALOGUER'S WALLET.

V.—GREUZE AND DE GIRARDIN'S MOTHER.

By W. ROBERTS.

I.

IN his entertaining and discursive book on *Greuze and His Models*, published eight years ago, Mr John Rivers told us a good many half-forgotten or only dimly remembered facts about the procession of beautiful models who have been immortalised by this ever-popular painter; but he did not tell us all. As a general rule, the world knows very little indeed concerning the models of famous artists; there is a natural reticence in such matters, and those who knew the facts have too often died without revealing their knowledge, usually on the mistaken score that such information cannot possibly interest either the public of the time or posterity. After Greuze himself and his beautiful wife, probably Diderot knew more about the artist's sitters than any one else; but he left much unsaid, and predeceased the artist by twenty-one years.

In spite of changes in the popular taste for paintings—the admired of one generation is often the despised of the next—Greuze's pictures of young girls have never ceased to attract and to charm. He may, indeed, be said to have invented a special type of youthful beauty, to have introduced a new note, with many variations, into art, and more especially French art. He struck the note in early life, and constantly played upon it up to the end of his career. One of his most popular and charming pictures is that of 'A Girl with Doves,' which is now in the Wallace Collection at Hertford House, London. It is probably the Salon picture of 1800, 'L'Innocence tenant deux Pigeons,' which Greuze himself sold to a 'Monsieur Wilkinson' for 4800 livres (or about 4500 francs) in Paris on 17th August 1802; the original receipt has always accompanied the picture, and is now pasted on the back of the panel. This 'Monsieur Wilkinson' was doubtless Joseph Wilkinson, who was residing at 42 Harley Street, London, in 1807, but who lived in Grosvenor Place from 1813 until 1825; Mrs

Wilkinson is given as the tenant from 1826 to 1830, her husband, presumably, having died about 1825. What there is no doubt about, however, is that Mrs Wilkinson herself sent the Greuze picture to Christie's, that it was sold there on 25th April 1828, and that it found a new owner at 245 guineas, a reasonably good advance on the original price. At that sale Mr Christie is reported to have 'informed the company' that the picture was painted expressly for the proprietor, and that the receipt would be handed to the purchaser. It was bought by William Wells of Redleaf, one of the most celebrated picture-collectors of the period, in whose collection it remained for twenty years, and at whose sale, in 1848, it was bought by the Marquess of Hertford for 750 guineas, over three times what it had cost Mr Wells.

There are probably replicas of the picture, as there are certainly other pictures in which Greuze has treated the same subject or idea in slightly different ways; for instance, M. Charles Vendrye's collection contained a picture of the same young girl differently posed with a single pigeon in her arms. Nothing could be more characteristic of Greuze than this type of young girl, and it is perfectly clear that the same girl was the model of many of his other pictures of like type, painted over a period of several years. There are half-a-dozen pictures in the Wallace Collection alone which will prove this. But the catalogue of the Wallace Collection—like most of the books on Greuze—tells us nothing about the model who is claimed to have sat for the picture.

II.

Rather more than a century ago a young man of the name of Émile Delamothe, *de parents légalement inconnus*, drifted to Paris and picked up a living as a clerk. 'Tout à coup,' as Vapereau tells us, he declared his real name to be Émile de Girardin, and announced that his

father was General Alexandre Comte de Girardin (1776–1855), who took part in the wars of the Empire, distinguishing himself at Austerlitz and various other places, and who, like other generals before and since, turned author in his old age. Émile de Girardin's birth is variously given as 1802 and 1806—the earlier is probably the correct date. At all events it is certain that he was abandoned by his parents, who sent him to a *pension*, described as *modique*. His early struggles for existence were undoubtedly great, but these were small matters compared with his efforts to obtain from father and mother the recognition '*que lui refusaient à la fois les préjugés absurdes et des lois mal faites.*' Later in life he declared that one of the most beautiful sights to the gods was a worthy man battling against adversity. Of his own experiences he made use in his first book, *Émile*, published anonymously in 1827; this autobiographical document was proclaimed by Jules Janin to be a *chef-d'œuvre*, and obtained a great success.

For just on half-a-century Émile de Girardin was one of the most forceful figures in French politics and journalism, scoring triumphs in many ways, the greatest of all being the establishment, in 1836, of *La Presse*, the first newspaper to appeal to the masses. He revolutionised French journalism in the teeth of the bitterest opposition. Over the signature of 'Le Vicomte de Launay,' his wife, Delphine Gay, '*la muse de la patrie*,' started the first *feuilleton* printed in a French paper; it was called the *Courier de Paris*, and under this rubric various persons and subjects were discussed with a freedom '*et même un peu scandale*' which compelled everybody to read *La Presse*. The secret of the identity of the Vicomte de Launay was jealously guarded, and Madame de Girardin did not hesitate to '*dire du bien de Madame de Girardin*!'

After a very full life of literary activity, Delphine Gay died in June 1855, but her husband lived for well over twenty years afterwards, dying in 1881. The lives of these two extraordinarily brilliant, and to all intents and purposes well-matched, literary people are scarcely paralleled in modern French authorship. Neither is perhaps much read to-day, and a more or less respectable oblivion is the inevitable fate of the journalist. But whatever the ultimate fate of these novels, plays, poems, and other

publications, *La Presse* will, in the history of French journalism, preserve the names of Émile de Girardin and his wife, Delphine Gay, from complete obscurity.

III.

It will be asked, what is the connection between Greuze's picture of the young girl with two pigeons and Émile de Girardin, the French journalist? The connection is a very intimate one, for the beautiful girl, with the large dreamy eyes, in the Wallace Collection picture was the famous journalist's mother. This would seem impossible if the young girl in Greuze's picture was painted *ad vivum* in 1800. But the fact is probably this, that Greuze painted the picture from a 'stock' portrait done some years previously, just as Turner painted many pictures from sketches and drawings done on his travels years before. The little girl was Adélaïde Marie Fagnan, the daughter of a high functionary in the finance department under Louis XVI. She died in 1851, but lived long enough to witness some of the triumphs of the son whom she had cast adrift as a child, who escaped the fate of our own Richard Savage, and who, unaided, carved his way to fame and to fortune.

Not only did Greuze paint Émile de Girardin's mother, but his maternal grandmother, Madame de Fagnan, also sat to him. In a letter to Arsène Houssaye, De Girardin wrote: '*Greuze a fait de Mme. de Fagnan, ma grand-mère, le beau portrait que l'on voit dans la galerie du Duc du Morny;*' and this is probably the 'Portrait de Mme. X' which was Lot 103 in the Duc de Morny's sale in 1865, in which she is represented as coiffured '*à la Marie Antoinette*,' the hair slightly powdered, and ornamented with a garland of little roses. De Girardin further wrote: '*et de ma mère l'admirable portrait connu sous le titre de "La jeune fille à la colombe," chef-d'œuvre acheté, en 1848, 35,000 francs, par M. Herfort aux héritiers du Baron de Wilckenser. Actuellement collection Wallace.*' Émile de Girardin, like most French authors of the day, was weak in his English names, and not consecutive or accurate in his facts; for 'Wilckenser' was only a bad shot at 'Wilkinson,' and Mr Wilkinson was not a 'baron,' whilst 35,000 francs was far beyond what 'M. Herfort' paid for the picture. But these are details which do not interfere with the interest of the story, or in any way invalidate the claim set out by the founder of *La Presse*.

ON SAFARI.

A RAUCOUS shouting and the sound of much commotion outside his tent awakes the sleeper, though it is yet dark, and through the tent door the camp-fires can be seen still burning. Next, his personal 'boy' appears with

the early morning tea and banana, and announces that the cook has already started, and that breakfast will be waiting for the *Bwana Mkubwa* two hours' march down the road.

Having consumed this frugal meal and digested

the more important announcement, the now fully awakened district commissioner proceeds to creep from under the mosquito-net, wash, and put on the accepted dress of the country—shooting-boots, puttees, khaki shorts, and tunic-shirt; and over this an old shooting-coat, for it is cold at 5.30 A.M., even in Central Africa, when one is at an altitude of over 4000 feet. About a quarter to six the first streaks of dawn appear, and the long line of porters can be discerned being marshalled by the headman, each man with his load, in single file. This manoeuvre necessitates much vituperation and a few cuffs on the part of the headman, for each porter has an ardent desire to seize the lightest load, and to leave the heavier burdens to his neighbours. The argument between the disputants is carried on in high-pitched and excited shouting. By the time order has been enforced the camp has been struck, and the non-commissioned officer of the police escort reports to the waiting commissioner, who is smoking the first cigarette of the day as he watches the scene, that the *safari* is ready to start. Permission given, the long line of squatting black figures rises to its feet, hoists loads, which are balanced on black heads with much shrill chatter, and surges off down the road in full chant, sounding for all the world like a band of Highland pipers tuning up!

The procession is headed by a happy individual proudly bearing the Union-Jack (which is the commissioner's travelling token of office), and setting the refrain of the chant; next come the police N.C.O. and two stalwart police *askaris* with red tarbooshes and black tassels, khaki shirt-tunics, shorts, and puttees (but bootless, for all African natives march better barefoot), armed with Martini rifles and bayonets; after them the long line of porters, the end being drawn up by the commissioner's servants, and the whole 'whipped in' by two more policemen.

The sun is now well up, and the morning mists have melted away, revealing the lovely green country of the Buganda Kingdom—tree and bush clad hills, and hollows luxuriant with tropical growth. The commissioner, tying his coat on the handle-bars, mounts his push-bike, and with rolled-up shirt-sleeves cycles down the 'road'—a broad native track in actual fact—past the *safari*, which is covering the ground at a smart pace, until he reaches the spot where, under a shady tree by the roadside, the black cook has camp table and chair set up and breakfast ready for his hungry master.

This meal is quite an English one of porridge, bacon and eggs, and home-made bread; but tinned butter and marmalade give it a colonial flavour, while an appetite made keen by the early morning air and exercise soon disposes of the lot. A short rest over the after-breakfast pipe, and then another hour and a half's ride brings the commissioner to the scene of this day's work.

This is a cleared patch in the elephant grass on the left of the roadside, in the middle of which has been built a cool grass hut, set back on the slope above the roadway, with a view out across the valley towards the distant forest, and almost within sound of the Sessebo Falls. It is not a permanent rest-house for the use of ordinary wayfarers, but one specially built for our commissioner by the local chief, who, having received news of the *Bwana Mkubwa's* approaching visit, has thus prepared for him; nor has he forgotten either to provide firewood for the cook, and bananas for the porters.

When the commissioner arrives at the spot, he finds the chief, one Tomasi Mkairi, waiting for him with his sub-chiefs and headmen—a round dozen or so. Mkairi, is an old friend of the commissioner's, a Maganda by tribe, a Christian by religion, who has been taught at the C.M.S. mission school at Nemirembe. He is both educated and intelligent, a chief who knows his district and his people through and through, and who works hard for the welfare of his charge. He can read and write, and ride a bicycle, and his most treasured possessions are his silver watch and his fountain pen!

His garb may appear peculiar, for whereas, like most enlightened Buganda, he wears a white, open-work, embroidered linen pork-pie cap and the white linen *kanzu* or long robe, rather like a nightgown, yet over the robe he wears an old tweed coat long since discarded by some European, and under the hem peep tweed-trouser-clad legs, and, alas! boots—the latter dilapidated and at least two sizes too large for him.

His retinue of sub-chiefs and headmen appear in caps and *kanzus* too, of the latter some of white, some of brown, bark-cloth. Several have coats, but none, happily, have risen to the dignity of boots.

All greet the Big Man with broad smiles, polite bows, and phrases of welcome as, dismounting from his bicycle, he shakes hands with Mkairi and returns greetings with the entourage. Then all move to the shade of a tree at the edge of the clearing, where two camp-chairs are placed. The commissioner and Mkairi settle into these, and the others squat in a semi-circle on the ground in front of them. (Chairs, be it noted, are dignities reserved for Europeans and chiefs.)

In musical sing-song Luganda all the affairs of the district are discussed; there is no need for an interpreter, for the commissioner has spent many years in the province, and speaks this and other dialects fluently.

So for two hours the talk swings through rainfall, cotton crops, rinderpest among the cattle, the ravages of sleeping-sickness, foreshore clearing by the lakeside (by which means the dread tsetse fly is combated), plantation boundaries, crime in the district, poll-tax, and the hundred other subjects of administration. Mkairi makes

his report, referring now to this attentive courtier, and now to that one, for corroboration or detail. The commissioner listens, making notes for his monthly report, advises, sympathises, and exhorts, sometimes in the midst of an explanation driving a point home with a jest which draws a shout of laughter from his listeners. Finally, when various orders have been issued, the *indaba* breaks up, and only Mkairi remains behind to gossip with the commissioner and watch the camp being pitched, for now the *safari* has rolled up.

Its arrival has been heralded by a full-throated chant, drawing nearer and nearer, the porters giving tongue with frenzy as the end of the journey comes into sight.

Loads are quickly dropped in the clearing, and the porters drift off to build themselves little grass huts for the night; to cook *mtoke*, a porridge made from bananas; and to fill their water-gourds at the stream near by. Meanwhile the cook is setting up his establishment, and the 'boys' are unpacking chop-boxes and uniform-tins and getting lunch ready in the hut; while the commissioner and Mkairi, over lime-juice and sparklet, exchange Headquarters news, and that of the country-side and of game. Presently the chief departs, with many expressions of goodwill, and pedals off to his *shamba*, five miles away, his dusky retinue panting behind him.

'*Chakula Tyari, Bwana!*' announces the head-boy. In other words, lunch is ready; and very nice, too, consisting, as it does, of cold guinea-fowl, tomatoes and fried potatoes, cheese, fruit, and claret and sparklet. This disposed of, our friend dozes over last mail's *Weekly Times* on his camp-bed until tea-time; after which, armed with a scatter-gun, and accompanied by a police orderly, he scours the neighbouring banana plantations and woods for green pigeon and guinea-fowl, in due course bagging a brace of each. Both are delicious eating; but whereas the guinea-fowl are fairly easily acquired, the pigeon are shy birds, and have terrific speed

on the wing, so that each one bagged means good stalking and good shooting.

Sundown draws near, a lovely pink and orange flush in the sky heralding the sun's sudden plunge and the quick change from daylight to the velvet dark; for of twilight there is scarcely any. A big camp-fire burns in the clearing, and several smaller ones twinkle by the porters' little huts at the edge as the commissioner reaches camp.

Now for a welcome whisky and sparklet, a bath, and a change, which includes putting on mosquito-boots; and then letter-writing and a book fill up the time till dinner.

This meal in due course pays surprising testimony to the cook's skill and experience on *safari*, for he dishes up a 'first-toast' (for some obscure reason the universal name in Banaland for *hors d'œuvre*), soup, tinned whitebait, roast-chicken with sweet potatoes and onions, followed by anchovy savoury and a pine-apple—the red native pine, which, if not so sweet as the Kew variety, is none the less an excellent fruit. The meal, topped off with a cup of excellent coffee, made from beans grown on the White Fathers Mission *shamba* in the district, and a glass of the inevitable liqueur of Africa, variously known as green wine or 'starboard light,' makes the commissioner feel that life is tolerable at times even in Darkest Africa.

Out comes 'His Master's Voice,' and Kennerley Rumford takes the hushed camp to his 'Little Gray Home in the West,' and tells them 'Where my Caravan has rested,' and Major Mackenzie Rogan shows how the Coldstream really can play 'Peer Gynt,' to the apparently keen delight of the dusky audience. (It is curious how a native who will take but a *blasé* interest in a train or a steamer seen even for the first time, yet is ever delighted with a gramophone.)

However, time passes, and to-morrow is bringing another early start; so 'His Master's Voice' is stilled, and a 'nightcap' and a cigarette usher our now drowsy commissioner to his mosquito-curtained camp-bed, and well-earned sleep.

THE RED HOUSE MYSTERY.

By CHARLES W. HOPPER.

I.

'THIS Desirable and Well-Built Family Residence to be Let. Apply to Brown and Randall, High Street, Barnet.'

The time-weathered board that made this statement tottered on its decaying supports. The house, built in early Georgian days, was falling to ruin. A tangle of ivy and brambles grew over the buttressed wall that divided it from the lane. Four of the six windows that overlooked the desolate landscape opposite

were bricked up. Undoubtedly the house had originally been well built; but Verner could not help thinking that the man who had put up that board must have been an optimist.

Yet, to Verner, it was desirable. Its remoteness from the town, its picturesque antiquity, its general air of mystery, all appealed to his dreamy, imaginative nature. What a strange drama of life it must have seen! What changes! What tragedy?

A mile or so away, in the little semi-suburban country town of Chipping Barnet, there was

fierce competition for houses of any kind. Why hadn't it let? Was it too inaccessible? The serpentine lane that led up to it was little more than a cart-track. Or—the idea fascinated Verner—was it haunted? Was its strange loneliness accentuated by the memory of some grim tragedy? As he stood there staring at the old Red House a thrill ran down his spine. Verner *knew* that the old Red House was haunted—felt it in every fibre of his being.

The lane, like the house, had evidently seen better days. He had turned into it one day in an out-of-the-way part of the town, followed it by the side of the golf-course, past the Red House, and had continued along it until it joined the St Albans road at South Mimms. The lane took five miles to reach the village; the main road did it in three. In that five miles he had not met another human being. The distant roar of motor traffic on the main road, heard across the intervening fields, had accompanied him all the way, strangely accentuating his solitude. Yet he had not been alone. The ghost of the past had kept him company.

It had been rough going. For generations, evidently, the ill-kept, grass-grown lane had seen no traffic. At one place, for half a mile it was under water, and he had to take to the fields. At another an old solidly built brick bridge, disproportionately wide and long, carried it across a marshy stream. Verner, a keen lover of the romantic and the picturesque, thought that the Red House, the bridge, and the lane wanted explaining.

Randall, whom he met at the golf club, explained them to Verner. A hundred years ago the lane had been one of the main coaching-roads from London to the north. Then, to ease the gradients and shorten the route, the new road had been cut.

'Directly they had done it,' added Randall, 'the railway came along. Until motors came in, for eighty years there was little traffic on the new road. Now at week-ends it's as bad as Piccadilly on a busy day.'

'That explains that fine old Georgian house,' mused Verner. 'Why hasn't it let?'

Randall eyed him curiously. 'Thinking of getting married—or got friends who are looking for a house?'

'No. But I know some people who would like to come out here if they could find a place. And I was wondering'—

'You wouldn't wonder if you saw inside the place. Don't let 'em waste their time looking at it, unless they are millionaires. There are no drains, light, or water. Every bit of wood is eaten up with dry-rot. We've had it on our hands for years. Owner wouldn't spend a penny on it—he'll only let on a long repairing lease, and he wants a stiff figure. Place wants rebuilding, and isn't worth it. It isn't a good

road for motors, and you could not get a tradesman to call there for love or money.'

'Why not?' said Verner, immediately interested. 'Some murder or mystery?'

'No. The road is too bad, and the house too isolated. Now I come to think of it, though,' said Randall, 'I believe that was the place where the murder was.' He laughed, a little uneasily. 'Funny you should mention it. It wasn't funny, however, when my grandfather told me—I was only a boy at the time. I remember it gave me the creeps. But I'm not quite sure now whether that was the house, after all.'

'Yes,' replied Verner confidently. 'That was the house.'

'But you can't know anything about it,' said the other man, staring at him. 'You were not born when my grandfather told me that story. It is over thirty years ago, and I've never heard it mentioned from that day to this, or repeated it to any one. I always thought the old man made 'em up, because he knew I liked them.'

'It was about a girl, wasn't it?'

'He told me several. But my special favourite was the one about a girl. The man wanted to marry another woman. His first flame cut up rough about it. So he strangled her, and buried her in the garden. And then afterwards she haunted him until he committed suicide.'

'That's the stuff,' said Verner enthusiastically. 'She stands there, at the window, watching for him—eighteenth-century costume—listening for his horse's hoof-beats as he gallops back from town.'

'B-r-r-r!' exclaimed Randall. 'Don't talk about it. I can see 'em now, as I used to see 'em, when I crawled up to bed, looking over my shoulder. Come and have a drink.'

II.

When he had not time to get a round of golf in, the Red House was the turning-point of Verner's evening stroll. After his conversation with Randall the place fascinated him more than ever. Verner was an average-adjuster at Lloyd's. He played cricket and golf, and had the social habits of the ordinary young Englishman. But his nature had an undeveloped side—that of the dreamer and poet. He was heart-free, and the prosaic groove into which his life had settled filled him with a vague discontent. There were moments when his spirit craved for an outlet that would introduce some colour, romance, or adventure into his humdrum existence.

In this mood he often strolled along the old coaching-road to the house that had so fascinated him. Randall had lent him the key, and Verner had explored the place. The quaint interior of the house did not interest him so much as the formal old-world garden, with its broken statues and its moss-grown paths. It breathed the very atmosphere of romance. He

was unable to find any confirmation of the murder story; but the obliging librarian at the Institute had promised to look the matter up.

Verner knew that something must have happened there. He felt it in his bones, and he pictured the poor girl who had been immured there by some stern guardian or jealous husband. He often stared at the cobwebbed window that overlooked the buttressed wall, half-expecting to see her listening for her returning guardian, or watching for the coach to pass.

Except for an occasional pair of lovers, no one frequented the lane. But Verner never found it lonely as he conjured back the life of the past. He knew exactly where the highwayman had waited for the coach. Sometimes he was the highwayman himself, courteously saluting the trembling fair one as she descended from the coach. More often he was the gallant who rescued her after a thrilling combat with the ruffian.

One summer afternoon Verner left the city earlier than usual. Finding no partner at the clubhouse, for practice he played idly round the course with a driving-iron. At the fourteenth hole he hit a ball into the spinney that comes between the course and the old coach-road. He could not find his ball, and tiring of the game, lit his pipe and strolled along the lane.

The day had been bright and sunny, but now, as the afternoon sun drooped towards the horizon, it shone with a sicklier light. A drifting haze threatened to obscure its beams. The air was sultry and oppressive. The steady, persistent whirl of traffic on the distant main road was broken only by the plaintive call of the pewits as they wheeled over the fields that lay between. Never had the old Red House seemed so melancholy to Verner, so steeped in tragic memories of the past.

His senses were curiously alert. A strange feeling of detachment—of remoteness from the world—possessed him, which the distant drone of motors only heightened.

Something was going to happen! Something was happening—now—on the other side of that wall, either in the garden or in the house. With every nerve strung to its highest tension, Verner listened. There was silence. Then he looked up at the window and saw—*her*.

III.

It was the face he knew so well: he had seen it scores of times. She was standing close to the window, gazing sadly at the landscape. Her powdered hair towered above the well-set head. Neck, shoulders, and arms were bare. Verner caught the gleam of jewels, the sheen of a satin quilted petticoat below her low-cut bodice. She had not seen him, and he knew that she was bored—intensely bored.

It was a beautiful face, but, oh, so ghastly pale. Verner shuddered. Suddenly, as she raised a

little hand and delicately stifled a yawn, she turned, and her eyes met his. He had never seen such wonderful eyes. They showed like purple pools against the deadly pallor of her skin.

For a moment she stared at him in astonishment; then, as a man's hand gripped her wrist and pulled her away from the window, she started in alarm, and glanced at Verner, as it seemed to him, with a look of mingled resignation and appeal.

He did not hesitate. Throwing his golf-club over, he swarmed up the ivy that grew on the eight-foot wall. There was a thick bed of nettles on the other side, and Verner dropped into it on his hands and knees. He felt just in the mood to meet the villain who had laid his hands so rudely on the girl. A tangled shrubbery lay in front of him. As he fought his way through it, full of impotent rage and nettlestings, smothered with dust and cobwebs, Verner caught sight of them in front of him as they left the house by a side-door. The man was dragging her along, and the girl was feebly resisting. She was calling, 'Algernon! Help! Oh, help me, Algernon!'

The coarse-looking ruffian who was abducting her laughed. The horrid mirth made Verner's blood run cold. He caught sight of the unearthly pallor of the scoundrel's face. He knew he could not help, for neither of them was a figure of flesh and blood, yet Verner was irresistibly drawn to follow them. The motor traffic on the distant high-road steadily droned a weird modern accompaniment to this eighteenth-century tragedy.

'You are wasting your breath, my pretty one,' chuckled the villain. 'We've got Master Algernon trussed up like a fowl in the bushes over there. If you come quietly and quickly, we will spare his life. If not'—The brute raised his free hand and drew it across his throat with a horribly significant gesture. 'So hasten, my pretty lady. There is no time to waste.'

Verner broke through the undergrowth in time to see them disappear along a moss-grown path. Another man was with them—a dreadful figure with a black patch over his eye. Verner cautiously followed them. Then, as a third ruffian with a sword joined them, and the little party halted at the end of the path, Verner hesitated. He wished now that he had stopped to recover his golf-club.

With a piercing scream that made his blood run cold, the girl flung herself down and knelt at the feet of her captor.

'Spare me,' she cried. 'You shall have gold.' The grinning scoundrel shook his head. Again she screamed, 'Help! Algernon! Oh, help!'

Although he knew they would all instantly vanish, Verner felt that he must rush to her aid, when suddenly a man burst out of the bushes, and in a second there was a clash of steel. The new-comer, whom Verner guessed to be Algernon,

knew how to handle a sword. He might have held his own with his two principal opponents if the third scoundrel, the man with the patch over his eye, had not suddenly stolen behind the rescuer and flung a cloak over his head.

The chief villain drew back his sword, and was about to plunge it into the prostrate victim's breast. It was too much for Verner. Flesh and blood could stand it no longer. Neatly side-stepping the second ruffian, who stared at him in surprise, Verner landed a straight left full on the would-be murderer's jaw. The man went down like a log.

IV.

The dazed Verner suddenly realised that he had struck solid flesh; that eyes were staring at him from all directions; that he was the centre of a crowd of people in costumes ancient and modern, who were studying him with amazement. Everything was hushed; even the purring motors had ceased their drone. In the middle of the lawn was a large camera, and the man who had dropped the handle suddenly let off a stream of American profanity that astonished Verner.

'You chuckle-headed mutt!' said the ruffian with the patch. 'How did you blow in?'

'Where am I?' said Verner feebly. He turned to the girl whom he had sought to rescue. 'Who—and what are you?'

'I am Ruth Adair,' she said, smiling.

'But y-your face!' he exclaimed. 'Your face! I know it so well. I've seen it so often.'

'At the pictures,' she replied. 'It's on every hoarding in the world.'

'But—I don't understand,' gasped Verner. 'It was so real.'

'We have to make it real,' said Miss Adair—'to speak and act our parts. Otherwise we could not get the effect. You see, we are the Famous Frisco Film Players, and we have come three thousand miles to use your English backgrounds.'

'And we'd been waiting all the blessed afternoon for that gleam of sunlight right here,' said the camera-operator angrily, 'when you butted in, you hen-brained lunatic! Look at it now. It's gone again.'

'Keep a stiff upper lip,' murmured Miss Adair. 'Mike has got the jumps, but Dan is taking it very quietly. He is the man who bosses this crowd.'

Verner was suddenly conscious of a large man—a man with a square jaw—who was chewing an unlit cigar. Daniel J. Emmott, the world's greatest picture-producer, seemed to wake out of his lethargy. He came forward with extended hand.

'Shake. Put it there. Dunno about your brains, but you've got grit, young man. Grit and good looks is all we want for the film. Don't want brains—to act for it. We want 'em behind it, though, and perhaps that's where I come in. What's your name?'

'Verner. Hartley Verner.'

'Good name for the bills,' said Daniel J. Emmott thoughtfully. 'They say Britishers are slow, but I never saw a quicker and neater bit of work. Bit too quick, perhaps. Think it registered all right, Mike?'

'Sure,' said the camera-operator.

'I am very sorry, sir, to have disturbed your operations,' said Verner. 'But their faces were so ghastly pale, I thought they were ghosts.'

'That's the "make-up,"' said Ruth Adair.

'I thought it was all a dream.'

'You've got it,' exclaimed the producer enthusiastically. 'It *is* a dream. And they *are* ghosts—the whole crew of 'em. You dream the whole thing. Get me?'

'Perhaps I dreamed this,' said the injured actor, scowling, as he nursed his swollen jaw. 'I'll give the rube something to dream about.'

'Can it, Smiler,' said Daniel J. Emmott. 'Cut it right out. I always thought this show wanted a little more punch, and, by Gee-rusalem! it's got it.'

'I guess I have,' said Smiler with a bitter laugh, 'if this show hasn't.'

'I propose we take this gentleman outside and run off a few hundred feet of him moseying round the house and dreaming; seeing faces, and breaking in—that is, if you'll permit, sir, and the infernal climate will oblige.'

As if in answer, the sun began to break through the clouds.

'It's a cinch,' declared Daniel J. Emmott confidently. 'It's *the* goods. This film will sell like hot cakes.'

And it did.

And now you know how Hartley Verner became a cinema star, and how Romance and Ruth Adair came into his life.

A SONG OF LIFE.

SING me a song of splendid Youth,
Free as the vagrant wind;
A merry song, a light song,
The song of a care-free mind,
When life is made of happiness,
And Youth is unaware
How surely Fate will mark him
With the lining hand of care.

Sing me a song of life's great prime,
So brave, and strong, and deep;
A steady song, a full song,
The song of those who reap,
And find life's harvest rich and ripe
With good that never dies,
When seeds of Great Ambition
Are sown by Enterprise.

Sing me a song of life's calm close,
Tranquil, and sweet, and frail;
A little, sad, contented song,
The song of the ended trail,
When, happy with our memories,
We watch life's twilight fall,
And smile on Death all tenderly,
When answering The Call.

J. DEWAR DAVIDSON.

Chambers's Journal

SEVENTH SERIES

RECOLLECTIONS OF A NAVAL SECRETARY.

I.—MEDITERRANEAN, 1861-1866.

By C. E. GIFFORD, C.B., R.N.

I.

IN March 1861 I was given a nomination as assistant-clerk in the Royal Navy, and duly presented myself at Portsmouth.

In the train I met a seafaring man, who said, in reply to my inquiries about a hotel, 'All the young gentlemen from the navy go to the "Cable's Head," on the Common Hard, just abreast of the *Victory*.' When I arrived at the Hard and asked for this curiously named inn, I found it was the 'Keppel's Head.'

Next morning at nine I presented myself on board the *Victory*, and though I did not (as the Irish assistant-surgeon is reported to have done) knock at the door of the entry port on the middle deck and ask, 'Please, is this the Royal Navy?' I was green enough to have done so.

When I look back to that day I appreciate the difficulty of the newly embarked Gosport marine, who could not find his hammock, though he was sure he had stowed it in the nettings on 'the Gossy side.' Neither he nor I had had any experience of swinging at moorings, and we equally lost our bearings.

We were interrupted in our examination to witness a sight which, an officer told us, we might never see again—a three-decker, the *Marlborough*, coming into harbour to pay off. Little did I think that four months later, when that grand old ship left the harbour, recommissioned, I should be on board her, taking passage to Malta. But it was so. I was one of eight fortunate candidates, and was appointed to the secretary's office of the Commander-in-Chief on the Mediterranean Station.

I spent my first two or three months on board the *Bellerophon* hulk, where the *Marlborough's* crew were berthed whilst their ship was in dockyard hands, and I learnt my first naval lesson very shortly after joining her. Our commander, Thomas Brandreth, of whom we gunroom youngsters were in wholesome fear, asked me a question, to which I replied, 'I don't know, sir.' 'Then go and find out,' rapped out in a sharp tone, taught me for ever after to adopt as a reply, 'I'll find out, sir.'

I learn from my home letters (all preserved by a fond mother), which will be freely quoted

from in aid of my recollection, that fitting-out days in 1861 meant busy times for all hands, but that we had 'glorious evenings.' I read of a concert in the chestroom, presided over by the senior midshipman, the instruments being tea-trays, combs, rattles, police-whistles, &c.

About this date the new breech-loading Armstrong guns were introduced, the *Marlborough* being the first ship in the Mediterranean carrying a 110-pounder.

Whilst we were lying at Spithead all the youngsters were sent for to come on deck and see H.M.S. *Ganges* arriving from the Pacific. She was the last sailing two-decker in commission at sea.

II.

We left Spithead in the *Marlborough* in July 1861, with 1444 officers and men on board, 30 cadets from the *Britannia* having just joined us, bringing up our gunroom numbers to about 65. Of these, 'the greater part have fallen asleep;' some have passed into civil life; two at least turned soldiers, one of them becoming a distinguished general—Sir Henry Hildyard.

I heard a story of Hildyard, as adjutant of the Highland Light Infantry, going, in uniform, on board the *Caledonia*, flagship at Malta, to call on an old messmate, whom he found to be officer of the watch. Hildyard hailed him with, 'I say, old chap, your fore-royal yard wants squaring.' The officer of the watch sends for the boatswain, and, on his appearing, 'Mr Baxter,' says he in his suavest tones, 'the adjutant of the Highland Light Infantry has come on board to say that your fore-royal yard wants squaring, and says something about getting a jigger on your lower lift.' Exit Mr Baxter, muttering, 'Well, I'm . . . !'

We had barely cleared the Isle of Wight when we fell in with a south-west gale, and experienced all the joys of an overcrowded gunroom, with ports barred in.

I think my previous experience of the sea had been limited to hauling up lobster-pots off Downderry, of which I retained very unpleasant recollections; and I certainly had never been out of sight of land. Little wonder that, in common with some fifty messmates, I paid toll to Nep-

tune. I read in my next home letter that one midshipman, Count Metaxa, offered one of the seniors five shillings to throw him overboard. I should have liked to do the same, but I had not the necessary five shillings.

The Bay of Biscay was not kind to us, and by the time we got across we had no coal left, and had to put into Ferrol, the chief naval port on the north-west coast of Spain, for a fresh supply. Our senior assistant-paymaster took fifteen of us boys ashore, and regaled us with fruit, cakes, and country wine. If all our childish orders of 'Rain, rain, go to Spain,' when we wanted a fine day, had been fulfilled, we should fully have paid for them now, for it poured in torrents throughout our stay.

Ferrol is ideally situated for a naval port, a very narrow channel of some miles opening out into a deep bay. In later years I was made very familiar with the difficulties of the approach to the harbour, having been assigned the unpleasant duty of prosecuting the admiral of the Channel Squadron before a court-martial for default in connection with the grounding of the battleship *Howe* in the narrows.

Ferrol was uninteresting, the chief impression remaining on my mind being the enormous crinolines of the Spanish ladies, and the brilliant colour of their dresses.

A gunroom crew rowed to Corunna to visit the grave of Sir John Moore. I have never had any sympathy with the critic who meanly looked up the phases of the moon, and proved there was none visible on the night of the funeral, so that the poet had no justification for saying that they buried the general by 'the struggling moon-beams' misty light.'

A more practical effort of a similar nature took place when the captain of the *Conqueror* was being tried by court-martial for running his ship on to a coral-reef in the Bahamas. To show the care taken in navigating her, evidence was given that a certain star was 'taken' by the midshipman of the middle watch, his observation carefully worked out and logged. A member of the court, Captain C. F. A. Shadwell, compiler of a volume of Star Tables, was seen to be busy with a nautical almanac, and, as a result of his researches, informed the court that the star in question was not visible during that watch! And this reminds me of a story I once heard Sir Robert Ball tell in one of his popular lectures on astronomy. He was on duty at the Rosse Observatory, when a visitor came in the evening to ask if he might see the moon through the great Rosse telescope. 'Certainly,' was the reply. 'Come here at half-past twelve. I am on night-duty, and shall be very glad to give you a sight of her. She rises at midnight.' 'Thank you for nothing,' said the visitor. 'I can see her with my own eyes when she is above the horizon, but I supposed with your big glass I could have seen her now.' And he took his departure.

III.

After a short stay at Gibraltar, we duly reached Malta on 10th August 1861. The Commander-in-Chief, Vice-Admiral Sir William Fanshawe Martin, was waiting to hoist his flag in the *Marlborough*. I was landed for duty in his office, and took up my quarters in Strada Zaccaria. Here I made my first acquaintance with the mosquito. From that day to this he has never neglected me, never ceased to sing to me at night in the intervals of feasting on my blood. What maddening pests mosquitoes are to thin-skinned people! Fourteen years later, in the Shanghai River, I had a violent attack of what the doctors called malarial fever. This was long before medical science had discovered that a lady mosquito is the bearer of the bacillus which is so often the cause of our fevers. I had been bitten badly, and have no doubt that was the cause of an illness which nearly cost me my life.

I met, in China, with a touching story of filial affection, as shown by the behaviour of a Chinese boy. 'Wu Mang, a lad of eight years of age, who lived under the Tsin dynasty, was very dutiful to his parents. They were so poor that they could not afford to furnish their beds with mosquito-curtains, and every night myriads of mosquitoes attacked him, unrestrainedly feasting on his blood. Although there were so many, Wu would not drive them away, lest they should go to his parents and annoy them. Such was his affection.'

Let us hope, for poor Wu's sake, that the mosquitoes of the Tsin dynasty were not the fever-bearing species.

But to return to Malta and the *Marlborough*.

The admiral had under his command a fine fleet of forty-two pendants, fourteen of them line-of-battle ships. Rear-Admiral Rodney Mundy was second in command, and Rear-Admiral Sydney C. Dacres captain of the fleet. When the fleet was at Malta the Commander-in-Chief occupied Admiralty House, whilst the captain of the fleet lived on board the *Marlborough*, and superintended drills, exercises, &c. Precisely at eight every morning the slight form of the Commander-in-Chief was to be seen in the well-known arch at the end of the Baracca watching the morning evolution. He and his flag-lieutenant had long been occupied in preparing a code of evolutionary signals for the fleet, which was to be tested during the summer cruise.

The fleet put to sea during August, and proceeded to Naples. Where could a boy find greater delight than in a cruise which gave him a view of Mount Etna, the Strait of Messina, Stromboli—always an active volcano—and Vesuvius, and led to a stay of two months in the beautiful Bay of Naples?

We had our own little excitements, too, on board the *Marlborough*. We were taken in tow by the *Terrible*, in those days regarded as a

marvel of power, though her 800 horse-power would now be scarcely enough for a modern dredger. It was she that put to sea in the disastrous gale at Balaklava in 1856, which wrecked so many British transports. 'Round went the ponderous wheels, and right in the teeth of the gale out steamed the mighty *Terrible*,' said one newspaper report of the gale. She took us along gaily at nine knots, but on a Sunday morning whilst we were at church the congregation was suddenly startled by seeing the two ships running into one another—*Charybdis*, the whirlpool, had hold of us, but we came through without collision.

After passing through the Strait we ran into a region of waterspouts, and counted fourteen. One big fellow was so near us that we fired two shotted guns at it to prevent its bursting over our heads and falling on our decks.

We spent the autumn in the Bay of Naples, anchoring generally off the city, but occasionally at Castellamare.

General Cialdini, viceroy of the province, dined one night on board the *Marlborough*, and it was made an occasion of great ceremony. A salute of nineteen guns was fired as he left the shore, and yards were manned on his coming on board. I had not before seen a great foreign official, and was much impressed with the nineteen orders and medals which he wore. On his leaving the ship, we burned red, white, and green lights at the yard-arms, and the boats of the squadron, all burning blue lights, formed two lines from the ship to the shore. The effect was charming.

The squadron was fully occupied in testing the new evolutionary signals, weighing in the early morning, steaming in the offing all day, and returning to the anchorage at night. It is the only occasion on which I remember a squadron 'anchoring by the stern;' but, then, Sir William Martin never spared either himself or his officers and men.

I had the pleasure, somewhere in the 'nineties, of sitting at lunch next to Mr (now Sir) Henry W. Lucy, and he asked me whom I thought the greatest admiral I had ever seen. I replied unhesitatingly, 'Sir William Martin.' 'Well,' said Toby M.P., 'that is interesting; I never heard of him. What did he do for the navy?' So short-lived is fame!

I told Mr Lucy that the navy owed to Sir William, among other things, the introduction of the continuous service system (under which men were entered for a term of years), which is admitted to have done more for the efficiency and discipline of the fleet than any other measure. I described how he had brought into a high state of discipline the crews of the Mediterranean fleet of some fifteen thousand men, a large part of them tagrag and bobtail swept into the navy at the time of the Crimean War; how tremendously keen he had been in

raising the fleet's standard in gunnery; to what a wonderful pitch of perfection he brought the fleet in sail-drill and other competitive evolutions; in fact, how much he had done to earn the sobriquet of 'Pincher Martin,' by which he was universally known in the service—the pinches being his constant and determined efforts to raise the efficiency of the fleet.

I served a second time in Sir William's office when he was Port-Admiral at Devonport, from 1866 to 1869. During this command he brought in great reforms in the Home Port administration. I remember hearing an Admiralty official say, 'There is still a pile of papers about a foot high containing Admiral Martin's proposals on naval matters which we have not yet been able to tackle.'

IV.

But to return to the Bay of Naples, where we youngsters enjoyed life thoroughly. Expeditions to the top of Mount Vesuvius, to Pompeii and Herculaneum, and frequent visits to the splendid museum filled up our days ashore.

Our morning and evening swim alongside the ship was interfered with by news of sharks having been seen; a soldier swimming close to Garrison Point, Corfu, had been taken down by a shark and had lost his life. But with a crew of 1120, a large proportion of them anxious for a dip, it was easy enough to find men to rig up alongside a lower-studding-sail as a bathing-tank. At sea, after the men's supper-hour—that is, about four o'clock—when the weather was fine, the squadron would heave to, and the signal 'Hands to bathe' come as joyful news after a hot day. It would be a bold shark that would venture into the midst of hundreds of men and boys skylarking in the water, and we were never disturbed. Weak or nervous swimmers would occasionally suffer a severe fright when the ship, forging ahead, left them some little distance astern.

Our summer cruise came to an end each year on 31st October, when the fleet returned to Malta, and those of us who were attached to the Commander-in-Chief's staff took up our quarters on shore. Here our gunroom messmates would frequently join us in making night hideous by singing the popular street-songs of the day—'Bob Ridley,' 'Dixie,' 'Champagne Charlie,' and other long-forgotten ditties.

It must not be supposed that our musical appetite was satisfied with such poor fare; we had a gunroom-box at the Opera House in Strada Teatro, where, for two shillings and sixpence a month, each of us had a front-seat twice a week, and where there was generally plenty of standing-room on other nights in our big stage-box. So we became familiar with Verdi, Rossini, and Donizetti, whose operas were prime favourites with the Maltese.

Our bands in the fleet were good, that in the

flagship particularly so. Nominally the bandmen were British subjects—Maltese; actually Italy supplied most of them. I find in my scrap-book a typical letter from one of them, dated from H.M.S. *London* at Corfu, 2nd January 1862, and addressed to 'His Excellency the Admiral on board H.M.S. *Marlborough*.' He writes as follows:

'Saverio Grancagnolo, a bandsman on board H.M.S. *London*, submits to Your Excellency that he has served the Illustrious and Valiant English nation the last two years and four months and never gets tired to praise and celebrate it at the highest degree, being an Italian, but with his greatest sorrow he suggests Your Excellency to obtain his discharge as his wife died of a cruel disease and left two unhappy children in the street without assistance from any relative whatever. Therefore the humble Petitioner begs of Y.E. in the name of whatever she has dearest in the world to allow him his disembarkment that he may go into the bosom of his two poor orphans.

'The Petitioner hopes it and remains, Your Excellency's most humble Servant,

'SAVERIO GRANCAGNOLO.'

It fell to my lot, whilst serving as secretary at Portsmouth in 1887, to make an inquiry into the mode of recruiting and training boys for naval bands, and later, as one of the secretaries of the Manning Committee, to visit most of the great Board-school establishments in the vicinity of London in search of recruiting-grounds for our bandboys; and I was impressed with the opinion that there was an abundance of native talent. Since then the Royal Naval School of Music has been established, which supplies British bandmen instead of foreigners, who might be a source of danger in war-time.

It is not all naval officers who are musical, however. A story is told of a captain who, on taking his morning exercise on the poop of his ship, observed that one of the bandmen, a Hercules in size and strength, was playing the piccolo, whereas a feeble little man was struggling with the trombone. Calling up the bandmaster, he ordered him to change their instruments immediately! It may have been the same officer who, observing that the big drum was silent whilst the other instruments were playing, sent for the drummer and threatened to punish him for laziness. 'Thirty-two bars rest, sir,' said the drummer. 'Rubbish!' replied the captain. 'There's not the least need for you to have any rest during the short time the band is playing.'

But I am letting naval bands run away with me.

v.

We spent a great part of the summer of 1862 in the Ionian Islands, which then formed a British Protectorate, with Sir Henry Storks as

Lord High Commissioner. Each island had its British garrison, Corfu specially being a favourite station, Cephalonia and Zante having also their attractions.

In 1858 Mr Gladstone had visited the islands to inquire into their desire to be restored to Greece; this led to the Union-Jack being struck in May 1864 and the Greek flag being hoisted. We were grieved at losing our favourite summer resort, but I remember that Sir William Martin strongly supported the policy of giving up the islands.

Many years later I was picnicking near the Empress of Austria's beautiful Corfu villa, and in conversation with our coachman, a Corfiote, learned that, as a driver in the British Commissariat Service, he had taken Mr Gladstone to the many villages, where he addressed the people, a Greek-speaking race, in the language of Homer. I asked, 'Did he speak to them in Greek?' 'Oh yes,' said he. 'Could he speak easily?' 'Splendidly,' said Jehu. 'Could you understand him?' 'Oh no! But they told us afterwards what 'twas all about!'

The cession of the Ionian Islands was preceded by the destruction of the greater part of the forts, which it was thought Greece would not be strong enough to hold against a hostile force. A party of R.E. officers, under Major Shaw, came out to blow them up, and my eldest brother, who was one of them, fired all the charges at Fort Neuf. The little island of Vido in Corfu Harbour was so strongly and expensively fortified that a question was asked in the House of Commons whether the guns were of gold. As each charge was fired—some of them of five thousand pounds of gunpowder (there was no gun-cotton in those days)—a groan went up from the crowds of Corfiotes watching the operations from the town.

Early in the morning of 27th October 1862, when we were lying at Corfu, we were startled by the firing of a royal salute, and soon learned that H.M.S. *Scylla* was standing-in, flying the Greek Royal Standard. On board were King Otho and his queen, driven from Athens by an insurrection, and on their way to Venice. His Majesty was to become one of Daudet's 'Rois en Exil.'

The squadron got up steam and started full speed for Athens, anchoring in Phalerum Bay, just outside the Piræus. We found great excitement prevailing, but no danger to life beyond that occasioned by straggling groups of soldiers firing *feux de joie* with ball-cartridges.

Having got rid of their king, the Athenians were enthusiastically in favour of offering the crown to our Prince Alfred (later Duke of Edinburgh), and every house in Athens displayed his portrait draped in British and Greek colours.

Just abreast of our anchorage in Argostoli Harbour, close to the beach and slightly below sea-level, were two mills with undershot wheels.

The harbour is tideless, and a constant stream flowed from the sea, drove the wheels, and then disappeared in a natural tunnel, the entrance to which was some hundred yards beyond the mills. What became of the water was an insoluble mystery. Scientists had studied the question in vain; barrels of tar had been poured into the stream, and the coast-line watched unsuccessfully

for some trace of it. The nearest active volcano from which it could have escaped, in the shape of steam, was Stromboli, some three hundred miles distant.

We returned to Malta at the end of October, and spent the next six months in our winter quarters.

THE PARTS MEN PLAY.

CHAPTER XXVI.—continued.

III.

IN a voice that shook with feeling Selwyn told of the fight for the bridge; how Dick, and Mathews, who had saved him, reached the Americans; of the desperate hand-to-hand fighting; how the groom had guarded his young master; the impending disaster; and the death of Dick.

'It meant more than just our lives,' he concluded, in a silence so acute that the crackling of the logs startled the air like pistol-shots, 'for as Dick fell we swept forward and gained the brushwood. Less than three hours afterwards the French arrived, and largely by the use of that bridge a heavy counter-attack was launched. We buried Dick where he fell—and, Lord Durwent, it is not often that men weep. The French general, to whom the tank officer had made his report, pinned this on your son's breast, and then gave it to me to have it forwarded to you. He asked me to convey his message: "That the soil of France was richer for having taken so brave a man to its heart."'

He handed a medal of the *Croix de Guerre* to Lord Durwent, who held it for several moments in the palm of his hand. From the distant parts of the house came the noise of singing soldiers, and a gust of wind rattled the windows as it blew about the great old mansion. Elise had not moved, but through her tears an overwhelming triumph was shining.

'And Mathews?' asked Lord Durwent slowly.

'We found him after the attack,' the American answered. 'He must have dragged himself several yards after he had been hit, and was lying unconscious, with his hand stretched out to touch Dick's boot. Have you heard nothing from him, sir?'

'Nothing.'

Again there was a silence fraught with such intensity that Selwyn thought the very beating of his pulses could be heard. At last Lord Durwent rose, and with an air of deepest respect placed the medal in the hands of his wife. Her theatricalism was mute in a sorrow that was free from shame.

'Captain Selwyn,' said Lord Durwent, 'we shall never forget.'

Feeling that his presence was making the

situation only the more acute, Selwyn pleaded the excuse of the waiting horse to hasten his departure.

'But you will stay here for the night?' said Lady Durwent.

'No—thank you very much. I have left my haversack at the inn; and, besides, I must catch the 7.45 train to London in the morning to keep an important appointment. Good-night, Lady Durwent.'

Amidst subdued but earnest good wishes from the peer and his wife, he wished them good-bye and turned to Elise.

'Good-night,' he said, his face flaming suddenly red.

'Good-night,' she answered, taking his proffered hand.

'I shall go with you,' said Lord Durwent.

The two men walked through the corridors, which were growing quieter as the night advanced, and, with another exchange of farewells, Selwyn went out into the dark.

He was weak from the ordeal through which he had passed, and both his mind and his body were bordering on exhaustion. He called to the sleeping driver, who in turn roused the horse from a similar condition, but just as the wheels grinding on the gravel were opposite him Selwyn heard the door open and the rustle of skirts.

'Austin!' cried Elise, running through the dark.

He almost stumbled as he went towards her, and caught her arms in his hands.

'I didn't want you to go,' she said breathlessly, 'without saying thanks. If Boy-blue had really been shot as they said, I—I——'

She did not finish the sentence, but clasping his hand, pressed it twice to her burning lips.

'Elise,' he cried brokenly—but she had freed herself and was making for the door.

No longer weary, but with every artery of his body on fire with uncontrollable love for her, he intercepted the girl. 'Elise,' he cried, 'I thought I could go from here and carry my heart-hunger with me—but now I can't. I can't do it.'

'You went away to America.' Her flashing eyes held his in a burning reproach. 'You did not need me then—and you don't now.'

'But—you didn't care? You never came back to the hospital, and I wrote to you every day. Tell me, Elise, did you really care—a little?'

'Yes, I did—more than I would admit to myself. But you didn't. All you could think of was going back to America.'

'But, my dearest'—his heart was throbbing with a tumultuous joy—'if I had only known. There was so much work for me to do in America'—

'You will always have work to do. You don't need me. I shouldn't have come out to-night. Please let me go.'

'Then you don't care—now?'

'No. You have your work to do still. You said yourself that we come of different worlds'—

'Elise, my dear'—he caught her hands in his and forced her towards him—'what does that matter—what can anything matter when we need each other so much? I have nothing to offer you—not as much as when we first met—but with your help, dear heart, I'll start again. We can do so much together. Elise—I hardly know what I am saying—but you do understand, don't you? I can't live without you. Tell me that you still care a little. Tell me'—

Her hands were pressed against his coat, forcing him away from her, when, with a strange little cry, she nestled into his arms and hid her face against his breast.

For a moment he doubted that it could be true, and then a feeling of infinite tenderness swept everything else aside. It was not a time for words or hot caresses to declare his passion. He stooped down and pressed his lips against her hair in silent reverence. She was his. This woman against his breast, this girl whose being held the mystery and the charm of life, was his. The arms that held her to him pressed more tightly, as if jealous of the years they had been robbed of her.

'I must go in,' she whispered.

He led her to the door, her hand in his, but though he longed to take her in his embrace and give his lips the sweet intoxication that they craved, he knew instinctively that her surrender was so spiritual a thing that he must accept it as the gift of an unopened spirit-flower.

'Good-night, dear.' She paused at the door, then raised her face to his.

Their lips met in the first kiss.

IV.

The following Saturday Selwyn met Elise at Waterloo, and with her hand on his arm they walked through London's happy streets.

It was 9th November.

News had come that the Germans had entered the French lines to receive the armistice terms, and hard on that was the official report that the German Emperor had abdicated.

London—great London—whose bosom had sustained the shocks, the hopes, the cruelties of war, was bathed in a noble sunlight. For all its incongruities and jumbled architecture, it has great moments that no other city knows; and as Selwyn and Elise made their way through the crowds, there was an indefinable majesty that lay like a golden robe over the whole metropolis.

Above St Paul's there floated shining gray air-ships, escorted by encircling aeroplanes. Hope—dumb hope—was abroad. Not in an abandonment of ecstasy, or of garish vulgarity which was soon to follow, but in a spirit of proud sorrow, Londoners raised their eyes to the skies. Passengers on omnibuses looked with new gratitude at the plucky girls in charge who had carried on so long. People stood aside to let wounded soldiers pass, and old men touched their hats to them. The heart of London beat in unison with the great heart of humanity.

From crowded streets, from domes and spires and open parks, there soared to heaven a mighty '*Gloria—gloria in excelsis.*'

After a lunch, during which they were both shy and extraordinarily happy, they took a taxicab and drove to a house in Bedford Square.

Leaving Elise, Selwyn knocked at the door, and was admitted to a room where a girl in an American nurse's outdoor costume waited for him.

'I got your letter in answer to mine, Austin,' said she, giving him both her hands, 'and I am all ready. Did you see him?'

'I did—yesterday afternoon. But, Marjory, I told him nothing of you, and if you want to withdraw there is yet time. Have you really thought what this means to you?'

Her only answer was a patient smile as she opened the door and led him outside.

'Elise,' said Selwyn, as they entered the cab, 'I want to introduce Miss Marjory Shoreham of New York.'

'Austin has told me all about you,' said Elise, 'and I think you are wonderfully brave.'

She took the nurse's hand and held it tightly in hers as the car drove towards Waterloo.

An hour later they reached a Sussex station, and hiring a conveyance, drove to a charming country home which was owned by a Mr Redwood, whom Selwyn had met on board ship. A servant told them as they drove up to the door that the master of the house had gone to the village, but that they were to come in and make themselves at home.

As he helped the girls to alight Selwyn heard the nurse catch her breath with a spasm of pain. He glanced over his shoulder and saw a man standing on the lawn facing the sun, which was reaching the west with the passing of afternoon.

'Please remain here,' said Selwyn, 'and I will motion you when to come.'

He walked towards the solitary figure, who heard him, and turned a little to greet him.

'Is that you, Austin?'

'Yes, Van,' answered Selwyn. 'How could you tell?'

With his old kindly, tired smile the ex-diplomat put out his hand, which Selwyn gripped heartily.

'I suppose it is nature's compensation,' said Van Derwater calmly. 'Now that I cannot see, footsteps and voices seem to mean so much more. I was just thinking before you came that, though I have seen it a thousand times, I have never *felt* the sun in the west before. See—I can feel it on my face from over there. Mr Redwood tells me that the news from France is excellent.'

'It is,' said Selwyn. 'I think the end is only a matter of hours.'

'A matter of hours; and after that—peace. Austin, I haven't much to live for. It was in my stars, I suppose, that I should walk alone; but there is one fear which haunts me—that all this may be for nothing—for nothing. If I thought that on my blindness and the suffering of all these other men a structure could be built where Britain and America and France would clasp the torch of humanity together, I would welcome this darkness as few men ever welcomed the light. But it is a terrible thought—that people may forget; that civilisation might make no attempt to atone for her murdered dead.'

He smiled again, and fumbling for Selwyn's

shoulder, patted it, as if to say he was not to be taken too seriously.

'The world must have looked wonderful to-day in this sunlight,' he went on. 'Do you know, I hardly dare think of the spring at all. I sometimes feel that I could never look upon the green of a meadow again, and live.'

Selwyn had beckoned to the nurse, who was coming across the lawn towards them.

'Van,' he said, taking his friend's arm, 'don't be too surprised, will you? But—but an old friend has come back to you.'

'Who is it?' Van Derwater's form became rigid. 'I can hear a step, Austin! Austin, where are you? What is this you're doing to me? Speak, man—would you drive me mad?'

Without a sound the girl had clutched his hand and had fallen on her knees at his feet.

'Marjory!' With a pitiful joy he felt her hair and face with his hand, and in his weakness he almost fell. Vainly he protested that she must go away, that he could not let her share his tragedy. Her only answer was his name murmured over and over again.

Creeping silently away, Selwyn rejoined Elise. Once they looked back. The girl was in Van Derwater's arms, and his face was raised towards the sun which he was never more to see. But on that face was written a happiness that comes to few men in this world.

(Continued on page 598.)

'THE STARS IN THEIR COURSES.'

By F. ROWLINSON.

THERE has always been a tendency, not only amongst the ignorant and superstitious, but also amongst some of the most enlightened, to regard the phenomena of the heavens as having a far-reaching effect upon human destiny. Man's life and his happiness are directly bound up in the earth's fertility, and since this is, without doubt, dependent upon the sun, it is argued that it is not improbable that the other heavenly bodies also play their part in the shaping of destiny. This much is within the bounds of possibility to even the most sceptical amongst us, but the argument has been carried still further. For since it is possible accurately to foretell the movements of most of the observed bodies, so, too, argue some, it should be possible to deduce from astronomical calculations some indication of the future of those influenced by the heavenly movements. So recent an authority as Dr Wilde has given his opinion that 'nothing incongruous with the laws of nature is implied in the theory that sun, moon, and stars influence men's physical bodies and conditions, seeing that man is made up of a physical part of the earth.' Not even in these unbelieving days does the science (if so it be) of astrology lack its

adherents—witness the yearly sale of almanacs by some dozen or more would-be seers; witness also the remarkable interest in Professor Porta's prediction last year of a world catastrophe.

The Babylonians were the first nation (apart from those of the Far East) to formulate a coherent scheme of astronomy. Their knowledge and their calculations of the movements of the heavenly bodies were comprehensive and exact; notably so, considering their apparatus. They were certainly the founders of modern astronomy so far as observation and calculation go, although their ideas would seem to us ludicrously absurd. On the basis of this knowledge their priests (who were probably their astronomers too) built up a system of astrology, at first, perhaps, as an artifice whereby the heavenly phenomena could be explained in terms of nature personified. Later, a special sect of the priests, the *bārē*, devoted themselves to the divination of the will and intentions of the gods by astrological methods; later still, mysticism and quackery were introduced as a hold upon the credulity of the ignorant.

The art of divination was at first a simple one. The course of the sun-god, Shamash, through the

year was mapped out into twelve constellations (now the twelve signs of the zodiac). A person born in a month when the sun touched such-and-such a constellation or sign was assured of wealth, of bravery, of misfortune, of chastity, or various other qualities. Everything was very simple.

But, unfortunately, the diversity of human fortunes and misfortunes is such that the discrepancies of the simple system were too noticeably frequent even for the most credulous, and so additional influences were called in as evidence: Sin, the moon-god, and Ishtar, Ninib, Nebo, Marduk, and Nergal (the five planets), all added to and modified the primary zodiacal predictions. Later the field was extended to include the fixed stars, and the whole gradually became involved in such a medley of magic and alchemy and quackery that it became almost unintelligible.

This rigmarole spread to other lands, modified here and there by some freshness of imagination, here and there adapted to an already existent mythology. The Arab philosophers in particular developed an extraordinary jumble of early chemical knowledge with astronomy and astrology. The Greek and Latin writers introduced poetical imagery to the queer science (Virgil connects Orion with approaching rain, and the Pleiades with wild storms). So, side by side, or, rather, linked together, astronomy and astrology grew through the centuries, sometimes officially encouraged, sometimes severely repressed, but always surviving by their appeal to the imagination. Interest and belief were not likely to flag whilst any man could go outside on a clear night and see great wonders for himself.

The combined sciences came to western Europe partly from the Arabs through the Moors and Spain, partly direct through the returning crusaders. Astrology, in particular, became fashionable in medieval times, and every court and prince must needs have a private astronomer. A sorry enough time some of these poor wretches must have had, and many were the ingenious ambiguities behind which they sheltered to preserve their positions—or their necks! Most of these were probably hangers-on, seeing in the 'science' an easy (if precarious) way to court favour. Amongst them, however, were some few real seekers after knowledge. The medieval astronomers were almost all astrologers too, but it is inconceivable that every one of these keen men could have believed the whole of their teaching. After all, they had to earn the means to carry out their more serious studies.

With the advent of the system of Copernicus began the estrangement of astronomy and astrology, although they were intimately connected for long after the sixteenth century. Instances of the way the astronomers of these early times mixed science and tradition are very numerous. Stöffler, the mathematician of Tübingen, calculated that in February 1524 Mars, Jupiter, and Saturn would be in conjunction, and predicted

a universal deluge as a result. His forecast, however, was based upon the slenderest of grounds—that the phenomenon would take place in the sign of Pisces, the Fishes! This pronouncement, coming from so noted a mathematician, created a great stir; arks were built, and many people made suitable preparations. Alas for Stöffler (but happily for the world), February was not even normally wet!

Not so unfortunate in his prophecies was Tycho Brahé a few years later. Having calculated from astronomical data, and with noteworthy success, the path of the great comet of 1577, Tycho indulged his fancy in a few astrological predictions. Most remarkable of these was his statement that a prince should be born in the far north who should lay waste the German kingdoms, and vanish in 1632. Brahé himself died in 1601, and this horoscope was fulfilled to the letter by Gustavus Adolphus, born in Stockholm, who advanced into Germany with overwhelming success, and who *did* disappear in 1632.

Stöffler and Brahé, as has been indicated, were of that school to whom there existed no distinction between astronomy and astrology. Kepler, only a few years their junior, already marked the rift which began to appear about this time, for, although he actually dabbled in astrology, he did so only to support his very large family. His attitude was clearly indicated in some of his own writings: 'What would you complain of, you too scrupulous philosophers, if astrology the daughter, whom you think foolish, support a poor wise mother (astronomy), if the mother is tolerated by the world only by reason of these follies? If men had not had the hope of reading their future in the skies, would any of you have been wise enough to study astronomy for her own sake?'

The last great stronghold of astrology in Europe was in France under the patronage of the Medicis. Paris was overrun with them, no less than thirty thousand practising at one time. There is an interesting story connected with Catherine de Medici. This much-feared queen, celebrated for her power, noble and imperious in character, was a prey to the most ignorant credulity where astrology was concerned. Having been told by one of the staff of astrologers who fawned upon her court (Cosmo Ruggieri, a Florentine) that the name Saint-Germain would seal her doom, she most anxiously avoided all persons or places bearing it. She abandoned the magnificent palace of the Tuileries, shortly after she had completed it, because it was in the parish of Saint-Germain l'Auxerrois. In its stead she built another (scarcely as magnificent, for funds were running short) near St Eustache. Even here, amongst her astrologers, vague fears troubled her, and she built near the palace a fine fluted Doric column of enormous height, from which she herself might examine the stars. But her

fate pursued her. One day, overcome with faintness at the news of the violent death of the Duke de Guise, she sent hurriedly for a priest. On his arrival she asked his name. It was le Père Saint-Germain! 'Ah me!' she exclaimed; 'then I am dead!' She died the next day.

In England, Swift and his satire gave the death-blow to astrology with his ludicrous 'Isaac Bickerstaff's *Predictions for the Year 1708*.' Since then astrology has existed only amongst the most credulous and ignorant of the country-folk, and the spread of education has all but extinguished these last sparks.

MARAZION.

PART II.

VI.

THEY caught him as he went to join his ship the next evening. All his crew were on board, even one-eyed Seth. And they waited, knowing nothing. It was night when my father came and told me. The tears were running down his brown face, but I stood before him, and could neither move nor cry.

Marazion! My Marazion! They would hang him. The beautiful strong throat would—

He had one day more, they said.

'Sidonia, my own child, my little lamb! Cry, or you will die!' The words came to me from a long way off.

I smiled. 'I am sorry, *padre mio*, I cannot,' I said.

He was rocking me on his knee, holding me tight. I put my arms round his neck. '*Padre mio*! we loved each other so. We did no dishonour to you, did we? And we were so happy! God would not punish us for such a little time—only one day for eternity, *padre*—only one day we had!' I heard my own dry voice whispering.

'No—no!' he said. 'It was as it always was with some of us. You did no wrong, poor lamb; and you paid. Always the weakest pays in that.'

I was very cold; even my heart felt like ice; but I had no tears. I put my hand on the padre's cheek. 'You'll take me to him, *padre*, will you not?' I said.

'They won't let us in till to-morrow morning,' he said. 'At dawn I'll take you.'

So we sat together all the night. Once the padre tried to make me drink some wine, but my throat seemed closed up; and at last the dawn had come.

The town was alive with people. Some soldiers looked at me stolidly as we passed. Then we dismounted, and I held on to the padre's hand as we walked along, till a big stone edifice reared itself before our eyes. By it stood a crowd of people, ugly curiosity in their eyes. For against the wall leant a woman sobbing, while an old gentleman in a red hunting-coat tried to lead her away. Her hood had fallen back and her chestnut hair was all loose about her face.

'Squire's daughter she be,' said a man to father.

'Squire tried mighty hard to get him off, but the case was too black. And Marazion—he'll go game. He cut his jokes in the face of justice. There's summat in the old blood after all.'

And I listened and heard and saw like one in a dream. Marazion! He would have been on the great galleon by now. He had told me of his big cabin with the red hangings, where we would be together some day. Together! That was all that mattered in heaven, or earth, or hell to me.

VII.

The leg-irons he wore clanked as he rose to meet us. And then—I was close in his arms, and lay still there. Then came my father's voice: 'Would to God I had hung in my youth instead!'

'Never say that, captain,' answered Marazion.

My father's voice was rough as he spoke again. 'I would leave you alone together, if I could, but I'll look at the damned wall.'

I had just strength to kiss the padre's hand as it clutched mine. Then he had turned away, and my only conscious thought was to bury myself closer in the arms that held me, and to feel his lips upon mine—as he whispered of those hours in the cave, and how nothing mattered, nor life nor death, just because of that. And then, in a moment it seemed, the jailer had come back, and the time was over for us two. For me there was no time. I had locked my arms about the red sash, feeling dimly that no power on earth would make me let him go. But Marazion took my hands in his, and his clasp was iron. And I screamed once in a sort of whisper, as a tortured little animal might scream. Only he could have made me let go, since my will was his, now for ever and ever. But I looked up at him, and my eyes prayed what I could not say.

I felt the padre's hand on my shoulder, and knew that their eyes had met over my head. To my tortured senses their voices came, but brought no understanding till afterwards. First came the padre's voice: 'Have you got any of it on you?' Then Marazion's voice from far, far away: 'Yes, in that glass charm round my neck. Pull it off—will you, captain?—and smash it. There's water in the pitcher there.' There was some growled interference on the jailer's part; that too I remembered afterwards. Then my

lover's voice again: 'You are faint, little one. Drink this—come—to please me.'

To please him! Perhaps they would let me stay longer, just a minute longer, if I drank, said my bewildered brain. My head was tilted back against his arm, and something cool and bitter-sweet was running down my throat.

How strange it was! We were back in the sea-cave, and outside was the roar of the sea beating for ever against the rocks.

VIII.

When I awoke I was lying on the oak settle in the panelled hall at home, leaning back against silken cushions. By me sat the padre, looking worn and old.

'Padre!' I staggered to my feet, and then full recollection came to me—recollection and frozen horror. 'Padre! Did you give me *that*?'

'Yes,' he answered. 'He carried some of that old Phœnician stuff on him. I had used mine years ago. You could not have borne it else.'

I spoke dully: 'How long have I slept?'

'Three hours, little lass. Only three hours; I swear it,' he answered.

It was already dusk, and to-morrow— The madness of my own agony mastered me, and I spoke always in a whisper, for my voice seemed nearly gone. 'Padre, if I went back—back to those who have judged him, and told them it was not one life they were taking, but three, would they listen?'

He shook his head.

'No,' came his answer. 'My daughter is not to shame herself even for a king of our people.'

I fell at his feet, kissing his muddy sea-boots. 'Padre! what shame if I bore his son? And what shame to pretend it, just for his life—his life? These people, who do not understand us, may have no pity upon our love, but they might pity a little one who had done them no wrong, even if they wished to kill him, and me. It would be such a small lie, padre; and there might be a chance—just a little chance.'

He shook his head. 'No good, dear heart! I know them. They would but mock you. Didn't some of the soldiers laugh at his Gentile wench, high in the land as she is? Still more would they laugh at one of his own kind.'

I sprang up. 'I am going,' I said. But he caught me in his arms and held me. Then something in my heart, or brain, or both, seemed to break with a thousand sparks of fire, and I knew no more.

IX.

Pain and the blackest depths of hell—I know them all. And all centred round the gray stone building of the jail, with the sobbing woman leaning against it. Sometimes they were leading Marazion to his death, and I tried to go to him, but she stretched out her arms in front of me like iron bars, and would not let me pass.

And I would throw myself at her feet, begging and praying her to let me go to him. For I was his. And then she would laugh, and I would feel for the haft of my knife. These, and many more dreams, came to me, out of hell. Then suddenly I seemed to rise up out of the depths—to lie in such deadly weakness that I thought death was merciful, and had come to me at last, to send me where my heart had already gone.

I opened my eyes, and found myself in my little room, with the spoil of many voyages about me, and a scarlet coverlet of soft Eastern stuff over me. I held up my hand, and could see the light through it. Then I called weakly, 'Padre!'

A woman came in—she was not of our people, I could see. She gave one look at me. 'Captain!' she called sharply—'captain!' And then he came—*padre mio*!—walking softly without his sea-boots. I clung to him, and his tears fell wet on my face.

'Tell her,' said the woman then. 'She is better;' and she went out.

I did not understand. 'Have I been very ill, padre?' I asked.

'It was the fever in your brain, my lamb,' he said brokenly. 'Can you bear it, if I tell you?'

'You'll not want me to stay behind him, padre?' I asked wistfully.

Poor padre fairly burst into tears. 'No fool like an old one,' he gasped. 'Child, he's *alive*—retrieved! Some Spanish prince, whose son could not swim, and was once dragged by Marazion out of the sea by the scruff of the neck, moved heaven and earth, and got a free pardon out of the king. Only just in time'—

I clung to his arm. 'Padre,' I faltered, 'do not be frightened, but I can't breathe!' And everything grew cold and dark, but not the darkness I had known. When I came to myself, the woman was bathing my head, and the padre storming at her. She was quite calm.

'I tell you she is not dead, captain,' I heard as I opened my eyes, to hear the last of the padre's words: 'And she tells a hard-bitten old pirate like me not to be afraid, and then falls over. If I've killed the only thing I love, bar one in Paradise, it's your fault.'

'Padre! Padre!' I murmured.

But the mischief was done. 'I take my leave to go, sir,' said my nurse angrily. 'I have heard heathenry enough in this house, anyway.'

My father bowed. 'Madam, my tongue ran away with me. If you must go, take my apologies'—

'And my grateful thanks,' I said timidly.

But she was adamant. 'I will take my money now, I think,' she said.

'As you will,' said the padre, and I heard her suddenly change her tone, and thank him, from the next room.

'No matter,' he said coolly, coming back.

'After all, the two of us have done most of the nursing.'

My heart was fluttering in my throat again. 'Padre—where is he?' I whispered.

'Asleep. He hasn't closed an eye for three nights,' said my father. 'You were quieter when he held you. You wouldn't have the woman at any price. Besides, you talked far too much for any one but us to hear, my poor babe.'

'Did I?' I whispered, holding his hand to my cheek, and feeling rather troubled.

He looked down at me, and never had I seen his black eyes so tender before. 'It is all right, little one. There was your mother and myself,' he said. 'That old temple in the rock saw us too, my dear.'

I kissed his hand, and for a while we were both silent.

'Oh, padre, and he must be so tired!' I said then, remorsefully.

'Well, it was your being so ill, most of all,' said my father.

There was a light step at the door. It opened very gently. I knew who was there, and I clung trembling to the padre's hand.

'Why aren't you asleep?' said the padre roughly.

'Asleep!' said Marazion. 'I heard her call me!'

The padre sprang up and left the room, blowing his nose in a large red handkerchief. Of the next moments I cannot speak.

So life came back to me.

X.

It was Christmas Day—the day before we sailed. We had asked the padre to come with us; but he snorted, and said he was there to keep a port for us to run to when necessary. And the women of our folk dressed me in white, with Marazion's great pearls about my neck and in my ears, and they covered me with my mother's veil; and so I walked with the padre to the church on the edge of the moor above the sea. It was crowded with scarlet sashes and fierce dark faces, for all Marazion's crew were there, and many others as well. But my soul was in the ancient temple of our faith, there in the pirate's cave. There was green holly with scarlet berries about the old pillars. The priest's voice shook, and his hands too, as he spoke hesitatingly: 'Who giveth this woman to this man'—and I saw the padre's hand touch the knife in his sash, as he answered with a menacing 'I do!'

Then I guessed. The poor timid old man had been frightened into this service. I lifted my eyes wonderingly to the beautiful stern face above me. The priest spoke on so low, I could scarcely hear him, till I felt Marazion put the ring on my finger.

Then suddenly some one had gone to the organ, and the old Christmas hymn had

thundered out, and, lo! we were all singing—priest, fishermen, women, and Marazion's crew—Marazion and I hand-in-hand—'Oh come, all ye Faithful!'

It thundered like the surf on the beach, one clear boy's voice—Marazion's youngest sailor—piercing through it like a sword. And then, to the last notes of the organ, we had turned and gone out.

'Hutt!' said one-eyed Seth as we passed him—'He born to-day judged not such as we, to my thinking, capitano.'

And Marazion took his hand as he passed, and next moment seemed to disappear in a sea of red sashes and glittering knives, as his crew hurled themselves upon him to shake his hand.

'Outside, outside, you mannerless dogs!' he said, and outside they fairly dragged him.

According to our old custom he could not lift my veil till we were home. I heard him laughing and talking, and then he came back to me, picked me up bodily, and strode off with me.

'Pirate!' shouted the padre after him.

'Pirate yourself, captain,' answered Marazion.

XI.

That night we feasted and danced in the old panelled hall. At the end of eating and drinking, young Malachi, the boy who had sung, sprang on to the great oaken table, and sang the old 'Song of the Sea Rovers,' a thing that made the blood run hot through our veins.

'Lord!' said the padre when he had finished, 'if I were not so happy, I could wish that I were what I was again.'

And then the hall was cleared for the dance. I danced the last dance of all with the padre. Marazion and young Malachi were tearing down the room together, almost landing in the fire of the great open hearth. One-eyed Seth was dancing solemnly with the gray puppy in his arms, amid shouts of laughter. My veil had fallen over my face a little. I put it back to look up into the padre's brown face, as we stopped by the foot of the old winding stairs of black oak.

'Padre,' I said, 'I can never speak well when I am too happy. But I thank you for all my life, *padre mio*.'

He gave me a great hug. 'God bless you, my lamb!' he said huskily. 'You are like your mother, when we danced in this very hall. Her veil was falling, just so, and I—I had to sail away for my life without her next morning. Well! well! Look here,' he continued in a different tone; 'you're not still troubled about that wench? You know whom I mean? You spoke of her when you were out of your wits.'

'Yes, padre,' I faltered, 'I know; but I was only frightened because I was ill, and had evil dreams.'

'The women will run after him, you know,' said the padre.

I laughed. 'As they run after you, padre,' I answered.

Had not that last shadow of my fevered brain been laid to rest when I lay clasped in Marazion's arms, when I came out of the Shadow of Death and Hell?

XII.

'This stands good for home, does it not?' said Marazion, putting his signed pardon into my father's hand as we stood on the deck of his ship.

My father grinned. 'So that's your game, is it?' he inquired.

Marazion looked him squarely in the eyes. 'A king of *our* blood asks for no pardon on the high seas,' he said.

'Well, of all the unmitigated young devils'—began my father.

'I am not ungrateful, but the ship is mine, and the men are mine, and as far as I can make it, the sea is mine. It always has been mine—ours, I should say.'

'That is all sheer, solid, damned Phœnician!' said the padre. 'Man to man I agree with you, but you will have a care for her—don't let her be frightened or see'—

'God knows I will not,' said Marazion. 'If they leave me alone I'll trade fair, but I doubt if they will; and if they do not, would you have me hide behind this king's pardon?'

'Blast it, no!' roared my father, so suddenly that I jumped. And then he had kissed me and bidden Marazion farewell and gone.

My own padre! I leant over the gilded rail

of the big ship till I could see his brown face no more as he rowed ashore. An arm came round my shoulders and held me close. I looked up into Marazion's face. 'I am saying the same words as the padre, down in my heart,' I said.

XIII.

I do not think great happiness leaves such a mark upon one's nature as great sorrow. Perhaps it is not that exactly, but happiness seems to merge now into one great light, that is not broken into hours and days, like sorrow. Certain these wild days, and wilder nights, on the great ship under the Black Flag seemed to merge into the beauty of sunlit, vine-clad countries, and the clasp of Marazion's arms, and the flame of love in those relentless dark eyes.

The gray puppy (who had grown into a huge shaggy hound now, and had given up eating every one's boots and bits of rope) showed one the passing of time outwardly, though to us two who were one there seemed no time.

It was upon one Christmas Eve that we sailed for the harbour below the gray stone house—and our hold was heavy with gold and strange jewels and casks of Spanish wine—and I was in the padre's arms.

'So you have done it,' he said grimly to Marazion that night.

'Only under compulsion,' said Marazion quietly.

The padre handed a sealed document to him across the table. 'Take this thing back, for Heaven's sake! It has burned my pocket for three years,' he said.

THE END.

THE LIVYERES OF LABRADOR.

By VICTOR ROUSSEAU.

EVERYBODY has heard of the mutineers of the *Bounty*, who married women from Tahiti and became the progenitors of the Pitcairn Islanders; but it is probable that only a few persons are acquainted with the romance of the Livyeres of Labrador, the descendants of British seamen who intermarried with the Eskimos.

The word Livyere is not a native name Anglicised. It means simply the people who 'live here,' as opposed to the floating summer population of whalers and traders. The Livyeres, who resemble the Eskimos more than the English, are, nevertheless, loyal to the core to Britain, and sent nearly twoscore of their men to fight in the Great War.

All of those who survived turned their backs upon civilisation, tramping five or six hundred miles on snowshoes to resume their occupations as trappers and fishermen.

The Livyeres consist of about a thousand souls, inhabiting a territory some nine hundred miles in length, between Canadian Labrador, in

the south, and the territory of the pure-blooded Eskimos to the northward. Their history as a people begins about a hundred years ago, with the settlement along that desolate shore of shipwrecked mariners, whose numbers were increased by runaway sailors from whaling-ships. Until quite recently, however, the Livyeres were practically an unknown race.

The British husbands quickly civilised the Eskimo women who had united fortunes with them. They constructed frame houses in place of the snow *igloo*, upheld the Christian faith staunchly, and taught their children to consider themselves as British subjects. To-day fidelity to Church and State is the first principle of the Livyere's belief.

Although the motor-boat has now been introduced, and the illustrated papers come two or three times during the brief summer, on the Newfoundland mail-steamers, the Livyeres are naturally not so up-to-date as the denizens of more accessible countries. In particular, they

are not abreast of the fashions, and the bustle is only just going out of style.

The year of the Livyeres consists of ten months of winter and two of mosquito-ridden hot weather, called summer; but practically it is divided into the salmon, the cod, and the trapping seasons. In June the native exchanges his *kossak*, or sealskin coat, for the lighter *dikki*, made of moleskin or cotton drill. He puts away his sleigh and takes to his motor-boat, to lay nets for the salmon in the 'tickles,' narrow runs between two islands, or between an island and the mainland. Salted fish forms the principal staple of his winter supply, eked out with flour cakes and perhaps a caribou, shot during the season of migration, and hung up to freeze throughout the winter.

When the ice begins to form, air-holes reveal the presence of the seal, upon which the Livyere is dependent for his winter dress, his traces and whip, and the long boots that are worn by both sexes. Young seals are laid by their mothers on the new ice; the warmth of their bodies causes it to thaw beneath them, and the next frost often creates a new layer above them, so that the 'whitecoats,' as they are termed, are frequently taken by the hunters out of a perfectly transparent prison, within which they are immediately detected. Besides the whitecoats there are the 'rangers,' beautiful piebald animals, and the well-known 'hoods' and 'harps' of the North Atlantic waters, so called from the pattern upon the shoulders.

When the fur of the wild animals has grown long in midwinter, the Livyere leaves his home and sets his line of traps in the district that he has selected. The sale of his furs to the company factor, here called a 'postmaster,' provides him with the necessities of life; but, like the Montagnais Indian, he is nearly always behind-hand and in debt, and in seasons when the caribou change their route, or there is a scarcity of fur-bearing beasts, his lot is a hard one. Sometimes, however, the capture of a silver fox brings happiness to a Livyere home for the ensuing twelvemonth, for the pelt of one of these animals is worth a hundred pounds to him.

When the news comes that the minister is on the way, the Livyere harnesses his dogs to his sleigh, or *komatik*, which has whalebone runners, takes his wife and children, the babies being encased in crates, and sets out to welcome the parson and escort him a part of the way along his route. The arrival of the clergyman is the occasion for the celebration of marriages, and in former years it was customary for unions entered into without any formalities to be legalised at this time.

Recent years have been a period of black misfortune for these kindly and simple people. The last whaler of 1918 brought the influenza scourge into the country. Within a few weeks it had run like wildfire through the entire settlement, with a mortality of 25 per cent. The Rev. Henry Gordon, an Oxford graduate, who has laboured for several years among the Livyeres, assisted by visits from the medical mission under Dr Grenfell, was utterly unable to cope with the plague. He was himself attacked, and lay for three days in a stupor, from which he was aroused by the imperative necessity of digging graves for the dead in the frozen soil. He toiled at this heart-rending task for days, for the most part semi-delirious. When he recovered, and was able to investigate, he discovered whole families dead and frozen in their fireless abodes. In one settlement the sole survivor was an almost imbecile old woman, who was gnawing a lump of frozen bread in the midst of the bodies of her descendants. Mr Gordon has been revisiting England in order to raise a small sum of money to build an orphanage for the children of the influenza victims, which is to be combined with a school where an elementary education can be given and some knowledge of domestic science inculcated.

Despite his apparently deplorable position, the Livyere would under no circumstances exchange his lot for that of the dweller in a more favoured clime. He thinks himself the happiest man in the world; and Livyeres who visit Newfoundland usually lose no time in going 'down north' into Labrador again.

INDUSTRIAL USES FOR THE POTATO.

By FREDERICK A. TALBOT,

Author of *The Rejuvenation of Agricultural Britain*, *The New Garden of Canada*, &c.

I.

THE potato has always been invested with a peculiar significance. Its food value has become established, and the potato is now generally regarded as coming second to wheat as the staff of life. During the war, when our wheat-flour stocks were at a low level, we were urged to eat more potatoes, while our small food-raisers

were strongly recommended to choose the tuber as the main crop for their allotments. Some idea of the extent to which the official requests were met may be gathered from the fact that during 1918 the allotment-holders south of the Tweed raised a round million tons of the tubers from their small plots.

Ever since the potato was introduced into Europe it has been regarded as an indispensable

vegetable. It appeals to every nation included in the category of 'bread-eaters,' and the farmer, appreciating the value of this crop, was disposed to devote more and more land to its cultivation. This tendency was encouraged by the discovery that the tuber constitutes a first-class food not only for man, but for cattle as well. The potato's profitable nature particularly impressed the German farmer, and he concentrated his energies upon increasing the yield from his holdings, as well as reclaiming land which was considered to be useless for agriculture, in order to extend the acreage devoted to the tuber. The inevitable result was a glut of potatoes. The problem was complicated by the circumstance that this food became available for stock at the time when other feeding-stuffs were plentiful; whereas if the potato could only be preserved in some form or other, to be released for feeding purposes at a later date, when other suitable foods were difficult to procure, and when open-air grazing was impossible owing to snow and frost, incalculable benefits would accrue.

In this country the situation did not present such a startling aspect. Our annual crop is relatively small, being seven or eight million tons a year. Cultivation for the table still constitutes the determining factor, while the question of storage does not present any grave problems, because resort can be made to clamping or pitting. But in Germany, which raises 54,000,000 tons of potatoes a year, clamping was quite out of the question.

II.

To cope with the glut in Germany two lines of investigation were undertaken. One was purely scientific, involving the perfection of processes for the extraction of the outstanding contents of the tuber and their application to industrial purposes. The composition of the potato, according to a British authority, may roughly be set down as follows:

Starch	15.4 to 17 per cent.
Fibrin and albumen	2.5 "
Dextrine and pectose	2 "
Cellulose	1 "
Mineral matter	1 "
Fat5 "
Water	75 "
Waste	1 "

The high starch content prompted the utilisation of the potato for the extraction of this industrial commodity; while it also proved profitable to secure the alcohol, for which there was a wide and increasing market in Germany. But the starch yield varied very widely. This variation affected the market value of the produce to a very great degree. Accordingly the growers found themselves at the mercy of the merchants, who fixed the prices, which erred so markedly on the low side as to render the cultivation of the crop far from profitable. The growers were compelled to accept the

ruinous quotations owing to the extreme susceptibility of the potato to frost, which militated against the elaboration of simple, effective, and cheap storage methods.

The agrarian interests were forced to attack the question from motives of self-preservation, and the successful drying of beet-pulp after the sugar has been extracted, thereby enabling the material to be kept indefinitely for stock-feeding purposes, suggested an examination of the feasibility of applying similar methods to the potato. These investigations were carried out, and as a result two successful and simple methods were evolved, perfected, and brought into operation.

In the one process the potato is shredded into pencil-like pieces, and then dried under intense heat, the resultant product being known as *schnitzel*. In the second process the potatoes are cooked, mashed to a pulp, and passed between hot rollers, after the manner of a sheet of paper, so that when finally removed they are in the form of thin, small flakes, called *flocken*. The product from both processes may be kept indefinitely (so long as it is preserved from the ravages of damp) and is not affected by frost. Consequently the farmers are able to hold their surplus crops to tide their stock over the winter; while, if they decide to place them upon the market, they can do so under advantageous price conditions, the ruinous tactics of the merchants thus being completely circumvented. To illustrate the keeping properties of the *flocken*, or flake, it may be stated that in some instances flake has been kept for a period of five years or more, and upon investigation has been found to be quite as good as that recently prepared.

While two processes are available, it is the *flocken* system which is the more widely practised. Although somewhat at a disadvantage in cost of production, flake is claimed to be superior in point of digestibility, and the capital cost of the requisite plant is lower. Thus, whereas the cost of producing *schnitzel* was computed to range from four to six shillings per ton of raw potatoes, that of *flocken* extended from eight to ten shillings per ton of raw potatoes.

The process completely solved the potato problem in Germany. Before the war there were fully 500 potato-drying factories in operation, of which total only about 20 per cent. were devoted to the manufacture of the *schnitzel*. The rapid development of the industry was due in great measure to the practical sympathy of the Government, which co-operated with the agricultural societies in the encouragement of experiment by the offer of attractive prizes.

III.

It was quickly found that the dried potato, especially in flake form, constituted a first-class raw material for many promising products. Drying did not adversely affect the composition

of the potato. Starch and alcohol could be produced as readily from the dried as from the raw tuber. The dried product is converted into flour, which is sold as 'farina.' The demand for this product is rising steadily in these islands, owing to increasing application of 'farina' to the preparation of proprietary custard-powders, bun-flours, thick sauces, soups, and mixed farinaceous articles. The extending use in these fields is not surprising in view of the nutritive properties of the product, more particularly as it represents the potato in a highly concentrated form and free from water, which allows it to be broken down according to the dictates of fancy.

This growing popularity of farina was responsible for a new development—a proposal to prepare potato-flour in the British Isles upon an extensive scale. Hitherto, owing to the tuber having been grown almost exclusively for consumption as a vegetable, it had been felt that the quantity of potatoes remaining would be inadequate to sustain such an industry; but from investigations which had been made, it was evident that the raising of this crop had not been developed owing to the fear among the growers that supply would far outdistance demand. Moreover, the fickleness of the British climate had also been regarded as an adverse factor, especially when it is remembered that the solution for blight has not yet been discovered, and that blight, as the result of a wet season, is likely to ruin the crop.

The outlook was improved by the perfection of a new process evolved by an English inventor. The salient characteristic of this process is its variability, which permits one or other product to be exploited according to the conditions of the market. Should the demand for the potato-flour show a decline, the recovery of the alcohol and the starch may be at once pursued; while, similarly, should these fall in favour, another change over to glucose or some other by-product may be effected. The ability to ring the changes in this manner according to the pulse of the market is maintained to be a decided asset, and will tend to steady the price paid to the farmer for his raw material, which, in turn, will encourage him to devote increased attention to the cultivation of the potato and the raising of more prolific varieties, and to have more liberal recourse to fertilisers to improve the yield per acre.

There are other features which will make appeal to the potato-grower. It is pointed out that the establishment of flake-preparing mills in the centres of the potato-raising districts, with adequate railway communications and ample supplies of water, will enable the haulage problem between factory and field to be adjusted very successfully. It is conceded that haulage should not exceed five to seven miles. Acquiescence in such a limit will facilitate the grower's

part of the task. He will sell his crop as it is dug. Even if it should have been ravaged by disease, the crop will not be lost, because the mill will at once treat the damaged potatoes for the by-products, which may be satisfactorily recovered from such raw material. Similarly, if the grower desires to retain the potatoes suited for the table, he will be at liberty to do so, the mill taking over all that remains after selection or grading has been completed. Furthermore, the farmer will not be required to resort to clamping, with its attendant expense and uncertainty.

IV.

The process is simple. The potatoes brought from the fields are dumped into a capacious hopper, whence they fall on to a conveyer, which carries them to the washer. Cleaned, they are again picked up by the conveyer, to be borne to the cooker. This operation is only partly completed with the aid of steam. The automatic carrier once more picks them up, to transfer them to the flaking-machine. This consists essentially of a nest of rollers of large dimensions set varying distances apart, the space between the final rollers being approximately equal to the thickness of a sheet of tissue-paper.

In passing through this machine the potatoes become reduced to a pulp, which finally forms a continuous film or sheet, as in a paper-making machine, the sheet diminishing in thickness as it approaches the final rollers. These various rollers are hollow, and are internally heated by steam, which serves to complete the cooking operation, practically the whole of the 75 per cent. of water entering into the composition of the raw tuber being thus extracted. The film clings to the bright surface of the final steel rollers, and is peeled off by means of scrapers. Owing to the extreme thinness of the film and its dry, crisp texture, the continuous sheet crumbles into small, thin flakes—hence the name—to fall into a trough, from which it is carried by the conveyer to the packing-room, where it is weighed and bagged for storage or immediate delivery.

The operation imposes very little effort upon skilled labour. Virtually the only attention required is in the control of the steam, which must not exceed a certain temperature or it will char the flake. It will be observed that the potatoes are discharged into the machine whole, but the peel becomes detached from the pulp or fleshy part of the potato, and is similarly flaked, to fall into the collecting-trough.

The flake may be used for the production of starch, glucose, alcohol, dextrine, or whatever other by-product may be required, or it may be utilised in this condition for the preparation of cattle food. A certain quantity has been used for the manufacture of nitrogenous soap, and has been found well adapted to this unusual

application. If farina is the ultimate product desired, the flake is milled in the ordinary manner. In this process the skin and other inedible material become separated from the rest. The offal is not wasted, but is recovered, to be converted into compounded cattle meal.

v.

The farina is yellowish-white in colour, extremely fine, fragrant, and slightly sweet to the taste, and the potato flavour is not so marked as might be supposed. It is eminently suited to the making of bread, yielding, if mixed with flour in the proper proportion, an attractive loaf of even cellular structure, free from sponginess—a loaf which will retain its moisture for a much longer period than one made from pure wheaten-flour. Moreover, it renders the bread more easily digested, while the rich carbohydrate content of the farina renders it a valuable nutritious food. The addition to the loaf may safely be carried to 5 per cent., which is equivalent to seventy pounds of mashed potatoes per sack of flour, one pound of farina being equal to five pounds of raw potatoes. Even in this marked proportion no trace of the potato is observable to the palate.

A popular prejudice against the use of the potato in bread-making appears to obtain, but in reality it is quite unreasonable. Probably the objection has gained strength from the sodden character of the loaf into the preparation of which mashed potatoes have entered. This is due to the difficulty of mixing the dry flour with the wet mash. Again, unless extreme care and cleanliness are observed in the handling of the mash the bread will speedily sour, the potato being extremely sensitive to contamination.

When the potato is used in a farinaceous form, however, no such disadvantages prevail, inasmuch as the farina can be more readily and completely blended with the wheaten product, thus ensuring a homogeneous loaf. The use of the potato in the making of bread is by no means a modern innovation; nor can it be regarded as an adulterant in view of its high food value. In the days of our great-grand-fathers bakers were compelled to incorporate a certain proportion of potatoes with the wheat-flour for technical reasons, British wheat being less glutinous than foreign wheat, which was not available in those days. With the introduction of the imported cereal, more glutinous in character, the necessity to resort to the potato to remedy the inherent deficiency of the domestic wheat disappeared, and so the practice was permitted to lapse. Even to-day, however, scientifically prepared potato-bread is superior to the pure wheat product, and this is one reason why home-made bread, obtainable on remote farms, is often so much appreciated.

The elevation of the potato to an industrial plane in these islands represents the dawn of a

new era. The proposal has been discussed in Irish circles, being strongly advocated as a means of coping with the surplus crop harvested in that country. The fact that it offers a means of steadying the market, and secures the farmer against complete financial loss in the event of adverse weather causing widespread disease, should be sufficient to encourage the devotion of more acres to the growth of this commodity, as well as the more extensive use of artificial fertilisers to obtain bigger yields per acre. If such enterprise should be displayed, the farmer would not only benefit materially in pocket, but he would enable certain other native industries to secure a solid footing, and render us less and less dependent upon the foreigner in matters pertaining to our foods and industries.

OUR SHOP.

MOTHER says it's awful, now, the price she has to pay
When she goes to do the marketing for dinner every day.
She says she wishes we could live on what the birdies eat,
With berries for our pudding, and a juicy worm for meat!

But underneath the gorse-bush, just above the old sea-wall,
Phyl and I, we have a shop that isn't dear at all.
And we are always most polite to customers, and say,
'How can I serve you, madam? *Everything* is cheap to-day.

'We have pebble new potatoes at a penny for a pound—
And we'll throw you in this pebble egg, so smooth and white and round.
And Phyl has made some cakes and scones that look extremely nice,
And a lovely slab of butter—may I offer you a slice?

'We can sell you needles, also, for they grow in dozens here,
Or a yard of seaweed ribbon—would a penny be too dear?
While to-day we're very lucky; we've a set of furs in store,
For Mr Rabbit caught his coat when passing by our door!'

The reason why our price is sure to be within your reach
Is because we mostly get our goods for nothing from the beach.
Materials for our butter and our cakes are close at hand—
They are made of best sea-water, and the very finest sand.

So when you're tired of spending in the ordinary way,
Just walk along the old sea-wall where, every sunny day,
We are spreading out our goods, and hoping somebody will stop,
For we *love* to have a customer at our little shop!

B. NOEL SAXELBY.

Chambers's Journal

SEVENTH SERIES

VENGEANCE VALLEY.

By W. VICTOR COOK, Author of *Grey Fish*.

PART I.

I.

PERHAPS the most convenient point at which to commence following the adventures of Kid Peters is a June morning on which he found himself released from the Montana State Prison at Deerlodge, where he had just completed a sentence for cattle-thieving. Such an introduction, I am aware, is scarcely calculated to enlist the sympathy of God-fearing people on Kid Peters's behalf; but it is best to be truthful. Moreover, it will cheer you to know that as a matter of cold fact the Kid never stole anything in his life, unless it were the affections of men and women—for he was a straight, dark, gay-eyed limb of a lad before Deerlodge closed its heavy gates on him. Even the judge, in sentencing him, had expressed regret that appearances should be so deceptive, and had added a quantity of good advice about pulling up before it should be too late.

Kid Peters thought of this good advice now with a grim smile on his thin face, as he stood and drank in the clean sunlight. Not, of course, that he had any idea of following the judge's counsel. He intended to follow Sid Morgan instead, and kill him. Why? Because it was Sid Morgan, foreman of the great ranch in the Musselshell Valley—near which the Kid, two years ago, had dared to set up as a homesteader—who had engineered the diabolical net of circumstantial evidence upon which the Kid had been unjustly condemned for a theft he had never committed. If you know anything about the way the powerful ranch-owners of western Montana try to freeze out homesteaders near their territories, you will not need to be told how such a net could be woven; if you don't know anything of these matters, you must excuse me for passing on. The fact remains that the Kid, with two years of bitter brooding in his young heart, intended to find Sid Morgan, and kill him. Very wrong and unchristian, of course; but the Kid was only twenty-three.

The State of Montana, taking a keen interest in the welfare of its citizens, and desiring the work of reformation commenced in the penitentiary to be continued beyond its gates, had kindly equipped the Kid in an all-cotton suit

of clothes which couldn't possibly fit any one, and was popularly reputed to cost three dollars seventy cents, and, as a further proof of its interest in his future well-being, had presented him with five dollars cash with which to pay his expenses in removing from Deerlodge. The citizens of that enterprising town object strongly to any ex-convict's presence within their corporate limits, just as strongly as the penitentiary residents object to their own presence there, before becoming ex-convicts. So the State releases its prisoners one day before the expiry of their sentence, and having thus twenty-four hours' control of their movements, compels them to take an immediate departure.

Kid Peters took his departure accordingly, and, with the assistance of a few rides borrowed at the expense of the railway authorities, made his way back to the ranching country, though not to the same district which had witnessed his misfortune. At that season, he knew, ranch help would be greatly in demand, and he easily secured a job. After a month's work he drew such of his wages as had not been already advanced for clothing, and began in earnest his hunt for his enemy.

II.

He had counted on finding Sid Morgan at his place on the old ranch, but at the outset of Kid's quest disappointment awaited him. Morgan had disappeared from the district. Kid Peters digested the rebuff as best he might, but it only added heat to the smouldering fires within him. He dared not make open inquiry; and so, smothering his fierce young pride, he got work again in the place where all men knew of his disgrace, and settled himself to await the revelations of chance gossip.

Two years previously he had been the proud possessor of a sorrel gelding of uncertain antecedents and more uncertain temper, which at the time of his misfortune had been taken charge of for him by a fellow-homesteader, who persisted in believing in the Kid's innocence in face of all the evidence brought against him. To this loyal friend the young man one day betook himself to claim his property.

'There he is, Kid, as strong as a lion, and

pretty near as dangerous,' said the homesteader, taking Peters out to his corral. 'I've had some good offers for him, too, but I knew you kind of liked the brute, and I wouldn't sell him. I always calculated on your coming for him some day. Who do you think made me the last offer for him?'

'Some guy who didn't know him,' answered the Kid with an approach to his old gay smile.

'You're wrong! It was that son-of-a-blank, Sid Morgan, who testified against you at the trial.'

The face of young Peters set hard, but he held himself in. 'What did he want him for?'

'He wanted a strong horse to go prospecting with.'

'So do I,' said the Kid. 'Morgan and the boss had a fall out, they tell me.'

'That's so. Morgan got fired. He packed up and went off to the Bitter Root Range, to hunt for gold-bricks.'

'The Bitter Root Range is a big place,' remarked the Kid, spelling for information. 'Some one put him wise?'

'If so, Sid kept it dark. He's deep.'

'I hope he'll meet his deserts,' said Peters, and rode thoughtfully back to the ranch on his sorrel gelding.

As he had remarked, the Bitter Root Range is a big place, running through five degrees of latitude, and forming the boundary between Montana and the State of Idaho. To look for a roving prospector among the infinite complexity of its five hundred miles of peaks and valleys, its forests and cañons and torrents, is many degrees more herculean than to hunt for a needle in a hayrick. Nevertheless, Kid Peters, nursing his vengeance from day to day, came to the wilds of the Bitter Root. To outward seeming he was a prospector like other prospectors, only perhaps better-looking than the majority.

Day after day up and down the gulches of the great divide he rode his sorrel gelding, his wide hat shading his grim young face from the scorching sun, his high lace-boots up to his knees, his provisions and his prospector's clutter strapped to the saddle. The yellow, marigold-like flowers of the bitter root, Montana's floral emblem, bloomed about his horse's feet; the torrents roared along their beds beside him; the great crags reared above him towards the blue. But go where he might, he could hear no tidings of Sid Morgan, his enemy.

III.

On an evening in late September Kid Peters was riding slowly down a valley of the upper foothills, following the course of a shallow creek that ran gurgling in a gravelly bed, and considering a suitable camping-ground for the night. For two days he had been traversing almost virgin country. He had crossed a pass in the

divide six thousand feet above sea-level, and he had come gradually down through a succession of scenery so glorious that the sheer splendour of it had made him forget the demon of hate which had brought him thither. Immense bull-pines, great fir-forests in the gorges, small, deep lakes that mirrored the sky from unruffled surfaces, made a solitude peopled only by the creatures of the wild—white-tailed and black-tailed deer, elk, mountain goats, black and cinnamon bears. Once he had seen a mountain lion, which had grinned at him with bared teeth and passed on. Along the stream-banks he had watched beaver and pine-marten and musk-rat busy at their affairs. The Kid felt good, and as the sunset glow reddened the heights above him, the spell of this mountain land descended on his soul.

'Say, have you seen a white mule?'

The Kid started out of his reverie, and looked over his shoulder for the origin of that clear musical voice.

She was the very complement to his dreams. Lovely? He had never seen anything like her as she stood there, questioning him with anxious brown eyes and parted red lips.

'Have you seen a white mule?'

If Kid Peters could have truthfully said he had seen a white mule, he would have felt happier. But he couldn't, so there was no use beating about the bush.

'No. Have you lost one?' He threw himself from his horse, and eagerness and admiration illumined his young face.

'I've had one stolen,' said the witch of the mountains, meeting his glance with a faintly rising colour.

She was dressed very much as the Kid was himself, and was clearly prospecting. She had on lace-boots like his, and a short-skirted dress over knickers. Her hair, cut short—but not too short—clustered about her face in shining curls. A little way behind her, where a tiny rivulet ran down to feed the creek, the Kid perceived her cabin—an ordinary prospector's cabin—at the mouth of a tunnel dug in a bank, with its dump of pay-gravel beside the sluice-boxes.

'You're the first living soul I've seen in this valley,' he informed her. 'Guess if I had met in with any one else like you, I shouldn't have got this far.' The Kid accompanied this forward remark with such an honest smile that it was next to impossible to take offence. 'I crossed the divide yesterday, and came right along down. What's the name of this gulch?'

'Vengeance Valley,' said she.

'Well, that's a nice name, sure!' remarked the Kid. 'Won't you tell me about this mule of yours?'

He noticed the red lips set firmly, and the brown eyes fill with tears, and he pretended to busy himself in a casual way with the girths of his saddle.

'Yesterday I went down for supplies to Hat

Creek,' she said. 'That is twenty miles away. I took what little dust I had with me—this placer does not pan out as I hoped, but I mean to persevere—and I came back this afternoon with stuff for three weeks. I tied up the mule for a minute by the cabin door before unloading her, and went a few hundred yards down the stream, round the bend yonder, to look at some traps I had set. I wasn't away half-an-hour, but when I got back the mule was gone, and all my stuff with her.' The witch's voice broke, and the tears would come. She dashed them away with a little brown hand.

'Say, that's too bad! A real dirty bit of work! But don't you worry, Miss—Miss'—

'My name is Hester M'Cleod. Guess you don't belong around here, Mr—Mr'— she countered, smiling through her tears.

The Kid was strongly tempted to sink his besmirched identity under a fictitious name; but looking into that face of hers, he felt it impossible. 'I'm called Kid Peters,' he said. 'I don't belong anywhere particular. See here, Miss M'Cleod, the guys that took your mule can't be far away. If she has come twenty miles to-day, she won't be good for much more this side of to-morrow. There's nothing to be done to-night. The dirty skunks who have stolen her will take good care not to light a fire, and we can't track them in the dark. There's plenty of grub for the two of us on my horse; so, if you will please allow me, I'll just build a fire here by the creek, and we'll have supper, and then you can turn in to your cabin, and I'll lie by the fire—in case they pinch that too.' The Kid smiled cheerfully, and his spirits rose mightily to see the relief in his pretty companion's face. 'As soon as it's light,' he added, 'we'll set off on the war-trail. Have you got a gun?'

'It's on the mule.'

'That's a nuisance! Never mind. We'll make out without one.'

IV.

How he was going to make out without a gun, in the face of bandits who had one, and probably more than one, the Kid had no very clear notion, but under the inspiration of present company his spirits soared above such trivialities.

Under the inspiration, too, of the excellent fire which he built, and of the excellent supper which he cooked, and of the elastic youth of them both, their acquaintance made surprising progress. The Kid, omitting only the disastrous episode of his residence in Deerlodge, gave Miss M'Cleod a truthful and not unattractive sketch of his roving young life as miner, rancher, and homesteader. In return, he learned how Miss Hester, an only child of a widower, had come west with her father as a girl; how her father, bitten with the prevalent gold-fever of the country, had contrived through good and evil

fortune to equip his daughter to teach in the high schools of the State. This fact at first went near to appalling the Kid, who had never in his life set foot over the threshold of a high school; but his alarm was happily discounted and tempered to mere human adoration by Miss Hester's frank, unabashed trust in his manhood, and the magic spell of her beauty. When he learned further that old M'Cleod, coming home to die after a distant expedition in the Bitter Root, had bequeathed to his daughter the secret of a supposed rich deposit in Vengeance Valley, and that she, inheriting his wander-lust, had put in the long summer vacation in carrying on single-handed the old man's prospecting, the romantic completeness of the situation held Kid Peters enthralled.

When at last, much later than was prudent in view of the necessity of a start at dawn, they bade each other good-night, they might have known each other for years. When the rough door of her cabin closed behind her, the Kid stood staring at it like a man in a trance, his young wits a whirl of mad, glad fancies. When he rolled himself in his blanket and lay down beside his fire, the solemn march of the stars over his head looked down upon a young man bewitched from all possibility of slumber; and long before the cabin door opened again, and the witch stepped freshly out into the dawning day, he had their breakfast ready, and the sorrel gelding saddled for the journey.

'I've been thinking about that scum that took your mule, Miss Hester,' said the Kid. (It had got to 'Miss Hester' already.)

'They have a good start of us,' she answered dubiously. 'And we haven't the least idea what direction they have taken.'

'We can make a pretty good guess, though,' said the Kid cheerfully. 'If you'll stand just here beside me, I'll be able to show you what I mean.'

Miss M'Cleod came and stood there accordingly—though, to tell the truth, she could have seen just as well where she was.

'They can't have gone straight down the gulch, or you would have seen them. And they can't have gone straight up, or I should have seen them. So it follows that they must have side-tracked themselves somewhere. That's logic!' Miss M'Cleod nodded approval. 'Next, they are not likely to stay close around waiting for callers, with an animal on their hands whose colour would identify her five miles away. Their plan would be to get away as quick as they could, and camouflage that mule so that her own sister would pass her without cocking an ear. They must have known you were here, and come over on purpose to rob you; and if that's so, it means they had either run short of grub, or lost their own beast, or both. And it means, too, that their own camp must be within a radius, say, of twenty miles or thereabout.

And on this side the creek. It's too deep and dangerous to ford for some distance, and the hills the other side are too bare for cover and too steep to travel. Is that logic too?'

'Yes, Sherlock,' said Miss Hester, smiling; 'though these things had not struck me before.'

v.

Mightily encouraged by her appreciation, the Kid pointed with a lean brown hand towards a dark belt of pines that straggled up the rise of the hillside a little behind Miss M'Cleod's cabin. 'Yon's the road they took, or I'm a Dutchman,' he pronounced. 'Those trees are the skirts of a great forest which stretches up into the mountains for miles. Yesterday, when I came down from the divide, before I started to follow this creek, I stood a while to get the lie of the country in my head. Some miles higher up, the ridge which that forest covers, and which shuts in this side of the valley, drops to a much lower level, and at that point a man who knew the country should be able without much difficulty to cross from this valley to the head of another that winds round and runs almost parallel to it. Seen from above, the two look like the halves of a much wider valley, split down the middle by the ridge of forest. I should fancy your friends are camped somewhere down in the other half of the valley. We'll just go and see.'

Fired by the romantic zest of the adventure, Kid Peters spoke as though the traversing of a score of miles of virgin hill-forest were as simple a matter as crossing the street to post a letter. But Miss Hester experienced a moment of hesitation at the prospect. In broad daylight the undertaking struck her as a little preposterous. Her brown eyes smiled at the Kid kindly—very kindly—and the curl-framed face tilted a little coquettishly to one side as she voiced her hesitation.

'You're good. You'll think me very silly, but I believe I'd be more sensible to come down with you to Hat Creek, and let the old mule go. If you don't mind, Mr Peters.'

'What!' cried the Kid, in genuine horror; 'leave those scallywags to get away with their plunder? Oh, say, Hester!'

The ardour of his protest was more than Miss M'Cleod had bargained for, and so was his free use of her name, but the honest warmth of the boy's enthusiasm defied reproof. Indeed, she rather foolishly laid a small hand on his shoulder.

'You see, it doesn't *really* matter so much to me,' she urged. 'I've got my living to go back to. It may be a serious thing to them.'

'I'll make it so, if I can,' quoth the Kid fiercely. 'The scoundrels—robbing a helpless girl like you!'

'I suppose I *must* seem pretty helpless,' she admitted, with a sly upward glance in his face. 'No grub, no mule, no idea who robbed me, or

where the robbers went. I must look kind of soft.'

The mock-rueful glance was still on him. The Kid felt pretty desperate. 'See here, Miss Hester,' he exclaimed, 'if I was to start telling you what you look like, I guess—I guess'—

'Well?'

'Oh, I guess you'd think me crazy! Now, let's think. I can see you don't cotton to the idea of chasing around the Bitter Root Range after that mule with a wild cow-puncher like me; and perhaps you're right. Here's what we'll do. I'll leave you half my grub, and I'll get along after them. If I don't strike their trail in three days, I'll come back and take you down to Hat Creek. Then I'll load up with some more stuff and a gun, and try again. Get that mule I will!'

'You're quite determined, Mr Peters?'

'Quite,' said the Kid.

'Then, if you go, I will go. So let's start.'

vi.

They started. Never in his life had the Kid felt so exuberantly happy. He seemed to tread on air. They spent a whole glorious day together, scrambling over the forest-clothed ridge. The going was hard at times—very hard; but if the Kid had been offered a bower in Paradise in exchange, he would have laughed contemptuously.

All day long they had seen nothing of their quarry. But towards sundown, having traversed the ridge, and begun to descend from the forest at the point where the valleys forked, they perceived, some way down the newly opened gulch, a thin spiral of smoke rising from a stretch of bare ground near the creek-bed. It was too far to make out any details, and the daylight would not serve long, but the sight gave them a new incentive.

'If the mule is there,' said Peters gaily, 'we'll go and collect her. If not, we'll perhaps hear about her.' He led his weary sorrel gelding down the steep hillside, and with the light failing they approached the camp.

The smoke was curling from the roof of a rough shanty built on rising ground a little way from the creek, and just clear of the timbered slope above. A white mule, plain for any one to see, was tethered by a rope to the doorpost. Nobody was to be seen outside.

'There she is,' said the Kid. 'You stay here with the horse, Hester, and I'll fetch her.'

But Miss M'Cleod, who throughout the long day had borne herself bravely, suddenly gave way to apprehension. She laid a detaining hand on the Kid's arm. 'Tell me; what are you going to do, Kid?'

'Why, get the mule, sure,' answered the Kid, who felt electric thrills running up his arm and all over his body.

'But there may be several of them, and you are single-handed and unarmed!'

Kid Peters lingered, loath to lose those electric thrills. 'I learned a hymn once,' he muttered. 'It went something like this, Miss Hester: "Twice armed is he whose cause is just, and three times he who gets his blow in fust." Don't worry about me.'

'Promise me,' she begged, 'that you won't do anything rash. Oh Kid, if anything happened to you, I should—I should feel dreadful!'

This was more than Kid Peters could stand.

'Would you?' he whispered, snatching both her hands in his. 'Would you? I wonder!'

'Please, please don't do anything rash!' she implored. 'Promise me!'

'I promise, on my—on my life!' he vowed; and even as he spoke the last word he unintentionally broke his vow, for he kissed both her hands fervently as he left her without another word and made for the camp.

(To be continued.)

A THRILLING INDIAN JUGGLER.

By C. D. WEBSTER.

THERE has been a certain amount of discussion of late about the mysticism of the tricks performed by Indian jugglers, and although I have never seen the 'pole-trick' performed, I have seen several very remarkable feats, about which there was no mysticism whatever. In fact, the crudity of the whole 'show' I witnessed was the most striking part of it. The juggler, his assistants, his whole 'bag of tricks,' and the perfectly natural surroundings seemed to preclude entirely the possibility of much aid from previously prepared apparatus.

The occasion was a regimental 'anniversary,' and for the entertainment of our guests the troupe of performers had been sent for from some neighbouring city.

The stage was an open, grass hockey-ground, and the setting a wide plain and the clear blue sky. The day was one of the usual bright cold-weather days of northern India.

A *shamiana* of tents had been erected on the edge of the hockey-ground, and under it our guests sat, and partook of refreshments. The sepoys all sat outside the side-lines of the hockey-ground. It was an ideal spot for the performance.

The troupe consisted of a middle-aged Mohammedan of about fifty, a younger man, and a boy. They gave the appearance of hailing from the United Provinces.

For the execution of their programme they divested themselves of all apparel, with the exception of the loin-cloth. The tricks were carried out within a few yards of the *shamiana*, and directly in front of it.

The first trick was a very thrilling one, requiring unshakable nerves. Two poles, each of them six or seven feet long, were produced, and lashed together, end to end, with string. So roughly were they attached to each other that when the combined pole was raised into the air a distinct 'kink' was visible at the joint, and the top half seemed to wave about as if disinclined to remain in a straight line with the bottom half.

The next item to appear needs a bit of describing. It consisted of a rough pad or saddle, firmly stuffed and covered with coloured cloth.

It was about a foot in diameter, and more or less circular. The shafts of three short javelins, each about one and a half feet long, were embedded in the saddle, so as to form a sort of tripod, with the heavy pointed spear-heads as the feet. Under the saddle there must have been a cup of leather or metal into which the end of the pole was placed. So much for the apparatus for this trick, which we shall now try to describe.

The older man, with the help of the younger one, raised the pole, with the tripod balanced on its tip, into a perpendicular position. He then proceeded slowly to circulate the wobbly pole, which was a good twelve feet in length, so that the saddle began to revolve. Gradually increasing the strength of the revolutions, he waited until the saddle was going round at a tremendous pace, making the hearts of all the spectators rise into their throats for fear that something would give way—and then, suddenly, to every one's horror, he gave the pole an upward heave!

In an instant the tripod, still whirling round and round at top speed, shot into the air. The pole fell sideways to the earth, and the fearsome-looking sharp-pointed tripod descended headlong. Before we knew what had happened, the old man, with a shout of 'Allah!' threw himself flat on his back—and there he was, pinioned to the ground by the spears!

But he had come to no hurt, and we saw that in his recumbent position his legs were stretched wide apart; one of the javelins had embedded itself in the grass between them, and the other two, between his arms and his body, were likewise so deeply buried that his assistant and a spectator had to pull the heads out of the ground before the daring old fellow could get up. With a bound he was on his feet and ready for the next trick, which, for what seemed sheer suicide, was even more blood-curdling than the first. Several of our lady friends had to turn their heads aside during its execution.

For it, a common or garden Indian bullock-cart, one of the clumsiest things on two wheels imaginable (if one does not take into account the iron-wheeled carts of central China), was hauled

on to the ground by some sepoya. It had heavy wooden sides and wheels, and its long shaft protruded straight out from the body of the cart.

To the extreme end of the shaft an antique bayonet, with an iron socket and ring, was tied, in the same effective, though crude, fashion, with its sharp point outwards.

The cart was then crammed with sepoya—at least a dozen must have got aboard—and the shaft was lifted off the ground by some others.

The old juggler then strode up to his bulky piece of apparatus, and bending down, guided the tip of the bayonet on to a point in his forehead about two inches above the level of his nose. Every one, except himself and the crew on the cart, stood well clear. His arms behind his back, he now proceeded to push steadily against the bayonet with his forehead. He put every ounce of his weight and every atom of his strength into that steady pressure. We could see the veins standing out on his neck and the perspiration on his temples. The ladies uttered little screams of terror. After a few seconds the cart began slowly to move backwards, and, having once started it, the extraordinary old fellow took some half-a-dozen steps forward, propelling it before him. Then he leapt backwards, and the shaft of the cart rattled to the ground. He afterwards displayed his forehead to us all. There was a little blood where the point of the bayonet had cut the skin, and a distinct groove about

half-an-inch long in the skull, caused by the frequent performance of this trick.

These were his two most spectacular performances, which between them seemed to have taken a good deal out of him.

He next proceeded to eat a small roll of white cotton, and invited any one to pull the end of it—which he displayed sticking out of his abdomen! I myself pulled it, and drew at least a foot of it out, and there was no doubt about its coming from under the skin, because as I pulled I drew the outer skin outwards into a peak with it! The ladies, I may say, were *not* invited to view anything except the first part of this trick—namely, the swallowing. They were left to 'swallow' the rest themselves, and accept what their male friends told them.

The juggler finished up his extraordinary entertainment by lying flat on the ground, face upwards, and allowing a huge stone about a hundred pounds in weight to be placed on his chest. Two immense mallets were then produced, and two of the regimental *pahleas* (strong men) were invited to get to work and hammer it to pieces on its living platform. This, with much grunting and groaning, and many mighty swipes, they managed to do, and the stone rolled off in two halves, one on each side of the smiling old ruffian, who, rising, 'salaamed,' and announced that the end of his programme had now been reached.

THE PARTS MEN PLAY.

CHAPTER XXVII.—A LIGHT ON THE WATER.

I.

A SULKY winter came hard upon November, and the war of armies was succeeded by the war of diplomats.

One day in January the same vehicle that had driven Selwyn to Roselawn deposited another visitor there. He was a sturdy, well-set-up fellow, but a thinness and a certain pallor in the cheeks conflicted with their natural weather-beaten texture.

The morose driver helped him to alight, and handed him his crutches, which he took with a snort of disapproval. He made his way at a dignified pace around the drive, pausing *en route* to look at the gables and wings of Roselawn as one who returns to familiar scenes after a long absence.

Without encountering any one he reached the stables, and opening a door, mounted the stairs that led to the dwelling-quarters above.

There was no one in the cosy dining-room, and sitting down, he hammered the floor with his crutch. The homely sound of dishes being washed ceased suddenly in the adjoining room, and Mrs Mathews threw open the door.

'Who is it?' she cried.

'Me,' said Mathews.

Uttering a pious exclamation that reflected both doubt and confidence in the all-wise workings of Providence, his wife fell heavily upon him, with strong symptoms of hysteria.

'Heavenly hope!' she cried, after her exuberance permitted of speech; 'so you've come home?'

'I hev,' said her husband solemnly; 'and I'm werry pleased to observe you so fit, m'dear. Is the offspring a-takin' his oats reg'lar?'

'Lord!' said Mrs Mathews irrelevantly, subsiding into a chair, 'I thought you was dead. You never writ.'

'That,' said Mathews, 'was conseckens of a understandin', clear and likewise to the point, atwixt me and Mas'r Dick. "Mum's the word," sez he. "Mum's the word," sez I. And that there was as it should be, no argifyin' provin' contrairiwise. But Milord he found me out, and sez as how he knows it all, and would I come home?—which, bein' free from horspital, I likewise does. Now, m'dear, if you will proceed with any nooz I would be much obliged to draw up a little forrader, as it were.'

'Did Milord tell you about Miss Elise?' said his wife, after much thought. 'She's gone and got herself engaged.'

'To who?'

'Captain Selwyn. Him as was visiting here when the war begun.'

'Now that there,' said Mathews, nodding his head slowly and admiringly, 'is nooz. That there is what a feller likes to hear from his old woman. You're a-doin' fine.'

'The wedding,' went on his wife, her eyes sparkling with the universal feminine excitement about such matters, 'is next week, and Wellington is bespoke for to pump the organ. Ain't that wonderful grand?'

'That,' said Mathews with great dignity, 'is werry gratifyin' to a parent, that is. Pump the organ at a weddin'! I hopes he won't go for to do nothing to give inconvenience to the parties concerned. Where is he, old girl?'

'Upstairs in bed, daddy, with the whooping-cough something horrid.'

'Wot a infant!' commented the groom proudly. 'I never see such a offspring for his age—never. Whooping-cough something horrid? Well, well!'

For a full minute he reflected with such apparent satisfaction on his son and heir's vulnerability to human ailments that there is no telling when he would have left off, if his reverie had not been broken by his wife placing a pipe in his hands and a bowl on the table.

'It was always waiting on you, daddy,' said the good woman. 'I sez to Wellington, "That's his favourite, it is, and we'll always have it ready for him when he comes home."'

Without any display of emotion or undue haste, the old groom filled the pipe, lit it, drew a long breath of smoke, and slowly blew it into the air, regarding his good partner throughout with a look that clearly showed the importance he attached to the experiment.

He took a second puff, raised his eyes from hers to the ceiling, and his broad face crinkled into a grin, the like of which his wife had never seen before on his countenance.

'Old girl,' he said, 'when I sees you first I sez, "There's the filly for my money;" and so you was. And, by Criky! you and me haven't reached the last jump yet—no, sir. M'dear, I hev some nooz for *you* now.'

He puffed tantalisingly at the pipe, and surveyed his wife's intense curiosity with studied approbation.

'When Milord come to see me last week,' he said, measuring the words slowly, 'he tells me as how he won't go for to hev no more hossees, and conseckens o' me bein' all bunged up by them sausage-eaters, he sez as how would I like to be the landlord o' "The Hares and Fox" in the village, him havin' bought the same, and would I go for to tell you as a surprise, likewise and sim'lar?'

'Heavenly hope!' cried the good woman, bursting into tears; 'if that ain't marvellous grand!'

'That,' said Mathews, beckoning for her to hand him his crutches, 'is what Milord has done for you and me. And, missus, as long as there's a drop in the cellar none o' the soldier-lads in the village will go for to want a pint o' bitter nohow. Now, old girl, if you'll give a leg up we'll go and see how the infant is lookin'.'

II.

A few days later, in the chapel decked with flowers, the marriage of Selwyn and Elise took place.

In spite of her disappointment that Elise was not marrying a title, Lady Durwent rose superbly to the occasion. She led the weeping and the laughing with the utmost heartiness, and recalled her own wedding so eloquently and vividly that those who didn't know about the Ironmonger supposed she must have been the daughter of a marchioness at least, and was probably related to royalty.

Just before the ceremony itself the youthful Wellington, who had confounded science by a remarkable recovery from his ailment, was confronted with the offer of half-a-crown if he acquitted himself well, and threatened with corporal punishment if he didn't. With this double stimulus, he pumped without cessation and with such heartiness that the rector's words were at times hardly audible above the sound of air escaping from the bellows—necessitating a punitive expedition on the part of the sexton, and engendering in Wellington a permanent mistrust in the justice of human affairs.

Late in the afternoon bride and groom left for London, on their way to America.

When the train came in and they had entered their compartment, Selwyn, with feelings that left him dumb, looked out at the little group who had come to say farewell.

Lord Durwent stood with his unchangeable air of gentleness and courtesy, but in his eyes there was the look of a man for whom life holds only memories. Lady Durwent alternated dramatically between advice and tears; and Mathews stood proudly beside his wife (whose hat was of most marvellous size and colours), nodding his head sagaciously, and uttering as much philosophy in five minutes as falls to the lot of most men in a decade.

And so, with his wife's hand trembling on his arm, Austin Selwyn leaned from the window and waved good-bye to the little English village.

III.

A year went by, and, with the passing of winter, Selwyn and Elise, in their home at Long Island, watched the budding promise of another spring.

Their home was by the sea, and in the presence

of that great majestic force they had lived as man and wife, taking up the broken threads of life, and knitting them together for the future.

The task of resuming his literary work had been next to impossible for Selwyn. He had tried to mould the destinies of nations—and they had fallen back upon him, crushing him. His thoughts cried out for utterance, but self-distrust robbed him of courage. Months went by, and his chafing, restless longing for self-expression grew more intense and more intolerable.

And then the woman who was his wife lost her own yoke of self-restraint in solicitude for him. Timidly, hesitatingly at first, she invaded the precincts of his mind. With subtle persistence, yet never seeming to force her way, she wove her personality about his like a web of silken thread. Her purity of thought, her innate artistry, her depth of feeling, played on his spirit like dew upon the parched earth.

As the passing hours took their course, each nature unconsciously gave to the other the freedom that comes only with surrender. His strength and his care for her liberated her womanhood, and, like a flower that has lived in shadow, her soul blossomed to fullness in that warmth.

And his troubled mind, directionless, yet rebellious of inaction, found again the meaning and the hidden truths of life, then gained the courage to be life's interpreter.

Once more Austin Selwyn wrote.

One evening towards the summer Elise was sitting on the veranda, when he came from his study and joined her. The first pale stars were shining through a sheen of blue that rose from the horizon in an encircling, shimmering mist.

'Are you through with your writing?' she said.

'Not yet,' he answered, sitting beside her; 'but I could not resist the call of you and this wonderful night.'

'Isn't it glorious?' she said softly, taking his hand in hers. 'I think that blue over the sea must be like the Arabian desert at night when the camel-trains rest on their way. Don't you love the sound of the waves?'

With a little sigh she leaned her head on his shoulder, and he held her close to him.

'Happy, Elise?'

'So happy,' she whispered, 'that I am afraid some day I shall find it isn't true.'

He laughed gently, and for a few moments neither spoke, held by the wonderful intimacy of the spirit that does not need words for understanding.

'Austin dear,' she said at length, 'before you came out I was counting the stars—and playing with dreams. Don't think me silly, will you? But I was planning, if we have a son, what I should like to call him.'

'I think I know,' he said, pressing his lips against her hair. 'Dick?'

'And Gerard for his second name. I should want him to be strong and true like Gerard—

but he must have Dick's eyes and Dick's smile. But, then, I want so much for this dream-boy of ours—for, most of all, he must be like my husband.'

With a sudden shyness she hid her face against his breast, and he ran his hand caressingly over her arm, which was like cool velvet to the touch.

The glimmering stars grew stronger, and a breeze from the sea crept murmuringly over the spring-scented fields.

'There are times,' he said, 'when I long for the power to reach out for the great truths that lie hidden in space and in the silence of a night like this—to put them in such simple language that every one could read and understand. I think, dear, if I could translate the wonder of you and the spirit of the sea into words, I could prove the immortality of the soul.'

She looked up into his face, and something of the mystic blue of the skies lay in the depths of her eyes.

IV.

Late that night he resumed work in his study, but a thousand memories and fancies came crowding to his mind. He tried to shake them off, but they clung to him—memories of the war—memories of the times when the world was drunk with passion. He heard, as if afar off, the whine and shriek of shells, and he saw the dead—grotesque, silent, horrible.

That was the great absurdity—the dead.

It was hopeless to write. He was no longer pilot of his thoughts.

He rose to his feet and threw open the door with an impatient desire for fresh air. Though the cool breeze refreshed his temples, the restlessness of his mind was only increased by the hush of nature's nocturne, through which the sound of the sea came like a drone.

Beneath the canopy of that same sky the dead were lying. Across the seas a breeze of spring was stealing about the graves, as now it played about his face.

What was his part towards them—to mourn, and fill his life with useless melancholy? To forget, and turn his face towards the future?

Forget . . . ?

'There are times'—he found himself repeating mechanically the words which, a few hours before, he had spoken to Elise—'when I long for the power to reach out for the great truths—hidden in space—and in the silence of the night.'

Suddenly his brow grew calm. The baffled, questioning look left his eyes, and he smiled strangely.

Closing the door, he turned back to his desk, and taking the pen, looked for a full minute at the paper before him.

'To My Unborn Son.'

He gazed at what he had written as though the words had appeared of their own volition.

'To My Unborn Son.'

With a far-away dreaminess in his eyes he dipped his pen in the ink and commenced to write:

'Somewhere beyond the borders of life you are waiting. I cannot speak to you, nor look on your face, but the love of a father for his child can penetrate the eternal mysteries of the unknown. To those who love there is no death; and in the hearts of parents, children live long before they are born.

'My son, this letter that I write now to you will lie hidden and unseen by other eyes until the time when you alone shall read it. I shall be changed by then: like the world, I may forget; but you, my son, must read these words, and know that they are truth—truth as unchangeable as the tides of the sea, or the hours of dawn and sunset.

'Civilisation has murdered ten million men.'

'The human mind cannot encompass that. It is beyond its comprehension, so it is trying to forget.

'Ten million men—murdered.

'Read these words, my son, written in the hush of night, when men's souls stand revealed.

'Nearly six years ago there came the war. History will prove this or that responsibility for it, but the civilisation that made war possible is itself responsible. The nations sprang to arms; but soon, by that strange destiny which seems to guide mankind, the issue was one not of nations against nations, but of Humanity against Germany. Do not ask me how the land of Goethe, Schiller, and Beethoven became so vile. I only know that Germany was the champion of evil, and on Britain and France men's hopes were rested.

'America did not fight. When this is read by you, my son, you will have known the noble thrill of patriotism, the pride of race and citizenship. But it is because of that that you must read what I write now about the country I love best.

'Less than any other nation, America is to be blamed for the war. Her life was separate from the older world, and the spoils of victory made no appeal. Yet this great Republic, born of man's desire for freedom, remained silent even when the whole world saw that the war was one of Justice against Evil. Men, like myself, were blind, and fed the flames of ignorance with ignorance. Others knew we were not ready, and called upon us to prepare; and others made great fortunes while Youth went to its Cross.

'Month after month passed by, and Britain and her Allies fought our fight; and the murder of men went on.

'At last we came of age, and our young men stormed across the seas, not to save America—for we had nothing to fear—but to rid the world of a monster that threatened the very vitals of Humanity. Look well on our shame, my son, but do not forget that when we went it was for

an ideal—just as years before our fathers died to free the Negro. That much was America debased; that much was America great.'

Selwyn put down his pen, and rested his head between his hands. Ten minutes passed before he looked up and began to write again.

'The war is over. *America is debtor to the world.* Read this, my son, with both humility and pride—humility that it is so, pride that we yet can pay.

'Those awful years while we stood apart, the homes of Britain gave their sons—the sons for whom their parents yearned, as I am yearning now for you. Through Britain's broken hearts, and through the grief of women throughout the world, the youth of America were saved. I know that we have our thousands of stricken homes and ruined lives, but the end of the war left America debtor to civilisation, even though she gave the strength which brought the war to an end.

'Faced with our indebtedness, what did we do?

'Europe lay stricken. The spectres of ruin, starvation, anarchy, hovered about her form. The world was through with war; men groped for light; and from the peoples of the earth a universal cry went up that these things must not be.

'It was our chance. We still were strong. We held the charter of mankind within our hands, and men looked to us. Over prostrate Europe the conquering nations gathered, and men in all the distant corners of the earth listened for the voice of him who would cry in the wilderness that a new age was born.

'Vital days went by. At last the man who spoke for us outlined his plan that all the Powers of the world should join together in a covenant that war should be no more.

'Men waited, and still waited. The plan was argued, ridiculed, applauded—and smothered beneath a fall of words. Already the agony of Man was hardening into the cynicism of despair. Nations that had bled together grew wary and drew apart.

'And still men waited, for they knew that only America's voice could allay the clamour. Then we spoke. Angered by the methods of our leader, angered by the spirit of revenge that was settling over Europe, angered by delay, once more we failed to see the great truths written across the face of the sun.

'America—debtor to the world—America cried out that she alone of all the nations would stand aloof. Let history gloss it over as it will, we held back the hand of succour that Europe craved for.

'From the land of scented mists came the Japanese; from Greece that once was first in all the arts, from South America and the countries of Europe, men gathered to the League of Nations—and *we were not there.*

'As I write to you, my son, the League is an impotent, powerless thing, at which the men who know only nationality and not humanity sneer and make jest. The body is there—America alone could be the heart.

'Bloodless, helpless, it is in semblance a living thing, but all men know it has no life, and already the diplomats who have no other way are using it as a shield for their methods that cannot bear the light.

'My son, in the hush and loneliness of night, ponder over these words. Because we did not fight, millions of men were foully done to death. What of the genius, the science, the beauty of the souls intended for great things, that fell so damnably? How many Miltons, how many Lincolns, were crucified in that army of the young?

'*We must repay.* Our destiny is clear, and no people can thwart its destiny without the gravest danger. Our duty is to restore. Whatever our resources, in things material or of the spirit, this generation and yours and the generation to follow must give unsparingly. Our minds and hearts must turn to Europe, for only in service to mankind can America fulfil that for which she was created.

'Across the seas lies England. She has done much that is unworthy of her in the past; she has much to teach and much to learn; but within the heart of Old England there is

majestic grandeur and great mercifulness, and with that heart ours must beat in unison. The solemn splendour of Britain's sacrifice must never be forgotten.

'Believe in life, my son. Believe in men. Take on my charge and fight the flames of Ignorance, not as I did, but with the power of Reason and of Right. The universal mind is still alive. Trust in it as Wagner when he wrote his music, as Shelley when he sang of beauty, as Washington when he founded this great Republic. Men speak through their nationalities, but in every country of the world there is an aristocracy of thought; and if you have the power, I charge you work towards the end when that great aristocracy will flood the earth with golden splendour and Ignorance will be no more.

'These words I leave with you, my son, on this silent night in May. Perhaps you will never read them. Perhaps you will live only in our two hearts. But on the borders of life we reach out for you, praying that you may come to stay the hunger of our hearts, to be our living son.'

Selwyn dropped his pen and rose slowly from his chair. Passing his hand across his brow, he went to the door, and opening it, looked out.

From the thin crescent of a new moon, a narrow path of light was glimmering on the water.

THE END.

HABITS AND CHARACTERS OF BRITISH WILD ANIMALS.

V.—THE BROWN HARE.*

By H. MORTIMER BATTEN.

I.

ONE of the marvels of wild nature is that the hare survives—not only survives, but, if given any chance whatever, thrives and multiplies. It is one of the few wild-folk to whom nature has given no secure sanctuary. The common prey of all, pursued first by one, then by another, only its marvellous speed and its superb staying-power enable the hare to hold its own against so many foes. The foxes and the rabbits have their burrows, but the hare has no such shelter; he meets his foes on their own ground, and beats them at their own game. He is a superb running-machine, wise in the wisdom of the trails, and withal a joy to behold. Away he goes—starting from a tuft at our feet, floating, gliding, over the pasture, light as a thistle-seed, keeping always to the hollows, seldom showing

himself on the skyline. And what lover of the great outdoors has never felt the desire to follow on in wild pursuit?

Truly he is the common sport of all, this creature which is always game to the end—living a life of hairbreadth escapes till he can hold out no longer against his foes. Particularly is this so when the snow is on the ground; for it is not the hard, swift run that kills the hare; it is the slow 'tramp, tramp, tramp' of a dogged pursuer on his trail. In times of snow the shepherd and the farm-man know that the hare is at their mercy, and taking down the old gun from its shelf, the hunter sallies forth. Here is the quarry's over-night trail; there is nothing to be done but follow that chain of tracks to the winter form, which is found in a sheltered hollow of the pasture, facing south. The man stops short in readiness ten paces away. The tracks lead to that tuft, but beyond the tuft the story of Jack's life, written in the world's oldest writing, ceases abruptly. Stooping, the man picks up a twig, and throws it at the tuft; then

* Earlier articles in this series, published in the May, June, July, and August parts of *Chambers's Journal*, dealt with the Badger, the Pine-Marten, the Water-Rat, and the Hedgehog respectively.

away goes the hare, ears laid back, eyes watching behind, eager to place some obstacle between himself and his pursuer. There is a loud report, a squeal, and the hare zigzags; another report, and silence. There, tinting the snow with his life's blood, lies the hero of many a fiery run, who owes his fate, like so many of his kindred, to the tell-tale writing of the snows!

II.

How far will a hare run before dogs? Some say eight miles at the most. Personally, I think eighteen a fully conservative estimate. Before a pack of hounds he will not run far, because his spirit is broken by fear; before a single dog no faster than himself he is capable of putting up a very different show.

Each hare has its own runways—or, rather, passes to and from its feeding-grounds by the same routes. Normally it will never go through or over a wall if there is a gateway through which it can pass, and it is to be feared that this partiality towards open going often proves the hare's undoing. The poacher knows it well, and has nothing to do but place his net across the gateway, and then drive the hare into it, using his snares in the same way. But occasionally an old hare knows these things, and once having been frightened, he never faces a gate again.

The hare is one of the few animals that can see behind it as it runs, and it is owing to this faculty that the animal is so well able to dodge hounds at close quarters, doubling and twisting in the ace of time, and thus tiring and disheartening its pursuers when every one thinks the run is at an end. So absorbed does the hare often become in looking behind that it forgets to calculate for danger ahead; and many a hare, pursued by dogs, has been known to run into the legs of spectators, never seeing them, so intent was its backward gaze.

Most motorists have indulged in a short, if unsuccessful, pursuit of a hare, the animal sticking to the open roadway ahead of the car, watching the vehicle as he runs, never thinking of turning aside till the car is actually on him. Pursuing a hare thus, I have timed it by speedometer to maintain a pace of twenty-eight miles per hour over a short distance, which seems about the animal's limit.

The hind-legs of a hare are most abnormally developed, for, like those of the kangaroo, they are the animal's propelling-members. Often the creature's life is dependent upon a sudden, lightning spurt—shooting off into space to foil the first dash of Reynard, who has discovered it in its form, and knows well that if once the hare gets on its legs the game is up. A hare has even been known to break one of its legs in shooting off the mark, the bone proving insufficiently strong for the sudden strain thrown upon it. The forelegs are comparatively feeble, functioning more or less as pivots over which the

creature bounds, and it is because the forelegs are inadequate for the strain thrown upon them by the gigantic bounds that a hare is so much at a disadvantage in going downhill.

A good hare will run any ordinary dog to a standstill with miles of energy to spare; but though one of the most 'marvellous running-machines in creation, he is, nevertheless, a creature of mortal limits. Pursued by beagles, bounding ahead of them mile after mile, and keeping them on the distant skyline, in the end he mounts a wall as a point of observation, and hounds and huntsmen, coming up, find him crouching there, still watching his back trail! But it is a limp and lifeless form the huntsman tosses to the hounds; for here, again, the old old tricks are set at naught, the marvellous uphill sweep has failed to leave his pursuers behind, and he has died as he has lived—watching his back trail. Looking behind! That is why he holds the roadway ahead of the motorist; that is why he often falls when descending a mountain-side at speed; and be his last effort the act of climbing to a point of observation, or launching himself into space in a final supreme effort to outstrip his pursuers, he is always looking behind.

III.

In disposition hares are the most solitary of all four-footed, warm-blooded things. They never associate except for the brief period of the honeymoon, being, of course, polygamous animals. Something of the solitude of their disposition begins to show immediately after birth, when very often the youngsters separate, and each makes for itself a solitary form, uniting only when the mother calls them at meal-times. If a honeymooning couple be flushed together, they separate immediately, to reunite later on, guided as to each other's direction by their sense of smell. The scent-glands are highly developed, purely for mating purposes. Were these glands less developed, the animals would never find each other where mating is most necessary for the survival of the species—that is, where hares are few and far between. I have never heard of hares uniting in any way purely for social amusement, though such a thing does not seem to be unknown among certain northern varieties.

March is the hare's love-making season; hence the saying, 'Mad as a March hare!' Hares are truly mad in March, and during that month many a stern battle takes place between the gentlemen who, unfortunately, fall in love with the same lady—which appears to be the common order of things. Neither are the contests worked out on Marquis of Queensberry rules, the chief ambition of every gentleman hare in March being to kick every other gentleman hare into insensibility. The one who can jump highest and kick hardest wins the fair lady, and it is

a laughable sight to see two hares indulging in one of these sky-hopping contests. Taking a run at each other, they collide in mid-air, striking furiously, each trying to kick the other over the wall and into the next field. I have seen two hares, startled by a common foe, make off side by side, and simultaneously take one of these running jumps at each other ere going fifty yards, to come to earth and repeat the performance time and again till finally out of sight. Also, a male hare, on seeing a rival, will stand straight up on his hind-legs, appearing of enormous size, and utter such a scream of rage that the other hare will bolt rather than remain to fight this veritable elephant among hares!

The Mad Moon lasts generally into the second week of April,* and at about this time the first leverets of the season come into the world. Hares continue to breed till September, and at least three litters are produced annually. Curiously enough, the young are born with their eyes open, though they remain in the form till about a fortnight old. Gestation takes approximately four weeks, and two or three at a birth is the usual number. During the periods of abnormal increase in their numbers, to which subsequent reference is made, five or even six may be born, but the number always returns to the original two or three. The young are mature at one year, and the first two years of a hare's life are the most critical. If it survives these, it is well on the way to becoming a wise hare, which is the only hare that lives till the decline of its powers heralds its going.

IV.

As soon as the young are old enough to leave the nest they are able to dispense with the services of their mother. Each day thereafter they become more and more independent of her, living their lives apart. By this time she has probably formed new associations, and is well on the way to the production of another family. It is seldom that the young are seen following the mother except, perhaps, during abnormally dry seasons, when water becomes necessary to their existence; then, occasionally, the young may be seen accompanying the dam down to the drinking-place. She will, however, fight on their behalf till she becomes occupied with a second brood, and the squeal of one of her leverets brings her instantly to the place, prepared to do battle with cat or stoat as the occasion may demand.

In passing to and from the form in which her young are hidden a mother-hare exercises the utmost care to break the line of tell-tale scent she leaves. This she does by back-tracking a

certain distance, so as to leave a dead end in her trail; then she takes a terrific leap to one side or the other, and repeats the performance. I knew one hare whose leverets were hidden at the edge of a swamp, and in coming and going she always threaded a tortuous course through this swamp, jumping and back-tracking many times, and seeking out the wettest patches, where the scent would not lie.

Just where does the hare stand in the scale of animal intelligence? Higher than the rabbit, yet a long way below the deer and the otter. It has not even advanced to the first stage of civilisation by keeping its home clean and sanitary, and in this may lie the secret of the fearful epidemics which occasionally devastate the whole hare population of certain areas.

But the hare profits by previous experience, and in this lies the beginning of wisdom. A mother-rabbit blunders into the same mistakes season by season, and her young are taken from her by the same harsh fate; but a hare seldom blunders twice into the same mistake—'Once bitten, twice shy,' is the axiom of her existence. The whole trouble lies in the fact that the young do not profit by the experience of their elders. Each has its own way to make and its own experience to gain. Were this not so, the hare would assuredly be among the fittest of the land, for to its natural gifts would be added the ability to adapt itself to changed conditions, and thus to become modernised, as have the deer, the otter, and the fox.

V.

A wild animal has two kinds of foes—hereditary, and those which are brought about by a change in the conditions under which it lives. The former it contends with guided by inherent knowledge, which is instinct; the latter it learns to circumvent only by experience. The hereditary foes of the wild hare are the fox, the weasel, the hound, even man himself. Against each of these the hare has its means of defence. A young hare that has lived its life in perfect immunity instinctively dodges through a narrow opening to baffle a pursuing hound, and as instinctively doubles back and leaps aside when going to its form in order to delay a pursuing stoat. All these tricks, clever in their way, are the outcome of endless decades of experience—they are, indeed, inherited habit. A young hare obtains little or no education from its mother. Not one single lesson as regards the circumventing of their numerous foes is taught the young hares by their mother, yet they grow up to hold their place among the wildest of all four-footed things.

Among the comparatively modern enemies of the hare, regarding which it must learn by experience, are the hempen-net, the snare, and the net set across the open gateway. If hares, like foxes and deer, possessed among their gifts

* In Scotland and in the Pennines hares may be seen in pairs, or even in groups, during the dusk of the evening, till well on in the month of May, or even later in very high country. Much depends on the weather conditions.
—H. M. B.

the ability to hand on their experience to their children, then these modern engines of man would be set at naught by their cunning. A hare lives to grow wise; by chance rather than sound judgment it has evaded death time and again ere, in its old age, the wisdom of experience is added to its inherited knowledge. But the children of that hare profit in no way by its learning. They are as unsophisticated as regards the modern engines of mankind as are the first brood of a dam who has lived in perfect security. This is yet another factor that makes it difficult to understand the hare's powers of survival. It is surrounded by foes; anything that can catch a hare can kill it; it is prone to all the ills and ailments of mortal flesh—barring, perhaps, kleptomania and orator's throat; the knowledge of the parents is denied the children—they have no friends or guardians, save the strength and agility of their own hind-legs and their own powers of reproduction. Truly the hare is among the marvels of modern existence.

In this country the hare population is reasonably free from disease, owing to the fact that they are never over-plentiful; but in other countries the number of hares periodically becomes so enormous that they literally overrun the land. In certain parts of Canada, for instance, hare plagues occur regularly.

Such plagues do not last long—a few months at the most sees them through; for disease, every disease under the sun, soon becomes rife, and in a season or two not a hare is left. It takes not only the weak, but also the strong—it clears the whole country of its hare population, and the dead bodies of the victims are littered like leaves over hundreds of miles of territory.

VI.

I have no notes on the length of life of captive hares, but there is no doubt that if both were in captivity the hare would probably out-

live the rabbit by two or three years. In the wild this does not apply, for, whereas a wild rabbit may live to become old and decrepit, a hare never does. As soon as its senses begin to lose their keenness, it inevitably falls a victim to one or other of its foes. A rabbit can seek the shelter of mother-earth, and becoming conscious of its enfeebled state, it ceases to wander far afield, remaining always near to some place of sanctuary. Not so the hare. When old age comes upon him he must still sally forth into the open, meeting his foes on their own ground; and the day of his first and last failure inevitably dawns with the falling off of his powers.

The average hare is well past its prime at nine; it is old at ten; and few, if any, live to see twelve.

The mean weight of the brown hare is between 7 and 9 lb. A 9-lb. hare is a good one; and 11-lb. hares are occasionally heard of, though seldom bagged.

Wherein lies the secret of the hare's survival? In its fecundity, and there alone. It survives simply because it is better able to stand the huge drainage on its numbers than the creatures that once shared its environment, but are now gone. In some districts its numbers have dwindled to the merest few, and were it nowhere preserved its extermination would be a matter of ten years at the most. Over vast areas of country the hares are totally exterminated by the end of winter; but during spring and summer, when the warfare against them abates a little, other hares creep in from the sanctuaries farther afield, and make good the shortage. Our old English and Scottish estates are responsible for keeping the hare alive; and were they to go, the hare would most assuredly go with them, and we should lose a creature that is not only inoffensive to man, but is a joy to behold—truly a child of the wild March winds and of the great open places.

RECOLLECTIONS OF A NAVAL SECRETARY.

MEDITERRANEAN—continued.

VI.

IN May 1863 Vice-Admiral Robert Smart relieved Sir William Martin in the command, and a place was found for me in the new Commander-in-Chief's office. In order to give me a short holiday, the home-going admiral took me as far as Marseilles in H.M.S. *Magicienne*.

After a short stay at Naples, we ran through the Strait of Bonifacio, between Sardinia and Corsica, and passed inside the little island of Caprera, where General Garibaldi, like another Cincinnatus, had retired to till his fields. A very modest cottage formed the home of the

national hero. Up to this time I had not seen the general; his embarkation at Catania for Rome the previous August, which led to the disaster at Aspromonte, had kept us on the *qui vive*, and I remember a midnight trip at Corfu to communicate to the admiral the news of Garibaldi being wounded and taken prisoner.

It is strange how long association between places and sounds lasts. I never think of my first visit to Pompeii without hearing the strains of 'Viva Garibaldi!' sung by a strolling musician, who haunted us for hours, and who had only two songs in his repertoire—'Viva Garibaldi!' and 'Santa Lucia.'

From Naples we went on to Marseilles, where we learned to drink that excellent wine, vermouth, whose virtues were described on the bottle as follows: 'The Vermouth, who is a wit wine of former qualities saturated and perfumed with odoriferous herbs. His tonic pungent febrifuge, and astringent qualities is a mighty preservative against fever, and he is the most beneficent of all the drinks.'

The summer of 1863 we spent mostly in Greek waters. The country was in a disturbed state, and had not yet found a king—Prince Alfred having been obliged to refuse the throne, since he was heir to the Duchy of Saxe-Coburg-Gotha. At Athens there was a fleet of British, French, Russian, Austrian, Turkish, and Italian men-of-war, and the Piræus was very gay.

The need of a supply of drinking-water took us occasionally to the Gulf of Nauplia, where there was a beautiful perennial stream, unlike the classic Athenian rivers Ilissus and Cephissus, which ran dry in summer. From Nauplia we visited Tiryns and Mycenæ, the former with its cyclopean walls and architecture, Mycenæ with its remains of the days of Agamemnon, only waiting for the coming of Professor Schliemann to give up the treasures concealed in the tomb of the king. We visited this treasure-house, its entrance being under a remarkable stone, eighty-seven feet long and eighteen wide. Had we only known it, close to our feet was a mass of wealth which a pickaxe and shovel would easily have brought to view. There was no one to guard these remains, and apparently we might have helped ourselves!

During the summer our squadron was doing police work; a report of a riot at once led to the despatch of a gunboat to the port nearest to the scene. In Athens itself Captain Charles Hillyar, of H.M.S. *Queen*, had landed a detachment of marines for the protection of the National Bank. During the rioting the Minister of War, anxious to quell the discontent amongst the troops, whose pay was in arrear, had bombarded the bank from the town square. On the admiral's arrival, detachments from the British, French, and Russian ships (the fleets of the protecting Powers) relieved the *Queen's* men.

Athens in 1863 had a very neglected appearance. The Acropolis was so uncared for that the signs of the Turkish bombardment in 1827 were still visible. One of our assistant-surgeons took possession of a skull, which he picked from a heap lying in a pit. Fragments of the pillars of the Parthenon were scattered about in all directions, and one was content that the Elgin Marbles should be safely housed in the British Museum.

Our amusements this summer were limited to an occasional cricket-match, rowing, and bathing. One of our favourite walks was to Xerxes' seat, whence, in 480 B.C., the Persian monarch is said to have watched the naval action in Salamis

Bay, when his fleet of two thousand ships was destroyed by the Greek fleet under Themistocles.

On the 30th October 1863 a Greek frigate, escorted by H.M.S. *Revenge*, arrived from Toulon with Prince George of Denmark on board. He had accepted the offer of the throne of Greece, and there were great rejoicings in Athens. The prince landed at the Piræus, drove to Athens, took the oath at the cathedral, and was presented with the crown.

We remained until the end of November, by which time the country had quieted down. King George, who was only about eighteen, and as handsome as his sister Alexandra, then Princess of Wales, was beautiful, came to a dance on board the *Marlborough*, and charmed every one by his gracious manners.

VII.

After a long and busy spell at Malta, enlivened by dances, picnics, cricket-matches, &c., we left in the *Marlborough* for Corfu early in May 1864, to be present at the cession of the Ionian Islands to Greece.

Towards the end of October the *Marlborough* sailed for England, and the *Gibraltar* became temporary flagship.

One's first ship has a special charm, and certainly we had good reason to be proud of the *Marlborough*. She was a model of efficiency in every respect. In competitive sail-drill she was an easy first; in discipline, in gun-drill, in general smartness, she left little to be desired. She may well have been smart, for, as we were so frequently reminded by officers of her rival ships, some hundreds of her seamen had served two commissions in her, and had, therefore, been continuously working together for five or six years.

I am reminded of an incident which took place in the Piræus when a little Turkish sloop, the *Broussa*, commanded by Hassan Bey, who had been serving in the British Fleet for some years, used to take part in the weekly competitive sail-drill of our squadron. The *Icarus*, commanded by Commander Nowell Salmon, V.C., was a very similar vessel, and the two commanders had been messmates. The *Broussa* would at times beat the *Icarus* at sail-drill, though the latter was splendidly smart; but then Johnny Turco was not above taking advantage of unfair dodges, as, for instance, when his upper sails, lightly secured by spun yarn, would fall before a man reached the upper yards to loose them—and so on.

Commander Salmon, calling on board the *Broussa*, asked Hassan how he made his men so smart. 'I'll show you,' said Hassan, and forthwith ordered the last man down from aloft to be bastinadoed.

Sir Nowell Salmon, as whose secretary I afterwards spent six of the happiest years of my life, was at this date the youngest commander in the

fleet, his Victoria Cross having gained for him his commander's commission at the earliest possible date. He was fond of telling us of another incident in his service in the *Icarus*. He had been ordered by Sir Robert Smart to report to him at 6 A.M. as ready for sea. A big Russian transport came into the Piræus during the night, and let go her anchor on top of the cable of the *Icarus*. Whilst the *Icarus* was struggling to get up her anchor, the two commanders appeared on their respective forecastles, and the polite Russian officer, raising his cap (we had not learned the new-fangled military mode of saluting which the navy has adopted of late years), said, 'Monsieur le Commandant, I am vair sorry; for me it is nosing; for you it is not so good.'

After much delay the cable was cleared, and Commander Salmon knocked at Sir Robert Smart's cabin door at 7 A.M., an hour late, to be greeted by Sir Robert's Northumbrian drawl, 'Young man, you are vary deleeborate.'

To revert for a moment to the men of the *Marlborough*. The captain of the afterguard, one Campany, a first-class petty-officer rating, was a fine old seaman, the apple of the commander's eye; for he and his afterguard-men never failed to keep quarter-deck and poop spotlessly clean and dazzlingly bright. Old Campany had, alas! a fault not uncommon amongst seamen in the 'sixties. As sure as he went on leave, so sure was he to get drunk, and, unless some sober shipmate took charge of him, to overstay his leave. On an occasion of general leave at Malta he came on board forty-eight hours late, and was fallen-in with the defaulters at seven bells next forenoon, for his case to be dealt with by Commander Brandreth. 'Well, Campany, what does this mean?' 'Beggin' your pardon, sir, I'd a stroke of bad luck. I took a boat and sailed down to Gozo, and coming back the she-rock [sirocco, the south-east wind] blew us nearly across to Sicily, and it took us two days to get back to Malta.' Result: case dismissed. Not long after this Campany was on leave at Syracuse, and returned twenty-four hours late. 'What happened?' asked the commander. 'Well, sir,' says Campany, 'I went with one of them Sicily chaps to see the Cattycoombs; the beggar left me in 'em in the dark, and I've been a-wandering about 'em till I was almost starved.' Once more the case was dismissed.

Arrived at the Piræus, the ship's company was again given general leave, with the usual result as regards Campany. It appeared that on this occasion he had gone up to 'Aythens,' and thought he would take a walk to the top of Mount Pentelicus, but that on the way he was captured by brigands! This was too much even for the friendly commander, and poor Campany was disrated to able seaman. It is pleasing to relate that he recovered his rating by good behaviour before the *Marlborough* paid off.

VIII.

H.M.S. *Victoria*, the new flagship, arrived from England, and we left in her at the beginning of July for the coast of Spain, calling at Port Mahon.

A gunroom mess in 1865 was conducted on very economical lines. Even in the wardroom messes late dinners were not allowed, and I see my home letters speak of the band playing daily from three to four for the admiral's dinner. We boys dined at noon, both at sea and in harbour; tea-time was about five o'clock; and after that hour the mess supplied us only with ship's biscuit, of which there was always plenty to be had. We were allowed to spend about sixpence a day in luxuries—jam, pickles, cheese, &c.—which were known as 'extras.'

I have often been asked why naval messes were (and, I believe, still are) so much more economically conducted than military messes. The reason is not far to seek. The naval mess subscription was, by the Queen's Regulations, fixed at three pounds a month for the wardroom and thirty shillings for the gunroom officers; in addition, the ordinary ship's ration, worth, perhaps, one shilling a day, was allowed to each officer; and a small subscription was authorised for servants and other mess expenses. Similarly the maximum permissible amount of officers' wine bills was laid down in regulations, and at every inspection rigid inquiries and examination of mess accounts were made to ascertain that these rules had not been broken.

Our 1865 summer cruise was very pleasant. Besides the wooden line-of-battle ships and frigates, we had three ironclads, very early instances of the new navy—*Royal Oak*, *Resistance*, and the little sloop *Enterprise*. The wooden line, led by the *Victoria*, watched their behaviour in rough weather with keen interest. It had been whispered that they called themselves the 'Guards of the Navy,' but the wallowing of the *Royal Oak* in the trough of the sea suggested to some wit of the wooden line that the name of 'Sea Pigs' was more suitable.

I have a lively recollection of the rolling capabilities of an armour-plated wooden ship. When I was cruising in the *Royal Alfred* from Bermuda to Barbados in 1869, she rolled thirty degrees each way for days together. I remember the commander of a little ship of some seven hundred tons, which was cruising with us, saying that he could have cast loose his guns on any one of those days (when, of course, the *Royal Alfred* dared not do so) and put shots into us, feet below the water-line.

We visited in the course of the summer Barcelona and Rosas Bay in Spain, and then, crossing to Italy, spent two months between Genoa, Spezzia, Leghorn, and Naples.

It was the fashion in those days for the

Commander-in-Chief's family to pass at any rate part of the summer in the flagship, and both in the *Marlborough* and the *Victoria* the admiral's ample quarters were at times fully occupied. On this cruise I joined in many a pleasant little trip with our ladies; but modern railway and steamer travel have made the coasts so well known that I will not venture to say anything about them.

At Spezzia we found that Charles Lever, the novelist, who held the post of British Consul there, had come down from Florence with his family to meet the fleet. The hotel—which, by the way, displayed his consular flag—became the rendezvous of the officers of the fleet. When Sunday came, instead of dancing, a wedding was suggested. Bride and bridegroom, bride's-maids and groomsmen, were chosen, and a sham parson officiated. In the middle of the ceremony Charles Lever, in a solemn voice, said, 'Perhaps you young people don't realise that, this ceremony having been performed in the presence of Her Britannic Majesty's Consul, he has but to sign a certificate to that effect to make it a legal and binding marriage.' The bridegroom, who became a distinguished admiral, would have been a desirable husband, and there was reason to believe that the lady, a relation of the consul's, would not have been an unwilling bride!

1865 was unhappily marked as a cholera year in the Mediterranean, and we had great difficulty in avoiding quarantine.

IX.

I saw very little of Gibraltar during my five years' service in the Mediterranean. Affairs in the western part of the station did not call for the Commander-in-Chief's presence, and our cruises were for the most part confined to the eastern waters. Having, therefore, very few personal reminiscences of 'The Rock,' I will end this account with some records, collected, I think, by a military staff officer, a copy of which came into my possession during one of our short visits.

SOME CURIOSITIES OF ADMINISTRATION AND DISCIPLINE IN OLDEN DAYS AT GIBRALTAR, FROM ABOUT 1730 TO THE EARLY PART OF THE NINETEENTH CENTURY.

(1) No asses are to carry wadding to any of the Batteries, but the men are to carry it on their backs.

(2) Any donkeys loose in the town are to be the property of the person taking them away, and any straying on the ramparts are to be shot by the sentries.

(3) Ships coming into the Bay without showing their colours are to be fired on, and the cost of the shot recovered in the Port Dues.

(4) All men who have complaints to make against their wives are to send their names to the Town Major.

(5) All masons whatsoever are to be employed on the King's works and on no other; and if any are found to have been employed on private works, Lord Tyrawley will have every foot of the work done pulled down.

(6) Fishermen are only to sell their fish after the servant of the Governor has bought what he requires.

(7) Although persons are strictly forbidden to go on the Spanish Glacis, some Officers of the Garrison have most courageously stormed the lines by getting over the wall. The Spanish General is glad the sentry did not shoot them; the English General would be glad if he had, as a warning to others. He hopes to hear no more of such schoolboyish behaviour, which would shame the service of the most unmilitary nation upon earth.

(8) A man of the — Regiment having been so wicked and cowardly as to hang himself, the Commanding Officer is ordered to treat the corpse with the greatest ignominy. No funeral service is to be performed; the body is to be hung up by the heels for a certain time, and afterwards thrown over the Line Walls, like a dog or a cat.

(9) If Sentries are attacked by bullocks in the streets or on the Line Wall, they are to retire into an embrasure or get upon the parapet; but they are not to fire inconsiderately.

(10) On account of the scarcity of flour, soldiers are not to have their hair powdered until further orders.

(11) The Queue is to be fixed to the hair of the head, but when an officer's hair is not long enough for this purpose, he may be allowed to fix the queue otherwise, until the hair is sufficiently long, but this is not to continue longer than two months on any account.

ROADSIDE FAIRIES.

HAVE you ever seen the fairies
That live in roadside ditches?
They wear the Lady's Mantle
With spider cobweb stitches.
They lie on Yellow Bedstraw,
The hedgerow is their town,
And for a clock to tell the time
They have the thistledown.

The nettle is for ailment,
The docken-leaf for cure;
The rich have gold of colt's-foot;
The garments of the poor
Are the leaves of Ragged Robin
With blushing crimson face;
And those who go a journey far
May take the Speedwell's grace.

They sup from off the toadstools
On hips and rowans red;
Their music's from the blackbird
That perches overhead;
The road it is their ballroom
With dusty floor and white,
And for their lamps and candles shine
The gipsy fires at night.

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

IT might sometimes be better at the holiday season to make a plan for the gathering of some extra moral strength, rather than to scheme for new stocks of physical vigour, which may be less essential for future happiness and content. For the most part the people of this time, despite war sufferings, are tolerably well in body; often with their minds and spirits it is not the same, for they have apprehensions and vague dreads. They experience the feeling of a fearsome insecurity and doubt. They think there is in the world, in our own islands, more evil in many forms than ever there has been before, and that it prospers as nothing else. In the political game cynicism and insincerity are carried to their farthest; faith and religion tremble; manners and conduct are wild; goodness and simplicity are rare. So it is not remarkable that one of the philosophers of the time should devote himself to an examination of the question—what is progress, and whether, indeed, what we think of as progress can have been any part of the scheme of the Creator, since with civilisation (as some had fancied) at its most advanced point it seemed to crack, and there was then a rapid retrogression. As we turn back the pages of history, the question is insistently presented—how are we of these times better than those of other civilisations of long, long ago? The Great War finished, the inventors became busy, and it was speedily announced with much enthusiasm in Britain and France that there had been fashioned a gun which would kill at a longer range than any other, and that Britain and France were to have the advantage of this weapon which would cast a shell about a hundred and fifty miles. So, then, what is progress? And if the progress of humanity in goodness and beauty is at present negative, then men and women, who are driven in these days to think as never before, are confronted with a question in a fearful form as to what is the value of progress, and what is the good of goodness. The problems of Time, of Hope, of the Future, have aspects they did not present in more careless days. It is found that to think now is to be troubled. People wonder if effort in goodness is worth the while. And is it a thing commendable and satisfying in itself? If

time and life do not lead on to some supreme achievement of the universe, if there is no ulterior object, is, then, the effort in goodness, as we call it, still worth the while? Is it a grateful and a satisfying thing in itself to be good?

* * *

Where is the progress? The question was analysed with fine reflection by Dean Inge in the course of his Romanes Lecture at Oxford recently. He pointed out that physically there had been no progress in the species for many thousands of years; the Cro-Magnon race lived, it may be, twenty thousand years ago, and was at least equal in size and strength to any modern people. The Dean considers that the ancient Greeks were a handsomer people than we are, and better formed, and that he would be a bold man who would claim that we are intellectually equal to the Athenians or superior to the Romans. This philosopher reflects: 'The laws of Nature neither promise progress nor forbid it. We could do much to determine our own future; but there has been no consistency about our aspirations, and we have frequently followed false lights, and been disillusioned as much by success as by failure. . . . For individuals, then, the path of progress is always open; but, as Hesiod told us long before the Sermon on the Mount, it is a narrow path, steep and difficult, especially at first. There will never be a crowd gathered round this gate; "few there be that find it." For this reason we must cut down our hopes for our nation, for Europe, and for humanity at large to a very modest and humble aspiration. We have no Millennium to look forward to; but neither need we fear any protracted or widespread retrogression.' . . . But Herbert Spencer, in his optimism, sang out: 'Progress is not an accident, but a necessity. What we call evil and immorality must disappear. It is certain that man must become perfect;' and again: 'The ultimate development of the ideal man is certain—as certain as any conclusion in which we place the most implicit faith; for instance, that all men will die.' But those who contemplate what has followed upon the Great War find their field of comprehension too limited to grasp this idea of certain progress. Then without progress there shall be no room for hope. And then? Life would be but a comic chaos. Such uncer-

tainties are troubling the minds of people of conscience now. They are disturbed, uneasy. They feel the need of strengthening their hopes and beliefs, of fortifying their character. They wish to believe that men and women, life and effort, are of some importance after all, despite the new truth that has seemed to burst on their imagination, the truth embodied in the most tremendous lines in any hymn :

A thousand ages in Thy sight
Are like an evening gone.

They cannot believe, looking upon the mysterious stars on a summer's night, that, even though there is retrogression now, even though the living world about them is but an affair of a speck and a second, they and their labours and their yearnings do not matter anything at all. Because, if that were so— . . . But, for their conviction that goodness is of value, for their own personal effort, they feel they need a strengthening of their character, of their spirit, of their belief in a standard of good as it was set up of old. They yearn for a kindling of moral enthusiasm. They would like to fix their standards aright again, to cease to admire or approve or countenance that which is knavery or trickery, mean and base, material and utterly selfish, as has become a custom in political, commercial, social, and other departments of the general life.

* * *

It is a good thing at such a time of stress to move away from the works and evidences of our modern civilisation and effort, and resort to the matchless purifying influences of simplest nature. The shimmer of sunlight on green fields, the crooning of a summer breeze through the leaves of trees, the music of a brook, the glory of floral colour, the prospect of mountains, with the suggestion, among all these, of beauty, strength, and eternity, are the best physic for the soul in times of doubt. Here in the half-silence of Nature, without the newspapers and their perpetual story of human error, one may sit in the sunshine and think, and be the better for it. It is even better if in this stillness and purity we may contemplate some of the circumstances of a noble life carried through in faith, simplicity, and goodness to a splendid end. Such a story at such a time should be stimulating, helpful. But at this season it should not be too ponderous a story. It should be dreamful, delicious. It should be new and, as we say, entertaining. And it should be warm with human love. Where, then, is such a story?

* * *

A story of this kind, one of the finest, is to be found in a book that was lately written by a daughter of her mother. It is the beautiful story of the life of Mrs Gladstone, written in honour and with love and tenderness by Mrs Drew. To dwell upon these pages—a proper supplement of Lord Morley's *Life of Gladstone*,

one of the finest works of biography in any language—is, to a spirit troubled in such a way as has been suggested, like entering into a majestic cathedral with its vast spaces of silence and solemnity, hearing then the sounds of dim and distant music, that seems as if it came from the walls and the pillars and from the gloom above, soothing the soul, yielding to it a heavenly sympathy and consolation. This was a woman in her true womanliness very great indeed. Last century could produce nothing finer. There is a picture reproduced in Lord Morley's work—based, as it would seem, on a photograph printed in Mrs Drew's—of Mrs Gladstone at forty-four years of age, in which the spirituality shines on those glorious features as in few other women's portraits that one can recall. It has been likened to a Romney picture of Lady Hamilton. In later years, if the eagerness that we see on such a portrait is softened, the general charm is in no wise lessened. Love and duty maintained the beauty, for Mrs Gladstone was a lover all her life. Pictures like these recall to me many memories of some childhood days near Hawarden, when often I saw the splendid pair, and, like all the other people of those parts, was happy to touch them as they came out from the parish church on Sunday mornings, and have the privilege of a hand-shake from the Grand Old Man. One remembers how she always tended him, was invariably by his side when it was convenient she should be; how suddenly, one evening in the 'eighties, he appeared unexpectedly in a village chapel, two or three miles away, at election-time, and made a great speech in support of the candidature of Lord Richard Grosvenor; how word of the coming was passed over the country-side; and how closely and affectionately Mrs Gladstone then held to his side when he was speaking, for he was not at his best in health. One sees her walking in the beautiful park of Hawarden and through the streets of a village not spoiled as, to some extent, it has been since. Many memories, and sweet ones. The story of her mother's life by Mrs Drew is truly the best reading we could have at such a time as this, and it has all the charm of a perfect love-story. She came of a noble race, and by her quality the most rabid of Democrats in these fierce days would be persuaded that there is more in breeding than he cared to admit. Twenty-fourth in descent was her father, Sir Stephen Glynn, from William de Percy, a Norman chieftain who came to England in 1066 with the Conqueror, and the blood of many famous statesmen ran in her veins. But these things do not matter to the story, after all; nor perhaps do the details of her childhood and young womanhood, sweet as they were. Mr Gladstone said in his diary that Catherine had reigned in her beautiful home a very queen. She was twenty-six years of age when that first period in her life came to an end.

'Her mother's feeling for her,' writes Mrs Drew, 'was little short of adoration, and with her radiant beauty and impetuosity of will she carried everything before her; her mother, her brothers, her sister, all moved as planets round the sun. It would not be easy to exchange this position of freedom and power for the more subordinate rôle of a wife, for the duties and responsibilities of marriage and motherhood. But she fell in love.'

* * *

Mr Gladstone met the Glynnes at Naples in November 1838, and he saw much of them there, and in Rome shortly afterwards. His intimacy with Catherine and her sister Mary (to whom she was most intensely attached, and who married Lord Lyttelton, the friend of Gladstone, on the same day as Gladstone himself married Catherine) grew, as we are told, in depth and devotion. They met most days, and he spent Christmas Day with them. One day they went to the Church of Santa Maria Maggiore, and they spoke there of the immense and costly amount of labour lavished on its embellishment. Catherine contrasted our own parsimony in the service of God and the extravagance of our secular luxuries. 'Such speculations,' says Mrs Drew, 'are now constantly in the very air we breathe; but at that time, now nearly eighty years ago, they seemed little to trouble the richer classes. "Do you think we can be justified in indulging ourselves in all these luxuries?" she said to him. He was profoundly moved. "I loved her for this question," he wrote in his diary. "How sweet a thing it is to reflect that her heart and will are entirely in the hands of God! May He, in this, as in all things, be with her."' Lord Morley's book is one of a great career, of thought and philosophy and mighty exertion; it is not pre-eminently a book of soft and sweet sentiments, and the tale of the courtship is passed lightly by. Mrs Drew yields to us some of the secrets, as her mother revealed them to her, and tells of the 'tragedy' of her father's first declaration of his feeling. It was only a few weeks after the pair had first met, and it was on a moonlight evening in circumstances and surroundings the most glorious and romantic, in the Coliseum in this Eternal City. If time and the world were searched for the ideal place for such a declaration as between two such young and earnest people, surely this would have been the choice. But Catherine then hesitated; she failed to respond. That was the 'tragedy,' as she put it to her children. But very soon afterwards she realised her destiny. Her interest in the man was intense; she inquired discreetly as to his political and other movements in every possible way. She became absorbed in his first book on *Church and State*, and copied long extracts for her private use. 'Nothing could express more honourable feelings and taste than the letter he wrote me,'

she says. But Gladstone himself, then just beginning to flash brilliantly on the political world, and being clearly destined for the greatest achievement, was, as always with lovers, too doubtful, and he spoke in his diary of 'his precipitancy, of his incorrigible stupidity, and of the worthlessness of his affections.' In the spring, in London, he saw much of them again; and once in May he wrote: 'But what I ask is next to an impossibility.' A week afterwards he told his father of it all, for 'concealment became too heavy for me.' But his heaven was opened to him only two days afterwards. Lady Shelley gave a garden-party at Fulham, to which they were both invited, and there Catherine Glynne told William Ewart Gladstone that 'all doubts on his part might end.' 'I went down with the Glynnes, and here my Catherine gave me herself,' he wrote. Mrs Drew tells us that they walked apart in the garden by the river, and he revealed to her his own story, and what had been the passionate desire of his heart—to take holy orders. All this, we are assured, produced a revulsion in her pure and lofty spirit. She asked for the earliest Communion 'that we might go together to the Altar of Christ.' 'May I have from my God a due sense of the value and the sweetness of this gift,' wrote Gladstone. 'Led by her questions, I have given her these passages for canons of our living'—and then there followed two passages from the *Paradiso* of Dante, which have been translated thus:

Love for each plant that in the garden grows
Of the Eternal Gardener. I prove
Proportioned to the goodness He bestows;

and:

In His Will is our peace.

* * *

The daughter remarks that her father's powerful intellect and pitiful heart appealed to a girl brought up, as Catherine Glynne had been, in the love and fear of God. In his diary the lover wrote a few days later: 'At the end of a long and chequered day—chequered with joy, business, and excitement—I sit down to write and think a little. First, how much have I thought of God to-day while my hand was coursing over the paper? How little have I thought of Him to thank Him! My blessing is, indeed, great. At two, she and I went to the Archbishop's by his desire, and he kissed Catherine.' Shortly before the wedding, which was only a month later, he and the other happy man, Lyttelton, went to Hawarden, and there they stayed until the eventful day. 'To quote the diary again: "'Kenilworth" aloud with dearest—much real intercourse. What am I, to charge myself with the care of such a being, and to mingle her destiny with mine? Instruction and profit on this earth do not usually come on the wings of joy so unmixed.' And then, on July 25, the wedding: 'Every

house a bower, the road arched and festooned with flowers, the deepest interest in every face—bands, processions of societies, the crowd thickening as they approached the church, the road carpeted, the churchyard-path strewn with flowers by the hands of children.' One knowing Hawarden of the more peaceful days when the Gladstones dwelt at the Castle can imagine something of that joyous scene. Gladstone said that the music broke down what little self-control he had left as he walked up the crowded church with Lord Lyttelton. At the altar he found his beloved, and they were married first. And at five in the afternoon he took up his diary again: 'The beloved sleeps on the sofa. We have read the lessons together. She sleeps gently as a babe—oh, may I never disturb her precious peace!' The next day they read the Bible together, and he wrote that he trusted that the daily practice would last as long as their joint lives. Looking back, then, upon the wedding-day, but one day gone, he reflected: 'How can I express the sense of the scene of yesterday?—it may seem extravagant to dwell so much on the accompaniments, but it is because they did ennoble and sanctify the scene, and did really, for the time, raise the heart to a high level according with the spirit of the great mystery of Christian marriage;' and again, on a subsequent day: 'Not only every day, but nearly every hour, convinces me of the brightness of my treasure, her pure enduring brightness.' Lover's ecstasy indeed, but the judgment of Gladstone was never more sure, nor his sense of values more correct.

This is but an episode in the joint lives, though the most important. It brought those two beings to their most splendid fruit, and we may be sure it had something to do with the history of this country. Gladstone, tremendously conscientious, stern self-disciplinarian, magnificent in effort and sense of duty, would have been great in any circumstances, but one cannot read this beautiful story of love and helpfulness and tranquillity, with certain old memories, slight and fleeting as they may be, without realising that much of his greatness and achievement sprang from her, the sweetness of her love and assistance, the nobility of her character. Early in their married life there came to him an important letter from the Prime Minister, embodying something of a secret. Then a question arose. Was she to be told all or nothing? And it was agreed that always she should be told everything. . . . The Lytteltons and the Gladstones remained ever the most intimate friends, in constant association with one another; and we are told that in 1847 there were eleven children in the house under seven years of age—six Lytteltons and five Gladstones. As Mrs Drew remarks, 'one can scarcely imagine how any one could safely cross the room with such a crowd about the floor.' . . . How through her life, by her sweetness and goodness, Mrs Gladstone was the joy and happiness of all who knew her is one great part of this story; her devotion to her husband, her admiration and belief in him, is another. They must both be read for the moral strength we gather from such an exemplary record.

VENGEANCE VALLEY.

PART II.

VII.

IT was now practically dark, and as Kid Peters slipped silently along in the cover of the pines he knew just what he was going to do. He rightly judged that whoever was in the shanty would be at supper, and as he went he got out his knife. The white mule, he perceived as he drew closer, was also at supper.

The Kid left the shelter of the last pine-bole, and advanced with extreme caution. His one fear was lest the camp should include a dog. Fortunately for his design, the fear proved groundless. The mule was so intent upon its supper that it did not see—at all events it took no notice of—the stealthy figure gliding in the darkness along the wall of the shanty, until the smart sting of a well-aimed stone striking its hind-quarters caused it to utter an angry squeal, fling its heels in the air, and start up the valley at a canter. There was nothing to stop the canter, because the Kid,

before letting fly the stone, had thoughtfully cut the tethering-rope.

As the Kid had calculated, the noise of the white mule's abrupt departure brought a man hurriedly to the door of the shanty—a tall, black-bearded fellow, carrying a Winchester rifle. The moment Mr Peters perceived the muzzle of that rifle emerge from behind the woodwork, he realised that the situation called for action rather than argument. Without a word, he sprang from his concealment and landed the shanty-proprietor such a tremendous blow on the side of the head as laid him senseless. Snatching the gun as it fell, the Kid stepped back into the shadow to await developments.

None came. The Kid therefore poked his head cautiously inside. A moment's inspection satisfied him that it contained accommodation for a single gentleman only, whose supper, barely commenced, was set out on an upturned wooden box beside the truckle-bed.

Hurrying outside again, and finding the pro-

priest still lying quietly where he had left him, Mr Peters possessed himself of what was left of the white mule's tethering-cord, and took the precaution of securing the shanty-owner's hands and feet with it before dragging him into the candle-lit interior to examine the state of his health.

Standing up after completing this job to his satisfaction, the Kid set his hands to his mouth and shouted into the night, 'Ahoy! Miss Hester!'

Then he dragged the man inside and propped him against the bed.

VIII.

The candle-light fell full on the captive's bearded face, and a few drops of blood just below the right temple marked the spot where the Kid's fist had landed. He was alive. His recovery from that knock-down blow would be a matter of only a few minutes. But Kid Peters stood rigid and staring, and as he stared a black frown deepened on his young face. The man groaned slightly, and the lids of his closed eyes quivered.

'Sid Morgan!' shouted the Kid. He stooped and picked up the Winchester, and instinctively his finger felt for the trigger. For the moment he had forgotten everything but the vengeance which he had nursed through two years of wrong. 'Sid Morgan!' he shouted again.

Sid Morgan opened his eyes, and stared, at first stupidly, into the terrible young face confronting him. Stupidity slowly gave place to terror as he gazed.

'You know me?' asked Peters.

'No,' said Morgan obstinately. 'Never saw you before.'

'Liar!' said the Kid. 'Jog your memory, Sid. I'm the man you saw that night with the red heifer from Murchison's ranch—you swore it, you know, in open court—the same heifer whose hide you put on the fence of my corral with your own hands. You got me sent to Deerlodge for two years. Two years, you perjured coward! And every day of them I swore I would hunt you down, and every day since I quit jail I've been hunting you. I've come a long way, but I've found you.' He slewed the rifle round so that it covered his enemy.

'Stop!' cried the wretched man. 'Kid Peters, are you going to murder me in cold blood?'

'I'm going to kill you, sure. Why not? You've murdered me. I was an honest man. You made me a jail-bird. You branded me for life. The law will never avenge me—you saw to that. I'll avenge myself.' Kid Peters raised the rifle.

Beads of sweat showed on Morgan's forehead. 'Wait!' he cried desperately. 'I'll make it up to you, Peters. Every minute of it—every second! I'll make you a millionaire this very night. There's a fortune in this shanty, Peters—

a fortune in sapphires. And a dozen more in the ground around. Spare me, and it's yours! Look for yourself, man!'

'All the sapphires in the Rocky Mountains won't pay me for two years in Deerlodge,' said the Kid as he rammed the butt of the rifle to his shoulder. And then, in the very act of firing, the present swept vividly back upon his consciousness, which the sudden cloud of vengeful memories evoked by the encounter with Morgan had momentarily obscured. Perhaps it was the mention of the jewels that had broken the spell, letting in reason's ray upon the black darkness of his passion. Jewels connoted woman, and since last night woman had but one name for the Kid. And she was outside. Any moment she might be in the shanty. There was one thing, and only one, which in his present mood Kid Peters dared not do, and that was to figure as a murderer in the eyes of Hester M'Cleod.

He lowered the rifle, and strode to the door. Listening, he could detect faintly in the distance his horse's footsteps. He re-entered the shanty, and paced up and down, the Winchester in his hand, wrestling with the problem. Morgan, on the ground, watched him furtively with alternate terror and hope.

'Look at them—for God's sake, look!' he urged. 'There's a gripful of stones by the oil-stove there. First-grade ultramarines every one of them, with the live spark, Kid. I didn't trouble to pack the commoner stones.'

He ran on with desperate praise of the jewels with which he hoped to buy his life, but Kid Peters never so much as glanced towards the bag.

'I was prospecting for gold,' pleaded Morgan. 'The gravel promised well by the stream-bed—all underlaid with clay and rotting limestone, Kid. I didn't find any gold, but I hung on. My horse died, and I went clean out of grub, but I had a kind of sense there was something rich right here. I was pretty near starvation, and it's fifty miles from here to Hat Creek; but I wouldn't quit. There's a woman camping down the other arm of the valley, thirty miles nearer the settlement than me. What does a woman want prospecting? I went down to get some grub from her. She wasn't at the cabin, but her mule was tied there, loaded up with a new lot of stuff. I brought the mule along with me. The woman can easily get back. She's only fooling around, anyhow; and I'll pay her for the beast one day. And the very same day I struck the gems—pockets and pockets of them, Kid. And they're all yours, every stone. Kid, you'll let bygones be bygones?'

Kid Peters halted suddenly in front of his enemy.

'Morgan,' said he, 'I've changed my mind. Not because of the stones—curse you! I brought a friend with me when I came here. If I had known you were here, I'd have come alone,

and you would be a dead man now. My friend knows nothing about you, and very little about me, but more about justice, I guess, than the two of us together. You shall have a fair trial. We will put the facts before my friend—the facts, and nothing else. And what my friend decides shall go. Do you agree?’

‘Agree!’ exclaimed the captive wretch. ‘God bless you for a white man, Kid Peters!’

IX.

There was a sound of hoofs outside. The Kid seated himself on the bed beside the food.

A minute later Hester M’Cleod came in, and stood in the doorway taking in the scene.

The Kid sprang up, and with polite, if somewhat theatrical, alacrity handed her to the seat he had just vacated.

‘Supper is served, Miss M’Cleod,’ he announced. ‘It’s *your* supper, every crumb of it.—That so, Mr Morgan?’

‘I’m afraid it is, miss,’ answered Morgan. ‘I robbed you, and that’s a fact.’

‘And the mule will be along by-and-by,’ said the Kid cheerfully. ‘She won’t stray far from her feed. This is the gentleman who stole her, and he says he is very sorry, and will be pleased to pay compensation.—That so, Mr Morgan?’

‘Quite right,’ said Morgan.

The Kid, as he talked, was busily supplying his wondering companion with the food already prepared.

Hunger proving too strong for speculation, Miss M’Cleod began to eat with relish while awaiting explanations, and the Kid ran on with assumed gaiety.

‘I had Mr Morgan rather at a disadvantage when we met, so I had to tie him up. He wasn’t expecting you, but he’s very pleased to welcome you to his place.—Aren’t you, Morgan?’

‘Delighted, I’m sure,’ said Morgan with a wry grin.

‘We had a few minutes to spare while we were waiting for you, Miss M’Cleod, and to pass the time away we got to chatting about old pals. There was a particular case of two fellows we both knew pretty well. One was a friend of Mr Morgan’s, and the other was my own pet chum. These two guys fell out, and Morgan and I both sided with our own man pretty warmly. It’s rather a queer story, and I was telling Morgan here about the finish of it, and we very nearly quarrelled about it ourselves as to who was right; but we settled to ask your opinion as an unprejudiced outsider.—Didn’t we, Morgan?’

‘We did, miss,’ said Morgan.

‘Hadn’t you better both have some supper?’ asked Miss M’Cleod in bewilderment.

‘Ladies first,’ said the Kid, smiling amiably. ‘Morgan and I felt we couldn’t eat till we heard your opinion. It was like this. Morgan’s friend was a ranch foreman up in the Continental Divide, and my friend was a fellow who set up

homesteading in the neighbourhood of the ranch. Morgan’s friend played the dirty on my friend—that’s agreed—and got him sent to two years’ penitentiary on a faked charge of cattle-thieving. My friend served his two years, and when he came out he set about looking for Morgan’s friend to kill him. Well, he found him after a bit; but the Devil looks after his own, and in the meantime Morgan’s friend had made a rich find of gems in the mountains. My friend caught Morgan’s friend unawares—pretty much as I caught Morgan himself to-night—and had got him at his gun’s end, when Morgan’s friend offered to buy himself off with the fortune he had discovered. That was the situation we were discussing when you came in.’

X.

Hester’s bright eyes shone with interest. ‘And what happened?’ she asked eagerly, pausing between two mouthfuls.

‘Before we tell you that,’ said the Kid, drawing back out of the candle-light, ‘we want your impartial opinion on the justice of the case. We both feel that we are too keen each on his friend’s behalf for our notions to be unprejudiced. Mr Morgan will correct me if I have left anything out.’

‘Mr Peters has put it quite straightforward, miss,’ said Morgan. His brow was damp, and his face livid under its tan.

There was a tension in the air that made Hester suddenly grave. But she did not hesitate. ‘Nothing could compensate your friend for the injury done him,’ she said, turning her brown eyes on the Kid. ‘If Mr Morgan’s friend had a conscience, he would never be able to forget that he had robbed an innocent man of his character. The gift of a fortune might be good for a man, or it might not. It would depend on the man. But Mr Morgan’s friend was right to offer the only thing in his power. Then, if he wanted to get square with himself as far as he could, he should have confessed his perjury publicly, and taken the consequences.’

‘I don’t know if he was just that sort of guy,’ said the Kid. ‘Was he, Morgan?’

‘I guess he wasn’t,’ answered Sid Morgan. ‘He was kind of weak in the conscience, miss.’

‘Morgan means he was an infernal coward; only, he don’t like to put a name to it,’ explained the Kid. ‘It wasn’t repentance the guy was suffering from, but blue funk. The sight of that gun put the wind up him properly—didn’t it, Morgan?’

‘I guess he was pretty badly scared,’ Morgan admitted.

‘But what happened? How did it end?’ demanded Miss M’Cleod. There was suppressed excitement in her question, for there was, she felt, something in this sinister story which she did not understand.

Kid Peters walked over to the large leathern

bag lying beside the oil-stove, and opened it deliberately. As he did so, he replied to the girl's question in a level voice.

'It ended, Miss Hester, just as you thought it ought to end. You see, my friend was kind of weak. He didn't want the gems, and he would rather have seen Sid Morgan's friend stretched out with a bullet in his heart than own all the jewels in the United States. But he happened to have a lady with him when he fell in with his enemy, and he didn't want the lady to think too badly of him. So the finish of it was that he decided to close with the other fellow's offer, and sell him back his life.' The Kid had opened the bag, and as he went on talking he was holding a handful of sparkling gems in his open palm to catch the glint from the candle. 'That reminds me—do you know anything about the law of grub-stake, Miss Hester?'

'Law of what?' With a heightening colour, as a dim suspicion of the truth began to dawn upon her, the girl leaned forward, staring at the Kid's open palm.

'Grub-stake,' repeated Peters without looking up, and carefully turning over the jewels with his fingers. 'Tell Miss M'Cleod the law of grub-stake, Morgan, as laid down by the legislature of Montana.'

'The grub-stake takes one-third of the claim,' said the bound man.

'Mr Peters,' said Hester with spirit, 'you are talking over my head, and I don't think you are at all polite. Have the goodness to descend to the level of my understanding.'

'It's really quite simple,' said the Kid. 'It has been held over and over again in the courts that the individual who lends to a prospector the cash, or its equivalent in food or horse-flesh, to enable him to carry on his prospecting, is entitled to a third share of whatever find the prospector may make. Morgan here stole your mule and

outfit, and as the result he has made a big find of sapphires. He owed me his life, and I have taken his jewels for the debt. But one-third of them is yours by law. You and I between us own this claim. To-morrow morning we'll start away for Virginia City, and get it registered.'

There was a minute or two of silence in the cabin, during which Miss M'Cleod sat studying her two companions, and endeavouring to acclimatise herself in the strange situation into which she had been swept, as it were, on the wings of destiny. She had a rather breathless sensation.

'You seem to take me very much for granted,' she said at last. 'And what about Mr Morgan?'

'Morgan and I agreed to abide by your verdict,' said the Kid, throwing back the jewels into the bag. 'You've given judgment, and that holds good.—Don't it, Morgan?'

'It sure does,' said the prisoner fervently.

'Very well,' said Hester, with a sudden little air of decision. 'Then there's only one thing more. Untie Mr Morgan, and let me see you two shake hands.'

'I don't think that would be very safe,' protested the Kid, 'in the interests of the partnership.'

'There won't be any partnership if it is not done,' said Miss M'Cleod very firmly. 'Untie him, Kid!'

Kid Peters met the judge's eye, and his blood ran quick in his veins. A few seconds later he had cut his enemy's bonds, and the two men somewhat sheepishly clasped hands.

'Now come and have supper,' ordered Hester.

'Yes—partner,' said the Kid.

The Vengeance Valley Sapphire Syndicate, to which some months afterwards Mr and Mrs Peters disposed of their joint interests, is a flourishing concern. Sid Morgan is still foreman of the workings.

THE END.

THE COLOUR OF THE SEA.

By HERBERT LUSS.

THE colour of the world of waters has been vaunted by poets and writers of all ages. Homer described the sea as 'wine-coloured'; Denham speaks of its 'amber foam and golden gravel'; whilst Byron, in that splendid poem of his, 'The Ocean,' refers to it as 'dark blue:'

Roll on, thou deep and dark blue Ocean—roll!
Ten thousand fleets sweep over thee in vain.

But these are only a few of the hundred hues which the great deep can assume. 'In every clime and every season,' writes Professor Downes, 'it bears the stamp of changeful beauty.' In bright weather, while its face is gold and white with the large light upon it, you will see under the side of a ship, or even of a small boat, a

patch of shadow colour so delicately blue, or so divinely green, that sapphire and chrysoprase are but foolish terms whereby to indicate them. Nor can you decide which combination is more exquisite to the eye, the dark blue of the deep water, laced with the broken silver of the foam; or the leaf-green loveliness of an inland gulf when the glitter of each lifting emerald ripple is backed by violet and gray; or the glory of the calm expanse under a golden sunset when the seascape is a far-stretching splendour of glass, mingled with fire. But the changeful glory of the sea ever mocks the poverty of words. We can only accept it, and thank the Great Creator for it as something worthy of His measureless beneficence. Byron sings:

Thou glorious mirror, where the Almighty's form

Glasses itself in tempests: in all time—

Calm or convulsed, in breeze, or gale, or storm,

Icing the pole, or in the torrid clime

Dark-heaving—boundless, endless, and sublime,

The image of Eternity, the throne

Of the Invisible; even from out thy slime

The monsters of the deep are made; each zone

Obeys thee; thou goest forth, dread, fathomless,
alone.

The bluish tint of the sea is rendered visible to the eye only when the light penetrates through a stratum of water of considerable depth. This may be easily ascertained by experiment. Take a glass tube two inches wide and two yards long; blacken it internally with lamp-black and wax to within half-an-inch of the end—the last mentioned being closed with a cork. Drop a piece of white porcelain into the tube, which, after being filled with pure sea-water, must be set vertically on a white plate; and then, looking through the open end, you will see the white of the porcelain changed into a light-blue tint.

In the Gulf of Naples we find the inherent colour of the water exhibited to us by nature on a most magnificent scale. The splendid 'Azure Cave,' at Capri, might almost be said to have been created for the purpose. For many centuries its beauties had been veiled from man, as the narrow entrance is but a few feet above the level of the sea; and it was only discovered in the year 1826, by two Prussian artists accidentally swimming in the neighbourhood. Beyond the portal the cave widens to grand proportions, a hundred and twenty-five feet long, and a hundred and forty-five feet broad; and except a small landing-place on a projecting rock at the farther end, its precipitous walls are on all sides bathed by the influx of the waters, which in that sea are most remarkably clear, so that the smallest objects may be distinctly seen on the light bottom at a depth of hundreds of feet. All the light that enters the grotto must penetrate the whole depth of the waters, probably several hundred feet, before it can be reflected into the cave from the clear bottom; and it thus acquires so deep a tinge from the vast body of water through which it has passed that the dark walls of the cavern are illumined by a radiance of the purest azure, and the most differently coloured objects below the surface of the water are made to appear bright blue.

All profound and clear seas are more or less of a deep-blue colour; while, according to seamen, a green colour indicates soundings. The bright blue of the Mediterranean, so often referred to by poets, is found all over the deep pure ocean, not only in the tropical and temperate zones, but also in the regions of eternal frost. Scoresby speaks with enthusiasm of the splendid blue of the Greenland seas; and all along the great ice-barrier which, under 77° lat., obstructed the progress of Sir James Ross towards the South Pole, that illustrious navigator found the waters

of as deep a blue as in the classical Mediterranean. The North Sea is green, partly from its water not being so clear, and partly from its sandy bottom mixing with the essentially blue tint of the water. In the Bay of Loango the sea has the colour of blood, and Captain Tuckey discovered that this results from the reflection of the *red ground soil*.

But the essential colour of the sea undergoes much more frequent changes over large spaces from enormous masses of minute *algæ* and countless hosts of small sea-worms floating or swimming on its surface.

'A few days after leaving Bahia,' says Mr Darwin, 'not far from the Abrolhos islets, the whole surface of the water, as it appeared under a weak lens, seemed as if covered by chipped bits of hay with their ends jagged. Each bundle consisted of from twenty to sixty filaments, divided at regular intervals by transverse *septa*, containing a brownish-green flocculent matter. The ship passed several bands of them, one of which was about ten yards wide, and, judging from the mud-like colour of the water, at least two and a half miles long.' Similar masses of floating vegetable matter are a very common phenomenon near Australia.

'On the coast of Chili,' says the same author, 'a few leagues north of Concepcion, the *Beagle* one day passed through great bands of muddy water; and again, a degree south of Valparaiso, the same appearance was still more extensive. Mr Sullivan, having drawn up some water in a glass, distinguished, by the aid of a lens, moving points. The water was slightly stained, as if by red dust; and after leaving it for some time quiet, a cloud collected at the bottom.

'With a slightly magnifying lens, small hyaline points could be seen darting about with great rapidity, and frequently exploding. Examined with a much higher power, their shape was found to be oval, and contracted by a ring round the middle, from which line curved little setæ proceeded on all sides, and these were the organs of motion. Their minuteness was such that they were individually quite invisible to the naked eye, each covering a space equal only to the one-thousandth of an inch, and their number was infinite, for the smallest drop of water contained very many. In one day we passed through two spaces of water thus stained, one of which alone must have extended over several square miles. The colour of the water was like that of a river which has flowed through a red clay district, and a strictly defined line separated the red stream from the blue water.'

Remarkable as it may appear, in the neighbourhood of Callao the Pacific has an olive-green colour, owing to a greenish matter, which is also found at the bottom of the sea, in a depth of eight hundred feet. In its natural state it has no smell; but when cast on the fire it emits the odour of burnt animal substances.

Near Cape Palmas, on the coast of Guinea, Captain Tuckey's ship seemed to sail through milk, a phenomenon which was owing to an immense number of little white animals swimming on the surface, and concealing the natural tint of the water.

The peculiar colouring of the Red Sea, from which it has derived its name, is due to the presence of a microscopic *alga*, floating on the surface of the sea, and even less remarkable for its beautiful red colour than for its prodigious fecundity.

Many more examples might be given where, either from minute *algæ* or from small animals, the deep-blue sea suddenly appears in stripes of white, yellow, green, brown, orange, or red. For fear, however, of tiring the reader's patience, we shall merely mention the *olive-green* water which covers a considerable part of the Greenland Seas. It is found between 74° and 80° N. lat.; but it varies in position with the currents, often forming isolated stripes, and sometimes spreading over two or three degrees of latitude. Small yellowish *medusæ*, of from one-thirtieth to one-twentieth of an inch in diameter, are the principal agents that change the pure ultramarine of the Arctic Ocean into a muddy green.

According to Scoresby, they are about one-fourth of an inch asunder, and in this proportion a cubic inch of water must contain sixty-four; a cubic foot, 110,592; a cubic fathom, 23,887,872; and a cubic mile over 16,000 billions. From soundings made in the situation where these animals were found, the sea at this part is probably more than a mile deep; but whether these substances occupy the whole depth is uncertain. Provided, however, the depth to which they extend be about two hundred and fifty fathoms, the immense number of one species mentioned above may occur in a space of two miles square; and what a stupendous idea must we form of the infinitude of marine life when we consider that those vast numbers, beyond all human conception, occupy, after all, only a small part of the green-coloured ocean, which extends over twenty

or thirty thousand square miles! It is here that the giant whale of the North finds his richest pasture-grounds, which at the same time invite man to follow on his track.

The crystalline clearness of the Caribbean Sea excited the admiration of Columbus, who, in the pursuit of his great discoveries, ever retained an open eye for the beauties of nature. 'In passing over these splendidly adorned grounds,' says he, 'where marine life shows itself in an endless variety of forms, the boat, suspended over the purest crystal, seems to float in the air. On the clear sandy bottom appear thousands of sea-stars, sea-urchins, molluscs, and fishes of a brilliancy of colour unknown in our temperate seas. Fiery red, intense blue, lively green, and golden yellow perpetually vary. The spectator floats over groves of sea-plants, corals, and sponges, that afford no less delight to the eye, and are no less gently agitated by the heaving waters than the most beautiful garden on earth when a gentle breeze passes through the waving boughs.'

Surely, then, the sea is one of the glories, as it is the chiefest of the guardians, of Britain. The track of the Atlantic steamer is the avenue to our palace-front. The mighty murmur of the ocean strikes the patriotic vein in us. We have discovered and peopled continents by our mastery of the sea. As it stretches before us, the stout, brave galleons, the 'wooden walls' of Old England, pass before the mind's eye; the guns of the Armada, of St Vincent and Trafalgar, boom in the mind's ear; the spirits of Drake, Rodney, Collingwood, and Nelson move upon the face of the waters, and thrill us with the memories of their valour.

Other things change and decay, but the sea changes without decay. Time writes no wrinkle on its azure brow. It is the symbol alike of Infinity and Eternity:

Roll on, thou deep and dark blue Ocean—roll!
Ten thousand fleets sweep over thee in vain;
Man marks the earth with ruin—his control
Stops with the shore.

MARGARET AND MARRIAGE.

By WILLIAM FREEMAN.

I.

YOU can't bluff Destiny. I've tried it, and I know.

I met Margaret Thewson first at the Vamberys', and afterwards we met at intervals and in all sorts of places, because it was intended that we should meet.

The Vamberys were young, and very modern, and, so far as I've been able to gather, they married because their steps suited, and really good jazzing partners were scarce. They'd no

patience with housekeeping, or babies, or any other out-of-date domesticities of that sort; and when, about the end of the fifth month, they found themselves without a maid and pretty considerably bored with one another, they invited Margaret, a poor relation of Netta's, to come and live with them. And Margaret came. She was one of those slight, fair girls who look frailer than they are; too hard-working to give her prettiness a chance, and an excellent foil for the dark brilliance of Netta. And she'd tact, and sympathy, and a phalanx of the lesser

virtues, and she stayed with them until the smash came.

I had my first real conversation with her on the day when George Vambery called me in to see what could be saved from the wreckage—though, of course, we'd met before. I'd spent the morning going into figures. It had been a depressing business, and the main fact that had emerged after some four hours' solid work was that the Vamberys wouldn't have more than about a couple of hundred between them to live upon. As a matter of fact, Netta didn't propose to live on it at all. An uncle—Sir Samuel Mellish, the Caramel King—was in need of some one to supervise his household, and was prepared to pay well for the job. And Netta had written and announced that she was taking it on.

'And you?' I said to Margaret. We were standing in the hall, looking through the open doorway on to the yellow sweep of the drive. There were still the grooves in the gravel where the motors had come up for the big party the Vamberys had given the week before.

'I must get something else to do.'

'Any particular preferences?'

She shrugged her shoulders. 'If I have, they mustn't count. I've no capital, and very little experience. I used to be considered fairly good at figures, and so forth.'

'What about a Government post?'

'I'm over twenty-five—too old to make a start at anything that matters.'

'I was thinking of a berth under the Board of Production. Waveling, a man I happen to know there, was telling me yesterday that the department's in need of temporary help. The pay, I gathered, would be somewhere in the region of three pounds a week. One can live on that.'

'Of course. I'd be most grateful for an introduction.'

So I took her the next day to interview Waveling. He's a permanent official, with all the permanent official's limitations, but a good fellow, and he was willing enough to give her a trial. She was, it seemed, leaving the Vamberys' at once.

I took her to Buffoni's to lunch, and then, by the sheerest luck, was able to find her decent rooms.

'You've been most awfully good to me,' she said when we parted.

'The boot's on the other foot,' I told her. 'You've furnished me with a whole series of excuses for a half-day's escape from the office.'

'I thought—her eyes twinkled—'that lawyers hated to be kept away from their parchments and deed-boxes.'

'It's a tradition, and tradition dies hard. But in this weather—only, for Heaven's sake, keep the thing secret!—every solicitor in London is racking his brains for an excuse to go somewhere else.'

'By the way,' she said—this was as we were about to part—'I owe you—how much is it?—for my lunch.' The keen April wind and a touch of excitement had brought an unusual dash of colour to her cheeks, and she looked very earnest and kiddish and pretty.

'That's all nonsense. You mustn't'—

'Please, Mr North!'

'But why insist upon spoiling a man's simple pleasure in acting as escort to'—

She cut short the discussion by producing five shillings.

'Invest it,' I told her, and made her put the money back in her purse.

I went on to the office, meditating on the queer streaks that run through a woman's character, and wondering if I should ever see Margaret Thewson again.

II.

When I did, it was four months later. The *affaire Vambery* had ceased to be an *affaire*. Their furniture had been sold by auction; the house had been let; Netta was with her caramel-making uncle; Vambery himself was loafing about, looking—not too strenuously—for a job, and wondering why four pounds a week had so devilish little spending in it. Then some business took me to the Board of Production, and in one of the corridors I ran against Margaret. The overworked housekeeper-companion-secretary had developed into a striking-looking young woman, alert, well dressed, obviously capable. She laughed and flushed as she held out her hand—I fancy my gasp of astonishment was audible—and presently began telling me about herself, quite simply and frankly. She persisted in regarding me as the originator of her good fortune.

'I've been promoted,' she said, 'twice. Mr Waveling has been kind—they've all been kind—and the work appealed to me. I'm going to be moved into the statistical branch in November. If it hadn't been for you in the first instance'—

'That's fudge!' I said. 'Or mayn't one use such expressions to a higher official?'

'But temporary,' she reminded me; 'merely temporary.'

'I decline to believe it. His Majesty's Government has its deficiencies, but it knows a departmental bargain when it sees one. . . . In the meantime, what about a light and sustaining luncheon at Buffoni's?'

But she declined. There were, I gathered, innumerable matters that claimed her attention for the next hour or so. And—well, she wouldn't come, anyway. So I lunched by myself, and thought about her a good deal, and for the next few nights dreamed about her as well. I wanted to see her often; to talk to her long enough to knock away all the silly barriers of formality that convention and habit set up between a man

and a woman. But it was another month before I did see her, and then it was where connected conversation was next to impossible.

She was crossing the Strand from one side as I crossed it from the other, and we found ourselves marooned on the same island amid a clattering stream of traffic that for some minutes made escape impossible. I thought she looked as though she needed a holiday, and was tactless enough to say so. But she shook her head.

'But what I do need,' she confessed, 'is new lodgings. My landlady has a married daughter coming to live with her, and the result is—expulsion. If you happen to know of a place that's falling vacant by the 29th'—

As it happened, I did know of a place, and told her so.

'It's in St Martin's Mansions, the big block of flats fifty yards from my own digs,' I explained. 'A client is giving up the rooms next week.'

'And the rent?'

I didn't know, but I offered to find out, and did, the upshot being that she took the flat. After that, I helped her in various small ways in connection with the furnishing—it was all natural and inevitable enough—and again when the landlord stepped in, a week or so later, and demanded all sorts of preposterous repairs. I told her to disregard the demand; and after that we discussed the sitting-room carpet and the disadvantages of anthracite stoves. And then, without the least premeditation, I found myself asking her to marry me. I told her that I'd never cared a row of pins for any other woman, and never should.

She refused me, kindly, but quite definitely.

'Is there any one else?' I asked.

She shook her head. 'It isn't that—or because I don't like you. There's only one reason. I'll tell you—it's fairer. I won't marry you because I'm not sure of myself, and because our liking for one another is almost entirely a matter of propinquity. I haven't many friends—and neither, I think, have you, though perhaps it's a hard thing to say'—

'But true,' I admitted.

'When we meet, it's by accident.'

'Not always,' I said.

She flushed faintly at that, but went on: 'These chance encounters don't carry one beyond the acquaintance stage'—

'The happiest married couples were only acquaintances once. I'd give you all the happiness I could. It's a stereotyped statement, but I mean it.'

'I know. We'd both do our best to play the game. Perhaps in the end it would be a success. Perhaps! Think of the Vamberys—or of the Tudor-Smythes, who lived almost opposite. . . . I'm afraid; I've seen so many shipwrecks. Do you understand?'

I suppose I did. At any rate I said so.

'But isn't there a chance?' I asked.

'Do you want kindness, or just the truth?'

'Isn't it possible to combine the two?'

She shook her head. And I knew that it wasn't any use arguing further—then. But I went back to my rooms feeling as though the best and biggest part of my life had withered and shrivelled. I'd never realised before how much I wanted her. The fool who wrote somewhere that any decent man could marry any woman, provided they were of the same social stratum, hadn't met Margaret Thewson.

She meant to climb, and women of her intelligence and grit who mean it don't usually fail. The publication of the next Honours List emphasised *that* point. I called at the office to congratulate her. It was a bigger one than she used to occupy, with an Axminster carpet instead of linoleum, and magnificently massive mahogany furniture.

'It's delightful of you to call,' she said; 'but it's really nothing. I happened to be able to produce certain facts that a certain politician wanted at a rather crucial time, and the rest followed.'

'It's definite recognition,' I insisted.

'Pooh! Or mustn't one use the expression to a solicitor? I'm still only temporary. I've no real status. I'm liable to be dispensed with at any time.'

'In which case'—

'I shall look for another berth.'

'There's a permanency waiting.'

'I should have to spend all my life under the same chief. And that, according to officialdom, means slackness.'

A typist came in with a batch of important papers, and I had to go. But for the rest of the morning I found settled work a difficult matter.

III.

The next day was one of summer brilliance, when even in the City the sunlight was dazzling, and confinement in an office sheer misery. I knew I could leave things to Jeens, my managing clerk—he was no more affected by the seasons than the office copying-press—and I left them to him, and took the train to Dorking, and spent the day prowling about the green slopes of Leith Hill. I had tea at the little wooden chalet on the summit, and walked back to the station as dusk was falling. The train was packed with a big East-End school-treat. The children were tired, and dusty, and thirsty, and noisier than it seemed possible for any crowd of children to be. But I'd have given something to have been as happy.

At the station I bought an evening paper. A paragraph on an inner page caught my eye. 'It was unexpectedly announced in the House of Commons this afternoon,' it stated, 'that owing to the increasing necessity for stringent economy, the Statistical Branch of the Ministry of Production will in future be undertaken by

the Ministry of Supply. The permanent officials of the first-named branch will be transferred elsewhere, while the services of those acting in a temporary capacity will be dispensed with.'

That gave me plenty to think about during the interminable journey back to London. I took a taxi to my rooms, and from there walked on to Margaret's flat. She had just come back from a shopping expedition, and looked white and fagged.

'Yes,' she said, 'I've been given my month's notice. Some of them got only a fortnight. My chief was tremendously apologetic and sympathetic'—

'And helpful?'

'He said he'd do his best. But the best isn't likely to amount to much. There are the claims of the ex-service people to be considered first. That's as it should be. But it complicates things for the woman who's playing a lone hand.'

'Not if she's willing to exercise her prerogative, and change her mind.'

She sighed. 'I'd hoped you wouldn't say that.'

'You shouldn't have given me an excuse. But you must let me make amends, and help you.'

She said she would. But she didn't. I think she had developed a sort of terror of dependence, that made her at times almost cruel. Days passed, and I heard nothing, and eventually I called again at the flat. It was locked up—empty. All the furniture, the lift-attendant explained, had been taken away the day before. He had a note for me.

It was brief, and written in extreme hurry and confusion. The number of my rooms had escaped her memory, or she would have posted it. She had heard unexpectedly of a berth on the farther side of London—that of organising secretary to the Woman's Advancement League—and had every hope of getting it. There were quarters attached; in any case, she wouldn't be able to stop at St Martin's Mansions. Ecclestein, the dealer in second-hand things, at the end of the road, had offered her a good price for the furniture, and there was a tenant waiting to enter the flat, and willing to pay a premium. She would write to me again as soon as things were settled, and in the meantime she hoped I shouldn't think that she'd treated me badly.

Well, that was *that*. She had dropped out of my life again, and I could only wait.

I waited for a fortnight without hearing, and then went to the flat again. Her letters, which were to be called for—there were only one or two—hadn't been called for. The attendant could give me no information at all. I inquired, by proxy, on the 'phone, the name of the newly elected secretary of the Woman's Advancement League. The garrulous and amiable lady who replied told me that there had been keen competition, but that 'her Grace' (I never found out who she was) had intervened very actively

at the last moment on behalf of a candidate of her own, which candidate had got the berth. The name? No, it wasn't Margaret Thewson.

I followed that up by a visit to the office of Margaret's late chief. But he had been abruptly transferred to the north of England—Government departments have a trick of doing that sort of thing—and his successor couldn't—or wouldn't—help me. And there the trail ended. But Destiny, grinning, still held the threads of her life and mine, and waited to interweave them again.

It was late autumn when I saw her—at the Caledonian Market, of all places. It had been a sunny morning, but the sky had clouded over, and a keen wind was sweeping over the wide, cobbled space. She was buying groceries at a stall near the clock-tower, and I watched her for some time before she saw me. She was thinner, paler, shabbier. There were lines of suffering at the corners of her mouth and eyes. She became aware of my scrutiny, and turned sharply. The colour rushed into her cheeks, and then away again.

'You!' she said, and smiled.

'I.'

'Are you curio-hunting? Or is it books?'

'It was both. But now I want to talk to you.'

'I mustn't stay long.'

'Why not? No—wait until I've found somewhere where we can sit down. There's a bench outside that refreshment-stall. It's reserved for customers, but if you'll let me get some coffee and cakes'—

She nodded. I fetched the coffee, and we sat down. Over the steaming cups she began to explain.

'You've heard of Bragge Brothers, the big Camden Town drapers? I'm an assistant there, at the ribbon and lace counter. I was lucky to get the job. . . . It seems a long way from St James Square to Camden Town, but when once you've started'—

I interrupted her. 'Why didn't you write to me? You promised.'

'I—I was afraid. I know I've been horribly ungrateful, and a hundred other things, but that's the truth.'

'Afraid of what?'

'That my resolution might snap.' Then she went on quickly: 'I've explained that I'm a shop-assistant. I live in—they believe in the living-in system at Bragge's—and we're looked after with great thoroughness by the housekeeper. Every fourth Friday, provided I've behaved properly, I'm given a half-day's extra holiday. That's why I'm here this afternoon.'

For a minute I found it difficult to speak.

'Look here,' I said at last, 'this mustn't go on. It sha'n't. You've no right to wreck your own life, and mine. If you care at all'—

'I care for you too much to face the risk of disillusioning you later on. The Vamberys'—

'The Vamberys aren't a horrible example any longer. They've come together again. A relative left him a house in Yorkshire and three thousand a year, and he wrote to Netta, and'—

'And the Caramel King has had to look out for a fresh housekeeper? Well, I'm glad—awfully glad. But it doesn't affect the argument. . . . And now I must be going.'

I walked with her to the market gates, and saw her into a bus which stopped at the Bragge premises. And after that I went home to think things over. I'd found her—that was the essential fact—and I wasn't going to risk losing her again. Until late that night I sat smoking and making plans—plans that had nothing at all to do with a solicitor's profession. I remember winding up with a preposterous decision to ask old Jeens to be best man.

IV.

But I didn't ask him. Jeens himself scuppered that scheme. He was away from the office the next day, and the day after that was Sunday. On Tuesday morning I'd a letter from him. To this hour I don't understand why he took the trouble to write it, unless he'd some sort of sneaking regret—though regrets don't usually afflict men of the Jeens type. He told me, more or less in detail, that 'availing himself of a growing and lamentable laxity' on my part, he had made certain 'financial readjustments' to his own advantage, and that by the time I received the note he would be comfortably beyond pursuit.

Investigations followed. They showed that the readjustments had been on a big enough scale to wreck the firm irretrievably. It's difficult to recall the order in which things happened after that; they merged in one prolonged nightmare. I did my best to straighten out the tangle, and some of the people concerned were decent—more than decent. But there were plenty less charitable, and there was a certain amount of publicity. And the end was a physical collapse, and a bad one.

I was barely convalescent again when I'd my first unofficial visitor—Margaret. She came into the room panting a little—the climb up from the street-level was a stiff one—and bringing with her a big bunch of bronze chrysanthem-

mums. She crossed to the couch, and stood looking down at me.

'It's good of you to come,' I said lamely at last.

'Good of me! If I'd known you were ill—but I only heard by chance, through a line or so in one of the papers.' She spoke jerkily, almost harshly.

'It was my own fault. Or, at any rate, I'm not going to blame any one but myself. And, after all, I'm not too old to make a fresh start. . . . Sit down—the chair by the fireplace is less rickety than some—and let's change the subject.'

But she didn't. She stood surveying the wretched little bed-sitting-room with steady, critical eyes.

'How long have you been here?'

'A month. I came the week before I crocked up. I suppose you got the address from the porter at my old digs. I was lucky to get these. The landlady's quite a decent sort, when she isn't'—

'Don't amplify—I met her on the stairs. . . . Listen! You're going to get well as quickly as possible, and after that make a fresh start. But in your old profession. And I am going to supply the capital.' I gasped, but she went on quickly: 'It sounds nonsense, doesn't it? But it's true. Do you remember the five shillings you refused as my share of our lunch at Buffoni's?'

I nodded.

'Well, I didn't want the money, and in a moment of recklessness I invested it in a big charitable lottery. It was before schemes of that sort were declared illegal. Yesterday I'd a visit from the organising secretary. He brought me a cheque for two thousand pounds—the first prize.' She opened her purse, and showed me the slip of paper. 'The money is yours—yours and mine.'

'I can't accept it.'

She refolded the cheque. I could see that her dear hands were shaking.

'Not as my wedding-present?' She slipped down beside the couch, and laid her cheek against mine. 'Jim dear, are you going to break my heart by telling me that I've come too late to exercise my prerogative?'

God knows that she wasn't too late. I'm spending the rest of my life trying to tell her so.

THE MONTH: SCIENCE AND ARTS.

THE COLD VULCANISATION OF RUBBER.

EXCEPT in thin sheets or layers rubber can be vulcanised only by the application of heat; at least this was the case until Mr S. J. Peachey, M.Sc., of the Manchester College of Technology, discovered a new process, whereby rubber can be vulcanised at ordinary temperatures. For

the benefit of readers who are not familiar with the manufacture of rubber goods, it may be explained that the raw rubber is intimately mixed with varying proportions of sulphur according to the quality desired, and heated to a temperature of 266° to 302° F. for from one to three hours. The results are the various types of rubber in everyday use, which possess qualities

not found in the raw material. A process involving the application of such high temperatures greatly restricts the choice of colouring matter and filling materials which can be mixed with the rubber. For instance, with few exceptions, it has proved impracticable to use dye-stuffs made from coal-tar for colouring rubber; while animal or vegetable substances, such as leather waste or sawdust, cannot be mixed with it. By the new process, rubber (either by itself or mixed with other materials and colouring matter) is vulcanised by exposure to two gases—sulphur dioxide and hydrogen sulphide. These diffuse through the rubber, and, according to Mr Peachey, their interaction produces a particularly active form of sulphur, which is capable of combining with and vulcanising the rubber even at ordinary temperatures. Rubber vulcanised in this manner is said to possess remarkable strength and toughness; but the most important advantage accruing from the process is the free choice of colouring matter obtained, which allows of the production of rubber goods in colours quite unobtainable by the old process. Moreover, materials such as wood-meal can be mixed with a small proportion of rubber, resulting in low-priced floor-coverings having greater flexibility and durability than linoleum. Similarly, re-formed leather, closely resembling the genuine article in appearance, could be produced from leather buffings and shavings bound together by rubber. The new process can also be applied to rubber solutions; consequently articles built up of re-formed leather could have their seams vulcanised instead of stitched or riveted.

A NEW ICE-CREAM FREEZER.

Almost every one likes ice-cream in hot weather, while to not a few it forms a welcome addition to a good dinner at any time. Hence this delicacy is prepared in many households. Hitherto the containers for freezing the cream have been somewhat cumbersome, and often not of the best form for easy cleaning. These drawbacks are eliminated in the apparatus known as the 'Auto Vacuum Freezer,' which consists of a double cylinder of tinned steel with an air-space between the two parts. The ice-cream container projects downwards through the top of the inner cylinder, leaving a second space, which, when the apparatus is in operation, is filled with a mixture of salt and ice. The container is fitted with a lid having a cross-bar, the ends of which engage under catches and lock it tightly in position. This inner vessel has a rounded bottom, so that no scraps of cream are left in corners from which they can be scraped out only with difficulty. Such a shape also lends itself to easy cleansing. At the bottom of the inner cylinder is an opening with a movable door similar to the lid already described, but provided also with a joint ring to make it water-

tight. When the freezer is to be used it is turned upside-down, and a supply of ice and salt is put in between the inner cylinder and the container. After the movable door has been put in place and tightened under the catches, the freezer is reversed, the cream is put into the container, the lid fastened down, and in half-an-hour the ice-cream is ready without any further effort. Very little loss of cold takes place in the case of this contrivance, owing to the air-space between the two cylinders. In appearance the 'Auto Vacuum Freezer' is by no means unsightly the outside being finished in white enamel.

A NOVEL MOUSE-TRAP.

To most people a trap which can catch and drown a dozen mice without being reset or rebaited will appear something of a marvel; yet such a performance is well within the capabilities of a device known as the 'Mysto' automatic mouse-trap. Except for a wooden base, the whole contrivance is made of tin and wire. The entrance is provided with a door which slides up and down between vertical guides. When, tempted by the bait, the unsuspecting mouse creeps through the doorway, he finds himself in a species of lobby with the bait fixed at each side near the far end. On his making further progress towards the attractive morsels in view, the floor suddenly gives way with his weight, and in doing so pulls away a trigger which holds up the sliding door; the latter immediately drops, and the mouse is a prisoner in so far that he cannot go back the way by which he came. Neither can he eat the bait, which is behind a grating. But there is apparently a way of escape upwards through a vertical wire-gauze shoot. About half-way up he pushes aside a lightly balanced flap, which swings back into place after he has passed, thus effectively cutting off his retreat. At the top of the shoot is a hole which seems to offer an outlet, and the mouse eagerly enters, only to find that he has encountered another untrustworthy floor, which this time collapses entirely, and precipitates him into a tank of water. This floor is hinged near the top of the shoot, and it is balanced by a wire lever on which hangs the sliding door. Therefore, as the mouse goes down with the floor the lever goes up, and the entrance-door with it, thus allowing the lobby floor to tip back into place with the trigger which holds up the door, and setting the trap ready for the next victim.

EASY STARTING FOR MOTOR-CARS.

Every motorist occasionally experiences some difficulty in starting his car, and this has become more frequent of late, owing to the indifferent quality of the petrol obtainable. Sometimes the difficulty can be overcome by priming each cylinder with petrol through the compression-

cock; but not infrequently this plan fails, because it gives only one explosion behind each piston. What is wanted is a priming device for the induction-pipe close to the cylinders that will keep up the supply of petrol for a number of revolutions. This requirement is exactly met by a supplementary carburetter which has recently been put on the market. It consists of a small cylindrical container, filled with absorbent material, and having a tap at the bottom and a perforated cap at the top. The cap is in two parts, closely fitting into each other, and is in the form of a well, into which the petrol can be poured without spilling. When the outer cap is slightly rotated, holes in it are brought into coincidence with corresponding holes in the inner cap, and petrol is poured in until the container is brim-full and the absorbent packing is saturated. The supplementary carburetter is screwed into the top of the induction manifold, where it branches off to two or more cylinders. When the engine is to be started, the throttle is set to the slow-running position, and the tap turned on at the bottom of the supplementary carburetter, the holes at the top being left open. Upon turning the engine with the starting-handle air is drawn in, and becomes charged with petrol-vapour as it passes through the packing to enter the induction-pipe, and thence the cylinders, in the form of mist. This, under compression, is an ideal combustible mixture which will be ignited with certainty by the spark. The engine can be run for quite an appreciable time by the supplementary carburetter, but so soon as it is well under way the tap is turned off, and the cap rotated to cover the air-holes and prevent the entrance of dirt. Means are provided for increasing or decreasing the amount of absorbent material to suit the suction of the engine, it being wound loosely round a spiral spring, which is removable with the inner cap.

OIL-FUEL IN THE 'AQUITANIA.'

Every one must be familiar with the fact that in all recently built ships of the Royal Navy oil-fuel is burned in the boiler-furnaces instead of coal. Many people know also that oil-fuel is being adopted rapidly in our big passenger-liners, the latest to be converted being the giant Cunarder *Aquitania*. The oil-fuel installation in this vessel is easily the largest ever constructed; hence some facts regarding it may be of interest. No fewer than twenty-one boilers are employed for supplying steam to the huge turbines which propel the ship, and each has eight furnaces, making a total of 168 to be fitted with oil-fuel burners. These take the form of jets, to which the oil is supplied at a pressure of sixty pounds per square inch. When passing through the jets the oil is vaporised and is given a spiral motion, so that it enters the furnace as a cone of spray or mist.

Before reaching the burners the oil is heated, and the spray lights readily at a point about six inches from the jet, producing a roaring flame of intense heat. If oil were taken on board at each end of the voyage, as with coal, the original bunkers in the *Aquitania* would have been more than large enough, as much less oil than coal is burned, while the former stows into a smaller space. It is intended, however, to purchase oil only at New York, where the price is much below that asked in the British Isles. The bunkers have to be sufficiently large, therefore, to hold enough oil for the round trip, or 7600 tons. Alterations to the bunkers include stiffening the flat surfaces to withstand the pressure, making the joints oil-tight, and fitting wash-plates to prevent violent surging of the oil with the motion of the ship. In addition to the original wing bunkers along the sides of the ship in the way of the boilers, large athwart-ship bunkers have been constructed. Even with these the capacity was insufficient, and part of the space between the inner and outer skins of the ship has been utilised for carrying oil. Four pipe connections are provided on each side of the vessel for filling the bunkers, which can be carried out in six hours from either side. The quantity of oil in each tank at any time is indicated by a 'pneumercator' gauge, while bells are rung by electric float-alarms when the amount reaches 95 per cent. of the full capacity. As an additional precaution, overflow storage tanks are provided to receive the surplus from the main tanks should too much be pumped into them. The oil is forced from the bunker-tanks to settling-tanks in duplicate sets, each having sufficient capacity to run the boilers for fifteen hours while the oil is settling in the other. There are four boiler-rooms, the first three containing six boilers apiece, while the fourth contains three. Two powerful direct-acting steam-pumps are provided in every boiler-room, those in the three larger having capacities of 100 tons an hour, while in the smaller each can pump 70 tons. From the settling-tanks, another series of steam-pumps draws the oil and delivers it through heaters and filters to a ring-main in every boiler-room at the correct pressure for the burners. For raising steam from cold boilers a pump driven by an electric motor is fitted in one boiler-room, electric current being derived from the emergency electric-lighting plant on the ship or from the shore by cable. The work of conversion has been carried out in thirty weeks, during which 300 tons of old material have been removed, and 650 tons of new steel-work have been put in. The length of the piping required was in the neighbourhood of sixteen miles. Among the advantages of oil-fuel over coal are: a reduction in the number of firemen by two-thirds; greater power from the boilers; almost perfect cleanliness owing to the absence of ashes and smoke; quick bunkering

without the noise and dust which form so prominent a feature of 'coaling;' a big saving in the cost of running the ship.

DAMAGE BY DOMESTIC SMOKE.

Much has been said and written concerning the wasteful use of coal on domestic hearths, and the Committee on Smoke and Noxious Vapours Abatement appointed in 1914, and reconstituted last January, has recently issued an interim report containing some very interesting statements concerning the losses and damage traceable to this source. The most important conclusions arrived at may be gathered from the following excerpts: 'We are satisfied that domestic smoke, which is produced by the burning of raw coal, causes serious danger to health and damage to property. Moreover, the burning of raw coal is, from the national point of view, a wasteful proceeding. Not only are the valuable by-products of tar oils, ammonia, sulphur and cyanogen compounds lost, but, in addition, a large proportion of unconsumed fuel escapes in the form of soot owing to inefficient appliances. . . . It has been established that methods are available for warming rooms, cooking, and the provision of hot water which avoid much of this waste, which produce little or no smoke, which are hygienic and economical, and which save labour. . . . A number of important witnesses have stated that even in industrial areas domestic chimneys contribute, at the least, 50 per cent. of the total smoke nuisance, and that at least 6 per cent. of the bituminous coal ordinarily burnt in domestic fireplaces escapes unconsumed into the atmosphere as soot. Taking 40½ million tons as the amount of coal burnt annually in the United Kingdom in its natural condition for domestic purposes, the loss amounts to 2,430,000 tons, or more than half the total amount of fuel required to heat the metropolitan area for a whole year. That is to say, nearly 2½ million tons of soot escape into and pollute the atmosphere every year from domestic fireplaces alone. Domestic soot contains a considerably higher percentage of carbon and tar than factory soot, and, by reason of its large proportion of tar, it adheres to every object upon which it falls, and is, therefore, more obnoxious and destructive than soot emitted from factories. . . . Statistical evidence shows a close relation between the death-rate and the atmospheric conditions; the number of deaths from pulmonary and cardiac diseases is shown to increase in direct proportion to an increase in the intensity and duration of smoke-fogs. . . . The health of urban communities is most injuriously affected by the loss of sunlight due to coal-smoke. It has been estimated that, broadly speaking, 20 per cent. more sunlight is experienced in the country than in a smoky town. . . . There can be no doubt that smoke and noxious vapours have a highly injurious effect on vegetation;

. . . the heavy deposit of acid soot on pasture causes damage to live-stock. The same cause . . . tends to deteriorate the quality of milk produced in or near smoky districts. . . . A valuable investigation was made in 1918 by the Manchester Air Pollution Advisory Board into the comparative cost of household washing in Manchester—a smoky town—as compared with Harrogate—a clean town. The investigator obtained one hundred properly comparable statements for Manchester and Harrogate respectively as to the cost of the weekly washing in working-class houses. These showed an extra cost in Manchester of 7½d. a week per household for fuel and washing material. The total loss for the whole city, taking the extra cost of fuel and washing materials alone, disregarding the extra labour involved, and assuming no greater loss for middle-class than for working-class households (a considerable under-statement), works out at over £290,000 a year for a population of three-quarters of a million.' With regard to the damage to buildings some striking evidence was given by Sir Frank Baines, this being supported by reproductions from photographs showing the rapid decay of the stone in the case of various well-known London buildings. The remedies suggested comprise the use of anthracite, ordinary gas-coke, 'low temperature' coke, oil, gas, and electricity. Finally the Committee recommended that the Central Housing Authority should decline to sanction any housing scheme submitted by a Local Authority or Public Utility Society, unless specific provision is made in the plans for the adoption of smokeless methods for supplying the required heat, as suggested in the body of their report.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

OUR OPPORTUNITY.

'Twas not made for you or me,
This mystic world of ours;
Life's harvest, then, will either yield
A crop of thorns or flowers.
For in the state we find it all
We're not compelled to take it,
So try to fashion and improve
And fairer still to make it.

PHYLLIS CONSTANCE CAVENDISH.

. TO CONTRIBUTORS.

- 1st. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

SHELVERDENE'S PLOT.

A TALE OF THE SEVENTEENTH CENTURY.

By G. APPLEBY TERRILL, Author of *Within Touch*, &c.

CHAPTER I.—LANARK: JUNE 1679.

I.

HAVING seen to it myself that the sentinels were posted as I had ordered, I returned to the house, and to the chair wherein I had passed most of the day. Glad enough was I to sit down again, for the pike-wound under my arm, though no longer giving me those pangs which were almost unbearable, pained me nevertheless in a dull, steady way that caused me by now to feel very weak. Old Spanton brought me some wine, and, being my family servant as well as my senior sergeant, was urgent to dress the hurt with a fresh pad, against the doctor's next visit, which would not be until morning. Whereat I found that my humour was as sore as my body—the thought of the kindly but heavy fingers at the wound setting me to revile the poor fellow so harshly that he went forthwith from the room, forgetting to light the candles.

The open window beside me looked upon the west, and for a while I sat gazing thither, quite content to have no glare of tapers, since the closing of darkness about me, and the cool, pure hue of the sky for a space above the skyline, were, somehow, soothing to my pain. The sun was gone, and across three-fourths of the heavens was a spread of dense cloud, touched here and there with violet, but most lowering and black with night. Between the edge of it and the earth, however, was a void of clear and lovely green; and this I watched until its colour was fading and the stars shone whitely in it.

The evening was very still, but not a sound of life came to me from the face of the country. I heard nothing save, in and around the house, frequent voices of my men, Shelverdene's Regiment of Horse, and now and again the blowing or whinnying of our beasts.

At length I was disturbed from my ease by two questions which rose, well-nigh together, in my mind. Why was not Louis Stuart come to me for my night-orders? Why were the troopers yet astir, when I had bidden them lie down early, to be ready for any length of riding and skirmishing to-morrow?

NO. 510.—VOL. X.

I stood up and called for Spanton.

Sundry voices echoed the cry, and soon he opened my door, a lanthorn in his hand. Discovering my dark state, he walked quickly to the table, craving my pardon, and unfastened his lanthorn to light the candles therefrom.

'Where is Mr Stuart?' I asked.

He looked up, his face strongly illumined by the flame beneath it; and there seemed to be something of apprehension in his eyes.

'I have been to his quarters, sir, but he is not yet rode in.'

'Rode in?' said I sharply. 'Whither is he gone?'

'He and his corporal went to the forge—where the Scots company from Graham's Brigade are being shod.'

I laid one hand on the table to steady myself, his words having given me such surprise and instant dread that I was turned somewhat giddy.

'Spanton, man!' I said; 'how durst thou suffer him to ride out thus? Two English miles, and he gone with but a corporal! Wert thou mad as he?' I drank from the wine-cup before me, and got to my chair. I leaned back in it, trembling, and knew for the first time how thoroughly my wound had sapped me. 'Wert thou mad, Spanton?' I repeated.

Holding a candle aslant, with the flame stretching high and the grease sputtering down, he had observed me anxiously—afraid, I think, that I should swoon; for his relief when I was settled in the chair was very plain. Not until then did he speak.

'Under favour, sir, I heard no word of this till Mr Stuart was an hour gone. And I hoped that your Honour might be getting some sleep, so came not at once to trouble you.' He put down the candle and closed the lanthorn. 'But I have mounted twenty men, and now, by your leave, I will take them and meet Mr Stuart on his road home.' Going towards the window, he added, 'Tis not yet dark, and Mr Stuart would be much delayed at the forge.'

He spoke as one who felt no real alarm, but he pulled hard on his gray moustache as he frowned into the dimness without.

[All Rights Reserved.]

SEPTEMBER 4, 1920.

'Shall I start forth?' he asked.

'This moment,' I said vehemently. 'Leave Sergeant Kirwan here with the men—and race as fast as the ground will let you. I have Kyle Cleod in my mind.'

'Ay, your Honour, I was thinking on him when I horsed the men.'

He saluted and left me; and in the briefest time there reached my ears a jingle of steel equipment, and then the roll of a fairly good canter.

II.

I slid lower in the chair, lifted my legs on to a stool, and so waited, near to groaning aloud at Louis Stuart's folly and my faulty care of him. Louis was seventeen years old. On my preparing to bring my regiment from Sussex to the north his mother had entrusted him to me, to be shown some soldiering. I wished rather that the lad should begin his warfare on the Continent, but she would not be dissuaded, for all my telling her what a sorry business this crushing of the men of the Covenant was like to be. Pah! and what miserable work it had proved! I shifted my feet impatiently as my thoughts fled back over the last ten days. For no other liege than King Charles (though I risked my head for disobedience) would I have allowed Shelverdene's Horse to charge and chase and rove after an enemy so little to my taste—religious, honest men the bulk, despite their rebel spirit; men who had been treated ill; yet with some pretty villains in their midst and some vile thieves on their skirts; and all so mixed that, when I gave no quarter to some that seemed the worst, I perhaps did learn anon that they were such as I would fain have spared.

Nevertheless, there was one rogue of many crimes whose face both Louis and I had seen, and whom I meant to hang without shrift—the fellow that the countryfolk called Kyle Cleod. We had been within an inch of taking him, but he had gained a copse and dodged my troopers, crying before he vanished that Shelverdene should pay for hunting him. And thereafter he and certain others would contrive to draw near my lines at night. They fired on and wounded three of the sentinels; they shot at, but missed, Sergeant Kirwan, who had run forth in the dusk after a horse which was broken loose; and they would get clear away from the pursuits which I launched upon them. It was because of Kyle Cleod that I feared so for Louis.

I turned in the chair, my armpit throbbing nastily again, and stared down the length of the room. I had known some wretched shelters when fighting for France in the English Brigade; and I was wont to take a pleasure in the comfort of this lodging, the more in that the house was not filched from a hapless owner, but lent to me by a loyal gentleman. Though the chamber

had been mine only a short while, yet, with my trunk and my strong-box, my two or three books and my papers, all to be seen about, it had ere this acquired a familiar air, which would cheer me much as I rested from my repugnant employment, and wondered how long it would last.

But now I found the room changed, become utterly mournful and desolate; and I felt that if evil chanced to Louis no place on earth would ever be otherwise than desolate to me. His mother's sorrow would haunt me.

Eighteen years ago, when I was a boy (and she soon to be wed and lost to me), I had loved her dearly; and though I was long since quit of that mood, yet was she a sweet friend that I had liefer die than harm. In entreating me to take Louis she had told me divers reasons for her desire. The most of them were but coaxing toys, such as that she would have him grow to be like none other captain but myself. Amid them, however, was her true reason, very earnestly spoken. She knew that, for her sake, I should guard him tenderly.

And a jab from a half-pike had made me forget him!

I shut my eyes, and tried to believe that by now he was met with Spanton, and safe. Faith! not again should he play a trick of this sort. I would forbid him to go beyond my call. This very night should his bed be fetched hither and he sleep within a yard of me.

From far out in the gloom there was borne to my ear a faint sound—'plup!' Again 'plup!' . . . 'plup!' And then no more.

In a moment I was at the window, hanging hard upon the sill by my elbow, my legs so shaking that I scarce could stand. Three pistol-shots—away towards the forge! There was warranty for the despair that sickened me. Fearing to fall, I raised my other arm to the sill, getting a bad stab from my hurt, and took a few deep breaths of the night-air, now turned cool. Being somewhat revived by them, I faced round. I could stay idle no longer. I must ride forth and learn all. But when I made a pace, the room looked to jerk this way and that, and I stumbled and reeled—and presently discovered myself lying sideways in a chair, with a vague belief that I had lain thus for some minutes.

And I had! For horses were stamping and voices mingling loudly under the window, and heavy steps were at my door.

'Louis!' I cried.

III.

The door was flung open. I saw not Louis, but I saw a face I was so unprepared for that I stared at it in complete bewilderment, giving heed to nothing else. It was the face of a child, a maid of nine or ten; a most pretty chit, with great blue eyes and tossed-about hair that was between chestnut and gold. Her head was

thrown back and her little teeth were clenched angrily; and she caught at the doorpost as if to stay herself from coming farther. And then I saw that Spanton's arm was about her and he was half-carrying, half-pushing her to me. A yard from me he allowed her to find her feet, and released her. But immediately another's hand darted forth and gripped her shoulder. Raising my eyes to find who held her, I perceived Raylish, the corporal who had ridden to the forge with Louis. He was bare-headed, with the bright-red patch of a fresh wound in his hair, and with his left eye closed and (from the blood about it) badly harmed. He appeared not to heed his injuries. His mien was full of excitement and rage; and in the faces of the two troopers who were behind him I saw the same blending.

As for the child, whose cheeks, I now noted, were wet from tears—she stood looking at me with her teeth still clenched and her colour radiantly high. Despite that she breathed as though on the point to break into sobs, despite the fright which I could read behind her helpless, indignant anger, she strove to show me nothing except anger. The words of my old first commander anent noble courage in children being a sure proof of gentle birth crossing my mind, I said to myself that this slip of a girl whom my men had for some purpose seized was no mean fellow's daughter.

I spoke to Spanton. 'Mr Stuart?' I asked; and, notwithstanding that recollected homily on courage, and the example before me, that should have shamed any man from cowardice, I flinched in dread of what he should say.

'Taken off by Kyle Cleod—to be flogged and hanged; so Raylish heard Kyle shout when he and his thieves sprang on them. Taken off'—He pointed to the child. 'And she knows whither, this whelp of evil. We might save him, and she will not tell! Ah, would I not have laid into her with a stirrup, but she is softly dressed, so I feared who she might be. Ask her, sir. I deemed she would tell you.' He bent over the maid. 'Hearken,' he said menacingly; 'this is his Worship the colonel, the Right Honourable Sir Edmund Shelverdene. An you answer not, he can kill you.'

'Cease that!' I said, getting up. 'Was Mr Stuart taken some fifteen minutes since, when three shots were fired?'

'Ay; and within three minutes we were at the place. They heard us bearing down, and fled off with him—tarried not to finish Raylish, who was in the ditch, stunned.'

'They had three, or more like two, minutes' start of you?'

'Ay, your Honour, but on ponies over quiet turf, and the night fallen thick of a sudden.'

'What did you?'

'Sent three pursuits, six men each—one party riverward, one the opposite way, and one

on down the road, lest they swerved back to it; and two men stayed by me and Corporal Raylish.'

'She was there, sir,' cried the corporal, and he swung the girl nearer me. 'She was there—stood by the road-edge with a lanthorn; and when I lay in the ditch I was not so senseless but I heard her speak to them, and them answer as they moved off, but all so Scotly said I could not know the meaning.'

I motioned his hand from her, and set mine gently where it had been. 'You understand English, child?' I asked. 'You are not of the high lands?'

She held her head stiffly in wilful silence, her eyes averted. Then her teeth relaxed, but only to bite her nether lip.

'She speaks it as well as I,' said Spanton.

At that she let her lip go free. 'I am English,' she said, softly but clearly. 'My father is Mr Denis Irby, that will sore punish you for stealing me.'

The name made plain to me whence came her spirit. Well I knew Denis Irby by repute—a stubborn, fearless man of old family, a supporter of Lord Shaftesbury, and exceeding bitter in Parliament against the King. He was possessed of land on either side of the Border, and having a house not far from this very one, wherein some English officers were lodged, had hastened thither, it was reported, with great truculence, 'to see that no harm was done to his goods,' the authorities, though little pleased at one so disaffected being in the midst of the troubles, not caring to gainsay him.

All this, however, but flashed into and from my mind. I had no thoughts to spare for Denis Irby. I turned the child slightly, wishing to judge her truthfulness by her eyes while I further questioned her, but she would not lift them above my sash.

'Did Kyle Cleod's men—they that fought with the young officer—tell you to what place they were carrying him?' I asked, having no belief that they would do so aimless a thing.

She hesitated, and then: 'I heard them say among themselves. Therefore Kyle Cleod bade me run aside from Shelverdene's soldiers, and to tell no word to them, if they caught me.' Without warning she fixed her eyes on mine—fixed them defiantly. 'I will tell no word,' she said.

IV.

Her knowledge brought a cry to my lips. Scant hope did the parties that had been despatched to search blindly give me. But here verily was the chance to snatch Louis from death.

'Mount a dozen men,' I said to Spanton; and in the stress of my mind I shook the child roughly. 'You knew!' I said. 'You knew, and would not tell my men, though you could have saved this poor young gentleman! Tell me now—now!'

She jerked herself from me, and stood putting back the edge of her gown to her throat, whence I had dragged it. Her eyes filled with tears, yet shone furiously at me.

'I will not tell,' she said, her voice gasping, because of her sobs, but rising shrill. 'I would not save a Shelverdene bully. I wish him dead.'

There was an oath from Raylish, the corporal, who started forward, casting up his hand to strike her.

'Stand off!' I commanded, throwing out my arm. And on his obeying, with a gulp of consternation at having almost struck me by mischance, I reproved him not for his unruliness, being aware of the deep affection he had for Louis. 'Child,' I said, 'you must tell; for my soldiers have never harmed you, save to bring you here.'

'They—you'—her breast heaved desperately as she fought for her voice—'you hanged Jim, that was Edith's father—she whose cottage I ran from my bed to, this night; for she is ill of sorrow. You hanged innocent Jim—Shelverdene beast!' She was beside herself now, her teeth clicking, her hands tight-gripped, and I thought she would leap at me. But, after another straining of her breast, she suddenly fell calmer, and, for all her tears, was more coolly taunting than I should ever have credited of a child. 'And you think to hang Kyle Cleod. . . . Ah, no; he was Jim's friend, and he gave me my six birds. . . . Ah, no,' she said again, linking her hands behind her, and regarding me with a marvellous grown-up demeanour. 'For I will tell nothing—nothing. I am no poor Covenant girl that you dare beat, Shelverdene coward! My father will put his boot on your neck.'

'Sweetheart,' I said, 'you have well scolded me. Now forgive, and say where is my friend. Look you, I will spare Kyle Cleod. Ay, in troth I will.'

I meant my words; and I was sure the pleading of my tone must touch her. Eagerly I waited for her reply, conscious that Raylish and the two troopers, leaning forward, were rigid in their expectancy. She also was still, her head a little drooped. For seconds nothing moved in the room save (door and window being open) the candle-flames, and our shadows jumping up and down the wall. And then she shook her head.

That sign, which declared that with her utmost will she would resist me and ensure that Louis should die, was more than I could endure. Spanton's coming with her had rallied my strength for a time; but in those moments of suspense I had felt it slip from me, and my wound fluttering and pulsing as though a barb were writhing in it. I intended that when she answered, saying where Louis was, I would immediately go to my chair. Then her refusal,

firm as a stone fence, rallied me again—and more.

'Where is Kyle Cleod?' I shouted; and, passing one hand behind her, I caught her arm with the other, and lifted it and began to bend it cruelly, not caring how I hurt myself so long as I pained her into discovering the truth.

'Where?' I shouted again, bending harder.

Her face was upraised to me. She breathed agonisedly through her nostrils. Her lips dropped apart and she groaned; but her blue eyes, speaking to mine, told me that I might murder her, but she would not tell.

I loosed my hands from her, stepped back quivering to the nearest chair, and sank therein.

'I cannot,' I said despairingly.

'Leave that to me, your Honour,' cried Raylish. But, seeing him go to her, with his teeth bared, I would not have it.

'Twas then that Spanton spoke from the doorway, whither he had come from ordering the new mounting. 'Sir, what of the Bootkin, that the gentleman from the Council brought yesterday?'

His face was furrowed grimly, yet he winked, and I read his plan. To find her leg in the Boot would surely terrorise a child, though she were Denis Irby's wonderful daughter.

'Ay, put her to it,' I said; and I rested my brow on my hand, conjuring horrid visions of what was being done to Louis, and anon determining to grip this child and beat her raw. But my strength was finished.

The setting-down of something before me caused me to lower my hand. I looked at the Boot, a device I had never seen, which appeared to me liker a clumsy, warped bucket than a boot; and I noted it was new, so that the iron garters had a dull polish and the wood smelt. Truly, it was a revolting thing. I waved it from me, and Raylish bore it some yards off, Spanton following him, holding a great wooden hammer and wedges.

I glanced towards the child. She was pale, yet not overmuch; she returned my scrutiny, and smiled—ay, smiled! Perchance she deemed there was to be no more than this show.

'I think you will meet my father in the morning,' she said.

Raylish asked if the Boot should not be screwed to the floor. I answered we had no time for that. Whereupon he put a chair by it, and drew a length of rope from his pocket.

'Nay,' I said; 'how can she sit and be booted, and she so small? She must be stood in it—you hold her, Spanton. . . . Raylish, begone and have your hurts looked to.' For I would not trust Raylish to have any handling of her; and I knew 'twould save me trouble if he were well away from the room.

'And quick, quick, Spanton!' I added. 'Think on the minutes we waste.'

(Continued on page 655.)

PAPER: THE TEXTILE OF THE FUTURE.

By FREDERICK A. TALBOT,

Author of Inventions and Discoveries, When Britain went to War, &c.

I.

PERHAPS no war-time expedient in Germany provoked the British man in the street to such mirth as the resort to paper as a textile substitute in consequence of the blockade. But is the vision of paper-clad *Frauen* and *Herren* so ludicrous as it appears at first sight? The general conception of the characteristics and the possible applications of paper is so confined in this country as to preclude full appreciation of the true import of the German development, or of the part paper technically described as 'cellulose yarn' is likely to play in future industry. This material is popularly regarded as being a product born of the war, doomed to disappear with the return to normal peace conditions. The suggestion that paper is capable of seriously challenging the supremacy of generally accepted textiles, such as wool, cotton, linen, silk, hemp, and jute, would by most people be dismissed as utterly absurd.

Now, many of the fantastic claims advanced by the German and Austrian interests exploiting this substitute must, of course, be discounted; but in estimating the future of paper textiles it should be borne in mind that paper yarn is neither a war-product born of deprivation, nor is it a German invention. Here, as in other lines of endeavour, the German has been content to copy and develop the pioneer efforts of others, and has only partially succeeded in the process.

Before the war Germany and Austria imported Indian jute to the value of one hundred and twenty-two million marks per annum. The overseas sources of supply of this fibre being completely cut off, the textile factories of Mittel Europa were faced with the prospect of a spell of enforced inactivity. This grave disaster they surmounted by resorting to paper, and they appear to have succeeded to an extraordinary degree. By the end of 1917, according to a professor of the Munich Handelshochschule, there were thirteen thousand persons employed in the German paper-yarn industry, turning out one hundred thousand kilograms (or one hundred metric tons) of paper yarn during one working-day. In November 1916 the Teuton War Raw Materials Department estimated the requirements of the army administration as one thousand wagon-loads of this commodity a month, for the making of sand-bags, straw-sacks, forage-sacks, tent canvas, and so forth. Then there was the civilian demand to be satisfied as well.

Long before the war Germany and Austria had extensively developed the manufacture of

paper yarn as a substitute for familiar textiles. Two products in particular achieved wide popularity, 'Textilose' and 'Textilit.' (To these another, directly due to the war, was added later—namely, 'Textilon.') But the German jute-manufacturing industry did not view this development with a friendly eye, so it brought pressure to bear to throttle the new enterprise. For the time being it succeeded in its efforts; but when, thanks to the blockade, there was no raw jute to exploit, paper yarn came into its own.

The German interests in those pre-war days even essayed to woo Britain to the new product, and in a measure they succeeded. But unfortunately for them, when they commenced operations in these islands, they found themselves pitted against a native rival that was producing a vastly superior fabric, at a lower cost, so that the path of commercial progress was not found to be so smooth in sleepy Britain as had been anticipated. The rival, firmly entrenched at home, was equipped with machinery and processes far in advance of the German installation and methods, with the result that the invader experienced a hard struggle to hold such ground as was gained.

Paper-spinning is probably one of the oldest arts and crafts, although it made no very pronounced advance during the flight of centuries until contemporary times. It was known in Japan and China, and even practised in those countries when the people of Europe were content to resort to woad for clothing. The hustling traveller, rubber-necking the East, may recall how deftly the Japanese, with their fingers, can spin the Bronsonnetia paper into a yarn, and how successfully this material fulfils the exacting tasks imposed on it. Paper yarn, then, is no invention of the much-vaunted Teutonic super-brain. Only ways and means have been evolved in the West to produce it by the aid of machinery, and upon such a scale as to constitute quite a new industry.

II.

When the Germans set out to manufacture this product commercially, they followed their characteristic methods. They did not attempt to adapt the new development to the established order of things, but devised special and weird, as well as expensive, machinery to achieve their ends. But originality of thought is not a Teuton forte, and their enterprise did not bring them materially nearer their goal. They discovered that many other brilliant minds had tackled, and were still attacking, the self-same problem, as

consultation of the Patent Office files will prove. The German did not experience the full brunt of this competition in brains until he essayed to capture the British market, when, as the American picturesquely has it, he came 'full up against it.' Curiously enough, it was an American inventor, Mr George Seaton Milde, one of sunny California's sons (long residence, however, in this country had made him almost a Britisher), who proved the most formidable obstacle in the would-be invader's path. Mr Milde had identified himself with this line of research for many years, quietly advancing step by step until perfection was achieved, and patenting every vital development as it established its value.

In view of the dexterity with which the Bronsonnetia paper can be twisted into a yarn, the perfection of a mechanical process to achieve the same end, but at an accelerated rate and on a cheaper scale, may not appear to present many pronounced difficulties. Such a line of reasoning is sadly fallacious. It was no simple task, and demanded all the ingenuity of a practical paper-maker, one thoroughly conversant with the technics of the paper-making craft, and possessed at the same time of a wide knowledge of the intricacies of spinning and its many complex problems.

The German machines, as has been said, were expensive, and the products they yielded were far from being cheap, owing to the low speed at which the spinning operation was conducted, and the enormous amount of waste incurred in the process. Paper yarn, being essentially of the character of a substitute, obviously could aspire to commercial success only by competing favourably with the staples which it set out to rival, notably cotton, hemp, and jute.

The paper, which is delivered in rolls similar to those for a web-printing or a newspaper press, has to be cut into narrow strips and wound on large discs. It is then transferred to the spinning-frame to be made into yarn. The German cutting-machines for carrying out the work—some manufactured in Sweden—were heavy, cumbersome, and very expensive, costing five times as much as the corresponding British appliances. The knives represented an expenditure of about thirty-five shillings per pair. On the other hand, the British Milde machine is of very simple construction, and can be worked by unskilled labour. Its knives cost only about one shilling. In capital outlay, therefore, the German product is completely eclipsed. But this difference in first cost is not its only disadvantage. Whereas the German knives for cutting the paper into the necessary strips require frequent withdrawal for resharpening, in the Milde machine the knife is made self-sharpening, and never demands renewal unless breakage is recorded through a latent flaw. On some machines knives have been in use

for several years. The susceptibility of the German knife to become dull of edge leads to wastage, inasmuch as the deteriorating edge fails to cut the paper as neatly as desired. The jagged strips have to be thrown out, so that wastage under this heading, unless unremitting vigilance be maintained, becomes appreciable. Moreover, the necessity to stop the machine at frequent intervals occasions considerable delay, which tends to increase the cost of production.

III.

In the Teuton method two systems of spinning are practised—dry and wet respectively. Under the wet process the paper has to be stored in a humidifying room for two or three days to become sufficiently pliable to permit spinning to be carried out. When withdrawn, the paper has to be cut up and spun without further delay; otherwise loss of paper is incurred.

The greatest advantage presented by the Milde process is the high spinning speed attained. Two methods are practised—namely, ring and fly spinning. Under the first named the speed can be varied from two thousand to five thousand revolutions per minute (from twice to thrice the speed attained on the German machine), while with fly spinning a speed of four thousand revolutions per minute can be achieved.

Besides, the British appliance has another advantage. The paper is placed direct on the spinning-frame from the cutting-machine, no matter whether the paper to be spun be of hard or of soft finish. The machine itself has a moistening apparatus, by which the paper, while being spun, is softened, hardened, and water-proofed, as may be required. The machine can be adapted to meet any requirement in regard to the number of twists, from two to eight per inch of yarn, so that there is no necessity to have a different machine for each line of goods. In other words, design has been so perfected as to enable the smallest number of machines to produce the widest variety of goods. By this arrangement, naturally, capital outlay is very materially reduced, thus permitting the process to compete with the equivalent operation in the working up of jute, hemp, or cotton. Individual stop-spindle motion is also incorporated. Should a paper yarn break, only the one spindle is affected, and stops—which, by the way, similarly affects the attendant devices, so that no waste of paper results. Consequently there is no necessity to arrest the whole machine to enable the break to be repaired.

The paper generally utilised as being best adapted to the process is that known as 'Kraft' paper—pulped Canadian spruce or pine. This grade of paper is not only comparatively cheap, but has a very high tensile strain when spun, it being possible, even in the spinning, to submit it to greater strains and stresses than could be safely resorted to when spinning fibres. Owing

to the inability to secure the necessary supplies of raw material from Canada during the war, it was found necessary to have recourse to Scandinavian Kraft paper.

Once the yarn is obtained, the subsequent operations in the preparation of the fabric do not differ materially from those practised with the more familiar staples. One feature deserves mention. If desired, the paper may be rendered waterproof and fireproof. These ends are achieved by impregnating the raw material, before it is spun, with a solution of suitable chemicals.

IV.

What of the fabrics which can be prepared from paper? Their variety is endless. The material has been extensively utilised for military and munition work, as well as for other official purposes. Sand-bags, yarn for the manufacture of explosives, containers, camouflage material, twines, cords, and ropes have been contrived therefrom. The diversion of jute to more vital duties resulted in paper being used for the fabrication of bags and sacks for grain, potatoes, flour, seed, and fertilisers. So far as ordinary commerce is concerned, it is being employed for the bagging of coffee, sugar, borax, salt, cement, soda, and other commodities. The authorities submitted the British fabric to exacting tests, and having established its equality with, if not superiority to, the ordinary accepted fibres, allowed the latter to be diverted to other fields of service.

Coming to general industry, we find paper yarn being used for other purposes, some of which at first sight may appear incredible. It provides excellent material for boot-laces, braiding, webbing, and belting, being not only stronger than the ordinary materials therefor, but having the additional advantage of being fireproof and waterproof, so that it will neither contract with damp nor stretch with dryness. It is a first-class insulator, and so is being employed for insulating flexible electric wire, the wire being threaded through the outer paper casing or armour. It makes a capital stair-carpet, being more durable and substantial than jute for this purpose, while any desired pattern and colouring can be obtained in the weaving. It not only offers a good upper for tennis and other shoes where canvas or jute is ordinarily employed, but can be used for soling purposes, as a leather substitute, with every success. Its ability to pass through a printing process after being woven renders it an excellent art fabric for covering walls and for other domestic purposes. Dressed with a varnish and given an outer surface, it can satisfactorily take the place of rattan cane, and be employed in place of popularly accepted substitutes for costly leathers in upholstery and binding. It also assists in the manufacture of trunks and bags.

But its domestic applications are by no means

limited to the decoration of walls and the upholstery of furniture. At the moment it is being exploited for the production of art carpets, and in this respect holds out many inducements. Wear and tear are appreciably less than in the case of woollen carpets. A paper carpet is not only far more durable, but is every whit as warm; and it is more hygienic, inasmuch as the covering may be washed. While the paper fabric may be made as flexible and pliable as desired, it can also be presented in a hard, solid form and of any desired thickness. Consequently it will develop into a serious competitor for household favour as an alternative to linoleum and other floorcloths. Here, apart from equal wearing qualities, it will be able to offer serious competition to the article of this character contrived from cork and other materials—not omitting linseed-oil, which for some time to come must command a high price. The paper linoleum can be presented in many forms. The pattern can either be woven right through, thereby offering a rival to the inlaid linoleum, or only printed on the surface, in which field it comes into competition with the cheaper grades of floorcloth—and with overwhelming advantage. It can even be woven into a kind of board, quite as good in every respect as three-ply wood, and free from splitting, shrinking, or buckling.

V.

What will my lady say to delicate lace curtains wrought from paper, carrying all the fragile-looking tracery of the cotton article, to grace the windows of her house? Yet it is perfectly feasible. Or how about the snowy-white tablecloth and its lustrous finish? Paper can fulfil the purpose as well as damask linen. We have long since used Japanese paper serviettes, but they are primitive creations compared with those obtained from spinning and weaving the paper. Whereas the pretty Japanese articles can be used only once, ere being consigned to the waste-paper basket or the fire, woven paper articles may be used again and again. Paper table-cloths, curtains, and the like may be safely laundered, scrubbed, and boiled without suffering more than their fibre counterparts in the process. As a matter of fact, it is scarcely possible to mention a single article at present wrought from fibre which cannot be reproduced with equal success in woven paper.

One exception may, indeed, be instanced—wearing apparel. It is quite feasible to produce tweed suiting or a costume in paper, and in such a manner as to defy ready detection; but the paper suit or dress, while having good wearing qualities, would probably reveal its composition within a short time; creasing would assert itself in a somewhat aggressive manner. Some brilliant mind may overcome this objection, inasmuch as at the moment

research and experiment concerning the possible applications of paper textiles to wearing apparel constitute one of the most fruitful fields of endeavour.

Paper yarn possesses one other distinct virtue. It can be blended with hemp, jute, and cotton in the weaving of cloth, either in the warp or the weft, and this proportion can be varied within wide limits. Thus the German 'Textilose' is a fabric composed of 90 per cent. of paper to 10 per cent. of cotton, and is declared to have unlimited wearing capacity.

That the British Government is fully aware of the prominent part paper textiles are destined to play in our complex social and industrial world is revealed from the assistance it has given for the securing of the requisite raw materials. As is well known, the importation of paper into this country was reduced during the war to a small proportion of the supplies available in 1913. Despite this fact,

the authorities were so convinced of the importance of spun and woven paper as to grant the British company exploiting this field a special licence to satisfy its requirements in regard to raw material.

Paper textiles, which many were apt to regard as a 'last hope' on the part of a war-exhausted enemy, are certain to remain with us, now that peace has been restored. Inventiveness has made too big a stride to be arrested by the *post-bellum* competition which is likely to ensue from the release of greater quantities of fibres ordinarily employed. A new industry has been established in Britain, and there is every indication that in the future there will be a severe struggle for supremacy, not necessarily between paper textiles and fibre textiles, but between the paper products of Britain and those of Germany. We have entered the paper textile age, and the future of the trade in these islands is amply secured.

RECOLLECTIONS OF A NAVAL SECRETARY.

II.—CHINA, 1871-75.

By C. E. GIFFORD, C.B., R.N.

I.

FROM 1866 to 1869 I was serving at Devonport, in the office of the Commander-in-Chief, Admiral Sir William F. Martin, Bart., K.C.B., my former chief in the Mediterranean. In August 1869 I went to Halifax in H.M.S. *Revenge*, bearing the flag of Vice-Admiral Sir George G. Wellesley, K.C.B. We spent some months there, and thence proceeded to Bermuda and the West Indies. Whilst at Trinidad we met Canon Kingsley, who was writing his book *At Last*, and took him to the celebrated Pitch Lakes. After a cruise round the West Indies, we returned to Bermuda and Halifax.

On the occasion of the outbreak of war between Germany and France, Sir George was ordered to return to England to take command of the Channel Fleet. He hoisted his flag in the *Minotaur*, and cruised during the next twelve months in the Channel, off the Spanish coast, Gibraltar, and Madeira.

The unfortunate grounding of the *Agincourt* on the Pearl Rock off the coast of Spain, almost opposite to Gibraltar, led to the trial of the captain of the *Agincourt*, and was followed by the supersession of the two admirals. Thus in July 1871 Admiral Sir George Wellesley's command of the Channel Squadron came to an untimely end, with the consequent dispersion of his staff.

I was busily engaged on board the *Minotaur* packing up my traps on the afternoon of the

day on which Mr Goschen's fateful minute on the *Agincourt* court-martial arrived, ordering both admirals to strike their flags. The postman brought me a letter in a handwriting which it took me long to decipher, but with which, during the forthcoming three years, I was to grow very familiar. It was from Vice-Admiral Sir Charles F. A. Shadwell, K.C.B., F.R.S., inviting me to go with him to China. My old Mediterranean friend, W. B. Hutchison, who as a youngster had done midshipman's duties for some years under Captain Shadwell (to whom he was always 'Jaggers'), was to be secretary, and I was offered the senior place in the office.

Nothing could have pleased me more, for not only had I a strong wish to see China and Japan, but also those were the days of 'death vacancies'—that is, the Commander-in-Chief on a foreign station had the patronage of promotion into vacancies caused by death; and China, of all naval stations, was the most productive of such advancement. The prospect, therefore, of a change from the somewhat dreary Channel Squadron cruises to the novelties of the Far East, with a chance of promotion thrown in, was very attractive. I accordingly accepted the admiral's offer enthusiastically, and left at once for home on leave of absence.

H.M.S. *Iron Duke*, then at Devonport, was to be the flagship. She was one of a class known as 'box and belt ships,' having her main battery of nine-inch muzzle-loaders protected in a box of armour-plate, and having a belt of armour at the water-line.

There had been vague rumours as to her stability, and a day or two previous to our sailing some miscreant posted a notice on the main gates of Keyham Dockyard that 'Mails for H.M.S. *Captain* should be sent at once on board the *Iron Duke*.' This was twelve months after the disastrous foundering of the *Captain* in the Bay of Biscay; and if the object of the scoundrel who posted the notice was to scare the relatives of some of the crew of the *Iron Duke*, he was, no doubt, successful.

II.

We left Plymouth Sound on the 16th September 1871, and met with an Atlantic gale off the Portuguese coast, during which our ship behaved splendidly.

Under the rigid Admiralty rule for economising fuel, based on a calculation that ships could steam farther per ton of coal at a speed of four or five knots than at faster rates, we spent three months in reaching Singapore.

We were the first ironclad to pass through the Suez Canal, and Monsieur Charpy, the French 'Chef de la Navigation du Canal,' who was on board, left us at Suez, rejoicing that she had been so cleverly steered as not once to have bumped against either side of the great ditch.

After the heat of the Mediterranean, the cool night-temperature of the sandy desert through which the Canal runs was very refreshing. There was, too, the novel experience of spending a night on board an ironclad in a desert, jackals howling around, and the first dawn of light bringing into view a caravan of camels bound to the east. Lake Menzaleh was white with myriads of pelicans. Until, through a spy-glass, one could see their great wings flapping, it was not easy to believe that there could be such a mass of birds.

Our passage through the Red Sea was saddened by the loss, when off Mocha, of three of our stewards from insolation (heat apoplexy). The heat was very great, the sea-water temperature being eighty-eight degrees; and, at our crawling rate of speed, it took ten days to steam the twelve hundred miles between Suez and Aden.

Aden interested me greatly; but what a desolate spot! We paid an early morning visit to the celebrated tanks, on which our Government has spent a million pounds. They occupy the whole of a ravine in the hills at the back of the town, a series of walls and buttresses having been built across it to save every drop of water that falls. Alas! there had been no rain for twelve months, and the tanks were dry. Moreover, on our returning three years later, they were still dry, and we were assured that there had been no rain during that period. The natives appear to make their living by carrying about water for each other in pig-skins.

The run—I should rather say the crawl—across the Indian Ocean was very pleasant; a

smooth sea, gentle breezes, and a temperature of from eighty to eighty-four degrees in the shade.

Our admiral, a Fellow of the Royal Society, devoted to astronomy, having announced that in the rarefied air of the Indian Ocean Venus would be visible in the day-time, the blue-jackets were all lying on their backs searching for her. True enough, she was visible every forenoon for a week. The admiral was also searching in broad daylight for Mars and Saturn, so as to verify the ship's position by his observations, but he was not successful in discovering them.

Our men caught several hawks which had perched, exhausted, on the rigging, and found that 'a few days on chillis and baccy-smoke tamed them'! Is there any living thing of which a bluejacket will not make a pet?

The middle of December saw us at Singapore, where we found Admiral Sir Henry Kellett flying his flag in the *Ocean*. Sir Charles Shadwell at once assumed command of the China Station, and my long holiday came to an end. We had been seventy-six days at sea, as against twenty in harbour; and it speaks well for the naval scale of victuals that the doctor's weighing of the crew showed an average gain of seven pounds.

Singapore is very attractive, and we landed daily for exercise after the afternoon tropical downpour of rain was over. The Botanical Gardens were in all their glory, the water-lilies being magnificent.

We had a visit from the King of Siam, P'ra Chulalongkorn Chawn Klaw Chao Yu Hua, who brought with him on board the *Iron Duke* a lot of little brothers, all clothed in purple and fine linen, with splendid feathers in their head-gear, white-silk stockings, and shiny shoes three sizes too large. His Majesty, accompanied by thirty of his great officers and nobles, was on his way to Calcutta, and was said to have voted himself £150,000 for the trip. It came to an untimely end owing to the cruel murder of the Viceroy, Lord Mayo, by a convict in the Andaman Islands.

III.

And now began that round of visits to the various ports of the station which went on so unceasingly for the next three years. No stranger would have suspected our admiral of possessing such untiring energy. His age and physique rather suggested a desire for a quiet life. But no; wherever the *Iron Duke* could go, he went in her. Where the water was too shallow for an ironclad, he took the *Salamis*, a paddle-wheel yacht appropriated to his use.

During the commission we visited every place of any importance between Penang, in the Strait of Malacca, and Nicolaevsk, on the Amur River, many of them yearly. We ascended every navigable river—the Menam, in Siam; the

Mekong, in Cochin-China; the Canton River, the Min, the Yang-tze-kiang, the Shanghai River, the Pei-ho, in China; the Amur, in Russian Tartary.

So far as the state of affairs in the region would permit, we visited the tropical parts of the station in the winter, worked our way up the China coast as summer approached, crossed to Japan for midsummer, and in the hottest months cruised to the Gulf of Tartary.

They were three years of great interest, which made a lasting impression on my memory. True, there were no great wars going on, or other wild excitements, and piracy, the suppression of which had actually employed the squadron in earlier days, was quiescent; but the modern development of Japan, which has created such wonderful changes in the Far East, was in full swing, and China was beginning to train officers and men for a modern fleet. The political barometer, generally speaking, was at 'set fair.'

The admiral had a large squadron of small vessels under his orders, a few of them corvettes, but the greater part gun-vessels and gunboats. They were stationed principally at the treaty ports in China and Japan, always ready to show the flag wherever British interests appeared to need support.

Sir Charles Shadwell had a long experience of China as a captain, and his crew had suffered from that scourge of the station—dysentery. Almost his first order was that in no circumstances, and for no purpose whatever, was any water to be obtained from the shore; all drinking-water was to be distilled from seawater by the ships' condensers. The result was remarkable; from the date the order reached the ships dysentery ceased to trouble them. Two years later a gun-vessel at Shanghai had two bad cases, one fatal, amongst the officers. On inquiry it was found that to escape the great heat caused throughout the ship by using the condensers in the month of August, water, guaranteed pure, had been brought from the shore!

IV.

In April 1872 we left Hong-kong on our first cruise to the northward; it lasted until the end of the year, and included visits to Swatow, Amoy, Foo-chow, and Shanghai on the China coast, and also to Japan. After a fortnight at Nagasaki, we enjoyed a perfect yachting tour through the Inland Sea; a pleasant stay at Yokohama, and then we proceeded farther northward to Hakodate, in Yesso, calling at Nambu.

In September we visited the Gulf of Chih-li, part of the Yellow Sea, as it is well called, for the volumes of yellow mud brought down by the Hoang-Ho (the Yellow River) spread far and wide, and not only give to the sea a greenish-yellow colour, but also are steadily filling up the whole gulf.

Chi-fu, at the entrance of the Gulf of Chih-li, was at this time 'the Brighton of Shanghai,' to which the wives and the children fled in summer to escape the great heat. We turned over to the *Salamis*, and crossed in her to Taku, at the mouth of the Pei-ho.

We had some trouble in getting to Tientsin, which lies about seventy miles up the river, for the whole country extending over one hundred miles to the westward was under water, and it was not easy to distinguish the banks. At one turn the *Salamis* ran her nose into a Chinaman's onion-bed! The European concession of Tientsin was reduced to a strip of land two hundred yards wide, the English church and club were accessible only by boat, the race-course had eight feet of water on it, and the cemetery was entirely submerged; so that there was no public worship or amusement for the living, no burial for the dead. And this had been allowed to go on without any serious attempt to remedy it. An English engineer submitted a scheme to the Chinese authorities, but it was rejected; a votive offering to the River God had been erected in a temple, and all would be well.

During our stay at Tientsin we became greatly interested in the fate of a mandarin who had been paid a sum of money to repair a breach in the river-bank a mile below the city. He had scamped the work and pocketed the greater part of the money (a common proceeding in China, well known as a 'squeeze'), with the result that a stream some sixty feet broad, and six or eight deep, was at this point flowing over the country. The mandarin was given to the end of the month to dam back the water, with a certainty that failure to do so would result in the loss of his head. We visited the spot daily, and found him seated in a big barge, placidly smoking his pipe, and occasionally shouting to the gangs of coolies who, in the most futile manner, were trying to construct a dam of millet-stalks and clay, which the current immediately swept away. The end of the month was approaching, and there was still a breach of some thirty or forty feet, through which the water rushed like a mill-stream; but the mandarin continued to smoke his pipe, apparently with equanimity. Just in time it was suggested to him that he should buy a junk, fill it with stones, and sink it on the river side of the dam, and so check the rush of water. He did so, and saved his head. (I asked our consul if it was true that for fifty dollars a mandarin condemned to death could find a substitute to take his place on the execution-ground. He said that he did not think so—that the price had gone up, and that it would probably cost one hundred dollars!)

V.

Li Hung-chang, then Viceroy of Chih-li, the province in which Peking is situated, paid an official visit to Sir Charles Shadwell on board

the *Salamis*. He came attended by a retinue of mandarins of every grade, from pink-button to brass-button—that is to say, from the highest State official to an army non-commissioned officer. He himself wore the yellow jacket presented to him by the Emperor for the capture of Soochow from the Taeping rebels. In front of the chair in which he was carried marched his eight executioners with drawn swords, apparently sharp and ready for use. His pipe-bearer, who brought up the rear, lost no time in making his way to the ship's galley to get from the cook a light for his Excellency's pipe. These interviews with great Chinese officials were of a very formal nature. It is part of Chinese politeness to ask visitors, 'What is your honourable age?' and to express surprise that so young an appearance should claim so many years.

At the Tientsin church the service was ordinarily conducted by missionaries of various denominations. A Church of England clergyman said prayers of his Church, and a New York Free Church minister preached an eloquent sermon, a combination which evidently appealed to the congregation.

Human life is held very cheap in the East, and Tientsin has a very bad reputation in this regard. We noticed a small crowd collected one morning on the side of the river opposite to the settlement, and learned that a soldier was being executed on the spot where his offence had been committed.

A secret society existed at that time in Tientsin, qualification for membership being to have committed a murder. The horrible murder, in 1870, of the members of the French Sisterhood of Mercy, who had founded an orphanage in Tientsin for Chinese children, was said to be the work of these scoundrels. The sisters, anxious to fill their orphanage, had, very imprudently, offered a reward for every *bonâ fide* orphan brought to them. The city was placarded with posters stating that the children were to be fattened and killed, and their livers made into an ointment with which Chinamen would be blinded and converted to Christianity! An attack was made on the orphanage, which was burned to the ground, and fifteen French sisters and one English sister were assassinated.

We had a somewhat disastrous trip down the river, which was so swollen by the floods that the current nearly took us on to a turnip-field, and caused serious damage to one of the paddle-wheels.

We spent a quiet afternoon at Ninghai (now known as Liao-tung), where the Great Wall of China runs down to the sea. So determined were the Chinese to keep out their northern foes that they carried the wall one hundred yards out to sea, so that the Manchurians should not come round the corner. The wall is about thirty feet

in height, and the same in width; every hundred yards or so there is a big buttress, and defensive outworks occur at intervals. The wall was, however, falling into decay, after an existence of over two thousand years. I brought away a large brick as a memento of our visit, and it is a curious proof of the unchanging nature of things Eastern that the characters stamped on it were at once recognised by our Chinese steward as meaning 'this side out,' a direction to the workmen as to the placing of the brick. From the beach the wall stretches for some miles across a plain, on the other side of which we could trace its zigzag course up the side of hills seven thousand feet high.

Our next port of call was New-chwang, then a small settlement on the banks of an extraordinarily muddy stream. It is frozen in for four winter months, and cut off from all outside communication. Amusements consist of skating, and shooting geese, which are most abundant.

After a flying visit to Nagasaki, we returned to China, with the intention of spending six weeks in the Yang-tze-kiang.

VI.

In 1872 there were only three treaty ports on the great river at which there were European concessions—Chin-kiang, Kiu-kiang, and Hankow. Near the sea the stream is seven or eight miles wide at parts; at others it flows through narrow gorges with startling rapidity; whilst in the neighbourhood of Hankow, six hundred miles from the sea, it varies from one to two miles in width.

At Chin-kiang we saw a review of Chinese troops, and had no difficulty in crediting the stories we had heard of the defeat of whole armies of them by a handful of Europeans. Captain Roderick Dew, in the *Encounter*, a corvette with a complement of 175 men, with a gunboat also under his command, once reported to his commander-in-chief as follows: 'Sir, I have the honour to inform you that I have found it necessary to capture the city of Ning-po. Your very obedient servant, RODERICK DEW, Captain.' Ning-po, he it remarked, was a walled city with a very large population.

Of the companies of one hundred men whom we observed at this review, about twenty carried old-fashioned flint muskets; there were two or three gingalls (long tubes firing a small round shot, requiring three or four men each to work them) to every company; another twenty men carried long bamboos with pikes at the end; and, so far as we could see, the remainder, who constituted the majority, were banner-bearers, and carried no arms. My memory is not clear enough as to these details to state them with certainty, but I know we came away impressed with the belief that the marine detachment of the *Iron Duke* would have easily put to flight

the whole force under review! China, however, appeared to be waking up to the necessity of reform in the arming of her troops, for shortly afterwards at Nanking we saw a modern arsenal, in the charge of an Englishman, where the latest patterns of rifled guns, rockets, &c. were being turned out. As illustrating Chinese procrastination, I may quote a statement in Sir R. K. Douglas's work on China, published in 1899, that many regiments of their troops were still armed with bows and arrows!

Our next anchorage was close under the walls of the great city of Nanking, which are twenty-five miles in circumference and sixty feet high. A broad canal runs round the greater part of the city. Inside the walls was desolation; not a third of the area was built over, and in the so-called Tartar City one saw high, bare hills where pheasants might be shot.

Close to the arsenal were the remains of the once celebrated Porcelain Pagoda, formerly a magnificent building faced with ornamental porcelain, now a heap of ruins.

We walked to the tombs of the emperors of the Ming dynasty—A.D. 1368 to 1616—a mile from the city, built on the side of a hill which is surrounded by a high wall. The tombs, though of imposing size and solidity, are of no architectural beauty, being in this respect in strong contrast to the magnificent resting-places which Indian princes have built for their wives and themselves. They are approached through an avenue (a mile in length) of huge animals carved in stone; these are placed in pairs facing each other across the avenue. There were two

horses, two elephants (at least twenty feet high, each carved out of a single stone), two lions, two dromedaries, and many pairs of nondescript monsters.

Nanking, the ancient capital of China, was the headquarters of the Taeping rebels, who captured it in 1853, and held it until 1864, when Gordon, with his 'ever-victorious army,' recovered it for the Chinese Government. He found the city a heap of ruins, the surrounding country laid waste, the inhabitants exterminated. It is even said that during the rebellion the Taipings (whose name, forsooth! means 'Princes of Peace') massacred a million of their fellow-countrymen.

As we saw it in 1872—eight years after the rebellion was suppressed—the country surrounding Nanking was as bare as Dartmoor, and full of game; we shot pheasants under the walls of the city, and on our walk to the tombs we saw several deer.

Hankow, the highest point to which the state of the river gave access to the *Salamis*, was in 1872 the centre of the tea and silk industries, and a very flourishing port. The river is thirty or forty feet higher in summer than in winter, and, as our visit was in November, we found ourselves in the *Salamis* out of sight of the Concession at the bottom of a long flight of steps.

The houses of the European community showed every sign of wealth and luxury, whilst the Chinese merchants were said to have acquired such a taste for champagne that they drank it (or what passed for it) in larger quantities than were produced in all the vineyards of France!

(Continued on page 650.)

WILD FLOWERS IN MACEDONIA.

TO many of us who have been there, Macedonia will generally be associated with mud, dust, flies, mosquitoes, and malaria; but as an offset to these unpleasant features it has many points of interest and beauty which it is good to remember. Among the best of these are the wild flowers. Mindful of the fact that their day is short, Nature seems to make a special effort to atone for the long barren summer, and in spring brings forth a wealth of flowers of such beauty, purity, and delicacy of colour that they are a joy to behold.

Up near Mount Hortiach, about ten miles from Salonika, there are some rolling hills and a meadow where wild flowers in endless variety abound. In April cream-coloured dwarf irises with brown veinings are to be found on emerald slopes, where starry white saxifrages tremble on their slender red stems. Here grow also hosts of wild orchises, among them the pale butterfly orchis. In May the meadow reveals new beauties from day to day. Trails of delicate shell-pink and white ground convolvulus with

tiny pale-gray leaves clamber everywhere; and heliotrope vetches with fairy-like foliage stretch out curly tendrils to tall lemon-coloured mulleins with downy leaves and stems. The vetches, indeed, vie with the orchises in variety of shape and colour, some being rose-colour, some purple of different shades, and others yellow. Tangled masses of wild clematis bear claret-coloured flowers, set off by vivid wild roses, and clumps of queen-of-the-meadow. Among the grass are to be found rose-campions, pink gladioli, and china-blue love-in-the-mist, in its veil of hazy green. Perhaps the most striking of the meadow flowers are the blue iris and the lemon thistle. Very light and delicate are the pale-lilac and pink scabious; and there is an exquisite sky-blue flower, the name of which I could not discover, so fragile that it withers at once when picked. Many of our own familiar flowers, such as poppies, corn-flowers, and daisies, grow on this meadow, but by June the best are over.

Farther up-country are other and more wonderful flowers. I have heard rumours of

beauty almost too fantastic to be believed—such as fields full of languorous milk-white poppies and deep-purple irises.

In early June I have gathered among the rocks and prickly-oak in the gulleys sheaves of white madonna lilies, with their voluptuous scent and their look of perfect purity. In sharp contrast to these are fly-catching plants which seem too uncanny to be merely vegetable. The maroon-coloured flower is of the size and shape of an arum lily. The spadix or tongue is red, and covered with a sticky substance to catch the unwary fly, which the flower attracts by exhaling an odour of carrion. The prisoner being secured, the fleshy trumpet closes over it, and not until the pollen is shed does the flower slowly unfold again, allowing the insect to proceed on its fertilising career.

By July the barrenness of summer has set in; still in the early morning the chicory is all starred over with blue flowers. These barely survive an hour in the sun, but for a time every day brings a fresh crop.

After that Nature takes a rest until in September pale-lilac autumn crocuses sprinkle the meadows. Following the stream which flows under the Roman aqueduct (which still supplies a portion of the city with water), one passes thickets of sloes, hips and haws, half-strangled by trails of old-man's-beard and sprays of tinted vine. Past yellowing fig-trees, the path leads upwards to the groves of ancient Spanish chestnuts, between whose gnarled trunks and twisted roots sinister and grotesque faces peep at dusk. Higher up are beech-woods where in spring primroses are to be found, and in autumn tiny pink cyclamen with mottled leaves, hiding beneath the bracken. On the top of Mount Hortiach are rough gray rocks, among which I have seen myriads of lavender colchicums in full bloom. Near the narrow ridge between Hortiach and Kotos is a well where the donkey-boys—Demetrius, Apostolos, or Christoph, as the case may be—water the mules. From here is to be seen on one side Mount Olympus, rising white and shimmering out of a sapphire sea; on the other, Lake Langaza, with its gipsy village of mud-and-straw huts. Here the women may be seen weaving rush mats and baskets from the reeds that grow in the lake, while the men and the little naked brown babies enjoy a prolonged siesta. Bulrushes, too, abound in the lake; but I have looked in vain for water-lilies. Curiosity compelled me to lift a stone out of the water, but I quickly dropped it on finding it covered with leeches. Beside the lake is a Roman tower on which storks build. In spring I have seen the father-bird, black and white, with scarlet legs, giving sage advice to his two unwieldy and downy-headed offspring, recalling the tales of Hans Andersen. Magpies flit about, goldfinches rise in flights from the

thistles, little blue butterflies hang on the grasses, and the air is full of the whirr of tiny wings. The variety of insects—particularly those of the grasshopper kind—would give a natural historian much scope for study. Among the sun-baked rocks on the hillside lizards dart about—some of them gray, with flattened heads and repulsive, bulging eyes; others bright green. This is also the home of tortoises. Higher up are vultures; and at night jackals come down from their mountain homes, and break the silence by their savage howling.

Some miles nearer the city is a dilapidated house—now used as a shelter for monks—with a neglected garden and orchard. Many, many years ago the then Sultan of Turkey was entertained in this house, at that time the property of an Englishman, John Abbot, who, it is said, amassed a considerable fortune by rearing leeches. Many kinds of fruit are grown here—figs, almonds, grapes, quinces, red and white mulberries, also melons, pumpkins, and other gourds. There are shrubs of pink oleanders, and in October apricot-coloured persimmons glow among their glossy green leaves. The fruit is not ripe till December, when the leaves are shed, and it has become red and pulpy and of a cloying sweetness. Nothing, however, is so decorative as the pomegranates, with their red blossoms set in a scarlet waxen cup, or with their ruddy fruit, which, when it has been too fiercely kissed by the sun, displays rows of fleshy pink seeds.

As you travel southwards from Salonika towards the Gulf of Corinth, the scenery gradually becomes more wild and mountainous. In April the fields by the lakes are full of pheasant-eye narcissus, smaller than our garden variety, but with a scent of more penetrating sweetness. Sunrise among the Greek mountains is a sight to be remembered—the snow-clad peaks, pink and glowing, and the goat-bells faintly tinkling. From Bralo, near the pass of Thermopylæ (where in ancient days Leonidas led the Spartans against the Persian hosts under Xerxes), runs a mountain-pass, thirty miles long, to Itæa—once a famous seaport—on the Gulf of Corinth. This pass among the heights of Parnassus is of the most majestic beauty and grandeur. From the road, which runs at a dizzy height, one looks down on a pale-green stream bordered with maples, which in autumn are vividly tinted. Bright-green slopes lead up to dense forests of black pine, above which tower precipitous gray rocks, the whole being crowned by snowy peaks. One picture in this wild setting stands out in my memory—a youthful goat-herd, black of eyes and hair, with shaggy coat and naked brown limbs, looking with his long crook like a young David, driving his flock to the pasture.

Through groves of olives, said to be among the oldest in the world, Itæa is approached.

In spring the ground below the olives is thickly sown with scarlet anemones. From the steep hillside the ancient town of Delphi (which seems to grow out of the rocks on which it

stands) looks down on the sunny gulf, with its mother-of-pearl islands and its translucent blue water—a fitting site for the temple of Apollo.

A. DOUBTFUL ADVENTURE.

By R. M. V. SWANN.

I.

I STAINED my face and attired myself in the habiliments of an Indian prince. I yawned. A bed would have been a fitter place for me than a fancy-dress ball with its fatiguing excitement. I was weary from want of sleep. My lot in life forbade me to choose my own breakfast-hour, and for a month I had been dancing with senseless frequency. I was half-determined that after to-night I would abstain for some time to come.

But, jaded though I was, I could not resist the allurements of this ball. I had a vain predilection for gorgeous attire, and it was only on such occasions that I was able to gratify it. To-night I found myself in the temporary possession of raiment almost unsurpassable in splendour. It was no mere stage fustian—it had been the ceremonial apparel of a great Indian potentate. Who he had been, and how he had come to part with his costume, I knew not. Something subtle—it may have been an odour—lingered about the garment, and set the mind wandering amidst scenes of splendour—princes and their captains, cavalcades and retinues of glittering soldiery.

I finished the tiresome business of adjusting the odds and ends of my exotic costume, and surveyed my appearance in the mirror. The effect was pleasing. I was transformed from an ordinary-looking clerk into a fine romantic figure of an Oriental ruler. My pasty face—the thing that annoyed me most—had vanished beneath the stain. I looked vigorous and forceful, and not a little mysterious. Something, however, was lacking. I did not quite look the part. I conjured up pictures of the few Orientals I had seen, and tried hard to alight on the deficiency. After a few moments I discovered it. I returned to the mirror, and bared my teeth.

I was startled. I looked sinister and terrifying. I was a perfect imitation of the real Asiatic. But withal I yawned once more.

I set out to walk the short distance to the dancing-hall. I had put on a long, heavy overcoat over my costume, so as to attract as little attention as possible. But no one seemed to be about as I stepped forth into the long, quiet street. This was somewhat strange, considering the hour. The respectability of my neighbours rose in my estimation. Their houses, I noticed,

seemed as quiet as their street. In those windows alone which the shadow of a dressing-table mirror proclaimed as belonging to a bedroom was there any light. And in many houses there was absolute darkness.

As I proceeded along the pavement, however, I became aware of a house ahead of me, on the opposite side of the street, out of which shot forth the rays of a strong illumination.

'Here, at all events,' I said to myself, 'are some people who do not go to bed at this ridiculous hour.'

I felt a sort of friendliness towards these persons, whoever they might be. Their window was a cheerful sight in that gloomy parallel of dark houses. Sociable people like myself, I thought, with enough zest in life to remain awake a little longer than their joyless neighbours.

But a moment after, when I had got opposite that house, I found that the reality was far removed from the pleasant. A horror gripped hold of me when I looked up at that bright window, and saw, unmistakably clear, as weird a betrayal of a crime as was ever afforded to mortal eyes. On the blind of the window was the silhouette, grim and uncanny, of two men in the throes of a murderous struggle, which seemed to be fast approaching its termination. One man had all the advantage. He was armed with a poniard, and it could be only a matter of moments ere he succeeded in driving it into his antagonist. The other was making frantic endeavours to ward off the fatal blow. But his bulk seemed smaller on the blind, and apparently he was weaponless.

I did not pause to deliberate. I rushed across the street. Providence seemed to provide for my intervention. The door was lying close to, and I pushed it open without noise. Immediately I found myself in a brightly lit hall. Above I could hear the sickening, beseeching cries of the man who was being killed. I tore off my heavy overcoat, and bounded up the stairs, three at a time. I needed no guide to direct me to the room. A shriek, more hideous than the rest, met my ears as I reached the lobby, and I rushed straight for the room from which it came.

I was just in time. It would have been all over in another moment. The large man had overcome his feeble opponent, and, unresisted, he was about to drive the dagger into his heart. As it was, I should have been too late to prevent

the deed by direct intervention. He could have done it, and been ready to turn upon me, before I could have got across the length of the room, obstructed as it was by all manner of knick-knacks of furniture.

But my appearance had the most astounding effect. The poniard dropped from the man's hands, and he surveyed me with undisguised terror. It was now his turn to scream.

'Gandarah!' he cried, or some such sound, and he retreated to the wall, where he cowered and trembled with abject fear. The other man by this time had recovered sufficiently to take a new interest in life. To my surprise, he regarded me with no less distaste than had his enemy. He uttered the same word as had the other, and relapsed into a like condition of miserable timidity.

I rather enjoyed the situation. It was clear that I was confronting a pair of scoundrels. Somehow I felt I knew a lot about these men. They were of middle age, each old enough to be my father; yet for the moment I was completely their master.

For a little time I made no move, but stood regarding them intently. They watched me with nervous apprehension.

'You damned rascals!' I said at length, and went forward slowly. The man whose life I had saved uttered a cry at this.

'Stop! stop!' he begged me. 'I will restore it, Gandarah. It is here. I will give it you.'

'Let me see it,' I said sternly.

It was obvious that they mistook me for some bloodthirsty person prepared to deal with them in the most desperate way. 'You will not touch me?' he cried in a cowardly voice.

'Let me see it,' I repeated, fixing upon him a look which cut short his hesitation on the instant. He went submissively to a cabinet across the room, and took from the top of it a little vase, which he upturned in his hand. A small key tinkled into his palm, and he replaced the ornament.

At this the other fellow, who had been regarding his enemy with the most ferocious hatred, snarled like a savage cur, and made to spring upon him. A word from me, however, admonished him effectively; and the man with the key, who had once more been seized with an access of tremulousness, at this demonstration took heart of grace, and proceeded on the business of restoring the mysterious 'it.'

He came over to a table beside which I was standing, and put his hand beneath it. I heard him turn the key.

A moment later I was gazing with amazement at a ruby of marvellous size and weight, which glistered in my hand as if alive with flame.

Whether it was my astonishment which betrayed me or his cupidity which overcame his fear, I do not know. The murderous rascal at the wall sprang forward suddenly, and before I

could do aught to prevent him, had repossessed himself of the dagger.

In another moment I should have been stabbed to the heart, when the unexpected happened. . . . I awoke—in my bedroom.

II.

I started from the chair in which I had been dreaming, and looked at my watch. To my dismay, it was one o'clock in the morning. After all my elaborate preparation, I had missed the best part of the dance. I was horribly disappointed, and cursed my stupid landlady in her abysmal basement for not noticing that I had not left the house. By turning up so late I should have lost my chance of obtaining a prize for my costume—a thing I had coveted, and had almost expected to receive.

I refused, however, entirely to be balked of my night's pleasure. I put on my overcoat hastily and crept down the stairs to the hall. The other boarders were evidently in bed, for the house was dark and silent, and in the hall the gas was lowered, for me to put out on my return.

I left the house with as little disturbance as I could, and set forth at a smart pace along the deserted street. The houses, for the most part, were in darkness, except for a subdued light here and there from a bedroom window. It was just as I had dreamed it, but, to tell the truth, I was too much annoyed by the circumstances of my sleep to think much about it. I strode onwards, cursing my bad luck, and wondering how much fun I had missed.

But I now saw something which filled me with a vague apprehension. Some distance ahead, a bright light shone from a house on the opposite side. The incidents of my dream came into my thoughts. I felt uncomfortable and anxious as I walked forward.

It was as I had feared. I was asleep again, and was enacting my dream once more.

On the familiar blind was the silhouette which on the previous occasion had caused me to shudder with such consternation. But I was now in a hurry to be awakened, and I refused to be alarmed. I had had enough of this sleeping, and I must get out of it. I shook myself, and endeavoured to return to reality. To my disgust, I shook and squirmed in vain. The street would not resolve itself into my bedroom; the shadows on the blind persisted in my sight.

I saw that I should have to play right through this game of dreaming to its appointed end—the sudden assault upon me by the taller rascal—before I could awaken. I hurried across to the phantom house to achieve this object. I opened the willing door and entered the hall. There was no need to hurry. I knew exactly what was happening upstairs, and what my part was to be. I kept on my heavy overcoat. To take it off would make no difference.

A hideous yell greeted me as I ascended the

stairs, and then there was silence. This was rather different from the first time, when a continuous series of screams had been my accompaniment. But the discrepancy was of small importance. I was really in the same dream, and it would soon be over.

I entered the room, prepared for the spectacle of Death averted by my intrusion. But, to my surprise, there was no struggle in progress, and I could see only one man, who was engaged in the comparatively prosaic task of opening a cabinet. He seemed, however, genuinely alarmed at the sight of me. His face paled, and he desisted from his employment to put a greater distance between us.

'Well,' I said angrily, 'where is the other rascal? I can't see him.'

The man made no reply, but it seemed as if his astonishment and dismay were greater than ever. I had no patience to repeat the question.

'Never mind,' I said. 'Give me the stone.'

'The stone?' he echoed, as though he had not understood.

'Yes,' I said, 'the stone. Confound you! The ruby—give it to me. Do you think I don't know all about it? Hurry up!'

'It is in there,' he said, indicating the cabinet he had been opening when I entered.

'Who put it there?' I asked.

'That is where it is kept,' he answered lamely.

'You are a liar,' I said sternly. 'It is kept in the wood of this table, in a small panel.'

The man regarded me with increased bewilderment.

I took the key out of the lock of the cabinet, and groped with it beneath the table.

'Where the devil is it?' I cried angrily, as I felt for the keyhole in vain. For a second or two I had my back to the man, and he took immediate advantage of my position. When I turned I was facing his revolver.

'That's right,' I laughed. 'Shoot. It will not hurt me, and it will put an end to this pantomime.' The man gaped at me with an absurd incomprehension. 'Shoot, confound you!' I said, as I saw his hesitation.

But the fool let his revolver slip from his hand to the floor . . . and I still dreamed.

I threw myself upon him, determined to hurt myself in a struggle with him, and thus awaken. But he eluded me with the swiftness of a cat, and was at the door in a flash. I pursued him furiously, out of the room, down the stairs, and into the street.

He raced along at a terrific speed, and completely outdistanced me. A curious feebleness invaded my limbs. With the utmost energy I was unable to force them to any vigour of action. I felt as if I was running on a ball. He thus escaped with ease, and soon I was left alone in the street.

Then everything was blotted out, and I remembered nothing more.

III.

When I awakened my brain was clear. I knew precisely what had happened. I had twice fallen asleep, and now I was in all probability too late to go to the ball. I made to spring to my feet to ascertain the time.

To my amazement, I found myself in my bed, and undressed. My Indian costume was hanging over the back of a chair. I was greatly bewildered. The light had been turned down, and my landlady had provided me with the unusual luxury of a fire.

A few moments later my cousin entered the room. He informed me that I was an invalid, and must remain in bed. I had been unconscious for fifteen hours, he told me, and my condition was somewhat serious.

'Bosh!' I said. 'Just loss of sleep. I've only been asleep.'

But I fell back weakly upon my bed.

I cannot make up my mind about the murder of Morrison, the Indian explorer. The facts are these. He was murdered in his house along the street by some person on the night of the fancy-dress ball. It is not known if anything was stolen.

I was picked up in the street unconscious, not far from my own door. I may really have been in Morrison's house on the occasion when I thought I was dreaming for the second time. If so, it was my dilatoriness which cost him his life, for with haste I could easily have intervened in time. Though I did not notice his body in the room, that is no reason against its having been there. I was too preoccupied with the other man to see it.

But I know perfectly well that if nothing had happened that night, my reason would have been quite satisfied with the explanation that all the transactions had been dreams, and my opinion would unhesitatingly have pronounced the first dream more real than the second, which, it might seem, was indeed reality itself. Therefore, as I have said, I cannot make up my mind.

ROYAL OCTOBER.

GOLDEN are the sands, and the sea is azure—

Sky and sea a-sparkle in the rain-washed air;
Sun and shadow racing across the broad spaces,
Chased by the West Wind from his far-away lair.

Silver are the sails of the boats returning,

Silver the flashes of the gull's wide wing,

Silver the foam-tips on the dancing waters,

And silver the high clouds where overhead they swing.

Nature's robes are royal on October mornings—

Trimmed with shimmering silver is her azure gown.

Golden is the carpet for her fleeting footsteps,
And diamond-studded is her shining crown.

B. NOËL SAXELBY.

Chambers's Journal

SEVENTH SERIES

THE OYSTER.

By WILLIAM GOSSE, M.D., D.P.H., Camb.

I.

THE history of the oyster can be traced back to the Tertiary period, where the common shell found is that of a gigantic oyster, sometimes a foot in diameter. Near Reading there is a fossil oyster-bed which covers six acres and is two feet thick, but this is composed of shells of the same shape and substance as those we find on our shores to-day. There is an oyster-shell island off Corsica; while on the western coast of South America, which is being gradually raised by seismic forces, these beds are from sixty to eighty feet thick and some forty miles long.

In the early Stone Age man lived mainly on roots, fruits, and shellfish. The débris of their meals is found buried on our shores, and in what are known as kitchen heaps or middens, which contain hundreds of thousands of shells, together with palæolithic flint instruments. These indicate the remote period at which the oysters were consumed. Such remains have been found on the coast of Elginshire, where now hardly any of these molluscs survive, showing among other things that the climate must have become colder.

The oyster was known to the Greeks; it is from them we get the word. The Romans not only knew the oyster, but appreciated it; for its shells, as well as those of the edible snail, another of their delicacies, are found in the sites of Roman settlements. They were the first to cultivate oysters, and their methods are still in use. They introduced oyster-culture into Britain; and Sallust (c. 50 B.C.) said there was 'some good to be got out of the poor Britons—they produce an oyster.' Under Constantine, when luxury was rampant, and later under the last of the Cæsars, millions of bushels of oysters were consumed in Rome; our 'natives' were most prized, being brought all the way from Richborough in Kent. The Patrician Roman was a man of leisure, and chewed his oyster, thus getting the full flavour.

So the humble oyster can claim the most ancient lineage; it has always moved in the most aristocratic society; and therefore its blood is found to be of the palest blue. The oyster may be compared to the 'Honest Lawyer,' being headless, which explains the old saying, 'As stupid as an oyster.' It has no eyes and no

ears, although it has a mouth and four lips. Yet it has some sense that can detect the passing shadow of a boat, or an alarming noise, such as a thunder-storm; so it is true that 'a noisy noise annoys an oyster.'

When an oyster is opened the unaided eye sees in the centre the closing-muscle, where it has been severed from the shell; and around it the beard with its five or six gill-plates; and on the beak side, the large mass of liver; and close to the hinge, the minute mouth with its hood and four labial palps. On more minute examination we find that the oyster is covered with a fine lace mantle, which is composed of fat and connective tissue.

The oyster having no neck, the mouth opens directly into the stomach, which is merely a bag and is surrounded by the liver. The intestine on leaving the stomach is comparatively short, and winds through the liver and even the heart before it reaches its termination. The heart is placed in a cavity reserved for it near the adductor muscle. It receives the blood from the respiratory apparatus and circulates it through the other organs.

The respiratory apparatus is of beautiful structure, peculiarly adapted for extracting the oxygen from the water instead of the air, so keeping the home-fires burning. This is popularly known as the beard, but is really the gills, which act in the same manner as those of a fish. They consist of gill-plates, between which are tubes lined with cilia or minute hairs, which continually wave, threshing the water through the enveloping network of blood-vessels. This serves a double purpose, extracting the oxygen for the blood, and filtering out the minute algæ and other nutriment for the stomach. Huxley says: 'I suppose that when the sapid and slippery morsel—which is, and is gone like a flash of gustatory summer lightning—glides along the palate, few people imagine that they are swallowing a piece of machinery (and going machinery, too) greatly more complicated than a watch.'

II.

All the conchiferæ have shells. The oyster has two, and is, therefore, a bivalve mollusc. The shells are irregularly circular, with a crescentic tendency, pronounced in some varieties. The lower shell is more convex than the upper,

and the average size is some three inches. The outside is rough, and the colour a dirty brown. The inside is in marked contrast, being perfectly smooth and pearly-white. Near the centre of each shell there is a scar; that is where the adductor-muscle is inserted, which, on contracting, closes the valves of the oyster. The muscle is large for the size of the animal, being, it is stated, the most powerful in nature, and capable of resisting nine hundred times its weight; hence the necessity of an oyster-knife.

Just inside the beak may be seen the insertion of the cartilages which form the hinge ligaments—for there are two, an external and an internal. When the valves are closed the external ligament is in a state of strain, while the internal is compressed. So, when the adductor-muscle relaxes, the shell opens because of the tension of the external ligament and the expansion of the elastic internal ligament, both forming a beautiful contrivance of passive elasticity.

The fool in Shakespeare asks King Lear, 'Dost know how an oyster makes its shell?' Fools often put posers, but we now know how it is done. It is done much in the same way as we deposit lime-salts in our own skeleton; as the oyster has no bones, he utilises his waste-products by building himself a house.

The oyster's organ of selection and excretion is its mantle, for, as the edge of the mantle protrudes as it grows beyond the edges of the shell, the calcareous matter which is always present in sea-water is first secreted, and then deposited in a soft state on the extreme edge of the shell, gradually hardens, and enlarges the diameter of the shell. The process begins at the boss, and is repeated at intervals as needed by the growth of the oyster, layer on layer like a pen-wiper.

On careful examination, each layer will show fine thread-like lines, which are called strizæ; these are parallel, but in each layer are arranged obliquely to those in the one above and below, on well-known mechanical principles, strengthening the shell as steel girders bind concrete walls. The oyster pays little attention to outside decoration, so long as it does not clash with its surroundings, and on our shores it is usually of a brownish tint and rough cast. But the inside is a very different thing, and there the oyster shows its exquisite taste; the shell is lined with mother-of-pearl, which is secreted by all the external surface of the mantle except the edges, and is called nacre. This is an iridescent pearly-white, as velvety to the touch as the finest old Worcester china, and as free from chinks and corners as an ideal operating-theatre.

The iridescence, with its beautiful play of colours, is not due to any pigment, but is demonstrated by the microscope to be caused by minute structural corrugations, some thousands to the inch. Sir Isaac Newton showed that a series of fine grooves break up a beam of light into its constituent colours, in a similar manner to a

prism. Curiously these tiny ridges and furrows, with their iridescence, are not obliterated by chipping or even grinding.

The nacre is not only decorative, but useful. Being deposited layer by layer over the whole interior of the existing shell, it increases the thickness of the shell. It sets into a very hard and firmly laminated shield, and consists of layers of organic matter impregnated with lime, and is well called mother-of-pearl, of which so many artistic ornaments are made, besides numbers of things which we handle daily as common necessities, such as pearl-buttons, of which myriads are made, broken, and lost. Yet never a question occurs in our minds—Of what are they made? How is the material supplied? As a matter of fact, the source of supply is becoming exhausted; for the mussel-beds in the Mississippi and other rivers show signs of failing, and means of restocking by artificial propagation is under consideration by the Bureau of Fisheries.

III.

In reviewing the oyster's life-history we must begin with reproduction. *Ostrea edulis* is hermaphrodite, first producing its eggs as 'white spat,' and afterwards fertilising them with a darker spermatozoic exudation called 'black spat,' which to the touch is viscid and gritty, being albuminous, and serves the purpose of the white of an egg in nourishing the embryo oyster. If a small portion of this slimy substance be examined under a low-powered microscope, the grit, which appears like slate-pencil dust, will be found to be young oysters. These are now to have the time of their lives, brief but exciting, for they are suddenly ejected by the parent oyster into a wild waste of waters, and they are free; and, more, they can swim and dance up and down in the water. But this lasts only for a few days; then the spat falls and the power of locomotion ceases, for as the shell grows it gets heavier and sinks to the bottom, where it usually rests on its left side, which becomes attached to the site it alights upon. This is what the fisher-folk call 'the fall of the spat,' and is the first and most important fact in the life of the oyster. It was always a mystery from where and how the spat came. When the minute oysters are seen safely anchored to the cultch (as the floor of the bed is called), the future prospects of the ground are good. They have then become visible as white dots on the surface of the substance to which they have adhered; these dots are found, on closer examination, to be flattened discs one-twentieth of an inch in diameter, which rapidly take on the distinctive characteristics of the oyster.

Here again Nature is to herself true. As Tennyson puts it:

So careful of the type she seems,
So careless of a single life.

For myriads of the floating spawn are scattered by the winds and the tides, myriads killed by an

unexpected snap of cold weather, without mentioning the depredations of voracious enemies that abuse the 'freedom of the seas.' However, Nature makes some provision for this, as every healthy adult oyster is capable of producing annually from one to two million fertilised eggs, and the amount of spat produced by a recognised oyster-bed must be enormous.

We left the little mite fixing its permanent residence on a concrete foundation, a sound example followed by all good builders. If the conditions and the surroundings have been favourable, in six months it will have attained the size of a threepenny-bit, and in twelve months it may be an inch in diameter. After that oysters increase about an inch a year, until they reach three inches, when they may be regarded as adults, and any further growth is chiefly in thickness of shell. This applies to our home variety of edible oysters, and is a rough guide to the age of the oyster up to three years, the normal growth being an inch a year; beyond this the oyster must be judged by thickness of shell. An oyster is supposed to be in its prime when five years old, and its average life is less than twenty years.

IV.

The oyster-ground is gone over methodically by the trawlers as a field is ploughed by ploughmen, until an adequate supply is obtained for the market. The dredge resembles a common clasp-purse with a framework of iron, covered with net. It is so contrived that the mouth is kept open and the lower edge scrapes the bottom. When sufficiently filled (which can be told by the drag), it is hauled on board and emptied. The bag is usually a mixed one; not only oysters of various sizes, but stones and shells, pots and pans, crabs and lobsters, are found. These are sorted and treated according to their deserts.

Before the man of Kent became infected with modern scepticism, talking was forbidden during dredging; but the fishermen chanted:

'The herring loves the merry moonlight,
The mackerel loves the wind;
But the oyster loves the dredger's song,
For he comes of gentle kind.'

There are many varieties of oysters, for there are no fewer than 170 named species, and of these there are several sub-varieties.

Of the well-known edible varieties our 'natives' naturally come first. Now the Whitstable beds are most famous; they are supposed to contain fifty million oysters. The estuary of the Thames forms an ideal bed of London clay covered with clean shingle and shell, lying in salt shoal-waters in a temperate zone. Milton-on-the-Swale had the reputation of supplying the finest English oysters. Colchester has still an annual feast, but sends few oysters to the London market.

Among other popular varieties the 'Royal Native' and the 'Victoria' are naturalised

aliens, being bred in France and fattened on English beds. Then there are Dutch oysters, Holsteins, Portuguese, and the Mediterranean oysters. Of American oysters the large 'Blue Point' is best known, and is so called because of the blue scars left on the shell when one is opened by cutting the closing-muscle.

As a modern exception and a geological commonplace, I mention the Australian oyster (*Costrea Lincolni*), which is as big as a dinner-plate, the largest edible oyster in the world. Another curiosity is the tree-oyster, which is found growing on the stems of mangrove-trees on tropical shores.

The ingenious and industrious Chinese grow their oysters on bamboo, planting them in mud as a gardener plants his cuttings. They take a split piece of bamboo about two feet long, again split it about half-way down, wedge it open with a shell and bring the split ends together, fasten them with a perforated shell over the top—and in four or five months the bamboos are hid by clustering oysters.

The pearl oyster must be mentioned, although not strictly an edible oyster. In fact, it belongs to a different family. Its scientific name is *Meleagrina margaritifera*. It is really a pearl mussel; but pearls have been found in many varieties of oysters.

V.

Already most phases of the life of an oyster have been described. We now come to the struggle for existence, which in the depths of the sea is even more ruthless than on land.

The few that escape the causes of infant mortality and settle down to build their homes in congenial surroundings are beset not only with inanimate enemies such as cold, sand, mud, &c., but by predatory animals of great cunning and resource. Among the chief enemies are skates, rays, octopods, starfish, crabs, whelks, mussels, and even sea-worms; and some birds, such as the oyster-catcher, gulls, and crows.

One of the most common pests is the starfish, a member of the horrid octopus family, which is called by fisher-folk 'Five Fingers.' In view of the difficulty we have in opening an oyster, the bivalve would seem an insoluble problem to the starfish; but the Rev. J. G. Wood, as the result of repeated observations, informs us that the starfish starts as we do, by clasping the oyster with its five fingers; then, not having a knife, it places its mouth over the hinge, and ejects some saliva, which paralyses the hinge-muscle and causes the shell to open slightly. But the most important part of the problem remains unsolved—how to extract the luscious contents. Fortunately the starfish has a capacious and accommodating stomach just behind the mouth; you step directly out of the hall into the dining-room. As the starfish cannot get the oyster's body into its stomach, the stomach is expelled

out of its mouth, envelops the oyster, and proceeds to digest it. This done, the starfish draws its stomach back again into its body. The wildest flights of Oriental imagination never equalled this perfectly true history of the oyster and the starfish.

One of the oyster's greatest enemies is the dog-whelk. This shellfish's tongue, called a radula, is a most murderous stiletto, which can protrude and bore a hole through the thickest oyster-shell, and is said to be able to select the site of insertion of the adductor-muscle, which relaxes, whereupon the whelk ravenously devours the shell's contents.

The common edible whelk is not so destructive, as its weapon is effective only against the young or the weak. Each enemy has its own method. The crab tries to crush a weak shell with its claws, or cunningly waits for the oyster to open, then puts a spoke in its wheel.

One of the sea-urchins, called the 'burr,' when out of the water resembles a bunch of harmless dried grass; but hidden underneath it has four sharp points, with which it drills numerous minute holes into the oyster's shell, until it becomes worm-eaten and crumbles.

Birds detach oysters from their beds when the tide is down, mount with their prey in the air, drop them on a rock, where they shatter, and so secure their dainty. Monkeys in the Tropics also feed on tree and other oysters, breaking their shells by hammering them with stones.

VL

The digestibility of raw oysters is well known. The raw oyster takes two hours fifteen minutes to digest; the stewed, two hours thirty-five minutes; while most fish take three hours, the

exception being boiled sole, which takes only two hours five minutes.

It is to be regretted that such a valuable and favoured delicacy should be under a cloud of suspicion, but it is well founded, for the oyster has been known to harbour the germ of typhoid-fever. This is due to the sanitary complications of our modern civilisation. Before seaside towns had water-sewers with their outfalls in estuaries or in the sea itself, the sewage was unable to injure or pollute oyster-beds. As we have to live under present conditions, it is useful to know that the oyster, if placed under hygienic conditions of a clean bed and water-supply, will purify itself in twenty-four hours, and will then be found free from objectionable bacteria. This safeguard is well worth the expenditure. Where there is any doubt (and there usually is), it is wiser to take the simple precaution of washing the oyster, after being opened, under the stream from a tap; for the juice in which the oyster lies consists of impure water, probably tainted with its own excreta.

Roman epicures used to chew the oyster, but modern ones prefer bolting the luscious morsel in the raw and natural state. Still, it would be safer to cook them, and there are many ways of so doing—over sixty are given by Dr Philpota. A good old English way is as follows, and is called the Colchester Carpet-Bag. Take a square slab of rump-steak about two inches thick. Cut lengthwise into one side so deeply that a margin of only an inch is left all round—but without removing any part of the meat—and open the steak into something like a bag in shape. Stuff the cavity full of oysters, well season with salt and pepper, add a lump of butter, sew up carefully, and grill on the gridiron.

MIRIAM DECIDES.

By CHARLES SIDDLE.

PART I.

I.

I SUPPOSE most people would admit without hesitation their delight in any suggestion of romance. Personally, as might be expected of a bachelor of fifty or thereabouts, I revel in it. So do you, I dare say. Our difficulties would commence only when we attempted to reconcile our definitions of romance. For example, these newspaper men can smell a romantic situation in an affair which drives me to Jeyes' Fluid and a hot bath.

The engagement of my goddaughter Miriam to Alan Cowen was not as bad as that, but I could never persuade myself to regard it as anything but disastrous folly. Miriam is the only girl I can tolerate, and I suppose I am selfish in my attitude towards her. She is necessary to

my comfort, and I have never seen any reason to pretend pleasure when I see some young fool monopolising her attention. Not that I protest; to do so would be foolish and useless. Flirtation is the natural safety-valve for a girl of twenty, and I am not yet mad enough to risk my position of confidant by raving against the breathless excitement of manipulating half-a-dozen jealous adorers. No. My policy has been to pretend an unconcern I do not feel, and to wait with what patience I can for the natural reaction and my opportunity. The scheme worked well until Cowen came along, and he, having neither manners nor patience, introduced a new element into the game and knocked me out in one round.

They met in some ballroom or other, and only a brain full of romantic nonsense could have

conceived any possibility of the acquaintance developing into friendship. Miriam Frances Wymondham Vincent is the daughter of a house that can boast—but never does—a descent from Plantagenet founders. Alan Cowen admits—very freely, confound him!—an ascent from the respectable artisan class too recent to be free from impossible connections with all kinds of five-roomed dwellings. Miriam is as dainty a girl as you'll meet anywhere. Alan is a clumsy, powerful man with a distressing chin and hard, gray eyes. He represents the class which I, for one, cannot tolerate—the successful fighter. You know the kind. Self-made is, I believe, their own phrase, and in my experience they never free themselves from the faults of their own handiwork.

Miriam tells me that her first impression of Alan Cowen was an amazed discomfort. He positively glared at her from across the room, and for the first time in her life she experienced that suspicion, so dreaded by all women, that something about her was conspicuous and wrong. She was being criticised adversely, or she thought she was—which is worse. Her cheerful occupation of keeping three contesting males amused became suddenly impossible and unimportant. The sensation began by annoying, and ended by interesting, her. She asked Cowen's name.

As if he had known that the moment was his, and the fruits thereof, Cowen clinched the impression he had made. Walking heavily across the room, he fixed one of the young men with his domineering gaze—they all detested him, of course—and demanded an introduction. The ceremony accomplished, he showed his gratitude by offering his arm to Miriam and taking her irresistibly away. Miriam repeated his opening sentence to me the next day, and it was typical of the man.

'I do not dance,' he said, 'and I never make a fool of myself by trying. Will you sit out with me?'

My jealousy where Miriam is concerned having been admitted, you will understand that I was quick to read the danger in her manner when she talked about Cowen. His abrupt speech was a new experience for her. She sat on the edge of my table telling me about him, and her eyes positively danced with excitement.

'Wasn't he just too quaint?' she said. 'It was about half-past twelve, and he must have known that my programme was full. I don't look the kind of girl who hides an empty programme, do I? His assurance was not very flattering, and I told him straight away that I was afraid I couldn't manage it; and what do you think he said? He looked at me in a dictatorial kind of way. "You can manage anything if you want to; and if you don't, I'm wasting my time." He did, honestly. Wasting his time! Well, you know, what could I say after that?'

I could think of several very effective things she might have said, but, then, I am not a young girl carried away by the excitement of a new experience. What Miriam really did say was equivocal—but quite sufficient for a man like Cowen. He took her away and talked to her. Of course, he told her all about his struggles and his successes, and I don't doubt Miriam found it very romantic. The story as I have heard it from other sources is one of ruthless determination and cruel disregard for moral scruple. A man does not emerge from the mob in ten years by wearing kid gloves and dealing gently with rivals; but in a broad outline unpleasant details are lost—one cannot blame Cowen for that. Miriam was more and more impressed. So was Cowen. When Miriam is interested her eyes sparkle and her energetic expression makes her little face a positive miracle of delightful inspiration. She is so eager, so transparent. I know exactly how she must have thrown Cowen's imagination into a sudden industry of castle-building. She was just what he had dreamed about, but never believed to exist.

'I told him I thought he was wonderful,' she said. 'He is; isn't he, darling? A real man, able to do things. Fancy Reggie Santella thrown into the position Mr Cowen had to face!'

This was unfair to poor Reggie, who has his points, and is devoted to Miriam. I felt obliged to protest.

'Or me, for that matter,' I said, with just a tinge of bitterness in my voice.

Miriam sprang down from the table and kissed me. 'Why, you silly darling, you are not jealous, are you?' she asked. 'I shouldn't like to think of you fighting anybody. It would be too tragic. Mr Cowen's life has been very exciting and—and romantic, but you—you are my dear god-father.'

I am a fool. I swallowed the sugar and asked for more. The question of Alan Cowen dropped, and we talked of other things more pleasant and soothing. It was not until Miriam was going that she referred to the experience at the dance again. She had said good-bye very prettily, and was at the door, when she turned suddenly on me.

'Do you think'—she began, and then stopped. She was blushing and a trifle confused.

'Do I think—?'

'Oh, nothing.' She hesitated, half in and half out of the room. Whatever the question which was troubling her, it was sending waves of red across her face. She closed the door and came back a little way. 'Mr Cowen is very disturbing,' she whispered, looking at me with troubled eyes. 'He says'—she hesitated again, then went on with a rush—'he says he will look out for me, and make me the next important business of his life.' She repeated this astonish-

ing speech—astonishing both on account of the suddenness of the declaration and the peculiar qualification 'the next important business'—and then seemed to realise how startling it must sound to me, for before I could reply she was gone.

That was my introduction to Alan Cowen as an aspirant for my goddaughter's hand. Possibly the affair was romantic. It was undoubtedly serious, and very distasteful to me. I tried to convince myself that Miriam's common-sense must show her the difference between a stimulating acquaintance and a prospective husband, but I was not surprised when the news came to me that she was engaged. Cowen, consistent, overpowering, masterful, completed his wooing in three whirlwind attacks. Miriam—my Miriam—was engaged to marry a man who presented in all respects a complete contrast to herself; and I was asked to congratulate her. The first act of the romance was complete, and the curtain about to rise on—what?

II.

I called on Miriam two or three days after the announcement. It needed that length of time to make me even reasonably sensible. I am not fool enough to encourage a young girl's wilfulness by opposing it, but I was finding it more than usually difficult to play my part as the indulgent friend. I muttered my congratulation with as good an imitation of sincerity as I could manage, shook Cowen's big hand, winced under his ridiculous grip, and then wandered away from the circle of tea-drinkers to join Reggie Santella. I like him, and could almost have forgiven him if he had been the successful lover.

'Well, Reggie,' I said, 'and what do you think of our little drama?'

He smiled at me with surprising cheerfulness. 'Queer start, isn't it?' he said. 'I feel rather as if I'd missed my cue somewhere, but I've seen plays where a lot of the action takes place off.'

I stared at him. I think I've known him ever since he was a snub-nosed youngster with lanky legs and a cheeky grin, and I recognised at once that something had been happening to him which I'd missed. I hate missing things.

'What exactly do you mean?' I asked, curious as any old gossip at her back-gate.

Reggie was watching Miriam, and had no eyes for me, but I dare say he found it pleasant to have some one to talk to. Anyway, it didn't need half the brains Reggie stowed away somewhere to guess my sympathies.

'I've been pretty keen on Miriam for a long time,' he said, 'but I've had a comedy part all the show. Comic relief—that's been about my ticket. Passing the time until the hero arrived. And here he is, sir; here he is. Strong man stunt, romantic past, everything complete. Ring in his waistcoat-pocket. Exit comic relief.'

His words were bitter enough, and, on the whole, what one might have expected from a disappointed lover; but Reggie was not speaking bitterly. He seemed to be rather amused, merely acting his part. He turned to me suddenly.

'That is what you think, isn't it, Sir John? But I see it differently. Alan Cowen may win through with it or he may not. I think he will not. He is up against a tougher proposition than he imagines, and he is missing his lines wholesale. He does everything wholesale, you know.' This was the only sneer Reggie permitted himself, and I readily excused its bad taste.

'You think, then?' I said tentatively.

Reggie stood up. 'I think he hasn't won yet,' he said, looking at me with quiet confidence, 'and I know he thinks he has.'

He walked away from me and joined Miriam at the tea-table. I stayed where I was. The youngster was giving me food for thought. Theoretically a man has no business talking as he had done about another man's engagement; but, after all, Reggie was first on the field, and if he had the backbone for the fight, I was ready to give him fair scope; my trouble began when I tried to calculate his chances. He had shown no signs of strength or ability up to now. Would the sudden change hold, or must I see my last hope crumple up into mediocrity again? The chances were against the boy, I decided reluctantly.

The other visitors departed, one by one, and soon there were only the four of us left—Reggie, Miriam, Cowen, and I. Reggie was chatting easily, keeping Miriam amused, steadily ignoring Cowen. I tried to engage the older man's attention, but he was too little concerned even to pretend interest. He was watching the others, and he cared nothing for my knowledge of the fact. This magnificent disregard for the opinions of outsiders was one of his strongest weapons, as you will know if you have ever tackled a man strong enough to do it naturally. I was an outsider, and I was not long in realising it and taking my proper place.

'No, Miriam,' Reggie was saying, 'not a single brief! My eloquence is still a-mouldering in my breast, and not a criminal believes in my powers.'

'Oh you poor boy! What a time you have to wait before you sit on the Woolsack or wherever it is!'

I am not surprised at Cowen's ill-concealed displeasure. The two young people made an attractive picture together—Miriam so fair, so eager, so young; and Reggie, straight-backed, cleanly built, obviously in the best of condition, an athlete trained for all kinds of sport, and perfectly modelled for his work. His wavy brown hair and humorous blue eyes removed the hint of weakness which a medium chin and

a lazy mouth would have given to his face. In appearance he was a perfect mate for Miriam, and he knew it. So did Cowen. The knowledge undoubtedly lent sting to his sudden interruption.

'No man need wait for work to come to him,' he said roughly. 'Men who do things go out after opportunity and find it.'

I was watching Miriam keenly, and she betrayed by a sudden movement of startled surprise that she had temporarily forgotten her fiancé. I glanced at him. He had noticed it too.

'Oh, but, Alan,' said Miriam quickly, 'Reggie is a barrister. It isn't just the same, is it?'

'That depends,' said Cowen, 'whether Mr Santella is a barrister merely as an excuse for doing nothing else. If he needs money and he is out to make an income, he needn't wait for briefs. And I think some of my City friends would be glad to see him earning money.'

This was really terrible for Miriam. The man was possibly reckless, driven to brutality by jealousy; but even that was no excuse.

Reggie didn't wink at me, but he let his eyes wander in my direction for a moment before they came pleasantly to rest on his attacker, and I began to understand his optimism. Cowen, dogmatic and aggressive, was allowing his irritation to destroy his discretion, and Reggie was out to encourage him. I looked at Miriam. She was blushing a little, and her eyes were troubled. There were undoubtedly possibilities in the situation.

'As you know so much about my affairs, I may as well admit,' said Reggie, 'that my private income barely pays the interest on my debts. But I don't see what I can do, you know. There is such a thing as professional etiquette.'

Cowen rose and walked over to Miriam's side. He was now very close to Reggie, and as he stood, firmly planted on his feet, strong, dominant, supremely self-confident, he might have stood for an allegorical figure of success. Incredible as it seems, he was blind to the impression he was making on Miriam.

'I have only one recommendation for men in your position,' he said. 'Take your coat off, take your gloves off, forget your miserable profession, and start at the bottom. If you are any good, you'll come up; if you are not, you'll stay down. But at least you will be facing your own problems, and not shuffling them on to some one else.'

I waited for Reggie's reply. None came. I looked at Miriam. She was uncomfortably watching the two men. Now, surely, was Reggie's chance to make a smashing attack on the ridiculous speech his rival had made. The silence was becoming noticeable.

'Really, Mr Cowen,' I said, unable to remain silent, 'don't you think that sort of thing'—

'No, I don't,' he said, interrupting me ruth-

lessly. (I hate interruptions. They leave me suspended in mid-utterance, and are so unnecessary. Like every other middle-aged bachelor, I value my own opinions, and men like Cowen have no sense of fair-play.) 'I hold that every young man should stand on his own feet,' he continued, looking at me, but talking at Reggie. 'Every pound owed is a pound stolen.'

I sat up, positively bewildered. This brutal method of conducting a discussion surpassed my worst expectations. Stolen!

'Oh, Alan dear,' said Miriam, 'I don't think'—

'I'm sorry if I have hurt any one's feelings,' said Cowen, without showing any very marked signs of penitence; 'but I am speaking generally on a subject which affects me strongly. I intend no personal implication.'

Reggie shook his head with a characteristic movement like a frolicsome dog shaking the water from its ears after a swim.

'Don't apologise,' he said cheerfully. 'I'm a careless beggar about money, but I started the discussion, and it's my funeral. You rather took my breath away. I'm not quite used to your methods. Very likely you are right, though.' He looked for his hat and stick.

I rose to my feet, too. The bracing atmosphere was affecting my mental lungs. I'm not used to it.

When we were out in the street Reggie exhaled a deep breath. 'Heavens! what a man!' he said angrily. 'I don't know how I resisted the temptation to go out after him with his own weapons.'

I was feeling pretty sick myself. Reggie had not played up as I had hoped. 'Yes,' I said gloomily, 'you gave him full permission to walk on you. Why ever didn't you stand up like a man, and let Miriam see that you can hold your corner?'

Reggie said nothing for several minutes, and then he laughed suddenly. 'You are not so clever as I thought you,' he said. 'Fancy allowing a youngster like me to give you points.'

I was annoyed. The afternoon had provided several unpleasant incidents, and now I was being patronised by a youngster of twenty-six. 'What do you mean?' I asked irritably.

Reggie stopped. 'I am going in here,' he said. 'Think it over, Sir John; think it over; and see if you don't agree with me that Miriam finds the masterful brute less romantic when he tramples on her friends.'

He left me, and I walked on, thoughtful, and more impressed than ever with the remarkable change in Reggie. The cheerful, empty-headed youngster was developing rapidly into a perfect Machiavelli; and as I let my imagination run on Miriam's impressions of that ridiculous discussion, my spirits rose rapidly towards optimism. The boy might pull it off, after all!

(Continued on page 661.)

THE VISIT OF BEN JONSON TO DRUMMOND OF HAWTHORNDEN.

By the Rev. GEORGE DODDS, B.D.

ONE of the most interesting literary memories which Edinburgh possesses and shares with other parts of the country is that of the visit of Ben Jonson to Scotland from August 1618 to 25th January of the following year. There was, unfortunately, no Boswell to accompany the massive figure of the most famous of English poets living at that date, and to record the story of his pilgrimage; nevertheless, it comes out into considerable vividness towards the end of the tour from the two or three weeks which Jonson was led to spend with Drummond at Hawthornden.

One cannot but wonder how it came about. One wonders more that it lasted so long. One wonders still more that any intelligent person could ever have held the opinion that Jonson made his pilgrimage to Scotland to visit Drummond. The visit was but an incident in the tour, probably hoped for by Jonson, who would know Drummond as a Scottish poet who wrote in English (as distinct from the written and spoken Scottish of the time). And Drummond undoubtedly knew of Jonson as the most famous man of letters of his day. After Ben's arrival in Edinburgh in August 1618 some city functions were arranged in his honour, at which, doubtless, the poet-laird of Hawthornden would be present. It is permissible to suppose that their first meeting may have been at such a function. Other meetings there may have been 'in Edinburgh houses during winter of 1618-19,' resulting in an invitation from Drummond to Jonson to visit his house, perched on the precipice-edge in the most exquisite bit of the beautiful valley of 'the wandering Esk.' But beyond this common interest in the realm of letters there was nothing in character to draw the two together. That the torrential genius of Jonson, then forty-six years of age (Drummond was thirty-three), accustomed to the easy supremacy which he wielded at 'The Apollo' or 'The Mermaid,' could ever have matched the mood of the refined, secluded, and sad poet of Hawthornden is unimaginable. And no one can be astonished that the famous visit ended in relief to Drummond, who must have found, as Professor Masson suggested, that in Ben he had 'caught a Tartar.'

It has turned out that this visit had an importance little dreamed of by either poet. Both of them came near to losing their reputation to some extent as a consequence of it—Drummond through having written his impressions of his visitor, and Jonson through these written impressions when published (partially), sixty-

two years after Drummond's death, having been taken in an uncritical way. In Gifford's *Life of Jonson* (1816) Drummond is treated almost savagely for having written these impressions of his guest. Mr Barry Cornwall, writing twenty years later a memoir of Jonson prefixed to an edition of his works (Moxon), says that through 'the treachery of Drummond the old poet became for many years a byword in biography.' Some ten pages farther on he says the publication of the *Conversations* 'was as complete a piece of treachery as can be found in the history of literary men. Drummond of Hawthornden has written poems of much merit; but we trust that whoever may read them hereafter will never forget that he was a traitor to his friend and guest, and that he has discredited the name of poet, and tarnished the hospitality of his hospitable country.' These are wild and whirling words, not at all representing the true way in which to regard the incident.

The impression made by so great a figure as Jonson, at any place or time, would sooner or later mount up into a position of almost universal interest, especially an impression made on a mind of higher order, in capacity and sensitiveness, like that of Drummond's. No doubt the Scot was considerably surprised to find Jonson the manner of man he was. The great figure of the Englishman could scarce find worse setting than in Hawthornden:

Sweet solitary seat
Where from the vulgar I estranged live,
Contented—

Professor Ward rightly says: 'The two men were, indeed, as ill-adapted to one another as two men of genius could well be. As poets they had little in common: the eminent qualities of the one were usually those in which the other was deficient. As individuals they were even wider apart. This loud, blustering, hard-drinking Englishman, with all his solid worth and real magnanimity, was not a man to attract the gentle, studious, retiring, and perhaps fastidious poet of Hawthornden.'

Professor Masson finds that Drummond had 'the habit of abundant note-making and keeping of commonplace-books.' It was, therefore, inevitable that Jonson would leave himself sketched on Drummond's pages in the way he impressed himself on the Scottish poet's mind. And, all things considered, this sketch could not well have been different from what it is, even though it is 'unfavourable and one-sided.' It is good to get 'Royal Ben' as Drummond saw him and thought of him. 'The morsels of Ben's talk so

preserved for us are worth pages of our dry literary histories of that period, and have helped, indeed, to give those literary histories more flavour than they otherwise would have had' (Masson). Little did Drummond know what an interest would gather round those few pages of memorabilia, probably never destined by him for any eyes except his own, or those of his most intimate friends. But it seemed fit to the publishers of the folio edition of his works in 1711—sixty-two years after Drummond's death—to give to the world about three pages of the *Conversations* of Jonson, and this was all that was known of them or accessible for more than a century later. In 1827 Mr David Laing, the distinguished Edinburgh antiquary, began an examination of Hawthornden MSS. He earnestly hoped to find amongst them the document from which the few pages of *Conversations* had been printed in 1711, but he found only the empty envelope in which they had been kept. Later, however, his search was rewarded by the discovery of a transcript of them in the handwriting of Sir Robert Sibbald, another distinguished antiquarian (1641-1722). This transcript Mr Laing edited with notes for a paper read to, and published by, the Society of Scottish Antiquaries in 1832. It extends to twenty-nine pages, so that it would seem that Jonson's talk supplied Drummond with a considerable amount of material. It was republished, with a preface by Mr Laing, for the Shakespeare Society, London, in 1842, and about nine pages of extracts of great interest are given in Professor Masson's *Drummond of Hawthornden*.

It was Ben Jonson's intention to leave an account of his Scottish tour in a poem, and such an account was written by him. But his London lodging was destroyed by fire in 1620, and the entire contents of his desk were consumed by the flames, amongst the MSS. thus lost to the world being this 'Lochlomond Pastoral.' The unfortunate event has been commemorated in Ben's poem, 'An Execration upon Vulcan,' and the following refers to the loss of the poem on Scotland:

And, among
The rest, my Journey into Scotland, sung
With all the adventures.

Doubtless we should have had the 'adventure' at Hawthornden among the rest, for it bulked so large in Ben's memory and interest that he corresponded several times with Drummond on his return home, and sent him two poems, each of considerable value, and included in Jonson's published works—'On a Lover's Dust made Sand for an Hour-Glass' and 'A Picture of Myself.'

Somewhere about three and a half years before Jonson came to Hawthornden Drummond had experienced a terrible sorrow. For a year or two before 1615 he had enjoyed the greatest happiness as the accepted lover of Miss

Cunningham of Barns (near Crail); but when all preparations were ready for their marriage, she was suddenly snatched away from him by death. The blow overshadowed more or less all the rest of Drummond's life. His own expression, 'Unhappy widowed dove,' well describes his sad, disconsolate days. We take this from Madrigal IV., in 'Poems, the Second Part,' rather than from the sonnet entitled 'The Praise of a Solitary Life' (which appears twice, first in *Urania*, and again, carefully rewritten, in *Flowers of Zion*). In the Madrigal, Drummond compares himself to the 'Unhappy widowed dove' whose cooings in the wood he interprets through the sadness of his own heart:

Poor turtle—thou bemoans
The loss of thy dear love,
And I for mine send forth these smoking groans:
Unhappy widowed dove!
While all about do sing
I at the root, thou on the branch above,
Even weary with our moans the gaudy spring.

Much of Drummond's poetry, and especially his second book (1616), is in this vein—a record of his love and his loss, making him known to the world, like Tennyson, as one deeply bereaved. By the time of Jonson's visit to him there may have been some slow return to a less unhappy state of mind, but the mark of the blow was on him till the end, adding a pensiveness to all his work. During the interval between Miss Cunningham's death and Jonson's visit he had been through a good deal, and he had taken a notable part in the celebration of the return of King James to Edinburgh in May 1617, having written what Professor Masson calls 'by far the finest literary product of the visit,' his poem, *Forth Feasting: A Panegyric to the King's Most Excellent Majesty*. When Ben and Drummond sat together in those long January evenings, three hundred years ago, in one of the rooms of Drummond's perched abode in the beautiful valley of the Esk, they talked about many people and things, and when they came to speak of Drummond's own verses, Ben said that 'he wished, to please the King, that piece of "Forth Feasting" had been his own.'

In 1619 Shakespeare had been but three years dead. Drummond knew of some of Shakespeare's plays—had them in his library, and had read them. But Ben knew Shakespeare personally better than almost anybody else did. What an opportunity for Drummond! There is no more effective page in Professor Masson's notable book on Drummond than that in which he points this out. We may, of course, be quite wrong, but the deepest emotion one has at Hawthornden to-day is that it is the scene of a lost opportunity. Ben Jonson lived there for two or three weeks—and Shakespeare remains as elusive and vague as if he who knew him so well had never set foot in the glen.

RECOLLECTIONS OF A NAVAL SECRETARY.

CHINA—*continued.*

VII.

ON our way down the river we passed close to the celebrated Nganking Pagoda, said to be the finest in China. It is almost white, and of very imposing appearance, with its nine balconied storeys and its winding flight of steps leading to the top.

The river was alive with wild duck. I had not imagined there were so many in the world as we saw on one day. There had been a sudden cold snap in the north, freezing all their summer haunts, and they had migrated to the south in myriads. The Yang-tze, the first open water reached by them, offered a welcome resting-place, and as we steamed some two hundred miles down the river with a strong, fair current, making about fifteen knots, there was a continuous flight of ducks over our heads.

The name of Shanghai brings back very pleasant recollections; each year we enjoyed the great hospitality of the community and their delightful late autumn climate.

The *Iron Duke* unfortunately drew too much water for the Hwang-pu (the branch of the Yang-tze-kiang on which Shanghai is built), and anchored at Woosung, a dreary spot nine miles distant. We fortunate members of the admiral's staff lay in the *Salamis* off the Shanghai Bund, as the river frontage is called. The houses of merchant-princes faced us, and their doors were always open. 'John Dent' was still a power in the land, and, as usual, his house provided a home and offices for the Commander-in-Chief.

During one of our visits our admiral was pressed to preside at a temperance meeting. He arrived rather late, beaming with smiles, perhaps accentuated by a moderate libation of Mr Dent's Château Lafitte. On rising to open the meeting, he said he did not wish to sail under false colours; that he was so strong an advocate of temperance in all things that he gladly accepted their flattering invitation to preside; 'but'—and here he laid his hand on a broad expanse of white waistcoat—'I am a humble follower of St Paul, who approved of taking a little wine for the stomach's sake.'

The admiral was deeply interested in the subject of magnetism, and as he moved about took observations recording the Magnetic Dip. In honour of the squadron's visit, our consul's wife at Amoy was giving a party in the pretty consular garden, which ran down to the sea. The admiral verbally accepted her invitation, and added: 'I will come with my flag-lieutenant rather early, that I may take my dip.' The scandalised looks of our hostess, who saw a vision of the admiral in bathing-costume, were

the cause of much amusement, as the story was wafted up and down the coast, where the lady was widely known.

The same lady lamented the somewhat neglected state of the garden, ascribing the fault to the admiral, who wouldn't allow his captains to sentence any of 'the dear sailors' to imprisonment in the Consular Jail, where, she said, profitable hard labour was found for them in her garden!

The admiral used to make up for the absence of hair on his forehead by bringing round long white locks which grew luxuriantly at the back of his head. At the close of a long day's inspection duty these locks had escaped, and were floating in the breeze. 'The fault,' said the admiral, 'of making the afterguard do foretopman's duty.'

I have before me one of the great red visiting-cards, with the admiral's name inscribed in Chinese characters, which the Consulate at Canton designed for his use when paying official visits to Chinese authorities. 'Sha-te-wei' was the nearest approach to 'Shadwell' of which Chinese sounds are capable.

One is reminded of the Hong-kong Hong (House) List, where, for the guidance of the stranger who wants to direct his chair-coolies to Mr Scott's house, for example, the word 'Scott' appears in the form in which they know it: 'Iz-zé-cot-té.' Pidgin-English was a never-failing source of amusement to us, and was our only means of communication with our Chinese servants. I remember the astonishment of our genial chaplain, the Rev. J. C. Cox-Edwards, afterwards chaplain of the fleet, at being designated by a boatman as 'that chin-chin joss man.'

I am, however, forgetting that I was recording my recollections of Shanghai.

VIII.

At the time of our visit the Taotai (chief civil officials) of the native city had conceded to the British the right to make a 'road' from Shanghai to Woosung. What was the Taotai's astonishment and indignation at finding that a railroad was contemplated, and that the materials for constructing it had been ordered from England! The line, some eight or ten miles, was laid, and duly opened. Several passenger-trains were run daily, always packed with Chinamen, many of whom came from long distances to see this novelty of the 'foreign devils.' The concession stipulated that at the end of a year the 'road' should become the property of the Chinese authorities; it had been assumed that long before the expiration of that period its value would

have been realised by the Chinese, and that it would lead to a general concession to build railways. Such expectations were doomed to be disappointed; the railroad was handed over, and the Chinese at once proceeded to pull up the rails, and to send them and the rolling-stock across to Formosa, under the pretence of using them for the coal-mines. However, on a subsequent visit to Sao Bay we found them lying on the beach.

Whether the objection to railroads arose from a jealous fear on the part of the mandarin class that railways would have a levelling influence, and would in some way undermine their position, or whether it was that the national spirit of Fung-shui would be offended, is a question; but the sharp practice which obtained the concession appears to have justified the Taotai's indignation, and to have delayed for many years the development of the country.

Fung-shui, the spirit of earth, air, and water, was at this time inimical to all progress. Under it, the surface of the ground must not be defaced by modern inventions—railways, telegraph-posts, and such like. Hong-kong harbour was restricted by two shallow patches running out from the shore; Fung-shui said they were two arms stretched out to protect the harbour, which ought not to be touched, lest its spirit should be offended. I do not know how the spirit has regarded the extension seaward of the naval yard, the work of recent years.

The European and American concessions at Shanghai were full of signs of the great prosperity of the merchants: a beautiful church, designed by Sir Gilbert Scott, who was given *carte blanche*, and built regardless of cost; library, public halls, theatre—every kind of outdoor and indoor amusement on a very generous scale. The race-course, the cricket-ground, tennis-courts, and bowling alleys were well calculated to keep in health a lot of young men who worked hard in a climate very trying for several months of the year.

Once a week in winter there was a mounted paper-chase; all the members of the hunt turned out in pink, and were well mounted. A cup for heavy and another for light weights were run for weekly. Three 'foxes'—one the best rider mounted on one of the best ponies—started, each carrying a big bag of paper. They picked out all the widest ditches, ugliest fences, and broken paths, strewing their paper freely. The starting-place and winning-post was the grand-stand of the race-course, and the chase was over eight or ten miles, ending with three huge water-jumps. The field, some forty in number, had to follow the paper strictly, and a pretty dance the foxes led them. Fifty minutes brought in the first horse, a crowd of some hundreds being gathered about the three final water-jumps. Such fun for the lookers-on—horses and riders floundering in together, the ponies which couldn't take the

jumps quietly rolling into the water, or climbing like rats down one side and up the other. The last man in on one occasion claimed that he was the true sportsman; he was waving round his head a pheasant, upon which his pony had landed when taking a jump!

Shooting-parties were organised at Shanghai on luxurious lines. The house-boats were fitted with every comfort—beds, tables, baths, cooking arrangements complete. Our first party returned from a ten days' trip to the Grand Canal, bringing 160 pheasants, five deer, and many duck and teal. Until my visit to China I never sympathised with the Children of Israel in their sufferings from a surfeit of quail; but before we left the Shanghai River the odour of cooking a pheasant was absolutely obnoxious, and the prospect of eating one unthinkable.

IX.

Whilst lying at Shanghai late one Saturday night in June 1873, news was brought on board us that the steamer *Drummond Castle*, which had started in the race to England with two and a quarter million pounds of the new season's tea on board, had run on the rocks one hundred miles from the port. The report said that the ship, with all hands except two boats' crews, had gone to the bottom. At daylight on Sunday we proceeded to the spot indicated, and found her sunk in fifteen fathoms of water, her top-masts just visible, and Chinamen busily employed in stealing anything which they could rip or saw off. All our boats were manned and the many islets searched, the captain and crew being eventually found in a temple. Our boats came back laden with fish, which had been picked up floating helplessly on the surface. Whilst the men were discussing whether they were fit for food, a Cornish fisherman, one of our crew, settled the matter by saying that they were all right, 'only puff-blaved.' This, he explained, was the result of fresh-water fish having been brought down by the river-current to the sea-water; the density of which had affected them. It certainly was the case that they were all found in blue seawater, close to the sharp line of demarcation between it and the yellow water of the Yangtze. As may be supposed, there were many suggestions that the fish had found the tea too strong for them.

To return to Shanghai, where the autumn races, the great event of the year, were coming on. A shipload of Manchurian ponies arrived from the north, and the animals were put up to auction on the following lines. Prospective purchasers drew lots for precedence in buying a pony at the highest price bid, and when each had in this way secured one beast, the first man on the list was given precedence in buying a second pony, and so on until all were sold. There was a compulsory selling lottery for every race. The commander of a gun-

vessel stationed at Shanghai had, in partnership with a well-known local gentleman-jockey, purchased two wonderful little gallopers, Ko-pu-chu and Snowdrift, but unfortunately orders came for his ship's company to leave Hong-kong for England two days before the date fixed for the races. The Commander-in-Chief was adamant; the troopship to be escorted could not be detained, and the gun-vessel had to go. The two ponies carried off everything they were entered for; and the lucky homeward-bound naval officer pocketed some thousands of dollars. 'Owners up' was the order of the day. The cynics remarked that the admiral was not so verdant in racing matters as some imagined, and that the fact that the civilian was a better jockey than the sailor may have had something to do with his stern decision!

All this time our messmates in the *Iron Duke* were lying at dreary Woosung. Our Fleet Paymaster, Alexander Thompson, made the discovery that there were ducks to be shot near by, and in proof produced three which he had bagged. Alas! next day the owner of a duck-boat, a great breeding and fattening establishment, came on board, and claimed compensation, an officer having blazed into his preserves. This reminds me that whilst at Nambu, in Japan, our commander, John Way, in firing at a pheasant, unfortunately peppered with shot the face of a small boy from the neighbouring village. He found the parents, bowed profoundly, apologised for his clumsiness, and gave them two dollars as compensation. From that day onwards every child in Nambu was posted in some likely spot to be hit by our sportsmen! There were, however, no further casualties.

X.

Bidding farewell to China and Japan was a long and trying ordeal, drawn out from August 1874 to February 1875. At every port which we had visited during our three years' commission our friends came on board to say good-bye, and we steamed out of harbour, the band playing 'Home, Sweet Home.' We reached Plymouth in May 1875, having spent a long and happy commission in the Far East.

These lengthy commissions were, no doubt, trying to the temper of officers and men, cooped up in a ship, and, chiefly for this reason, they were reduced to about two years.

In the *Iron Duke* we wardroom officers were remarkably, perhaps unusually, harmonious. I attribute this in part to our having kept up throughout the commission a system of birthday celebrations. Our custom was for the member whose birthday it was to inform the messman, who then told the president. After dinner the president, rising, would invite his messmates to drink the health of Mr So-and-so, who wished them to take wine with him.

Well on in the commission we found that

one member had not had a birthday. Possibly he was born on the 29th February, but, as he was a very close-fisted man, we ascribed the worst of motives to him, and decided to try to get a bottle of wine out of him. He was specially fond of blood oranges, and was skilful in selecting them. We picked out a light-yellow-skinned orange, and painted the peel to resemble that of a blood orange. Then it was taken to him, and one of the conspirators asked him if he thought it a blood orange. 'Of course it is,' said he. 'I'll bet you a bottle of port it is not,' said the bringer. 'Done!' said the man without a birthday. We collected round to see the joke carried out; the camouflaged fruit was cut in half—and, lo and behold, it was a blood orange!

A dignitary of the Church once asked me how we amused ourselves at sea. I said that on piping-hot days in the tropics we played fly-loo—not the game of our boyhood, but one more suitable to tropical heat. We sat round the tea-table, each put ten cents into a pool, and a lump of sugar in front of himself, and—the owner of the lump upon which a fly first perched won the pool.

Lest my friend should think we were entirely frivolous, I told him that at times we played chess, ship against ship, signalling a move or two at meal-times, or in the evening after work was over.

Then we had a geographical game. One gave out the approximate latitude and longitude of certain places, and the rest had to name them. Thus:

36 N. and 6 W. A celebrated cape. (Trafalgar.)

51.30 N. and 0 W. A great city. (London.)

56 S. and 67 W. A celebrated cape. (Cape Horn.)

38 N. and 122 W. A great city. (San Francisco.)

We soon grew skilful at the game.

On one of our cruises to the north we took a guest with us, a Cambridge M.A., and a fine whist-player. Arrived at Yokohama, he landed to visit a friend, with whom he stayed a fortnight. On coming off again he brought a bag of dollars, which he had won at whist. He must have scorned our modest threepenny points.

One day at sea the president announced that there would be a spelling-bee after tea. Our Cambridge M.A. rather scorned the idea, but was told it was compulsory for every member of the mess to join. One of our number had made up a story embodying every hard word he had been able to collect. When our M.A. friend's paper was examined, it was found that he had written in the margin the Greek derivation of several of the words; but, alas! he had made twenty-six mistakes, notwithstanding!*

* The above story I recorded nearly fifty years ago. I see that Lord Fisher in his *Reminiscences* has a similar tale.—C. E. G.

I must wind up my story with a testimonial in our favour from the chaplain of the United States flagship. While at dinner with the chaplain of the hospital-ship *Melville* he said, 'I was dining

last night in the wardroom of the *Iron Duke*, and I want to say that I never met such a gentlemanly lot of officers. Why, sir, I didn't hear a single damn from soup to pea-nuts!'

HOW POISONS ARE DETECTED.

NOT only in this country, but throughout the world, cases of murder by poisoning pass undetected every year owing to the absence of the least breath of suspicion. To commit his foul crime without attracting the least attention must of necessity be the aim of the modern monster. There was, indeed, a time when he might reasonably hope to defy detection even in the midst of a whole host of accusers, but that day is done. To-day, once a case has gone to the point at which the aid of chemical analysis is invoked, there is very little chance of escape. For there is now probably no known poison which, if administered in a sufficient dose, cannot be detected after death—a striking tribute to the efficiency of modern science.

But, all the same, the methods adopted by our scientists are both difficult, lengthy, and complicated.

If a penny and a sixpence were placed in a glass jar and a quantity of nitric acid poured upon them, both coins would disappear, leaving nothing but a bluish-looking liquid in the jar. But by adding a little salt a deposit of silver-chloride would at once become apparent, and this, filtered out, could be changed back into a tiny piece of silver. To find and recover the copper, a little ammonia would be added to the remaining liquid, which would immediately turn a brilliant blue colour, and eventually the penny would be returned in the shape of a tiny piece of metal.

It is thus the chemist works when seeking for poison; but instead of seeking copper and silver, he is seeking some unknown death-dealer, and has to try the whole range of his tests and experiments until he finds one that produces some response, as did the acid containing the coins when salt or ammonia was added.

But the poison-seeker has other and more peculiar difficulties to encounter. Since the poison may come from the whole domain of the animal, vegetable, and mineral kingdoms, it is quite likely that the samples sent him may be exhausted long before all his tests are through. Then, again, there may be more than one poison present; whilst, to complicate the matter still further, he knows that it is not sufficient merely to prove that such-and-such a poison was present—he must also prove its presence in sufficient quantity to cause death.

All these difficulties are exemplified very clearly in what is perhaps the first of all classical poisoning-cases. Malcolm John, a schoolboy, not feeling very well, accepted and consumed

'medicine' given him by his brother-in-law, who was a doctor. Half-an-hour afterwards he became unwell, and complained of heartburn, sickness, difficulty in swallowing. Presently he became delirious, and in less than four hours he died.

A post-mortem examination proved that death had taken place either from hydrophobia or paralysis of the heart; but some relatives were not satisfied, and they insisted on the chemical-analysts being called in.

Acting on the assumption that poison had, in fact, been administered, the chief chemist soon decided that nothing but a vegetable poison could have been used, as animal or mineral poison would have produced greater internal changes than the post-mortem had proved to be the case. Again, in view of the rapidity of its action, an alkaloid poison was the probability. But of the alkaloids, strychnine, atropine, and morphia could be at once counted out, because they would have produced other symptoms, such as sleepiness, spasms, dilation of the eye-pupils.

So, with these useful preliminaries settled, the analysts set to work. They took the boy's stomach and plunged it into a vessel of alcohol, where it remained undisturbed for forty-eight hours. Then the alcohol was poured off and filtered. The residue left by the filtering process was to supply the evidence of poisoning or non-poisoning. To remove from the residue everything other than alkaloids, it was treated successively with warm alcohol, tartaric acid, ether, and chloroform. Afterwards it only remained to find out what this alkaloid was. The first test was to try an infinitesimal quantity on the tongue, and when this was done the peculiar tingling sensation led the analysts at once to suspect aconite. But there remained one more decisive test—the action on animals. A tiny portion injected under the skin of a mouse provided the necessary symptoms within two minutes. A few weeks later the dead boy's brother-in-law was hanged on the evidence thus obtained, for it was shown that the aconite was contained in the 'medicine' he had administered.

Another very virulent vegetable poison that has proved a common weapon of murderers is atropine, obtained from a plant known as the nightshade, or, alternatively, belladonna. In India, particularly, thousands of deaths are caused by it. By centuries of practice Hindoo poisoners have gained deadly precision in the use of it. Personal enemies, political rivals, and others

whose power is deemed too great are frequently 'removed' by its aid; not always killed, but, far worse, rendered imbecile by the frequent application of small doses. It is its deadly efficiency in softening the brain that makes atropine distinct from every other poison of its class. In England atropine-poisoning is mostly accidental, arising from chemists' mistakes in dispensing, and from the ignorance of children in chewing the bright-red berries and the leaves of the belladonna-plant. The symptoms are very similar to those of rabies or of delirium tremens. Curiously enough, the only effective antidote in such cases is pilocarpine, which is itself a poisonous alkaloid.

In searching for atropine the analyst has to-day the choice of several chemical tests, but he usually ignores all of them in favour of the infinitely more delicate and more modern physiological test. Some animal—usually a rat—is taken, and a tiny portion of the mysterious residue, dissolved in water, is applied to its eyelid. If in the water there is only one part in every 130,000 atropine, the rat's eyes will commence to dilate in a most remarkable manner. Indeed, poisoning by atropine can usually be identified by the same sign in the eyes of the victim, for the dilation will continue long after death, and cannot be effectively interfered with by any other drug known.

The search for every other kind of vegetable alkaloid poison is prosecuted in the same way—that is, by soaking the stomach and its contents in alcohol, and afterwards obtaining a residue. This residue, steeped in ether or chloroform, yields into the liquid any alkaloid poison it contains, and the ether or the chloroform, being mixed with a solution of gold or platinum salt, gives up the alkaloid in a solid form. Then there remains a particular test for each possible poison. To find strychnine, for instance, a small part of the residue would be placed on a porcelain plate along with an equal quantity of chromate of potash. A drop of strong sulphuric acid is added, and then, if strychnine is really present, the whole mixture at once turns a rich blue, changing rapidly to purple, and then to red. The chief difficulty in proving strychnine-poisoning lies in the minute quantity that suffices to cause death. Half-a-grain has proved a fatal dose, and this quantity would spread to every organ and tissue in the body.

Another well-known vegetable poison is morphia, but here the difficulties of the chemists are decidedly less. For without great difficulty they can detect the presence of even one-twenty-thousandth part of a grain! The usual residue having been obtained, an addition of iodic acid is made, and then, should morphia be present, the whole at once turns blue when a little starch-paste is added. Alternatively, chloride of zinc may be added, and the mixture, when heated, produces a beautiful and lasting green colour.

Apart from vegetable poisons, acids cause the next largest number of deaths. But such poisons are not favoured except by suicides, for they invariably leave easily distinguished traces, and, because of this, trouble chemical-analysts but little.

But on the Continent metallic poisons are greatly used, and arsenic is the favourite. The peculiarity of this substance is that if it is taken in gradually increasing doses the consumer often becomes immune from its ill effects. Another remarkable point is its preservative effect on the human body. A woman poisoned by arsenic, when exhumed after eleven months, was found quite unchanged, and her case was the rule rather than the exception.

In Great Britain a common use for arsenic is in poisonous fly-papers, and this has led to many accidents and to at least one murder. A brief *résumé* of the scientific evidence well illustrates our modern methods of detecting arsenic-poisoning.

The victim died after thirteen days, apparently from a severe attack of stomach derangement. For this trouble his doctor had treated him, with every appearance of success, and death was quite unexpected. But it afterwards transpired that his wife had been soaking 'fly-papers' in water, and then mixing the water with her husband's food and medicine.

So the analysts were asked to find out definitely whether or not there was sufficient arsenic in the man's body to have caused death. This they attempted by soaking small portions of the body in acid, and afterwards adding to the solution hydrogen sulphate. This yielded a yellow substance which, when heated, partly disappeared, leaving behind only a few bright metallic beads. But three metals in the world would have given such a result—cadmium, antimony, and arsenic. The next step, therefore, was to prove that cadmium and antimony did *not* cause the phenomenon. Cadmium was eliminated first. A quantity of the acid in which pieces of the dead body had been soaked was poured into a receptacle, and boiled. In it was placed a piece of copper, and the copper immediately became covered with a gray film. It was dried, placed in a glass tube, and heated, when a ring of crystals appeared. Cadmium could not have produced such a result, so it was eliminated.

The final test was now approached. A few pieces of zinc were placed in a flask, and vitriol was added. This gave off hydrogen gas, which was tested and proved pure. Then a portion of the body-soaked acid was added to the zinc-and-vitriol flask, and the hydrogen-gas was lit. Over the flame a fragment of porcelain was held, and a black spot of arsenic soot was quickly deposited. Since antimony could not have given such a result, arsenic was proved beyond all possible doubt.

Such, then, are the modern methods of detect-

ing poison and poisoners. Successful as they are, science will yet improve upon them. For even to-day we have very, very few men thoroughly competent to conduct such investigations.

And, again, the method of deciding what constitutes a fatal dose of any given poison is more than a little crude whenever a difficult

case, or one for which there is no precedent, arises.

The general principle is this: if a cat weighing ten pounds just recovers from the injection of one-fifth of a grain of arsenic, a man weighing ten stones should just recover from a dose fourteen times as large.

SHELVERDENE'S PLOT.

CHAPTER I.—*continued.*

v.

SPANTON laid down the mallet and the wedges, and came and took the child by her arm. She leaned from him, setting her lips; at which he swept her from the floor and carried her, hard put to, I would vow, not to whisper a word of comfort to her. But the stake was too grave for that.

He bore her to the Boot, thrusting the chair aside; and then there was a pause, he and the two troopers looking from one another to me—the reason being that they knew no more surely than I the proper manner of putting to the Boot.

'Haste—doff her shoe, and in,' I urged them.

Purtlin, the elder trooper, took the shoe from her left foot, slipping off the hose also, and lifting the skirt of her gown beyond her knee and tucking it beneath Spanton's arm. She tried no struggle, and for the moment that she was held poised thus seemed not even to stir, her arms hanging, her head against Spanton's breast-plate, her bared leg straight down by his riding-boot, and so white and slender, with a little slim foot very pretty, and all so babyish, that to see it nauseated me with myself; and had it not been that I was imagining the voice of Louis's mother imploring me, and that I was certain I should not go too far, I should have given up the scheme there and then.

Spanton lowered the child, and her leg was in the Boot, Purtlin stooping and holding the limb by the knee, that she could not withdraw it. Stretching his free hand to the wedges, he slid one to him and slipped it in by the side of her leg, which, however, was so slight as to let the wedge drop a long way down. Whereat he took another, and placed that between her leg and the first; yet this, too, fitted but loosely.

Something which I believed to have been told me occurred to me.

'The wedges are wrong. They should be more at the back of the leg,' I said.

'Nay, under your Honour's favour,' replied Hodgett, the second trooper, who now was holding the mallet. 'For how, then, can I strike?'

Well, since he would not strike, what matter? So I let it be.

'Where is Kyle Cleod?' I said to the maid.

'Now, mark thee, child—Hodgett, lift the hammer—now, mark thee, child, an thou sayest not this instant, thy leg shall be broke to pieces.'

She gave no answer, but set her teeth and shut her eyes; and her hand nearer me held a corner of Spanton's coat, to help her to endure.

Averting my gaze in blank hopelessness, I allowed it to rove to the window; and the murk of the outside night wrought upon me. Somewhere therein was Louis, dead by now. And yet, it might be, not dead—able to be brought to me scanty harmed, to greet me with his quick, fond smile, if this child would but speak, this child who was striving for his death. I stood. Scarce could I keep my feet, the beating of my armpit was so poignant and so dazing. But a demon had me.

'Strike,' I said to Hodgett, and my tone told him this was no play.

He looked at me, astonished; and I was aware of Spanton's face turned my way in protest.

'Strike, Hodgett,' I said.

He raised the hammer higher—and hesitated. Then his arms stiffened; he held it motionless. I felt my fury blaze. Yet some fleeting vestige of self-control enabled me to speak not to him, but to the child, giving each of them a last chance.

'Tell me,' I cried to her, 'or instantly shall this man strike with the hammer! Tell me!'

Taking no heed of my demand, she opened her eyes, trying to look up into Spanton's face. She dragged at his sleeve.

'He doth intend it,' I heard her whisper. 'Kill me, pray, pray! Get me so from Shelverdene.'

Then, despite those piteous words, my remnant of control was gone. I thrust forth a finger menacingly at Hodgett. 'One blow. . . . Deal it!' I ordered.

'Sir—your Honour!' cried Spanton. 'Nay, nay!'

And Hodgett, lowering the hammer and scowling upon me, muttered he would not.

'You mutinous dogs!' I said chokingly. I went with a lurch to the chest whereon lay my pistols, and, holding one, swung round upon Hodgett. 'Strike, you traitor cur,' I called, 'or I shoot you for mutiny.'

For a space, giving me a look of sudden, bold hatred, the like of which I had never dreamed to see from one of my own troopers, he plainly weighed his life against other things. Then, 'Tis your Honour shall answer to Heaven for this, not I,' he said, and whipped aloft the hammer and smote savagely upon the inner wedge.

There was a shriek from the child, the piercingest, most echoing, most awful sound possible to hear, and her head fell on her shoulder, her senses gone.

I laid the pistol on the table, and walked to, and leaned against, the window-sill, my face to the night.

'Spanton,' I said, 'if I am shot in the back, I deserve it, and care not, and will forgive any that does it.'

'Your Honour!' cried the voices of the three honest fellows behind me. And Hodgett added, 'I bore it ill, your Honour, yet I am your Honour's faithful man.'

'When she is free of the Boot,' I said, 'place her on my bed, Spanton, and strive to win her round with brandy, for she may die. And, Spanton—send straightway for Dr Travers, and for her father, Mr Denis Irby, at the house where Ensign Latour is. . . . Bid Mr Irby bring his rapier or duello-pistols and a friend. . . . He will not want to wait for morning,' I ended bitterly.

'Ay, sir—a wedge fell to the floor—'there, she is free now, and,'—He broke off with an exclamation. 'Your Honour, the wedge was on her ankle, and a splinter has drove right in. Look, your Honour.'

'No, take her!' I said, staring into the darkness.

VI.

They went away, and I endeavoured to force my mind from what I had done, and to mourn undistracted for Louis. Presently I caught the drumming of hoofs—the first of the search-parties returning. For a while it sounded no nearer; then of a sudden it was very close. I was descried against the light of the room, and from the midst of the advance there rang out the voice of Louis, excited, gay, and eager to reassure me: 'Sir! Sir! Ho, sir!'

I bent forward; and into the illumined space beneath the window rode the band, and drew rein—half-a-dozen troopers, and, sitting behind one of them, Louis, hatless, and clad, above the belt, only in his coat, as I perceived from its gaping open and showing his bare body. None the less he waved his hand in bright-spirited salutation, with just that fond smile which I had recalled, believing 'twould never again greet me.

With devout thankfulness I cried his name, repeating it two or three times. Then, to screen my emotion, I said abruptly to the men, 'This rescue was well done by you boys.' For, from

the prompt advantage which several took of the light to examine themselves and their mounts for trivial wounds, I could tell it had been a rescue with plying sword.

'Ay, sir, indeed 'twas well done,' said Louis. 'There shall be a purse of guineas for these lads and for Spanton, who sent them scouring; and the best corn we have for two other of my helpers, that I think will trot hither presently—Raylish's horse and mine.' He laughed merrily. 'Sir, in truth the discovery of me was strange. And none too soon,' he added, suddenly graver.

'What befell?'

He took a deep breath, and poured forth the tale. 'Kyle Cleod brought me to a hollow by the river. He muffled my mouth, stripped my shoulders, and tied me to a tree to beat me ere he hanged me—all this without a spark of light, for fear that should betray him. He gave me one lash'—Louis grimaced—'and then was there a galloping on the turf. I knew 'twas my gray following me, with Raylish's horse. They were smarted by pistol-balls in the attack, and broke away when we were forced from the saddle.

'Kyle guessed the beasts were ours, and spoke a quick order to his fellows—not to shoot, I deem. But one on the edge of the dell loosed his pistol. These fine lads saw the flash, and were upon us like the very wind. They cut down four of the enemy—though Kyle slipped them again. . . . Four, sir, of those pests.' Louis's voice became wheedling, in anticipation of the talk I should have with him when we were alone. 'So there is nothing to regret, eh, sir!'

'Dismount. Come hither,' I said harshly.

I faced round to the empty room, and moved a few steps. *Nothing to regret!* The little maid seemed yet to stand before me, so pretty, so intrepid, so hopelessly in my power.

I caught at my lips, but a sob broke from them before I contrived to steady myself to receive Louis.

(Continued on page 667.)

DAWN.

(Suggested by Farquharson's picture of that name.)

As if across the waters of a lake,
Kissed into ripples by a gentle wind,
A sleeping bird had started into flight,
And, driven by an unknown strong desire,
Had pilgrimed forth, upon a vague command,
To seek some dim, unapprehended good,
Half-seen, half-felt, inadequately known,
And found a glorious God, a mighty sun,
Lighting its world into new loveliness—

So went my soul forth from the mists of youth,
From doubts and darkness, questionings and fears,
And found its God, and with Him peace at last—
Peace, and a faith that quieted my heart,
And, to complete and perfect everything,
His kingliest gift, the fire and gold of love.

ALINE BLAKE.

Chambers's Journal

SEVENTH SERIES

THOMAS WARD, THE VALET PRIME MINISTER.

By ARTHUR L. HAYWARD.

I.

SOME seventy years ago a small, shrewd figure passed across the stage of European politics. It was Thomas Ward, Prime Minister of the Duchy of Parma, Ambassador to the Court of Vienna, and son of a Yorkshire labourer. In that age of romance and revolution there were few figures more romantic or less revolutionary. Unmoved by ambition, or, indeed, by any other emotion than that loyalty which a good servant should show towards his master, Ward rose from the stable to the Council Boards of Europe, indifferent to his personal success or failure, ready and willing to return, when the play of politics was over, to that condition of life from which he had started. English to the backbone, with the typical Englishman's half-humorous contempt for all that is foreign, he fought for his master's interests in the diplomatic world with the unmoved, inscrutable face of a well-trained lackey. 'A heaven-born diplomatist,' said Metternich; 'one of the most remarkable men of the age,' commented Palmerston; but 'it is not for the likes of me to be meddling in the affairs of princes,' was Ward's opinion about himself. Exercising the same scrupulous attention to his master's politics as to his master's wardrobe, this extraordinary man helped him through untold difficulties, only to receive in the end the usual reward of the Bourbons for loyalty and courage—ingratitude.

Thomas Ward was born at York, 9th October 1810. His father was stud-groom to a trainer in that city, but showed so little affection for his family that Tom ran away at the age of seven, and spent the next five years with his grandfather at the quiet little town of Howden, in the same county. After a couple of years' experience as a stable-lad, being then fourteen, he was sent with a horse to Vienna, where he entered the service of Prince Aloys von Lichtenstein. He had been in this nobleman's employment a year or two when fate placed the first trump card in his hand, and transferred him to the service of Charles Louis, Duke of Lucca, brother-in-law of the Emperor of Austria, and a prince of the House of Bourbon.

There was nothing meteoric about Ward's

early career in the service of his new master. He was a smart lad, invariably clean and tidy, and diligent in his work. In a year or two he attracted the attention of the duke, who took him from the stable and made him his under-valet. Recommended by his sterling honesty and reliability, he steadily rose in his place until, in 1836, he became Charles Louis's confidential attendant, and, as such, an impartial and impassive spectator of the remarkable world of European society.

II.

At that time Lucca was the most fashionable resort in Europe. The Riviera and other modern centres were then unexploited, and it was in the little duchy of Lucca that the galaxy of society assembled. Princes and beauties, soldiers and statesmen, flocked to the brilliant Bourbon Court; and Ward, who was host to the princely servants, just as his master was host to his princely guests, acquired a unique insight into the private as well as the public doings of every one of fame and fashion. He had learned Italian in his intercourse with the highest circles, and spoke it fluently with a cultured accent, in strange contrast to the Yorkshire dialect which was his only mode of expression in English. He spoke German and French too, but not with the same correctness.

The very existence of the duchy of Lucca is now barely remembered. A mere enumeration of the remarkable political relationships succeeding the Great Peace of 1815 is confusing. The situation was, however, briefly this: In his infancy Charles Louis had been given by Napoleon the kingdom of Etruria—a phantom realm which soon dissolved. When a fresh shuffle of kingdoms, dukedoms, and royal wives took place, he was dealt the duchy of Lucca, together with Maria Theresa, the beautiful princess of the House of Savoy. But this was not all. Napoleon's widow, the Empress Marie Louise, had been granted the duchy of Parma, and at her death this was to pass to Charles Louis, who would then hand over his duchy of Lucca to the Grand Duke of Tuscany.

It was this supreme indifference to the populace of these unfortunate principalities, who were

thus bandied about from one ruler to another, which helped the cause of Italian unity, espoused, as it was later, by men of such different calibre as Cavour and Mazzini.

For six or seven years Thomas Ward occupied his confidential post near the duke's person, seeing and hearing everybody who was anybody in Europe, and gleaning a fund of private and confidential information which was terrible in its exhaustiveness. His knowledge of the world and its doings was further increased by several visits he paid with his master to the crowned heads of Europe, one of these being to Windsor Castle, where he saw the young Queen to whom he ever in his heart owned allegiance as the sovereign of his native land. It was on this occasion that the duke felt aggrieved because, on his being invited to dine with the Queen, the invitation came by card instead of by letter, as was the etiquette towards reigning princes. Lord Palmerston summed the matter up concisely in a note to the Queen, in which he explained the duke's grievance. 'Your Majesty may think this a small matter, but the duke is a small sovereign.'

Ward was also sent on yearly trips to England in order to buy horses for the ducal stables, and perform such errands as might occur to his master. On these occasions he never failed to visit his old grandfather at Howden, and dazzle the simple Yorkshire folk with stories of the great doings of great personages.

III.

A grave crisis occurred in the affairs of Charles Louis in 1843. Although the duke was amply provided for by the various treaties which guaranteed his throne, his unbounded extravagance and hospitality proved too heavy a burden on the revenues, and he found himself embarrassed to an appalling degree. He was obliged to sell the magnificent collection of Old Masters which adorned his palace walls to pay for one of his visits to England. Yet even such expedients were of little avail. Lacking the courage and ability to retrench his expenses or extricate himself from his difficulties, he was soon plunged in a gloomy despair which bordered upon madness, and helped but little to ease the desperate situation.

It was nothing short of a stroke of genius which led the duchess to confide in Ward. His unswerving loyalty, his unblemished integrity and imperturbable demeanour, pointed him out as the one man in that Court of unscrupulous time-servers who could be relied upon in an emergency. Maria Theresa told him everything, though it was no news. There were none of the great folk who had thronged the palace and partaken of their lavish hospitality who would help the royal pair in their hour of need—none whom she could trust as she trusted this foreign valet.

Ward knew the people of Lucca well. 'They are a horrid lot,' he remarked. As for the great men of Europe, to her amazement the duchess heard from her servant such an astounding revelation of the inner lives and the political obligations of all who had crowded her *salons* that she was dumbfounded at the omniscience of her humbly born adviser.

According to Ward, the only person who could come to Charles Louis's aid was the Archduke Ferdinand of Austria, but to approach him was a matter requiring the utmost delicacy. There was no one save Ward to undertake the task. No written instructions could be given, and, furnished with a mere letter of introduction, Ward set out on his first diplomatic mission. He was successful. He described his master's difficulties in so lucid a manner and with such honest deference that he overcame the archduke's natural repugnance to dealing with a domestic in matters so important. The necessary help was given, and Ward returned triumphantly to Lucca. This was the beginning of his diplomatic career. He had earned the duke's confidence, and continued to serve him as an intimate counsellor. Much against Ward's will, in 1847 the duke insisted upon making him a baron, and gave him a portfolio as Minister of Finance.

Titles and honours meant nothing to Thomas Ward. He made no attempt to enjoy any of the privileges to which his rank entitled him. His official position gave him almost plenary power in the little dukedom; but every day, so soon as his office-work was done, he retired to his own modest house, and spent his leisure hours in the company of his wife, a Viennese girl, Louisa Genthner, of as humble station and quiet tastes as himself. He was much too shrewd a man to find entertainment in the Court of Lucca. The ignorance of even the highest classes was colossal; indeed, for those who claimed to have any part in the government of a people it was criminal. The most elementary facts of contemporary history, geography, and science were unknown.

IV.

In 1847 the ex-Empress Marie Louise died, and, under the arrangement already described, the duchy of Parma reverted to Charles Louis, whilst that of Lucca passed to Tuscany. Ward was sent to Florence to arrange the transfer, with strict injunctions to make as satisfactory financial conditions for his master as lay in his power.

Whilst he was on this mission the great revolutionary tempest of 1848 swept across Europe. When such men as Metternich fell, there is little wonder that the princelets of Italy trembled. Charles Louis of Parma, as he had now become, was ill-fitted to face the storm. Ward, who hastened to his aid, found him terrified and

impotent, threatened by his subjects and abandoned by his counsellors. But the mere presence of his ex-servant restored the confidence of the duke. Ward knew the people with whom he had to deal. Judicious threats, and still more judicious scattering of gold from the palace windows, soon changed a howling mob into an enthusiastic crowd.

But the crisis was only delayed. The spirit of 1848 was something better and nobler than the ignorant spite of an ignorant mob. The ideals of Cavour, of Mazzini, of Garibaldi, of the countless martyrs like the Bandieras, were stirring the peninsula from Sicily to the Alps. The cause of Absolutism was dying, and, labour as he would, the faithful servant of that cause could do but little against the new-born spirit of liberty. The end was not yet, however. Ward, who had hitherto been only squabbling in the little arena of petty Italian politics, now entered a larger ring, and against no less an antagonist than Cavour. He knew that the welfare of the dukedom depended on something more than the plaudits of a piazza crowd; he was acute enough to perceive that his master's real enemy was Sardinia, and that nothing but the boldest of measures would avail.

With consummate bluff Ward threatened Cavour with British intervention if Parma's independence were not recognised. Needless to say, he had no authority whatever for saying this, and Cavour knew he had no authority. Ward was in Piedmontese territory when he made this threat, and Cavour retaliated by sending him his passport. Ward claimed that he was a British subject—an amazing piece of impudence—and was thus immune from Cavour's jurisdiction; but he hastened back to Parma, aroused his master to the danger of the situation, and hurried him away in disguise to France, whence they proceeded to Weistropp, in Saxony.

This change of fortune meant little to a man of Ward's calibre. Whether as a menial or as a Minister, he had always been his master's faithful servant; and now that troublous times had come, he returned once more to the clothes-brush, and tended his old patron as loyally and carefully as ever.

v.

Once again, however, the tide of misfortune was on the turn. Marshal Radetzky, then over eighty years of age, culminated a vigorous campaign against Sardinia with the overwhelming victory of Novara, and for the time being the cause of Italian unity was crushed, and another lease of life secured for the small potentates.

In the reaction from the events of 1848 Ward entered European politics. He was appointed to the Court of Vienna as *chargé-d'affaires* for the duchy of Parma. Grave political events necessitated his recall, however, after a short sojourn in the capital.

Charles Louis had long meant to abdicate, and saw his opportunity in the reconstruction of his principality after Novara. Parma was to be a sovereign state, and Ward determined that no effort of his should be lacking to ensure the prosperity of its ruler. He viewed politics from a unique standpoint. Whatever he did was part of his service. The same loyalty, the same self-denial, the same whole-hearted application that a faithful servant devotes to his master's person were to be given to his master's affairs of State. Of his own sympathies and convictions he took no heed whatever—they were as apart from his duties as a Minister as they had been during his lackey days. It is in no sense derogatory to say that he was a domestic always—gifted and resourceful, it is true; but still a domestic. Indeed, he gloried in the fact!

Ward's first duty on his return to Parma was to arrange for the abdication of his old master, Charles Louis, and prepare for his son, who succeeded under the title of Charles III. This young man at the time was staying with the Marquess of Douglas at Arran, and thither Ward went to hand over the duchy. Passing through Yorkshire on his way, he stopped at Howden, and made his simple relatives breathless at the sight of the crosses and decorations which had been forced upon him at one time or another during his career.

Ward brought Charles III., a handsome young man of twenty-six, back with him to Parma. 'He is a born prince,' wrote Ward; 'one of the best sovereigns in Italy.' Time showed, however, that he was mistaken in this judgment of his new master. They did not stay long in the capital, for Charles went off to win his spurs under old Radetzky, whilst Ward repaired to Vienna, from which city he governed Parma with a strong but just rule. His success at the Court of Vienna was considerable. Honours were showered upon him; he was given the Iron Cross of Austria by Francis Joseph, who had just succeeded to the throne. It was a decoration unique for one so young, and of such origin; but Ward had no use for such gew-gaws. 'As to titles and honours,' he wrote, 'I really do not know what to make of them, as they are of no use but for a show, such as a Court ball, and these come but seldom.'

It was at Vienna that Ward reached the zenith of his diplomatic career. The Austrian Minister Schwarzenberg had conceived the policy of forming a union of the absolute states of Tuscany, Parma, and Modena, under the tutelage of Austria and the patronage of the Pope. The object of this, of course, was to burke the rising spirit of revolt which was already straining to drive out the foreigner, and make Italy free and united. Ward concurred in this scheme, rather because he was the servant of one of the rulers to profit by such a union than because he was indifferent to the wishes of the people concerned. Provided

that Parma were generously treated, Ward would lend his influence in Italy to further the designs of Schwarzenberg. The latter was at first inclined to pay little heed to Ward's demands, but he was too wise a diplomat not to perceive very soon that without the Englishman's help his scheme could never be accomplished. Once again Ward won the day, and by this victory placed himself at the very head of the diplomatists at the Court of Vienna.

VI.

Meanwhile Charles had taken up his residence in Parma, and begun to lead a life of extravagance and dissipation ill-suited to one who held his throne on so precarious a tenure. Indeed, the city of Parma, under his auspices, had more the atmosphere of a comic opera than that of a town on the brink of revolution.

Charles was not bad by nature. In that age of oppression, when the infamous Bourbons of Naples were inflicting physical tortures on their political prisoners—tortures which recalled those of the worst days of the darkest ages—it is remarkable that not a single sentence of death was passed during Charles's reign. But there was a strain of madness in him which led to excesses and ridiculous exhibitions of a most undignified nature. He would stroll about the streets of his capital swishing his cane and striking harmless pedestrians when and where they least expected an assault. Dressed as a postillion, he would dash through the city at full gallop, sounding a discordant horn with all his might. Many a summer night he spent asleep on his palace steps, surrounded by ragamuffins and jeering revellers. Audiences with his Ministers he liked to hold in the dressing-room of his latest favourite of the ballet. For his people he cared nothing. 'They are all right so long as they have a theatre,' he would say.

It can be well imagined how offensive such a state of affairs must have been to a populace who were but waiting the signal to cast him and his from the throne, and proclaim their unity with the great Italian nation.

In the Court itself petty intrigues soon reached such a pitch that Ward was summoned from Vienna to set his master's house in order. He had placed several trusty friends about the duke's person, men whom he had put into responsible positions, much to the disgust of the native place-seekers. These kept him apprised of the state of affairs, and when Ward returned he soon set matters as right as was possible with such a master and in such a period. For the end was at hand; the patience of the people had reached the breaking-point.

On the afternoon of 26th March 1854 Charles III. was strolling down the Via Santa Lucia, when he observed some girls seated in a window. He stopped to smile at them, and was waving

his hand in a gay farewell, when suddenly a man rushed out from a passage and hurled himself against the duke. The next moment, with a cry of 'Sacramento! sacramento!' Charles fell back with a stiletto buried in his body. He was carried fainting to the palace, where, after a night of agony, he expired the next morning, murmuring, as the breath left his body, 'I must make ready for the great journey!' He was but thirty-one years of age.

VII.

With the death of his master the whole edifice of Ward's policy came clattering about his head. The very day the duke died his widow issued a proclamation announcing the succession of their son Robert, and the dismissal of Ward and all his colleagues. The catastrophe was complete, and to a smaller man than Ward would have been overwhelming. But a nature so devoid of any trace of ambition could regard the incident as regrettable only on account of the tragedy involved in his master's death. As a loyal and devoted servant Ward naturally lamented what had occurred, but the loss of his own prestige and influence was merely what one might expect upon the occasion of losing a situation, whether it be that of valet or Prime Minister!

The great days were over. Ward and his wife retired to a farm which he had bought near Vienna, and there he lived for five years in the utmost tranquillity and obscurity. On 5th October 1858 he died at the early age of forty-eight, thus missing by a couple of years the sight of that United Italy which he had striven so hard to prevent. As Minister or servant, diplomatist or exile, he served his masters with a devotion which cannot but call for admiration. In the midst of the subtlest intrigues he maintained the single-minded simplicity of a country schoolboy. He realised to the full the remarkable career which fate had awarded him. 'Think of a boy,' he writes, 'torn from school in the ninth year of his age, placed in a livery-stable without education, and then see him placed amidst the affairs of Europe, concluding treaties!'

Considering the opportunities he had, and the examples of gross speculation and shameless jobbery on all sides of him, it is to his credit that Ward should have made so little of his chances. He obtained several concessions, but he was never a wealthy man. Indeed, the worst his enemies have been able to say against him amounts to little more than that he served his masters, rightly or wrongly, regardless of consequences and heedless of the political aspirations of those whom he was called to govern. Wealth, advancement, honours—all were matters of indifference to him. So long as he felt that he was doing his duty as a good servant, Thomas Ward had no other ambition or ideal in his life.

MIRIAM DECIDES.

PART II.

III.

THERE was an interval of three weeks between the afternoon of Miriam's At Home and the final struggle for victory between the very dissimilar rivals. During those weeks I waited impatiently for some definite movement, but so far as I could follow the game from my very badly placed position nothing happened at all. I met Miriam occasionally, and noted the puzzled uncertainty in her eyes. I made excuses for talking to Cowen in his club, and found him irritable and more than usually disinclined for courtesy and gossip; and, lastly, I questioned Reggie as to his campaign, without much success. I was driven steadily back on the unpalatable conclusion that no one of the principals was interested in my curiosity, and, unflattering though their attitude was, it convinced me that each one of them recognised a coming crisis, and had no time to worry about an amiable nobody. I say amiable in self-defence. Probably their description was less flattering. Certainly I should find it difficult to excuse the shameless eavesdropping which enabled me to witness the closing scenes of the little drama. Difficult, do I say? Impossible would be truer. Having admitted so much, I will abandon the attempt and merely confess the truth. I was far too deeply interested to consider for a moment an honest withdrawal.

We were all at the Brillingford place for the week-end. It was what the newspaper men call a brilliant and select party of beautiful ladies and distinguished men, and, like all other week-end parties, it was very mixed, very boisterous, and very crowded. In such an atmosphere Reggie Santella is at home, and he organises with devastating energy all kinds of high-spirited games, from hunt-the-slipper to amateur theatricals. Miriam, as might be expected of a girl of twenty, finds this kind of thing highly exciting, and is not yet grown-up enough to prefer bridge to dancing. I don't know that I need elaborate the situation. On the one hand you have youth, high spirits, thoughtless gaiety, and Reggie and Miriam; on the other you have Alan Cowen and the hovering menace of his engagement-ring. So much was on the table. The only question remaining to be settled was, which of the two sides could count on love as an ally? I didn't know. I question whether Miriam did. Reggie felt sure he did, and Alan Cowen was beginning to realise that his own definite assumptions were questionable. And there we all were.

On the Sunday evening I was sitting in the summer-house at the edge of the lawn thinking about engagement-rings and broken promises,

when two young people crossed the lawn and sat down on the seat which Providence had placed just within hearing. We will not enter again on the question of my excuses. I stayed where I was, and watched. Reggie was whispering, and from where I sat it was impossible to distinguish words; but neither was it necessary. I understood perfectly what was happening. After two days of brilliant demonstration, Reggie was punctuating his experiment by an impassioned appeal and the old argument. Moreover, Miriam was listening. When a girl as honest as Miriam condescends to listen to such an appeal, it is safe to assume a half-surrender. The first intoxication of romantic devotion to strength as shown by a self-made man was proving unequal to the steady disappointments of ordinary social exchanges. In place of the capable, dominating personality which had captured her emotion, Miriam was directing her attention to the very different spectacle presented by a stolid, imperfectly civilised outsider staggering round in the mazes of a world he is never likely to understand, Reggie Santella always hovering near her in a kind of animated demonstration of what a man can do to make life easy and exciting—underlining by a hundred little courtesies and attentions all the blunders of the other.

IV.

Miriam leaned nearer to Reggie. The two figures blended into one in the half-light, and a coming kiss cast its shadow before. Another moment, and Cowen's fate would have been sealed. Another moment—but the man arrived. 'Miriam,' he said harshly, 'you forgot to bring a wrap.'

The two young people sprang to their feet, betraying, as young people do, their guilty feeling. Miriam shivered a little, and accepted without protest the attentions of her fiancé as he adjusted her cloak. Reggie stood by in angry discomfort. It was an embarrassing situation for him, undoubtedly. Another moment . . . but a miss is sometimes better than a mile. It would have been so simple to explain to Cowen that Miriam desired her freedom, but she had not yet definitely admitted the desire, and Santella's hands were tied.

'If you will excuse me,' he said, 'I'll find some one who'll play billiards. A grand night, isn't it, Cowen?' He turned away.

'One moment, Mr Santella,' said Cowen. Reggie came back willingly. His rival's tone was menacing, and I know what delight the prospect of a quarrel must have given Reggie in his disappointment. 'I am not a patient man,'

continued Cowen grimly, 'and I have had enough of this comedy. More than enough. Miriam has got to decide here and now which of us is to have the right to claim her.'

Reggie laughed lightly. 'Really, Cowen,' he said, 'your methods are delightfully direct and, considering the engagement-ring Miriam wears, rather ridiculous. You'——

'Don't be a liar as well as a fool,' said Cowen roughly.

There was a silence which lasted a very long time after this insulting speech. Reggie could not resent it, for Miriam knew it to be based on truth. He had ignored the engagement-ring when they were alone, and his diplomatic speech was pretence.

'You are a brutal hitter, Cowen,' he said at last. 'I should like to save Miriam all I can, but if you will have it I cannot object. I love her, and I believe she loves me. You can never make her happy. I can. What have you to say about it?'

Cowen turned to Miriam. 'Give me the ring,' he said, then added impatiently as Miriam hesitated, 'Give it to me.' He held it in his hand for a moment, and then threw it from him. No one moved until the last sounds of its fall were lost in silence. 'It is gone,' he said. 'You are free, Miriam. I want no unwilling wife. If you love Santella, go to him.'

In my secure retreat I moved restlessly. What a man! His every action was a mistake, and apparently he was too blind to see.

Miriam, already doubtful between two conflicting appeals, was having the worst side of her first choice thrust roughly under her notice. Unyielding, obstinate, brutally disregarding the natural need of a young girl for sympathetic understanding, Cowen was forcing her away from him. I began to feel sorry for him, standing there in his disastrous independence, disdainful of just the weapons he should have used. I have never liked the man, but I longed to shout a warning to him. If he continued as he had begun, he had not a dog's chance.

'Miriam darling,' said Reggie in an eager voice which was not quite under control, 'I am waiting. Will you come to me? I—I love you.'

v.

I waited, eyes straining against the darkness, to catch the first movement on Miriam's part; but none came. She stood perfectly still, waiting for something more, something which only a woman could understand. The silence became unbearable. I felt it, even I, and I knew what it must be to those others. Strangely enough, it was Cowen who gave the first cry of distress.

'Choose, girl!' he said harshly. 'I cannot bear much more. Don't you see how hard it is

for me to keep my hands off him? Choose quickly, before I shake the life out of the impudent young devil!'

Reggie cried out angrily, and sprang forward, but Miriam moved at last.

'Be quiet, Reggie,' she said, and then ignored him.—'Alan, if you care for me so much, why don't you try to make things easier for me?'

I can understand Reggie's disappointment and his anger at Cowen's insolent contempt, but I cannot excuse his next speech. It was a mistake, and he should have recognised that mistakes at such a time are fatal.

'Don't ask him, Miriam,' he said. 'Don't you realise the fellow hasn't a notion that anybody else exists besides himself? He never had!'

The unconcern of the other two was a crushing comment on this speech. They ignored it.

'I have tried, Miriam,' said Cowen, 'and I have failed. That is why I give you your freedom. Your happiness is my only concern, and I thought that my love would show me how to make you happy. I was wrong, perhaps. I am not equal to the task; but at least I am strong enough to get out of the way.'

When I heard that speech I recognised that the crucial period was past and the climax reached. When a dogmatic man of masterful disposition attains to deep humility before the girl he loves, his battle is ended. So long as Alan Cowen held on to the truth he was grasping he would hold the key to Miriam's heart. Trouble there might be in store for them, and difficulty; but for the first time in my experience of him Cowen was demonstrating a willingness to realise that the method which conquers the world is powerless against a woman's heart; and with such a man to understand is to conquer.

'Reggie,' said Miriam, turning to the boy who had in a brief quarter of an hour passed from conquest to defeat, 'please leave us.'

He went without a word. There was no appeal against so gentle a verdict. I made cautious preparations for departure, too. My curiosity is strong, but my moral code is not lax enough to allow me to disregard the rule which brings the curtain down on the stage at this point in a play. As I edged away in the shadows I heard just a part of Miriam's confession.

'I have not been very fair to you, dear,' she said; 'but I am going to change all that. You'll try to find my ring to-morrow, won't you? And I'll try'——

I made my escape, and heard no more. It was quite a long time before Miriam and her lover returned to the house, so I am glad I managed to get away in time.

Perhaps, after all, romance is personal and not subject to definition.

THE END.

HABITS AND CHARACTERS OF BRITISH WILD ANIMALS.

VI.—THE GRAY RAT.*

By H. MORTIMER BATTEN.

I.

IT would seem that the gray rat hailed originally from Persia, and that it first came to England from the Baltic early in the seventeenth century. Since then there has been a free exchange of gray rats all the world over. From every port where ships touch they have spread, steadily increasing in numbers from east to west till in many parts they have exterminated not a few of the native animals, just as, with their introduction to Great Britain, they speedily exterminated the original black rat, which was a far less repulsive creature.

The extraordinary power of survival of these animals is largely due to their ability to colonise, the rat millions of the thickly peopled centres being ever ready to send their pioneers into new country in quest of fortune. Their intelligent distribution follows in the wake of their numbers as a natural course of events, and their seemingly uncanny ability to locate new quarters is probably owing to the fact that the pioneers and forerunners leave a scent-trail behind them, which their fellow-citizens, uninvited, and probably unwished for, readily follow.

When once rats have begun to come to a place, they will continue to do so for so long as food exists there for them—a state of affairs which would seem to prove definitely that they follow in each other's steps, distributing themselves in such numbers as the quantity of available food alone determines.

It may take years for rats to penetrate into a region where food is scarce, whereas they occupy a fruitful territory in a veritable invading army, sweeping over the country in a wave of settlement. This is because any move of individual rats quickly becomes a general move; and the greater the number that settle in one locality, the greater is the number of the scent-trails leading to that locality and the stronger do these scent-trails become, till finally the drift may assume the form of a migration, the rodents moving in shoals from their original feeding-ground to one of greater promise. Many such migrations have been witnessed. The failing of food-supplies, or the superabundance of foes in one locality, quickly decides the rats to move elsewhere, but the rate of their going is governed

by necessity. If the food-supply gradually gives out, the rats gradually dwindle away; but should the famine be sudden, should the assault of their enemies be fierce and effective, should water or fire invade their territory, then they seek strength in their unity of purpose and migrate *en masse*. One can be quite sure, however, that they know where they are going, and the horde will very soon split up into communities distributed with due regard for the necessities of life, just as one can be quite sure that they will drift back into the evacuated territory immediately the conditions which led to their sudden abandonment of it ameliorate.

II.

Such an invasion of rats must, indeed, be a fearsome proposition for the fauna of the territory they invade. A single rat is plucky enough and fierce enough to attack any creature it imagines it can pull down, and rats possess a power of combination which is unparalleled in the animal world. A rat has only to utter a certain squeal in order to bring to the vicinity every one of his fellows within hearing, prepared to unite in a common attack, so that an army of rats sweeping the country leaves behind it an area of death and destruction.

Such rat armies, however, do not remain long united. They may travel together for the distance of a mile or more, but after that every hundred yards sees a considerable reduction in their numbers. The spreading and the redistribution commence immediately, but for several months thereafter every stream and ditch within the vicinity of the migration may harbour more rats than usual.

Many curious stories have been told about the gray rat's powers of prescience or preconception, and it is, of course, commonly believed that rats will leave a doomed ship, just as it is gruesomely said that a shark will follow a ship carrying a corpse. It is a matter of history that when, in 1887, a great fire broke out among some warehouses on the Thames Embankment, the rats were seen to leave the buildings in a closely packed army some hours before the fateful spark began its dread work, and, swimming together, were observed to put the river between themselves and the scene of the coming conflagration.

There is no doubt whatever that rats will leave the banks of a stream subject to sudden spate some time before the water rises to flood them out—even though the storm which causes

* Earlier articles in this series, published in the May, June, July, August, and September parts of *Chambers's Journal*, dealt with the Badger, the Pine-Martens, the Water-Rat, the Hedgehog, and the Brown Hare respectively.

the water to rise may have occurred some miles away, so that they can have had no apparent warning. A house in which I lived in Yorkshire was close to a small stream which came down from the moors, and along the banks of which many gray rats made their summer home. Invariably, an hour or so before this stream rose in flood, the rats could be heard under the floor of the house, having forsaken the banks of the burn for this more secure residence. The phenomenon was of such regular occurrence that it ceased to create any wonder, it merely being observed, on the rats being heard, that the brook was about to rise again.

III.

Gray rats penetrate to the most remote shooting-cabins in the heart of the hills; they are to be found comfortably established by mountain lochs and moorland tarns far distant from agricultural activities; in fact, it would be difficult to find any spot within the British Isles upon which the gray rat has not as yet obtruded its presence. Yet these millions, spread all over the country to the loneliest and wildest corners, are merely the overflow from our cities. Were it not that the great centres of population already harbour all the rats they can feed, there would be no country rats. Were all the urban rats destroyed by plague or by some other means, the country rats would throng back into the cities to take their place. The thought is rather a startling one—Great Britain is to-day so overwhelmed with rats that their teeming millions are crowded into the most remote corners of the island in order that all may find the wherewithal to live!

This fact should be borne in mind when one reads the estimates by authorities of the rat population of Great Britain, for, whereas it may be a comparatively simple matter to arrive at a roughly approximate estimate of the rat population of our cities, he would be a bold man, rather than a wise one, who attempted even to guess at the rat population of country areas. Everywhere where the plough has turned the earth, rats may be seen in scores about every storage building at the fall of dusk, and the scene is repeated even in the lonely glens and corries where the buzzard and the peregrine still hold their own. Can it be doubted for one moment that the gray rat, an alien to our shores, and two centuries ago unknown, is to-day overwhelmingly the most abundant of all our larger mammals?

These facts, together with such data as are forthcoming, serve to show that the rat peril is by no means a journalistic dream—serve further to suggest that the era of nature's unfailing remedy, disease, with all its ghastly possibilities, must be drawing near at hand, unless man steps in and by systematic and widespread destruction diverts the ordinary

course which nature would adopt in reducing the gray rat's numbers.

IV.

A good deal has been written of late setting forth actual figures of the damage done by rats, and of the peril they present in our midst by spreading disease through the medium of their parasites, or even by the contamination and filth of their own persons.

In this connection it may be as well to reiterate the fact that research has resulted in the discovery that the terrible bubonic plague, which at times reaches such horrifying dimensions in India and China, is communicated by rats to human beings by the medium of the rat flea, and it must be borne in mind that so long as rats remain with us in their present numbers we ourselves are assured no immunity. The plague is nature's plan of keeping the rat multitudes in check—otherwise they would overrun the whole earth—and the flea is nature's means of spreading the disease from rat to rat. Incidentally, it is also the instrument by which the infection is spread from rat to man.

Deaths from this plague in India alone reach many millions periodically, and occasional outbreaks of it occur in Britain, generally in our big seaport towns, where rat-infested ships come to harbour. Rats suffering from plague have been caught in England, and if once the epidemic got moving in earnest it would be virtually impossible to check it. Since 1914 rats have increased enormously in numbers, and here and there the rat population must already be so dense that the animals can be regarded as living 'under unclean conditions,' which in the case of the rat means disease.

As regards the material damage actually done by rats—the destruction of valuable materials that is taking place in every village and town of the British Isles—one needs only to picture the loathsome hordes to be seen swarming forth at the fall of dusk from every suitable harbourage where food for them exists. Rick-yards, knackeries, slaughter-houses, warehouses, docks, stores, sewers, shops—everywhere and anywhere that food-stuffs or filth exist—gray rats are to be found in numbers decided only by the shelter obtainable for them and the food-supply at hand.

'In a knackery in the north of England,' writes S. L. Bensusan, 'food was placed in a room to entice the entrance of rats, and at midnight the door of the room was closed. Next day men and terriers entered to destroy the spoilers, and over a quarter of a ton of rats were killed!'

In the first three months of 1919 Leicestershire made a return of sixty-five thousand rats killed, yet there was no appreciable lessening of their numbers in that county.

Dr A. E. Shipley estimates the rat population of Great Britain and Ireland to be equivalent to one rat for every human being; but this would seem to me a very conservative estimate. A large number of dwelling-houses harbour many more rats than they do human beings; farms, especially those having rick-yards attached, retain a rat retinue which outnumbers its human inhabitants by at least ten, and possibly fifty, to one. In our cities the walls of all too many human dwellings, of every factory, storehouse, and warehouse, harbour rats, while the animals congregate in thousands about slaughter-houses, refuse-dumps, and the like, to say nothing of the hordes that dwell in the underground sewers and culverts. It would seem, then, that the rat population of our cities far outnumbers the human population, and I have no doubt whatever that the balance in favour of the rat is even more marked in country areas, agricultural or otherwise. In many cases the rat population of a single barn would exceed the human inhabitants of the whole village; then we have the numerous rats living remote from man's habitations, in stream and hedge banks, together with those that take up their quarters in isolated barns.

V.

Two hundred millions would probably be a more accurate estimate of the rat population of Great Britain and Ireland; but taking it at Dr Shipley's conservative estimate of forty millions, and accepting another authority's pre-war calculation that each rat costs the country 7s. 6d. per annum, we are annually paying this creature the handsome sum of £15,000,000 for living in our midst! Dr Shipley himself reckons the damage done by rats as amounting to £10,000,000 annually, while Sir James Crichton-Brown's calculations agree with the sum of £15,000,000. In all probability only those rats living in granaries, wheat-stacks, and such places do damage averaging out at 7s. 6d. per rat; rats living in book-shops, hotels, furniture-stores, &c. probably do a great deal more, but this is liberally offset by the swarms of country rats that in summer do very little damage at all.

It is estimated that fires in America due to defective insulation of electric cables cost the country £3,000,000 per annum, and it is definitely proved that the majority of these fires are caused by the gnawing propensities of the gray rat. Fires are also produced by rats gnawing lead gas-pipes, and many disasters have occurred through their activities in this line. One American authority estimates that it costs large towns, such as Baltimore and Washington, four millions annually to maintain their rat battalions; and it must be borne in mind that, owing to the construction of American buildings, fires are a far more potent peril there than in this country.

In addition to gnawing cables, gas-pipes, books, and valuable ivories, rats have been known to gnaw the teats of pigs and goats, the feet of small children, and to destroy sucking-pigs and even calves. Nothing, indeed, not even man himself, is secure from them. In the main sewers of London it is customary for men to work in pairs, as owing to the size and numbers of the rats it is deemed unsafe for the workmen to venture singly into these dim corridors. Shelves and runways are provided for the rats, as at one time it was considered that they were of value as scavengers, though now it is generally realised that even amidst the filth of their choice these obnoxious creatures are of little or no service to man.

In ancient villages and old dwelling-houses generally the rats' subterranean tunnels tap the drains and the sewers, and thence passing into the walls of the buildings, allow foul gases to enter the living-rooms—in fact, to permeate the whole of the dwellings—a state of affairs which is doubtless the cause of sickness and disease. No wonder the pressure of public opinion has at last induced one or two of our lethargical health authorities to take steps for the systematic destruction of this enemy in our midst, and the movement is one in which each individual should consider himself or herself bound to be personally active. On no occasion should a gray rat be allowed to live if it is within our power to bring about its destruction.

VI.

It is of no use ridding a building of its rats unless, when this is done, steps are taken to prevent, or at least impede, the return of others. Ferrets and terriers probably afford the best method of getting rid of the rats in the first place, though in some cases they can be dislodged by pouring water into their holes. This method is obviously of no use where the rats are able to escape the water by climbing inside the walls. When it is practised, a piece of wire-netting should be placed over the hole into which the water is poured, to prevent the rats from escaping by that way, the terriers being kept in readiness at the adjoining holes. Immediately the work is completed, all holes in the masonry should be mortared up, slats of tin nailed over gnawed doors and other damaged woodwork, and holes in the ground thoroughly made up; otherwise new rats will immediately take the place of those that have been killed.*

Steel traps are not sufficiently wholesale in their effects to warrant general recommendation, though it is a good plan to keep three or four always set in obscure corners, as their presence tends to make the place unpopular among the rats. They are also useful about chicken-runs,

* Holes filled with broken glass and tar are permanently abandoned.—H. M. B.

&c., and when set should not be baited. Rabbit-traps are far preferable to the small steel rat-traps, as they generally kill the rat outright, and the trap should not be handled before being set. A clean steel trap has practically no scent, but an old one should be smoked or smeared with oil—bacon fat is excellent—before it is set. When it is being set it is best to erect a pen by placing two boards on edge, the trap being laid between them.

A most efficacious plan for wholesale extermination is to select a chamber which can be rendered rat-proof by cementing up all the holes in the walls. Leave the door open two or three nights, and feed the rats in the chamber with some food they cannot carry away and store. When it becomes evident that the rat population has become accustomed to gathering there after nightfall, secure a string to the door in such a way that it can be slammed-to from a suitable distance. The rats having thus been trapped, they can be left imprisoned till daylight, when terriers are introduced to do their work.

Another excellent plan is one which was recently practised in a Liverpool warehouse, and with such effect that the refuse-collectors finally refused to handle any more dead rats from this particular warehouse. An iron tank, containing about eight inches of water and of suitable size, was covered over with a sheet of strong, glazed paper. Immediately above the tank, and about eight inches from it, a dead hen was suspended from a beam along which the rats were in the habit of running. Everything being thus prepared, several long slits were cut in the paper covering of the tank, so that, while appearing solid, it was in reality a pitfall. The rats that attempted to mount to the fowl by the tank inevitably met their fate, while those that climbed down from above naturally dropped rather than attempt the difficult climb back. Hundreds of huge rats were killed in this way, and it would appear to be a thoroughly practical method.

VII.

Figures bearing upon the gray rat's powers of reproduction create a sense of dazed paralysis in the mind, and it need only be said that their rate of multiplication is such that, if none were killed, a pair of rats might at the end of two years have descendants to the tune of ninety thousand!

But, although figures illustrating this point may appeal to some as vaguely amusing, the actual results attained should provoke tears rather than laughter. Though not fully developed till six months old, a gray rat under suitable conditions may begin to breed at the end of five weeks. The first litter, however, is a small one, numbering, probably, not more than three. Thereafter the number of litters per

year, and the number of young per litter, are decided entirely by the circumstances in which the rat lives. If the season is normal, neither too hot nor too cold, and food is plentiful, the gray rat will produce six litters annually, the young numbering from eight to twenty at a birth. Working on a basis of a wide range of statistics, we arrive at the fact that a normal gray rat living under normal rat conditions—in other words, the average rat—successfully brings into the world forty-eight children per year. Accepting the predominance of bucks which seems always to exist, this would give us twenty female children to the year, each of which may begin to produce its equally fertile offspring at the end of five weeks, and thus *ad infinitum*.

The young are blind for fourteen days, and if the male rat plays any part in their existence, it is by bringing that existence to a sudden end, to his own epicurean satisfaction. The young leave the nest at the end of about eighteen days, and at this age are to be seen abroad at all hours, little larger than mice, and readily falling victims to any kind of trap that may be set for them.

If hunger happens to come upon the rat population, the feeblers members of the community fall to the stronger, which means that the very young are killed by the old, and that the very old are killed by the middle-aged. In short, only the fittest, which probably are the middle-aged, escape death at the hands of their own kind.

It would seem that gray rats habitually kill off the old male members of their communities, and it may be observed that when a rat is found living alone, it is invariably an old buck which, having had one attempt made upon his life by his clansmen, has sense enough to avoid further encounters by living a life of isolation and solitude.

The gray rat has probably not reached *le premier Octobre*, as the French call it, by the end of the second year of its existence, and the solitary males, driven out from their colonies, are in all likelihood living in their fourth or fifth summer. At six years a gray rat would have far outlived the majority of its kind, and I doubt whether the females breed after their third year. These statements, however, are based on such scanty observations that they border upon guess-work, and no doubt the whole question is decided by the conditions under which the rat lives, which means the rate at which it lives. A female that begins breeding at five weeks old, and thereafter produces five or six litters annually, naturally does not continue to breed so long as one living at a more moderate rate; and it is probable that the bucks outlive the does, as most of the very old rats caught or observed are bucks.

S H E L V E R D E N E ' S P L O T .

CHAPTER II.—THE SUSSEX SHORE: JUNE 1690.

I.

NIGHT was fallen, and a mist about us, when the schooner dropped a small anchor to hold her from drifting too much in. The last breath of wind and the flow of the tide had brought us to the very place we sought, as we knew from having seen the lights of Hastings ere the mist thickened. We were midway 'twixt there and Beachy Head, a quarter-mile off the lonely coast (the schooner drawing but shallowly), and arrived upon the hour when we were first to be expected. So it was with extreme satisfaction that I prepared to land, although I should do this in the guise of an invader of my country; for which circumstance the usurping Prince of Orange was to blame, he now holding the English throne, and King James, and such true men as could get to him, holding Ireland, where His Majesty was like to have a hard fight, the greater part of the Hollander prince's army being gone thither, and the prince himself just passed over to join it.

A hope that I might give this prince a counter-stroke which would spin the crown from his head had led me here to the Sussex shore. The design was of my own planning, but, of course, entered upon with His Majesty's approval and aid; and I cherished it lovingly, not only for what success would mean to His Majesty, but, since I was no more unselfish than other men, for what it would mean to me—a dukedom and a pension, and my name graven large in history. Sussex was my native part, where I was wont to have uncommon influence, and wherefrom, in the old days, I had raised Shelverdene's Regiment of Horse—merged with the main cavalry on my retirement in '81, and long since lost sight of. I was come now to raise, not a regiment, but the county—ay, and all south England—for the King; which, if my influence still held to give me a nucleus in Sussex, I believed I should verily do.

For this grand enterprise I was accompanied by no force—forty-two soldiers were my strength. Success would depend, under Providence, upon the welcome I received, not upon the numbers I landed with. His Majesty had offered me a full regiment, which he could ill afford to spare, and I had refused it. If my welcome were good I should get recruits by the hundred; if it were bad I and one regiment could accomplish nothing, and, in all likelihood, would die forthwith, every man of us.

But, in troth, I had no foreboding of disaster. I had plotted the affair most subtly, using the discreetest messengers to arrange a tryst with certain reliable Sussex friends, who declared my

reception would be wholly favourable; and I had sailed not from Waterford until the Prince of Orange was sailed to Ireland, when, I presaged, the attention of the English Government would be directed thither.

To-night a score of my friends should be on the shore yonder, with a drove of horses for the forming of our cavalry, and for transporting the armament I had brought—two fine brass field-pieces, a demi-cannon, ten barrels of powder, and above two hundred carbines and muskets. And other trustworthy persons should be for-gathering, with every available weapon and horse, at divers points within a small radius, prepared to join me so soon as they were advertised I was here; so that when morning broke there would be a little army drawn up, for loyal men to haste to.

II.

The cargo of ordnance and munitions was to go ashore after us. Leaving my ensign and two gunners to watch to its careful lowering into the boats, and bidding the shipmaster sound his bell frequently to guide the boats as they returned to him in the mist, I climbed down to one of these, of which there were three now floating on the water, laden with my company. The sea was quite smooth, though there was a gentle wash of it against the beach, which told us how to head; and, despite the momentous hours that lay before me, I discovered enjoyment in being rowed over the placid surface. I drew long breaths of the air of Sussex, and thought on the pleasure it would be to see the green plain of Pevensey marsh and the rampart of South Downs hills in the early, shimmering sunlight of to-morrow.

Because of the mist the schooner's lamps could not be marked from the shore; therefore, when our prows stopped at the shingle (no hail having greeted the noise of our oars), I ordered some one to give a whistle, which he did several times, very loud and clear. But, though we sat still for a space listening, we heard nothing in reply.

There was a touch of ill-omen about the silence, and even a touch of chill at my heart as I wondered whether an incredible thing could occur—my attempt fail weakly in its very beginning, through some strange error. But at once I threw off this humour.

'Out,' I cried to my fellows.

Then I sent back the boats, which, voyaging to and fro for an hour, brought the equipment; and this I had borne to a grass bank by the top of the beach. After which, allowing my men to drop down and rest, I stood with ears astrain, not daring to believe but that soon I should hear

the reinforcements. Two or three times I gave a start of blithe relief, certain that I had distinguished many soft footfalls; yet a second later they were not to be detected.

'You have no doubt this is the place, Sir Edmund?' asked Nayford, the ensign, quitting the demi-cannon, whereon he had long sat alert, to join me.

'None,' I answered. 'Below us is the path by which they were to come, and thirty yards from us the cross-path by which they were to halt. . . . No; 'tis the fog delays them, or another trifling matter.'

'Ay,' said he, and remained with me, breathing a dance-tune; but soon recollected himself and craved pardon for his easiness, saying the sea-murmur had beguiled him.

A further ten minutes were passed, when I threw up my hand and snapped my fingers; he, in the same instant, exclaiming, 'There!'

'Sergeant, order your men,' I said; and when that was done, in two ranks, and the bustle thereof was ceased, very numerous steps were to be heard on the path and on the beach itself.

'Some are on the shingle to our left, sir, also,' said Nayford.

'Yes,' said I merrily. 'They are coming in well.' I raised my voice, speaking to the men. 'Now, ye boys, we shall give a sharp twist to history.'

III.

To my dumbfounding, to the utter bewildering of us all, there ran through the mist a trailing, woman's laugh—sweet beyond telling, mocking beyond description; and anon it changed to words:

'Write it in the History Book,
'Shelverdene and all are took.'"

Once more the voice was laughter—joyous, derisive laughter; and then, again:

'Write it in the History Book,
'Shelverdene and all are took,
Brought to London from the shores,
Hanged and drawn and cut in fours.'"

'Madame,' I said, 'I beseech you, haste into shelter, or you will say no more such pretty poetry; for "Shelverdene and all" are going to shoot.'

Then I spoke towards the chieftest trampling of feet—many scores of them, and almost upon us.

'We are for King James,' I said. 'Are you folk for the Dutch gentleman?'

'Sir Edmund Shelverdene and those with you, put down your arms, and then let no man move from where he stands.'

'Oh, nay,' I said; 'I think we shall fight for it.'

I turned to my troop, whereof the front rank, though not a yard from me, was scarce to be discerned. A device was in my brain to order a retreat at full speed to a distance of fifty paces.

Then should every man face about again and crouch or lie flat, and fire his carbine in the direction of the powder-barrels, which by that time our enemies would have reached. I hoped that a fortunate shot, discharging the powder, would cast a fair part of the foe skyward, and afford me a chance of victory yet, if my men were not too stunned to charge upon the remnant ere they recovered from the shock; and the crushing despair which had fallen on me went, and my spirit surged buoyantly as I imagined this triumph.

But, alas! before I had given two words of command, a quick, dull flicker lit the visages of my soldiers, and the enemy's muskets deafened our ears. A few of our carbines answered, and we were at grips, striking and being stricken blindly, and we driven backward on a run from weight of odds.

The scuffle lasted little above a minute; for, as I learned after, there were two hundred and fifty against us—one hundred regulars of the Royal Fusiliers, and the rest volunteers from traitorous parts of the county.

At the commencement, springing round when the volley sounded, I fired both my pistols and hurled them after the bullets. Then, shouting to my boys to keep close to me, and we would burst a road through to Hastings, I drove into the mist, my sword levelled, so that it would spit anything save armour it came against. I got a fellow who wore no plate, probably a Fusilier, and, whipping the blade forth from him, pierced another while I was being flung back. A third, using a clubbed musket, by the feel of the stroke, knocked the sword from my hand. I hit at him with my fist, giving a shiver as I did so, for a wild bayonet-thrust had grazed my cheek, an inch from the eye. My fist landed, but he who received it caught my arm, and, a side rush sweeping us to the edge of the fight, we grappled closely and fell, and presently were left to battle undisturbed on the grass, I having him by the throat so that he could in no wise summon help. And soon, my knee touching a big flint stone, I slipped down a hand for it, and thus beat him.

IV.

I rose and straightened my peruke, and paused to recover some breath ere rushing back to the *mêlée*; and then I realised it was over. The beach was loud with voices, but they were calm, saying such things as, 'How many prisoners, lieutenant?' 'Here is a wounded one of them, sir.'

I clenched my hands, and in this grievous moment hot tears crept down my cheeks. Here was the end of Shelverdene's Plot, that had promised so much, and the end of the brave boys who had been trusted to me.

At first I was for going forward to surrender myself. If that would have brought me death

swiftly, I would have. But the sombre prospect of cell and trial and scaffold withheld me. For a short time I tarried, hearing the schooner busy with her gear, and surmising whether she could get away with this lack of wind. Then, shrugging my shoulders, I walked inland, wishing I knew how many of my friends were betrayed and whether any could shelter me.

I followed no path, but made for the centre of the marshland. Ever and anon, since I could not see on what I was setting my foot, I tripped over tufts of rushes or sank knee-deep in a bed of swamp; and at length, though advancing so warily that I slid either foot onward, rather than stepped, because I was come to where there were many water-dikes, I dropped clean into one of these, managing to fall erect, but having the water sousing round my neck. A little while later I splashed into a second, in the very same manner. Climbing from this, I threw into it my heavy back-and-breast plates, trusting thus to prolong my strength. But some two hours from leaving the beach, having lost my bearings, and being too shaken by my falls and too hampered by my wet clothes to struggle further, I sank upon the ground.

For a minute thereafter I lay on my elbow thinking of the countless happy hours I had passed on the marsh, in youth, in maturer years, always with the future bright and never hinting that one night I should return, a wrecked, discredited fugitive, in my forty-eighth year.

Then I rolled over on my side, stretched out my legs with a great sigh, and slept.

v.

When I awoke I believed for a space that it was the sound of a cannon which had roused me. For, sitting up and finding the part of the sea in front of me so adance and aglitter with sunlight that my eyes could not endure it, I looked westward, and saw a ball of white smoke rising from a warship, which was heeling off round Beachy Head—in pursuit of the schooner, I did not doubt. But then I heard a human sound, a low, rapturous murmur; and, turning my head another inch and glancing up, I discovered, leaning forward betwixt me and the sky, and framed in a great, broad-leaved, furry black hat, with dewdrops from some shaken bush hanging to the brim, a lady's face—high above me, because she stood on a bank.

The face was, maybe, a shade thin, but gay with the colour of health, and pretty indeed. The hair, blown about and between chestnut and gold, and the big blue eyes, seemed to stir in me a memory of some one I once had seen or dreamed of, but I could not recall whom. The eyes were shining—ay, and the lips were laughing, with such a strange, exultant welcome that I was sadly puzzled. My gaze fell to the lady's throat, finely moulded, and bare, from the flat setting of her lace collar; and then it

fell upon other particulars. Her cloak was cast back, and beneath her left arm was a crutch. In her right hand was a long, polished pistol, hanging apparently in carelessness, yet, it seemed to me, held very ready. I looked down the length of her slender crutch and saw the foot it aided—a narrow foot, comely still, but with the heel clear of the ground and the toe pointing straightly to the turf in a way most pitiful to see. Then I knew her.

I was surprised I had not known her instantly, for, though I had not seen her for eleven years—and she a child then—she had dwelt very constantly in my thoughts until some two years past, when her implacable spirit had caused me to put her from my mind.

Denis Irby's daughter. . . . In the moment of recognition there rose before me, not one, but many remembrances, like clear pictures, of which I seemed to read all details during that brief moment—an inexplicable thing. I recalled the first wretched weeks I passed in London on my return from Scotland, when I had to endure the news that the child I had shamefully Booted was lamed for life; and the staunchness of my friends exasperated rather than comforted me, so that I did fight with Colonel Loomer for his saying I had rightly served the girl. I recalled my frequent entreatings of Denis Irby that he would bring me to her—and his cold denying me. I recalled how, on realising she was growing to womanhood, I sent her year by year on her birthday, which I had learned the date of, a letter, conjuring her to receive me, to offer me some chance of making a little amends; bidding her know that my sword, my influence, my all, save my Faith and my Allegiance, were hers to be done with as she listed. Every of which letters was despatched back to me, with no word, but with the stroke of a pen drawn contemptuously across the page.

And I recalled the spring-time morning in '88 when, Denis Irby being under much suspicion, Louis Stuart (a captain by then) had been sent with others to seize his papers. I was lodged in Whitehall. At the first bruit of what was afoot I went to His Majesty, and craved his sanction to accompany the party. Whereupon King James's worn face had relaxed a jot, and a kindly satire gleamed in his mournful, heavy eyes.

'In the interests of the Crown or of the suspect, Ned?' asked he. Then, seeing me frankly troubled for an answer, he bade me go with Louis, adding graciously that he was assured which person, of those that went to Mr Irby's house, would watch most tenderly over the King's safety.

Denis Irby was from home; and his daughter, on learning of my arrival, had hurriedly withdrawn (so I was told) to some chamber of her own. Feeling her presence in every room we entered, I kept with Louis and Sir F. Pochin,

a magistrate, and scanned such documents as they found—with no intent, of course, to destroy aught, but to prime myself for defending Irby, should that prove necessary.

We discovered no treason. But from a little box in a music-room—a box that had been very carefully locked—Louis took something, which, after a glance, he gave to me, with a whimsical look.

It was an engraving of myself, bought from some print-seller. Below my delineation was the customary jumbled flourish of printed words: '*The Most Honourable Sir Edmund Dene Shelverdene, Bt.; One of His Majesty's Lords-Lieutenant,*' and thus onward. But there was another inscription, done very daintily and womanly with a quill—writ privily to my image; yet I could not resist reading it:

'Able, brave, high-natured—men say thou art; blindly loyal to the King, clement when thy foe is weak, ruthless when strong. QUOTHA! how fair a character! And thy brow doth bear it out!'

'But I know thy clemency, do I not? Was I thy strong foe? thou arch-tormentor, that sent me to limp through life, and smoothly askest my pardon. I know thy clemency. And be thy other virtues true or false, one day, through me, thy mouth shall lie in the dust.'

I noted something, and held the print up to the light; and I could not but smile wearily to observe a group of holes, pierced in my breast by a vengeful needle. I replaced the print in the box, which held nothing more save silks and sewing-work. Anon, hearing Louis ask Pochin whether he would have the chamber searched wherein the lady was, I bade them pass a message to her by one of her own servants, inquiring if she had any of her father's papers there—saying I would vouch for the honour of her reply. Which being done, and the servant carrying more than the message, she returned answer that she had no writing in the room, yet would wish the gentlemen below to come and prove that for themselves, if they brought not with them the fellow who had so insolently presumed to vouch for her honour.

VI.

Such were the remembrances that had me spell-bound, until the lady softly spoke, bringing me to realise that she and I, with the fragrant marshland around us and the azure sky overhead, were come together in no vision of the past, but in a present circumstance which was evidently as diverting to her as 'twas like to prove ill for me.

'Shelverdene!' she whispered in delight. 'It is you, as I thought from my telescope.'

'Denis Irby's daughter,' I said, shifting a trifle, to face her squarely, and clasping my hands about one knee. 'Why would you never meet me?' I asked.

Her head drooped teasingly to one side. She

smiled on, but her eyes had a deadly fierceness which she made no endeavour to hide. 'What meeting could compare with this?' she asked. 'Behold the great captain, fallen and a runaway. King James's Hope, set on the ground, with muddled peruke and lost cravat—and—blood on his cheek.' There was a hint of faltering in her voice, of waning smile, when she japed at my blood. But, 'Great captain,' she taunted, her smile back again, 'may I have the aid of your sword, of your mighty influence?'

Then, indeed, her smile faded; and, turning her face from me, she laid the wrist of her hand, which held the pistol, athwart her forehead, as though disquieted. And I heard her murmur, 'Am I cruel as he?'

Recollecting she was off her guard, she turned again, veering the pistol towards me as she lowered it; yet, most strangely, something of gentleness was about her.

'I will not be paltry with the truth,' she said. 'Thou wert a captain, and a power, and a sure blade, that wished to serve me.' Therewith, however, she raised her chin suddenly, with a motion of impatience, of stress. 'Oh, what things do I speak! I think I am all bewildered with gladness, to see thee stricken utterly, and the headsman waiting for thee. . . . You planned to serve me, to soften me!' Had she deliberately lashed it, her temper could not have leapt more hotly. 'Me!' she cried. 'That you tortured and maimed, you very fiend. . . . It was my part, not yours, to say how you should pay for your black villainy.'

And then in a breath, as a short while before, she was teasing, smiling, deadly withal.

'You have paid somewhat already, Shelverdene?'

'Two duellos with your father, and a fine of two thousand pounds in the King's courts.'

'Two more duellos in Dublin,' said she.

'So!' I cried; 'were you responsible for those?'

She nodded. 'I ever intended to take the matter in my own hands. I was in no haste; but when you quitted England I deemed I were best begin. I sent two of my friends to kill you, but your sword was overmasterly. Last month I sent another.'

'He sought me not.'

'Nay, he did far better. He chanced upon, and discovered to me, Shelverdene's most wicked design against England.'

'You!' I gasped. 'You!'

'I am to be thanked for the foiling of it. I bade my friend no more think to fight you, but to cozen you and your brother-plotters; and so we learnt all, which my father disclosed to the Government. Thus was I privileged to be with them that awaited you last night. . . . Are you not sorry you adjured me to shelter from the bullets, Shelverdene?'

(Continued on page 676.)

A GOSSIP ABOUT NOVELISTS' NAMES.

By Sir GEORGE DOUGLAS.

IN choosing names for the children of their fancy, novelists, generally speaking, would appear to be guided by one of three aims—namely, beauty of sound, verisimilitude, and the desire to mark or indicate the general lines of a character by his or her name. And to these three aims, though rarer, may perhaps be added the striving after local or territorial correctness or conformity. For example, when, forty years ago, Mr Baring-Gould produced his magnificent *Tale of the Salt Marshes*, baptising his protagonist by the magnificent name of Elijah Rebow, I remember hearing that certain members of a fine old Essex family were not best pleased at the use to which their patronymic had been put, the more so seeing that the said Elijah was alleged to have consorted with smugglers, to have put in practice the theory that all's fair in love, and in the course of so doing to have perpetrated sundry very questionable acts. But supposing that my old friend Mr Baring-Gould really did give offence in this respect, and that what I heard was not mere unfounded local tattle, then he was certainly gloriously impenitent. For in his very next novel, of which the scene was round about Launceston, he introduced the beautiful local surname of Trecarrel, and made the hearer of it odious and contemptible. He was quite right! For there is surely no reasonable ground of offence in the use of local names in local novels.

Still less justified, if possible, was the objection of an obscure Parisian named Vabre to Zola's use of that name in his novel of *Pot-Bouille*. I know not whether he obtained an injunction or threatened proceedings; but I do know that the use of the name was suspended, the truth being, as I suspect, that Zola had scented a rare opportunity for *réclame*. For, by substituting the phrase *Sans-Nom* for the forbidden name, he set all Paris talking and exercising its wit about the incident. This continued so long as the story was appearing serially; but when it came out as a book the name Vabre was reinserted, and then there was nothing left for the wits but to allege collusion!

I am glad to say that I know of but one instance in which the name chosen by an author for one of his fictitious characters actually led to tragic consequences. It was when Sir Arthur Pinero entitled one of his plays *The Notorious Mrs Ebb-smith*, and a weak-minded lady who bore the same name was thereby driven to destroy herself, under the delusion that her sad history had become public property. Needless to say that Sir Arthur had never heard of her existence. Innocent as he was, I hope he realised that this poor lady would almost certainly have

taken her life in any case, and that, if one pretext had failed, she would have found another.

To go back now to my classification of novelists' names, Captain Marryat must be awarded high praise for his success with the names which help out character. His *Peter Simple*, it is true, was not quite original, but who now remembers *David Simple* or its authoress, Sarah Fielding? And what other name could so well befit the delightfully ingenuous young sailor, whose history has captivated successive generations of right-thinking young Englishmen from the 'forties on to to-day? *Mr Midshipman Easy* is scarce less happy, whilst *Jacob Faithful* and *Masterman Ready* are quite worthy of their distinguished relatives. In the same style Becky Sharp seems the one and inevitable name for Thackeray's typical designing minx—a name, too, which seems to postulate immortality for her who bears it. And, in this connection, is it allowable to draw attention to the astonishing report, current among aged Anglo-Indians less than ten years ago, that the lady from whom this portrait was drawn was at that time still alive? I cannot vouch for its truth, but as *Vanity Fair* was completed in 1848, the lady referred to must certainly have reached a very venerable age. In names of the kind now under consideration Disraeli was conspicuous for failures. His art took long to clear itself of balderdash and acquire certainty of touch, and most of us will be ready to echo the inquiry of Mr Gosse, 'Who can believe in the existence of persons whose titles are the Earl of Fitz-Pompey and Baron Deprivyseal, or Sir Carte Blanche and Lady Aphrodite?' The happiest find in nomenclature of this kind is, however, Oliver Goldsmith's Dr Primrose. Who can imagine the beloved vicar or his family under any other patronymic?

I must confess that, as an anti-realist, the names which are life-like and nothing else interest me scarcely at all. Jane Austen, with her Elizabeth Bennet and her Henry Tilney, her Henry Crawford and her Fanny Price, gives us little but such as these. And in their own place they are right. Nothing more can be said about them. Only, I do not think that the name Marianne (so spelt) is ever met with now. It must have passed into disuse since 1817. Trollope, Meredith, and Henry James are also strongly inclined to realism in their choice of names, though certainly less exclusively so than the authoress of *Pride and Prejudice*.

Other things being equal, I freely own that I prefer a heroine named Cytherea Graye, as in Mr

Hardy's *Desperate Remedies*, or a hero named Valmajour, as in Daudet's *Numa Roumestan*, to all the Elizabeth Bennets and Henry Tilneys in the world. For I presume that the refinements of hearing were not bestowed upon us for nothing. Bathsheba Everdene, the heroine of *Far from the Madding Crowd*, bears a name almost as rhythmical as Cytherea Graye's; whilst Fancy Day, Eustacia Vye, and Thomasine Yeobright all appear to me to rejoice in names which unite intrinsic beauty with suitability to the character of the bearer.

Mr Hardy, who has never been an out-and-out realist, and who, in the classification of the latest edition of his novels, himself acknowledges as much, inherited his refinement in the choice of names from the romantic novelists, and this carries us back to Walter Scott. Scott's ear for the music of vocables, though not uniformly faultless, had been early trained and educated by the practice of writing verse. No one had been before him, and to a man of his vast historical and territorial knowledge, the entire treasury of nomenclature lay open and ready to be laid under contribution. The grand names of Waverley, Peveril, Ivanhoe, are his by right of appropriation. He has made them his own, and, in so doing, has endowed them with a significance more than worthy of their native beauty. Who now thinks of Waverley as an abbey in Hampshire? It is the name of a principal province in the Country of Romance. It is become the private property of the man who, from the beginning, could design such captivating titles for his works as *The Lay of the Last Minstrel* or *The Lady of the Lake*. And his inventions were as good as his finds, if I may assume that the name of Redgauntlet was his own creation. And where in the whole directory of names is there any lovelier combination than Minna Troil? I solemnly declare that, were I asked to meet a lady so baptised, I should be more than half in love with her upon the strength of her name alone! Of course, one ought to be on one's guard against confounding romance of sound with romance of character; but, where Scott is concerned, I doubt if at this time of day it is altogether possible to do that. Another proof of the delicacy of Scott's sense for names is that, when history happened to make a mistake in this respect, he did not scruple to correct history. For example, the real name of the sequestered beauty of Cumnor Hall was not Amy, but Ann. Froude's *History of England* is my authority for this minute correction, and I have little doubt that Samuel Pepys, who tells the story, bears me out. But Ann in conjunction with Robsart is, perhaps, a little hard. Amy is softer, more sympathetic, one might almost add more clinging. So by a beneficent decree, retrospective in its action, the hapless lady turns in Scott's hands into Amy. Victor Hugo, following Scott, calls

her Amy too, and so assurance is made doubly sure, and Amy for all time she will remain.

Did space suffice, I should like to say, not merely a word or two, but a great deal, about those names of Scott's which are characterised by raciness in the first instance, and beauty only in the second. Meg Merrilees and Dandy Dinmont are examples of what I have in mind. These names, again, are simply right, inevitable. Those particular roses could not possibly smell half so sweet by any others. And there would fall a word to be said about Scott's nicknames, of which Madge Wildfire is a brilliant example. But I must pass on.

The later romantic novelists, such as Bulwer Lytton, Ainsworth, Disraeli, the author of *Guy Livingstone*, and Ouida necessarily labour under the disadvantage of gleaning after Scott. But they make, on the whole, a brave show with their Devereux, Maltravers, Tancred, St Aldegonde, Ercildoune; their Idalia, Venetia, Flora Bellasia, and Lady Corisande. In this respect Disraeli soon redeemed the errors of *Vivian Grey*, and the name *Lothair* is of itself enough to excite interest, even though the book had been anonymous. Next to the grandiose, the aristocratic, the high-sounding, or the simply beautiful, the fantastic or extravagant in names provokes curiosity. And here, of course, Dickens, with his native tendency to caricature and to high colouring, is the master without rival. His Chuzzlewits, Pardiggles, Pumblechooks, Turveydrops, and a host of others are his, and his alone. That these ever had originals in the flesh I would not take it on me to say. But truth is proverbially stranger than fiction, and I know as a fact that Edwin Drood was the name of a publican carrying on business close to Gad's Hill, whilst probably all the world knows that Pickwick is a village in Wiltshire.

A daily study of the births, deaths, and marriages in a newspaper will reveal some curiosities of nomenclature, and it is no secret that the late Sir William Gilbert, who at that time lived in Kensington, found a name for the sentimental sailor in his most successful opera above a shop in the Brompton Road. Dickens's disciple, Wilkie Collins, would seem to have given nice attention to the selection of names, though wisely making no attempt to rival the extravagance of his master. Count Fosco, the subtle villain of his *Woman in White*, bears a name as well calculated to strike the imagination and to dwell in the memory as Dumas' Count of Monte Cristo. And, again, what could be better adapted to the positive and loquacious little soldier of *No Name* than Captain Wragge? The tang of his wearisome self-assertion seems embodied in the sound. Finally, George Eliot composed her names with no less care. Nor would it be easy to find a hero and a heroine more beautifully named than the Daniel Deronda and the Guendoline Harleth of her last great book.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

PEOPLE have begun to move again. Travelling has recommenced. Europe and lands beyond Europe acquire a new interest for us once more; they are not merely spheres of war, areas of battle-grounds. The old traveller's spirit returns, and facilities are slowly being restored. There are announcements of tours that may be performed within a certain time and at a definite cost. It is more expensive than it used to be, but still it seems wonderful, so magnificent in opportunity. England, Scotland, and Wales are good to look upon and wander in; during the war we learned much of them we knew not before; but these islands, after all, are but a very little of the world. Now travelling is a thing that will never be the same again. And it is better so. With the tornado that has swept over the world, the transformation that has been effected, the tremendous problems still before us—problems that will remain for long—and the close front we have had to make with elemental facts of living and of death, this is a world in which to think, and not to pass through in the dallying, careless way again. Hardly a man or a woman, scarce a child, but is impressed with some aspect of elementary and social economics as not before. For years the peoples have been as hungry wolves; they have needed to grapple with realities as animals do. In the old days of peace pleasant persons of accepted intelligence, and of a taste that was proved by their voyage into Switzerland or Italy, would return to their native Britain with nice descriptions of mountains and lakes, assisted, as was evident, by guide-books and sundry photographs. They would also be in a position to make descriptions of certain pieces of architecture they had inspected. By this they essayed to show they had the traveller's way, had witnessed wonders and could take advantage of them in the true spirit, making of themselves persons to be envied among the others who merely stayed at home to wander through summer lanes, admiring the miracles of creation everywhere and making new discoveries among them.

* * *

The new travellers will be less concerned with the emptiness of the old system and manner. Their travelling from the beginning to the end

will be a more serious and more difficult undertaking, and at every step they will have new points suggested to them of the grimness, the bitterness, and the hardship of life, and the compromises for varying degrees of happiness and satisfaction that it affords. It is, to take the simplest case, inevitable that when a stranger arrives in a foreign city and walks about therein, he should become interested in the cost and price of things, especially food and clothing. It is inevitable, unless he is very stupid, that he should make more or less diligent inquiries into this matter, institute comparisons with his home quotations, and drawing conclusions, seek for further explanation. No special intelligence or tendency to investigation is needed in such a case; this is a process which, we say, is certain, and is conducted by nearly all men and women who now wander abroad. It takes the place of much of the meretricious inspection of and reporting upon things not understood or appreciated, that occurred in the case of continental trippers in the other time. And so here is the beginning; and once the active mind makes such a start it leads on to more and more investigation on this economic side, and strangers are brought to an understanding of and sympathy with the ways of life of different peoples in their many aspects. As an abstract study of a few phases of the evolution of the human race, it is interesting enough; but, better, it yields first-hand knowledge for use at home in political and semi-political argument and for application to the needs and necessities we ourselves experience. It affords us knowledge above that of newspapers, and enables us to correct the politicians in their misstatements and omissions. For near as are France and Italy, Spain and Germany to us now—never nearer—the ignorance of our own people concerning the ways and conditions of life, the thoughts, feelings, and tendencies in those adjacent places, which can be reached in a few hours by the air, is amazing; and the traveller in his new mood will come back to Britain enlightened (but humiliated) upon the want of knowledge of our people born of their insularity, which seems—and perhaps naturally enough—to have become intensified during the past six years, though some publicists blandly assure us that the reverse is the case. Never did we

know so little, never were we so misinformed, about the lives of other peoples. And a minor point is that, granting that there is much jealousy of us, that we do not receive fair credit for the good we have done, as men and nations rarely do, it is good as a tonic or a corrective for the British subject that he should know the arguments used against him, especially in the matter of the war. Foreign races do not regard Great Britain as having been an instrument of heaven for the salvation of the world; they are more inclined to mention Machiavellian politics and capitalist greed, and it will be found that such affairs as Amritsar are mighty hard for an Englishman to explain away in a foreign land.

* * *

In the spirit of the new travelling, then, the one who wanders will fortify himself with facts, so that he may apply and test and use them for the gain of others from the foreign lands, to bring them home for application here. Most persons in the old travelling way took a guide-book with them, and generally glanced upon it at the moment of inspection, and perhaps a little more carefully afterwards. Clearly wrong and ineffective. The mind should advance prepared, else the eyes do not see, and nine-tenths of observation is wasted. One must be able to look and search, and for that there must be instruments of knowledge in hand. Bear in mind the truth that is carved in stone over the entrance to the great railway station at Washington, U.S.A.—‘He that would bring home the wealth of the Indies must carry the wealth of the Indies with him; so it is in travelling, a man must carry knowledge with him if he would bring home knowledge.’ So before the advance on a foreign state, there should be much priming upon it from reliable sources. It should be studied and considered from every aspect; brief notes or reminders of special points should be compiled; newspaper cuttings (with the dates and the sources marked upon them) should be collected. By such means will observation be assisted and the value and interest of the enterprise be increased a hundredfold. This is no counsel of perfection, nor is such preliminary study, in view of the oncoming realisations, dreary. One who travels much and seeks the utmost gain made such a careful study of seventeen different volumes in various languages before approaching certain foreign lands a few months ago. Here it may be said that great as is the British Empire, far as our people have wandered, our books of travel, brilliant on the side of adventure and special individual statement, are scarcely so good as the French in the plain and semi-statistical presentment of basic and economic facts about life and work in certain foreign countries, particularly such as are within easy distance of Paris, like Spain and Portugal, North Africa, and some places away in the East. There is another matter, Baedeker, which is at the same

time a commercial enterprise—as to which we are not concerned—and a traveller's public institution. During the war it was said that we had done for ever with Baedeker, as with other German things. In the excess of feeling it was insisted that all German writers told deliberate lies, and that Wagner knew nothing of music but only made an ugly rag-time noise. Such judgments are not flattering to our perceptions now; they only show the devastating effect of war upon the intellect and the judgment as upon the land. At the same time it was urged that Baedeker, besides being poor and unsatisfactory, represented things from the German point of view, and was partly, if not mainly, a political compilation. The fact remains that it is a marvel of thoroughness, and what we may for convenience call the general facts of the case are set forth in this guide-book as not elsewhere. And in this general consideration there is one other point that comes to mind, and it is this, that there is a way of saying that now, as the result of the war, the world is full of seasoned travellers—the soldiers in the war—who have seen things, as to which the most splendid efforts in foreign investigation by private persons at the present time are pale and insipid. There could be no greater mistake. The soldiers saw nearly nothing. They came to understand hardly a single fact or truth of the most insignificant character about the peoples among whom they marched and camped. For one thing, their business was death, not life; and for another, they saw these peoples under the most abnormal conditions possible, artificially organised for a special purpose, and dissembling all the time. They did not see them at their work, which is almost the only thing that matters in the world; and they did not see them enjoying the love of their home lives, which is most of the rest. They could know nothing whatever of their struggle for existence then, and still less of the tremendous problems that face them now. And besides all this, the military spirit naturally was in possession of the soldiers, and they saw not the truth or the plain facts as they were to be seen. Their own movements were severely restricted; military discipline and routine ruled over all. And the result is that whether it were France or Belgium, Turkey or Egypt or India, these soldiers came back with less knowledge of the lands they had laboured in than might be acquired in an evening with a good book and a following night at a cinema that pictured the place in question. So let not the new travellers feel that they have been overshadowed. They have great work to do now, and it has been neglected for many years. Never was there such need, never such opportunity.

* * *

On what we may call the material side of the travelling question, those who go far (and especially if they deviate a little from the few

main streams of continental tourist traffic that have already been established) will encounter strange and uncomfortable conditions. They will realise, perhaps better than they have ever done since the armistice was first declared, what a dark mark the war has left upon the manners and customs of foreign peoples in regard to the traveller; and even of our own people who are officially engaged in the conduct of the travelling business towards their brethren, hoping for a little guidance and assistance perhaps, remembering pleasantly the days before 1914, when it was so kindly proffered and the way of the traveller was one of happiness and soft cushions. No more of those flowery and cushioned ways, for a time at least. And seeing with what amazing tenacity when convinced (as they assuredly are) that it is contrary to their own material interests, the nations adhere to the passport system, and trap it elaborately with a grand system of visas, one is a little inclined to despair of any improvement until—as some would say—there has been an even more terrible war, and it has taught the few remaining people a little common-sense, a little appreciation of the fact of mutual dependability, and a little faith in the principle of good and its practical utility in the promotion of happiness. Even during the war the passport system was of very doubtful advantage and effectiveness. It certainly prevented timid and resourceless people from leaving one country for another—but those people were largely harmless anyhow; it never prevented any real desperado from moving as he listed. And if that were so in the war, what of now, when means of vigilance are inevitably much relaxed, when the war strain and the war manner and the war service are relieved? It is not only that passports and visas are in every country at the present time recognised as completely and utterly ineffective, but after the issuing of them and the employment of officials in the process and the collection of the fees, no steps are taken to make them effective. They are abandoned; and one is justified in calling this process the passport swindle, one of the worst inflicted upon peoples that have lost much of their liberty. The governments do not attempt to justify it; they remain silent under the charge that it is maintained in almost its full war strength merely for the employment of large armies of officials, the underlings of the bureaucracies, who retain in full measure their war-time arrogance and bad manners. But what remedy? There is only one. People—those middle-classes, for the most part, who suffer anything and everything because they are prepared to suffer—should themselves study the art and science of striking as the working-man has studied it, much to his advantage. They should have the courage of their feelings, as they so rarely have. And they should boycott strictly and absolutely a country like Switzerland, that

impudently and with less excuse than any has played the robber in this way. They should not only demand the removal of every vestige of restriction, but should, in the manner of strikers and victors with just and honest grievances, demand reparation in some form. There should be a Travellers' League, and the members should by general agreement refuse to travel in such countries as abuse this system of restriction of movement and the setting-up of inconvenience until, the offence being removed and in some way expiated, the league withdraws the ban; and the members should at the same time strive their best to prevent others from doing what they themselves for the good principle will not do. In the matter of the French it is remarkable with what official punctiliousness, the signing of forms and the payment of fees, they force their victims through the ritual of the passports before the travelling begins, and also at other stages, as when from a country on the far side of the journey the wanderer would move back again through France. In such a case there may be half a day spent in finding the local consul, to whom considerable fees are again to be paid. He may not be in his bureau, being long delayed at lunch, and his absence may lead to the postponement of the traveller's journey. But the visa once made, the money collected, the bureaucrat having by a few moments' labour justified to his own conscience his existence, nothing matters. The passport is given scant attention at the later stages, where it should really serve if it ever served at all. I have watched closely the methods of the investigators at the frontiers in different countries, especially in France, and never once in hundreds of cases have I observed the official lift up his head to see if the person before him was the same as the one represented in the photograph on the passport. It may be that there is some diminution in this passport nuisance, but nothing but an overwhelming protest by travellers will ever dispose of it altogether, and that protest must needs take the practical form of the strike or boycott. We should have the Travellers' League. The times in travelling are changed. They are difficult now. Travellers have common interests, and they need to co-operate. A league, international in character and strong, could make a government or two here and there realise that there are limits to post-war antics of the kind that are being practised. But perhaps, as it depends on middle-class effort, there never will be such a league.

* * *

There are some other points for mention in the matter of the discomforts and difficulties of travelling in these new times. It is often a hard affair; its inconveniences are enormous. Military arrogance—sometimes brutality—is encountered constantly. Travelling is far more expensive than it used to be, in every respect.

Countries that need not have raised their prices high have done so in the profiteering vein, feeling that they, too, might take advantage of the helplessness of payers. There is Spain, for example, now being filled with strangers from Britain, America, and other parts of the world, and without proper hotel accommodation for all of them. These strangers go to Spain because it is a deeply interesting country, and because, Spain having held out of the war, it is felt that here the conditions of living must be less harsh than in the war-stricken, even though victorious, countries. The latter consideration is true; but Spain, knowing that she is thus in demand, and having limited accommodation, and having, moreover, certainly found her costs mount much higher through the European reaction upon herself, charges far more than before. Thus a stranger should consider himself fortunate if he obtains a fair room in a first-class hotel in Madrid for thirty pesetas a night—and I have paid more—the equivalent, with the exchange as it was a few months ago, of nearly two pounds a night in English money. The exchanges must be considered carefully. They make things in France and Italy cheap to us when they would be otherwise dear, and this is especially the case in Portugal, where the money is at this time of writing worth only a quarter its normal value. Since placing in these pages some notes upon

travel in Portugal, I have received many inquiries from readers for further details, requests of a kind that it is difficult or impossible to comply with. The facts are as stated, and the chief thing for possible visitors to Portugal to bear in mind is that just as there is rarely even the smallest paragraph in the newspapers concerning affairs and events in Portugal, so there is as much happening there as in any other country, and it is very fateful. The politics of the country are torn to tatters; she is bordering on revolution, is in a shocking state financially and economically, and there are openly expressed fears of a collapse and foreign intervention. Meanwhile soldiers are everywhere; there is rifle-firing and occasional bombing at night. While things remain as they are, the country is possible for strangers, but they might become suddenly worse, as they did once when I was there, causing me to leave the place by the last train that went from Lisbon to Madrid for some time. A final word of valuable suggestion is this: do not conduct the luggage business on the pre-war scale. Cut it down to the lowest possible point. Strive to the utmost to take with you only that which can be carried in the carriage. The dangers of delay, loss, and theft are far greater now than ever before. And harden your heart towards the servants, for their demands for tips are far more impudent and exorbitant than ever before. This nuisance has increased enormously.

SHELVERDENE'S PLOT.

CHAPTER II.—*continued.*

VII.

IN her mien now were the completest mockery and triumph; and, her hat being high-crowned, so that it reminded me of a witch's hat, she made, to my thinking, a picture of a beautiful, cruel witch. Yet, because she moved slightly, showing me how her foot dragged, I had no wish to upbraid her save on one point.

'Madame,' I said, 'I am glad you escaped harm, for there is great justice in all you have done to me. But I blame you for the slaying of the poor lads that were with me.'

'You slew them. You would not suffer them to yield. Also, came they not hither to slay others?' Her eyes flashed indignantly.

I answered no word, having scant inclination to argue. For a space I stared down at my clasped hands. Yet I could perceive a movement she made, a gesturing outward of her pistol-hand from her side, and its sinking back; the movement (no threat to me) so telling of troubled thoughts that I looked up astonished—to find that trouble was in her face, though forthwith it was changed to composure.

'All I have done to you, Shelverdene?' she

said, taking up the phrase I had used. 'That were stingy payment to me. What I shall do will be better.' With a sudden action she aimed the pistol at my head. 'Have you any arm?'

I raised my eyebrows. I think I smiled at this menace. 'Not a penknife,' I replied.

She let the pistol hang by her side again. 'Then my purpose is very easy to carry out. I am lodged at a farmhouse, a mile from here, where are stout herdsman that will bind you in readiness for the soldiers. I bade not any come with me when I spied you, for I desired that we should speak privily.' She gave a gentle sigh of contentment, her head falling anew to one side. 'Shelverdene, I shall feel paid in a week or two, when you are on the scaffold-boards; nothing can save you from them.'

'Nothing in the world, madame, except your foolishness to bring no men. I shall not go to the farm.'

'Then I will shoot you.'

'I trust you will, for you have so ruined me, I shall be grateful for a pistol ball.' I held my eyes on hers to let her read from them I was not fibbing; and in an instant her prettiness and her lamed condition stirred me most deeply, and

I was forced to add, 'Verily, child, I think I want to die by your hand, if that will end the debt between us. This sight of you hath made me more than ever wish to end it. And to be shot by you, out here in the country sunshine, will be a sweeter way to die than I had hoped for.'

She searched my eyes intently, deeming, I imagine, that I had descended to craven flattery on the chance of coaxing mercy from her. Finding that I was calmly in earnest, she could not keep a flicker of surprise from her own eyes. I saw them soften eloquently for a bare second, and a darker colour in her cheeks. But then she gibed, as though she had fathomed me wrongly.

'Nay, Shelverdene; thou wilt not cajole me at last with sneakish words and a good-looking face.' She bent more towards me, and her lips actually quivered fast from an access of anger. 'Ay, of a surety, thou art good-looking, though older than my father. . . . Good-looking!' Her voice rose vibrantly, and she held her maimed foot forth an inch for me to note. 'Good-looking—limber. And see what thou hast made of me, that was but a child in thy power, and, for love of Holy Gospel, should have been spared. . . . Dost thou dream I shall have pity? Nay, Shelverdene, nor pity enough to kill thee. I shall shoot through thy knee or hip; and thou wilt not crawl far while I am gone for the herdsmen—I warrant me thou wilt not.'

She rested with greater dependence on her crutch, breathing quickly from her speech. Lifting her pistol, she surveyed carefully the priming and the cocked hammer, yet with the corner of an eye on me. Anon: 'I must be closer for delicate shooting,' she said; and, moving a few yards, to where the bank sloped gradually to my level, but having always that corner of an eye on me, she picked her way down in a mode both graceful and sad to watch, and came right to me.

'It is true you have no weapon?' she asked.

'What odds if I had?' I said sullenly. 'I put you to the question that I might save a lad's life. I would not hurt your finger-tip to save my life.'

'More cunning words.' Her mouth rippled tauntingly. 'You hope still I may prove a fool—eh, Shelverdene? Well, I think you have no weapon; and so'—she looked longingly at the side of the bank just opposite to us, which was wellnigh perpendicular to the flat turf—'and so I am very safe to sit.—A crutch is a weary thing in marshland. . . . No!' she cried, as I would have risen to aid her. 'I will not take courtesy from you, that I mean shall perish like a dog.'

VIII.

Skilfully she lowered herself, and sat with her back against the bank, laying the crutch to one side of her, and resting the long, polished pistol on the other, but never ceasing to hold this. The sun had begun to pour hotly on the

bank. She took off her great, heavy witch's hat, shook out the curls she had freed, and leaned her head lazily amid the grass.

I had a queer thrill of pleasure at perceiving how fair was her brow, and how enhanced her hair when uncovered. She discerned my thoughts.

'Yes,' she said derisively, 'despite my foot I lack not wooers, for all that you spoiled twain in Dublin. . . . I am told you are not wed, wondrous, quick-handed swordsman.'

'Tis so,' I answered.

'I am pleased. I had liefer not bring sorrow to a woman—or a child. . . . *Holà!* How cometh Master Swift-hand by an old rapier scar on the throat!'

'By the finest blade that was in Britain—one Colonel Loomer,' said I thoughtlessly.

Her eyelashes fell. She gave an uneasy sigh. 'I know why you fought. Lackaday! that I do know. . . . Yet, not that—nothing—shall put me from my purpose.'

'Regarding this purpose, madame,' I said; 'I will not suffer to be carried to prison. Be resigned to that. You say you will but wound me.' I smiled tauntingly in my turn. 'I shall find means to be dead ere you come back.'

She lifted her lashes, meeting smile with smile.

'Very brave. But I deem you will do as I bid when I point my pistol at your knee, which shall be in a minute, when I am rested.'

Her tone rang with confidence. Well I knew, though, that my will would be stronger than hers in this matter; and, perchance with some disdain, I diverted my gaze from her, and contemplated steadily the grass beside her cheek.

The bank was parched, and the long grass, in contrast to the herbage round about, already much browned. I was conscious of a half-hid hole a yard to the right of her; and presently my attention was caught by an unaccountable pattern showing through the grass between the hole and her. It was a dark, zigzag ribbon, edged with a length of dark blotches. Of a sudden all moved undulatingly, with a gloss as of oil now visible around them; and I saw rise, within a hand's-breadth of the white throat before me, the head of a snake.

I swayed forward on to my toes. 'Do not shoot!' I whispered; and, leaping with my whole strength, I fell across my captor. My knee snapped the crutch; the long pistol, jabbed like lightning against my midriff, slid as it was fired, and, I was sure, blew a hole to put one's head through in the back of my coat; but the only happening which interested me was, that I had the serpent's head safe in my palm, and was crushing it finely, the beast squirming and like a steel spring to feel.

Denis Irby's daughter, her face close to mine and her rage frenzied, wrenched the pistol from between us and struck my cheek-bone savagely with it, holding me with her left hand. She

swung the pistol to let me have a rare buffet—and the lashing body of the snake touched her wrist. She looked, screamed in horror, and released me.

Whereat I jumped up, set one boot on the snake, freed his head, and stamped the life out of him. Then, turning to the girl, I saw her sitting with the whitest face, watching the still-moving snake.

IX.

'Madame,' I said, 'will you not let me charge the pistol, for fear I shall escape?'

'The poison-adder,' she muttered quaveringly, 'such as killed the ploughman last Tuesday.' And then she looked at me. 'Your hand? You held it!'

I had been groping round my back for powder-sparks. Now I glanced at my palm. There was a hurt spot, pinched and nicked, which reminded me of a squeeze from a gun-hammer.

She saw. 'And you have no knife,' she cried. 'Nor I!' She stooped and ripped a silver buckle from her shoe, and held it forth. 'It is sharp. Slash, tear, make the blood pour.'

I moved a few paces from her, to where a pool was, and—though only to soothe her, since a dose of snake-venom offered an excellent escape out of my troubles—tore and gashed my palm deeply, bathing it also.

'Suck, suck,' she cried. 'Oh, harder! Come hither, that I may try.'

'Nay, indeed,' I answered—several times, for she persisted.

But anon, turning to her after I had rinsed my mouth, I found her coming towards me on her hands and knees. For a second I was amazed. Then I understood—her crutch was broke.

'Madame,' I said, 'will you be pitiful in one thing, and let me not see this? . . . Madame!' I pleaded, and stopped, too disordered to say more.

'I think you are bled enough,' she said, kneeling and then sitting back on her heels in a fashion which told me that the maimed foot had no suffering in it. She took a handkerchief from her breast. 'Have you one?' she asked.

I shook my head, having lost mine on the beach, where, together with my neck-bands, my ruffles had been torn off.

She looked down at her collar, doubling her chin into her throat in an attitude that was most alluring. Then she untied the cord of the collar and drew it off.

'Suck again,' she said; 'give the wounds another wash, then come hither to me.'

And I stood by her, perceiving with content that her colour was all returned, while she bound my hand with the collar and the kerchief. That done, with no hurry, even pensively, I thought, she glanced up at me with a glorious smile, her eyes bereft of any shadow of dislike.

'Sir Edmund Shelverdene, this makes a great difference.'

'You have forgiven me a little of my wrong, madame?' I asked, my voice trembling with eagerness.

'A serpent would have bit me in the throat, she said—'me, that meant to have you die. You saw. You knew it must rescue you. You knew I should shoot. But, to save me, you risked my pistol and put your bare hand on the snake. Verily, Sir Edmund'—with a reviving of mockery, but this very sweet now—'verily, it were unthinkable I should forgive.'

She lifted her hands to me, and swift was I to clasp them and to rest my lips on one. Then quietly she said, 'Your left hand was the nigher to the snake; but wise were you, and 'twas your sword hand, your fast hand, you drove athwart me with such speed I could not see it. Your sword hand, that did reproach and wring me in my—my dreams to slay you, so that I jeered it viciously to-day.'

'Reproach—wring?' I asked, raising my eyes to look at her.

'My father—dear, gallant man—is yet no Shelverdene or Loomer with the sword. Did not your hand twice spare him?'

'If so, child'—for I would not lie to her—'methinks his death is the only suffering in all the world I have not given you.'

And picturing the long, piteous contest in her soul which her words had told of, I kept her hands, watching her eyes grow ever sweeter as they widened slowly, bidding me perceive how fully I was pardoned. Ay, I kept her hands for a minute. Then, when they were leaving me, I asked with a sigh: 'Have you a charge for your pistol? 'Twould be of use to me.'

'No.' She regarded me questioningly, uneasily, her fingers stayed by my words.

'Little matter,' I said, and kissed her hand again. 'Since you forgive, I am happy, and the scaffold will not force me to be otherwise.'

She shook my hands reprovingly. 'Why talk of scaffold? Is not that forgot between us?'

'I saw soldiers searching for me, as I washed my hand,' I replied. 'Perchance, they heard not the pistol; yet I can in no wise escape.'

Her fingers tightened sharply round mine. 'Aid me to rise,' she said; and when she was risen she added: 'Will you hold me? I cannot stand very surely alone.'

I gently steadied her by her arms, and strange it was to be holding her thus, near to me—strange, delightful; but the remorse of it! 'Oh, child,' I said. 'If I could have lived! If you would have let me woo you!—for in this half-hour I have come to love you madly and for ever! . . . Child, if I could have been your husband, to pass my life in serving you tenderly, in striving to make amends!' I laughed sadly. 'Faith! the power that would have been yours! For did ever we differ on a question, you should need but to bid me hold you, but to point to your crutch, and straightway I should think as you.'

'Come,' she said, 'you are very careless of your peril. Now is not to woo, but to do.' And yet, with a soft, caressing gesture, she raised her hand and touched the bruise which the pistol had left on my cheek. 'You must carry me to the farm,' she said. 'Have you strength? You look so weary.'

'Strength to carry you anywhere,' I answered, lifting her in my arms, 'if the soldiers hinder me not. But assuredly they will.'

I moved a pace, and stopped, observing her hat and pistol lying on the grass.

'Leave them,' she said; 'I want to bring you quick to Elphick's farm.'

'Simon Elphick's?' I asked, walking forth past the bank with her; and, on her nodding, I said, 'I think he would be friendly to me.'

'I know,' she replied, 'from his bearing when I spoke ill of you. And my father will be your friend when he learns of this morning. I must instantly send to London for him.' She shifted, and slipped her arm over my shoulder, saying that thus would she less burthen me; and continued, 'No soldiers are at the farm. 'Twill be a marvel if Elphick, and my father and I—your known enemies—cannot hide you securely there and put you over the sea.'

Her face lit with confidence; and my arms tightened about her as I looked on it, telling her of my gratitude. But I was sure she would have no chance to help me.

X

Our straight path to the farm lay clear, but on starting I had noted, a half-mile to one side of it, the heads of soldiers, in the midst of some bushes they were beating for me. For a while, however, I gazed on her, unheeding the fellows. I should see enough of them anon, but never more in life see these lips and eyes.

When I looked up, the soldiers were withdrawn from the bushes, their faces being towards us, so far as I could discover, for they were a good distance off. Then suddenly they hurried to intercept us. By their scarlet-and-yellow 'night-caps' and the form of their like-coloured coats, I could tell they were Fusiliers, whom the government, perhaps for money-saving, had kept in their uniforms of King James.

I bent again over her I bore.

'I shall not get to the farm,' I said. 'There are soldiers running to cut me off.'

She turned her head quickly to see.

'I believe you will get to the farm,' she replied quietly. 'Wait, I will stand for a little, that you may take ease; for you must not put me down when they are near. . . . Nay, face not to them, though they be so far.' She stood between my hands, fingering a loose button of my sleeve. 'I suppose,' she said, with a touch of pride that I durst not deem I was the reason of, 'I suppose that most soldiers know Colonel Shelverdene's face!'

'I can vouch for those Fusiliers,' I answered. 'I saw much of them two years ago, when I took a command again on troubles threatening the King. Ay, since they seek me, they will recall my face.'

'Tis well I have a plan,' she said. She began to pull off her cloak. 'You must wear this, to cover the hole I have shot through your coat; else will the soldiers think it was done last night on the beach.'

Together we got the cloak about me, and then she fell silent, leaning once or twice to peer past me to find how near were the soldiers.

'Lift me,' she bade at length, with a tiny gasp and a hot flushing of her cheeks that I could not account for.

'Sir Edmund,' she said, as I obeyed—and her arm closed round my neck; 'to hide your face, yet give them no suspicion, I—I shall play your lover—your bold, horrid lover.' She met my eyes imploringly, rapid, nervous twitchings at her nostrils. 'Sir Edmund, you will know it is all make-believe!' She glanced towards the Fusiliers, and threw her other arm round my neck. 'Sink your head,' she whispered. 'Do all I say; and when you cannot see I will guide you.'

She had contrived to press my peruke partly across my face, which, moreover, was now in her hair, so that I could use but one eye. That showed me the soldiers standing prepared for our coming, their officer taking a pace in our direction.

He was some hundred yards away, when the arms about me drew my head right down. The cheek of Denis Irby's daughter lay against my peruke, and my face was held hard upon her bare neck.

'Make-believe,' she reminded me tremulously; 'for who shall look for Shelverdene's face on my breast?'

And then, her arm and shoulder rising to guard me more, she began to carol and to laugh, and to direct me by calling, 'Straight forward—to the right—to the right,' her tones thrilling against my mouth, of which the lips were folded, and clenched by my teeth, for I must have kissed the place whereon it was pressed, had I not fought my hardest to be guiltless of such dishonour.

I felt the racing beat of her heart, yet her voice had only cool laughter in it when presently she cried: 'Captain Grey, I broke my crutch; but he who is to wed me came and found me.'

I heard a man reply, saying envious things of me.

'To the left—straight, my blind horse,' she cried; and we were through.

I had a week for wooing her, but, in some marvellous wise, she was back in my arms as my promised wife ere half that time was passed;

and on the night that Denis Irby was to lead me to the fishing-galliot which would sail me over to France, I kept him many minutes waiting for me at the gate of the farm. His daughter's voice and mine had bidden him believe the delay was for stuffing my pockets with food and a brandy-flask. Doubtless he believed no such tale, and, maybe, he smiled,

little guessing what relentless importuning of him was being hatched in the porch of the house. For there, the dear lips which spoke against mine were urging, 'Beg him let me follow thee soon. Beg him! beg him!' And mine were replying, 'Three miles to the galliot, sweetheart! And I will din his ears at every step.'

THE END.

INCONVERTIBLE PAPER MONEY AND CURRENCY PROBLEMS.

By JOHN D. LECKIE.

NEARLY all the late belligerent Powers, except the United States and Japan, are now contending with the problem of an inconvertible and depreciated paper currency. By 'inconvertible' is meant paper money which has nominally a certain gold value, but which, not being readily convertible into gold, is really worth much less.

The experience of practically every country that has issued inconvertible paper money has been an immediate depreciation in its value or purchasing power—in other words, an increase in the cost of living. The recent war was not the first occasion on which the British Government authorised the suspension of gold payment of currency notes. This was done in 1797, during the Napoleonic wars, and the complete resumption of gold payments was not effected till 1821, after a lapse of twenty-four years. The gold value of the paper £1 fell to about sixteen shillings; but the total expense of those wars, though spread over a period of more than twenty years, was small in comparison with the expenditure in the recent World War. The immediate result of the financial measure of 1797 was a decided increase in the cost of living. The mutinies at Spithead and the Nore, which broke out in the same year, can be traced in part to the same cause, the seamen complaining that, notwithstanding the augmented cost of living, their pay remained unaltered, and was wholly inadequate. The demands of the sailors were ultimately conceded—though some of the mutineers were executed.

Seven years previous to this (in 1790, soon after the outbreak of the French Revolution) a great part of the lands of the French clergy had been confiscated, and on the security of these lands the Government issued notes called 'assignats,' which were supposed to have a gold value, but were not really payable in gold. Subsequently these assignats were issued to such an enormous extent (45,578 million francs) that they rapidly depreciated in value. The effect was to increase the cost of living enormously, to disorganise business, and to cause a general demoralisation. How far the excesses of the revolution may have been thus produced it is hard to say. In March 1796 a golden 'louis'

was worth 7200 francs in assignats. The assignats were redeemed at a thirtieth of their nominal value by 'territorial mandates,' which again, in their turn, fell to a seventieth of their nominal value. The mandates were called in, in the year 1797. Thus ended this miserable system of finance which brought untold disasters on the country.

The Bolshevik revolution in Russia is said to have originated in a somewhat similar way, the first step being an overwhelming issue of inconvertible paper money, resulting in a great increase in the cost of living, general strikes, and a revolution.

The case of the United States offers another example. During the Civil War in that country the Government had recourse to the issue of inconvertible paper money. These notes, known as 'greenbacks,' from the colour of the ink with which they were printed, soon fell in value; in 1864 the paper dollar was worth only thirty-eight cents in gold. On the conclusion of the war, by a steady process of redemption, the value of the paper dollar was gradually raised, and the cost of living proportionally reduced; but the redemption was not completed till 1879, when the paper dollar was once more at par. Thus it took the United States Government fourteen years to redeem its depreciated paper, though the expenses of the Civil War were small in comparison with those caused to Great Britain by the great World War. It may be added that the years which followed the close of the Civil War were, on the whole, prosperous ones for the United States. It was during this period that the first transcontinental railway and the first permanent transatlantic cable were inaugurated. The fertile plains of the West were opened up, and a great rush of immigration ensued. The rapid increase of wealth and population thus greatly facilitated the financial problem which beset the United States Government. These remarks apply only to the paper money issued by the Northern States. In the Southern States the position was much worse. The paper notes issued by the Southern Confederacy fell in value till they were worth only a few cents to the dollar; after the collapse of the confederacy they were only worth the paper on

which they were printed. These notes, known as 'bluebacks,' bore on their face a promise to pay in gold 'two years after the conclusion of a treaty of peace with the United States.' Needless to say, that treaty was never concluded.

Recourse to an inconvertible paper currency has been in some South American countries a favourite mode of solving (or rather evading) financial problems. In Colombia the dollar fell to less than a halfpenny in value; in Paraguay, when the writer lived there, it was worth a little over twopence, and it afterwards fell lower. In Argentina, also, the paper dollar was at one time much depreciated, but some years ago, during the presidency of Pellegrini, the Government took the step of reconverting the paper to a gold basis 'at the rate of exchange of the day,' which was forty-four cents gold to the paper dollar. This measure, though denounced by outsiders as a partial repudiation, gave general satisfaction to those on the spot, who were most affected by it. It was accepted as the only practical mode of a prompt return to a gold basis. It must be remembered that the paper notes were not all issued when exchange was at or near par; most of them were issued when the paper dollar had already a greatly depreciated value. The operation practically amounted to this: that the Argentine Government bought in its own notes in the open market and at current market prices—just as the British Government, on more than one occasion, has bought in consols in the open market at much less than the price of either issue or redemption—their value having fallen in the meantime.

In Brazil, owing to the excessive issue of paper money, the value of the milreis (worth at par two shillings and threepence) fell at one time to below sixpence; but owing to a process of gradual redemption and other sound financial measures, the quotation gradually rose, and has recently stood at fourteen to sixteen pence—the cost of living being correspondingly reduced.

The confusion and demoralisation caused by a prolonged or excessive issue of inconvertible paper money can scarcely be over-estimated. Among other disadvantages, it places a great impediment

in the way of foreign trade. We have seen this in the case of trade with the United States; the continually fluctuating value of the dollar as compared with the pound has led to serious complications and losses. Yet in the case of countries like France or Germany, the evil is greater still; for in the United States the currency is still on a gold basis, whereas in the case of international trade between Great Britain and Germany or France, each separate country has a depreciated and fluctuating currency, even measured on a gold basis. The confusion, in fact, is so great that commercial transactions are almost impossible except by barter. But barter can seldom be effected at a distance; in most instances it requires the presence of both buyer and seller. In fact, it brings us back to the conditions of a remote antiquity, as in the time of Sindbad the sailor, when the merchant made a voyage on his own account, took his goods with him, sold them personally on the spot, or exchanged them on the spot for other goods, which he took with him and sold on his return home. Only in this way could the complications of exchange be avoided. And this has actually happened of late in the case of continental merchants, who have been compelled to make their purchases and sales on the spot, this rendering frequent trips necessary to the great trading centres.

In the Argentine Republic, before the reconversion to a gold basis, all imported goods were paid for (and also sold) in gold, while articles of local production were sold in local (paper) currency. The consequence was that every merchant and shopkeeper had to keep a double set of books, one in gold and another in paper, with constant conversions from the one into the other at a rate which fluctuated from day to day. For although imported goods were sold in gold, there was no actual exchange of gold coin, which was often unprocurable; the payment was really made in paper money 'at the exchange of the day' when the payment was made. Hence the necessity for these constant conversions, and of a system of accountancy which more than doubled the task of book-keeping. But to enumerate all the defects of an inconvertible currency would require a volume in itself.

OCTOBER STONES.

By G. TREVOR ROLLER.

I.

DOMINGO sat smoking in the straight-backed, uncomfortable American rocker that he had trained his body to appreciate. He had paid ten pesos for the thing, so surely it should be the fulfilment of comfort; anyway, it wouldn't be for the want of trying if it wasn't. Domingo was surrounded, in his two-roomed adobe house,

with uncomfortable bachelor things. The room he sat in now was his front parlour, dining-room, office (not that he ever had to do much official work), reception-room, everything. In Mexico many houses have the same type of room. The other compartment, opening from it, was the bedroom; in this case it contained nothing but an old stock saddle. No bed, only four walls, a window—unglazed—and a door; in solitary state

sat the saddle. Domingo's bed consisted of a *patate*, or straw mat, on the floor of his *multum in parvo* front room.

But Domingo was not thinking as yet about his bed. A book lay beside him on the unplanned pine table, and he was thinking of it, for he had just finished it after some days of careful reading. Oh yes, he could read, truly an accomplishment in one like himself, a *vaquero*,* for in Mexico many a man who works with cattle cannot read a word. But he was a lonely fellow, lucky enough to have a house left him by an uncle who had cut off his son from the property because that son had joined the wrong faction in the last revolution—or was it the last but one? The uncle wasn't sure, while he was dying from a surfeit of *agua vida* taken on a hot day. And Domingo did not care the price of ten cigarettes, as he got the adobe house and all that therein was—not much certainly.

Being lonely at night, not caring for promenading after ladies round the Plaza, and loathing drink because of the terrible example of his uncle, who died prematurely and not quite sound in his brain, Domingo took up education.

Having learnt to read, he bought numerous paper-backed atrocities (all generated in the United States) of the 'Bloodstained Putty Knife' type, translated by educated—heaven save the word!—Mexicans.

So there he sat digesting his last meal of 'Iron Claws,' 'Masked Criminal Catchers,' and what not, in his American rocker, smoking a cheap but excellent Mexican cigarette, and looking out through the open door on to the finest thing in the world, virgin ground as God made it, unspoiled by the wrecking hand of man, who cares naught for beauty—only for stomach-filling efforts. He looked out and saw nothing; he missed that great expanse of moonlit plain dotted with sage brush and rank cattle grass, the ridges of alkali that silvered as they caught the moonbeams; discerned nothing of the dark-blue mountains that rose and blotted out the things beyond, calling for the searcher, the one who would have Romance.

It all went unseen by this child of nature who had got 'education' and had lost his natural soul.

Domingo spat on the mud floor and lit another cigarette. Leaning back, he ruminated on how he could thwart the police, supposing he stole the hair-and-hemp lariat belonging to Ignacio Larrelde, the boss of his outfit. As he rocked and thought and smoked, to his ear came a distant sound, the thud of a horse galloping over the alkali.

He sat up listening.

'Why should a horse gallop over the plain to-night? None of his lot—he knew what each was doing. A loose horse frightened? No! going too steady for that.' So flew his thoughts.

'A man in a hurry,' he went on thinking, 'with death or *Rurales*† behind.' His distorted imagination, plus 'penny-dreadful' literature, made him relish that thought.

'Riding for a doctor? No doctor hereabouts. For the *Rurales* themselves? What?'

He rose, shut the door, and looked from behind the candle through the window. Then he saw them, horse and rider swinging along in the moonlight, dodging the sage brush, but holding a straight line for his house. With a slithering sound they pulled up at the door. Domingo reached back to the wall, took down his revolver and belt, fastened the belt round him so that the butt of the gun was easy to his right hand, and advanced to the door.

II.

'Good-evening, cousin,' said the rather out-of-breath man holding the very out-of-breath horse.

Domingo gulped. Mother of Saints! this was the cousin who joined the wrong faction in the last (or the second-last) revolution—who might have owned this very house.

'Why, Don Pedro, cousin, you are welcome. Everything in my house is yours;' politely said Domingo, sliding his hand on to his gun. 'But the horse, let us take it to the corral; there is plenty of *paha*‡ for it,' he went on.

'He is nearly a dead horse,' said Pedro, undoing the cinch. 'To-morrow I must borrow one off you.'

'Everything that I have is at your disposal. But why this great hurry? Is it for a wager?' Domingo queried. Pedro swung the saddle off the pony's back and in through the door.

'Yes,' he said, still rather breathless, 'a wager with—*ah cielo!* let me put the pony away and I will tell you. Then, after a rest—only an hour or two—I must be away again.'

'You have the manner of a frightened deer,' sighed Domingo, as he removed his hand from his gun.

They put the pony into the corral, and returned to the house.

Once the door was shut Domingo—a bully at heart—faced his cousin. He, the cousin, had shown he was, to say the least, a bit upset.

'What have you stolen?' asked Domingo.

Pedro looked him up and down, not missing the large forty-five Colt hanging below his hip. Then he smiled.

'I have not stolen, but have taken something that a certain Señor Don Gonzales Reyes claims as his.'

'Opals!' gasped Domingo, his eyes nearly bursting themselves to find where Pedro had them secreted.

'Yes,' went on Pedro; 'uncut opals from the ground he claims as his—but 'tis not. It is open country, and always was. But now this over-fat Reyes—may the good saints forget him!

* Cowboy.

† Civil guards.

‡ Straw chaff.

—claims the place as *his* opal-field, and has it guarded at night by his own men—what he pays them to be honest the Virgin knows. By day the *Rurales*, who don't belong to the present government, patrol it and escort you across, as is usual on every opal-field, and if you attempt to pick anything from the ground you are shot. But I—well, I camped near and searched in the moonlight. Cousin, I believe that by the light of the moon one can find the best stones—they wink at you with all their colours. Also, the *peones* who are hired to guard at night can be circumvented by one who crawls on his stomach warily. But those *Rurales*! God helped me, for they do not work at night.'

'But why,' asked Domingo, 'did you leave so hurriedly? Had you as much as you could carry?' And again he surveyed the slim figure before him. Uncut opals are bulky.

'No, because I was seen last night. I ran, jumping sideways and sideways, for they shot. I reached my horse. It was a moment to fling on a saddle and ride for my life. I accomplished it, señor.'

'Your life!' gasped Domingo; 'but what of the stones?'

'I had them ready packed here.' Pedro took a stride to his saddle and patted the saddle-bags.

Domingo, overwhelmed with excitement, implored to be shown this wealth that Pedro had accumulated. Out came two gunny sacks, one from each side of the saddle; the sacks were opened, the treasure displayed.

Uncut opals are worth very little, so much depends on the cutting and the polishing—a huge percentage powder to worthless stuff in the process.

Probably the value of Pedro's theft was about fifty pesos (five pounds). Pedro—knowing nothing about it—imagined he had a small fortune.

Domingo thought the same, and they fingered the uncut stones lovingly.

'Come,' said Pedro reluctantly, 'I must rest, if only for two hours. Can you awaken me in two hours' time?'

Domingo glanced at the stones, then his eye fell on the penny-dreadful. 'Yes! yes!' he said hurriedly. 'But are you followed, er—closely?'

'No,' said Pedro considering, 'not closely followed, but for some days they will search. They may come asking to this house, asking questions.' His eyes closed for a second or two, and he swayed against the table. 'I must sleep, just a short while. Here, take these.' He dived his hand into the nearest bag and put on the table a quantity of the uncut stones. 'They will repay you for harbouring me, for the loan of a horse. I leave my pinto pony with you as *conflancia* (surety); he is better than any two you have.'

'But the law; I do not wish to come under the law,' murmured the educated Domingo, fingering the stones.

'Oh, to the devil with the law!' cried Pedro; 'it cannot touch you. You will know nothing of me, if questioned, only of a man who craved a meal from you and rode on to the West—the West, mark you.' Again he leant against the table, dead-beat. Then, noticing Domingo's attitude of still-not-persuadedness, he went on hurriedly, 'After all, Domingo, you owe me something. My father left you all this, when I was the natural one to have it. I have never grumbled.' (No! because he had been too busy with his revolutionary efforts to worry.) 'You have lived here in peace, lain in the house that was rightly mine. Here, take these also.' He dived again into the sack, and produced more stones.

'Bueno,' sighed Domingo, 'you can rest and welcome for two hours. Here is food—and also, though I never touch it, *tecela* the best. Drink of it; it will make you wake refreshed.'

Pedro ate hurriedly and gulped down a large *copet* of *tecela*, which is a potent liquor almost pure alcohol. Domingo filled his glass again, and, breaking his rule for once, drank himself—as he said—to the speed of the good horse he would lend Pedro to reach the state border on, where he would be more or less safe.

Pedro entered the small back room unsteadily, fatigue and *tecela* having made him not a little drunk; but he did not forget his two bags. He rolled his blanket round him, lay down with the bags cuddled to him, his head on the old saddle. Domingo closed the door, took another pull at the *tecela*, then plumped himself into his rocker.

III.

'Certainly,' thought Domingo to himself, 'in a moment or two I could enter that room and take the treasure. The drink was strong; he drank as if 'twas water. He will sleep like a log. But he would awake, and then I should have a bad enemy on my heels, or he would take over this house and I should lose it, and my two ponies—also his pinto. Certain, I should be rich with all those stones, but I know little of Mexico, and I would rather be rich here with people I know. No, I cannot appropriate the stones, unless'—

Here Domingo derived much benefit from his extensive study of crime in his lurid books, and he constructed a nice little crime all on his own account, something after this fashion. First, he must shoot Pedro. Unfortunate for poor Pedro, but entirely necessary—besides, would not Pedro do exactly the same by him if the positions were reversed? Then he must bring the body into the front room and place it as naturally as possible, lying face down on the table. Next he must fire two shots out of Pedro's revolver and put it back in Pedro's hand. Then he must empty the opal rubble into his mud stove, and fill the sacks with waste from outside, with a few opals on the top of each, laying them again by

the dead man. After that he would ride off, find the searchers, and tell his alarmed story of a man who came to his door demanding food, saying he was being pursued, even boasting of his stolen opals. He, Domingo, like a good and stubborn citizen, refused succour to a *ladrone*, a common thief, and reached to the wall for his gun. The man fired twice, but Domingo's saints were with him. He seized his own revolver and fired, meaning to wound. Alas! he killed the man. He left him in his house and rode forth to acquaint the thief's pursuers and lead them to their quarry. Certainly a good story. He probed it for a possible flaw. Perhaps a shot through his hat where it hung on the wall near his revolver? Yes, certainly, that should be arranged.

Then he had another *copeta*, strapped on his belt, and proceeded to enact the part he had planned to play. He went round the house to the unglazed window. The moon shone white on Pedro's forehead. Domingo rested the barrel of the revolver on the window-sill.

Domingo took the sacks, emptied them in the mud stove, filled them as planned, tied them up and placed them on the table.

He carried the body—not noticing that it was bootless, for Pedro had kicked off his boots before going to sleep—and laid it, face down, over the bags, right arm outstretched. He pulled the automatic out of the holster—a smaller bore than his own—and fired two shots, one through the hat on the wall; then placed the weapon in the dead man's hand. He picked up Pedro's saddle, and without a look behind went out into the night.

The moonlight shone through the still open door on poor unlucky Pedro, whose birthday was in July.

IV.

Domingo entered the corral and caught the nearest pony. He did not have to rope it—simply walked up and put on the bridle, never giving a thought to the fact that it was Pedro's pony. Then he saddled it and rode off.

His search for the pursuers did not take him far. Over the next ridge he found them—all *Rurales*, with a sergeant (or the equivalent) in charge; they had just made camp. He told his story to the sergeant. Immediately they saddled up and rode to the house, turned their horses loose in the corral, and inspected the damage. There were six of them who trooped into the house after Domingo, who showed them how the robber entered, from where he shot, the bullet holes—one through his hat—the bags, and how he had fallen on top of them. Then, quite overcome, he sank in his rocker, and offered them the hospitality of his house. He was so upset by the events of the evening, he explained, that he could not play properly the part of host.

The sergeant quite understood.

'You have shot this man,' he said, 'and

naturally you now regret it. But it is as well. He would have lived to be a bad man; I am certain of that. He got away with only a few dollars' worth of opals, and we wished to make an example of him as a reminder to him another time. But what matter? He tried to take your life—you took his—it is just as well.'

Domingo offered them *tecela* from his big jar. They accepted it, and conversation became general, the corpse having been laid decently in a corner.

'When the *ladrone* made his escape from the opal-field,' ruminated one, 'it was reported that he was clothed in dark clothes.'

Pedro in his run for liberty had thrown his dark blanket over himself, so as to make less of a target.

'Well?' questioned the sergeant.

'Oh, nothing,' went on the inquisitive one; 'but the poor dead one wears a white linen coat.'

All eyes seemed to turn on Domingo for the answer. He was clad in leather *chaps*, with a dark-blue waistcoat and a brown shirt.

'Possibly the guard was deceived,' he said; 'perhaps—a lucky shot—he covered his back with his blanket.'

The talk went on as the *tecela* went round. Some one suggested hot water. Domingo did not hear the suggestion, so behind him one of the men began to make a fire on the mud stove.

Presently the fire-maker had a complaint.

'The draught,' he grumbled, 'will not draw.'

Domingo leapt up, realising what was happening.

'No,' he cried, 'that stove will never draw a good fire. Come; I have a spirit stove to heat water.'

Then suddenly the sergeant rose and pulled the blanket off the feet of the dead body.

'He wears no boots, does this miserable one,' he announced. And again the six looked at Domingo, not for an answer this time, but with suspicion.

Then one man rose, an elderly man with gray hair and a keen eye.

'Sergeant,' he said, 'while you were making camp, I rode on to the ridge before us, hoping to see some ranch. I saw no lights, but I heard a shot. I listened; after some time I heard two more. This man says that the man there—may the saints take his soul to heaven!—fired twice at him, then he killed him at his first shot. I heard differently.'

Domingo, feeling that things were now getting really awkward, rose to explain, but unfortunately the man with the culinary bent had been grubbing down the flue. Suddenly he came to the candle on the table.

'Cielo!' he cried, 'these are uncut opals. Look!' and he spread them on the table.

Some one seized the yet unopened bags and poured out the contents, some opal native stuff and the rest rubble.

Without any order being given, Domingo was seized and held.

Then the sergeant put in a bit of thinking, and for one who had not studied the same literature as Domingo, reconstructed the crime quite nicely. He was a lot out, but the end justified the means.

'You,' he said, addressing Domingo, 'are the man who stole the stuff from the Reyes opal-field. I know this, because you are dressed darkly; the dead man there has a white coat. You rode a pinto pony away from the field; you met us on a pinto pony. What you did was this: you came to this house and killed the poor one there—look, he has no boots. He was sitting in here, and you shot him as he sat, then secreted your gains, arranged the picture for us—a pretty picture, but not clever enough. You are the thief, also the murderer of the poor man sitting here in his house. You come with us.'

'But I am the owner of this house,' shrieked Domingo. 'I can prove it to-morrow.'

A man entered from the room behind with a candle.

'He shot him sleeping, señor,' he said to the sergeant. 'I have been in there. Blood on the floor tells of it, and a hole through an old saddle

made by a bullet; also a pair of boots. The poor fellow must have laid his head on the saddle. Ah! heaven, what a villain!'

The sergeant motioned for silence. Domingo, knowing the game was up, wilted into his expensive rocker. Then the sergeant spoke.

'In Mexico we have a law; it is called "*El ley fugal*." What it means is this—to my mind: Should a prisoner attempt to escape, shoot him. It saves much litigation at times.'

Then he turned to his men.

'Take the prisoner to the camp,' he said quietly.

They shoved Domingo out of his own cottage into the dark, and the door shut.

The sergeant sat in the American rocker, helped himself to another *copeta*, lit a cigarette, and waited. Presently he heard four or five shots. He puffed away at his *Buen Tono*—and waited. The sound of footsteps came to the door, and one of his men entered.

'The prisoner,' he panted, 'attempted to escape. We shot him.'

The sergeant smiled. '*Bueno*,' he said. 'I do not believe that that man's birthday was in October.'

THE MONTH: SCIENCE AND ARTS.

PRODUCER-GAS FOR CARS AND BOATS.

THE prices of petrol and paraffin having reached such high figures, with little hope of any fall in the near future, other sources of power for road-vehicles, aeroplanes, and boats are attracting an unusual amount of attention. Although unsuitable for aircraft on account of the weight of the apparatus involved, producer-gas has proved a practicable proposition for cars and boats. Until the advent of the producer patented by Lieutenant-Colonel D. J. Smith, however, the apparatus was also too heavy for road-vehicles. Most of our readers will know that the ordinary petrol-engine can be run on coal-gas practically without alteration. It is likewise possible to use what is known as producer-gas, but at some loss of power, this averaging about 20 per cent.; while the consumption is greater than that in an engine specially designed for the purpose. At the same time the results are remarkably good, as will be shown later. Gas suitable for engines can be generated very simply from coal or coke. The producer devised by Lieutenant-Colonel Smith takes the form of a cylinder having a refractory lining and a fire-grate at the bottom. A fire of anthracite or coke is lit, the fuel chosen being supplied by a special device, and air and steam are admitted under the grate in controlled quantities. The top of the producer is connected to a tubular cleaner, which extracts the dust from the gas

on its way to the engine. Once the engine is started the suction of the pistons draws in the requisite quantities of air and steam, which, combining with the carbon in the fuel, produce the necessary gas. The steam is generated in a simple manner by the heat of the fire-grate from water introduced by a pump. For a 50 horse-power motor the weight of the apparatus is about two hundredweights. When tested on a motor-lorry recently, the original petrol-motor being used, the cost per vehicle-mile came to 566d., against 85d. for petrol, these figures being based upon anthracite at 40s. a ton and petrol at 3s. 4d. a gallon. Trials of the apparatus in a 35-foot boat with a 75 horse-power petrol motor, carried out under the supervision of the Admiralty, resulted in a cost per sea-mile of 125d. for anthracite and 2075d. for petrol, anthracite being taken at 55s. a ton and petrol at 3s. 8d. a gallon.

AN ELECTRIC HOT BOTTLE.

A hot-water bottle in the bed during the winter is now looked upon by a vast number of people as an absolute necessity. The very small amount of heat required to keep a person's feet warm in bed favours the use of electricity for this purpose, and a simple bed foot-warmer utilising electricity as a heating agent has recently been placed on the market. The device consists of a cylinder of sheet metal in which is a smaller cylinder, the annular space

between the two being filled with specially prepared cork. The inner cylinder is open at each end. Carried on a sliding bracket in the middle of the cylinder is a small carbon electric lamp, which can be attached by a flexible cord to the nearest electric-lamp socket. A flannel coat completes the appliance, which gives a steady heat so long as the current is turned on. A lamp of this size consumes about one-hundredth of a unit an hour, so that even with current at 10d. a unit the appliance will keep hot all night for a penny. When compared with the hot-water bottle this foot-warmer has the advantage of giving the correct amount of heat continuously, instead of being too hot to begin with and practically cold in the morning. Moreover, assuming the switch to be within reach of the bed, the lamp can be turned on or off as required. In considering the question of cost, it must be remembered that the water for a hot-water bottle is not heated up for nothing, especially if the operation is performed over a gas-ring at existing prices for gas. This device can also be utilised in other ways. With the flannel coat removed, it can be stood up on its end and used to warm up foods or drinks. For this purpose lamps up to eight candle-power can be used, and the bracket carrying them is slid up until the lamp nearly touches the cooking utensil. The bottom edge of the warmer is cut in four positions to allow the flexible cord to pass when the apparatus is used in this way. The warmer may also be employed for the vaporisation of scents and disinfectants, the warming of plates, as a reading-lamp with the addition of a shade, and, with ice substituted for the lamp, for cooling drinks. It is made in tin, nickel, copper, or brass, as desired, and is supplied complete with lamp, flexible cord, adapter, and flannel coat.

PNEUMERCATOR GAUGES.

Last month, in a note describing the oil-fuel installation for the *Aquitania*, reference was made to the 'Pneumercator Gauges' which were fitted to the bunker-tanks to show the level of the oil therein. These instruments really indicate the pressure due to the depth of the oil, this being obtained in a small bell-shaped balance-chamber at the bottom of each tank. If a chamber with an open bottom and a closed top be placed in an empty tank, and the tank be gradually filled, air will be imprisoned in the top of the chamber and compressed to an extent corresponding with the depth of the liquid in which it is immersed. The pressure of this compressed air could be ascertained by fitting a small pipe between the top of the chamber and a pressure-gauge, but the results would not be quite accurate, because the liquid would rise in the chamber to a height which would vary with the temperature of the air, and would be seriously affected by the slightest leakage. A hole with a lip at a

definite height is cut, therefore, in the side of the chamber, near the bottom, and a hand air-pump is added to the equipment. When the pressure is to be taken, a few strokes of the air-pump force down the level of the liquid in the balance-chamber until air bubbles out through the hole at the bottom, the pressure being read on a mercury gauge. It will be noted that whether the air be hot or cold is immaterial, the pressure due to the depth of the liquid in the tank above the lip being accurately shown. The pressure per square inch is really the weight of a column of liquid one inch square and equal in height to the depth of the lip in the chamber. For a tank, therefore, of which the surface area in square inches is known, the weight of the contents is shown by the pressure, whether the liquid be water or oil, and regardless of differences of temperature. This is a great advantage in dealing with large quantities of oil, such as are required in big ships, as purchases are always made by the ton, and the gauges for the various tanks can be marked in tons. Another advantage of the system is that the gauges can be located at any reasonable distance from the tanks, in offices or in cabins, while electric contacts can be arranged so that the mercury will make connection and ring alarm-bells at any desired level.

A SMALL AEROPLANE.

One of the most interesting aeroplanes to be seen at the recent Aero Show at Olympia was that known as the 'B.A.T. Crow.' The design of this machine forms quite a new departure, in that the airman is accommodated under the plane in a little body, between the wheels of the big central skid. In fact, there is no fuselage as ordinarily understood, the tail being supported by two beams under the single plane, which are extended to the rear for this purpose. The engine, which develops 40 horse-power, is mounted at the front of the plane, and drives a 63-inch propeller having two blades. With a range of 150 miles, this machine is capable of doing 65 miles an hour at the ground-level, while it has the low landing speed of 30 miles an hour. Its length over all is 14 feet, and the span of the plane 19 feet. The weights when empty and loaded are 220 and 450 pounds respectively. The engine runs at 1200 revolutions a minute, and the tank capacity of five gallons is enough for two hours. If the machine cannot be housed complete, the plane can be taken off by removing sixteen nuts. In fact, the whole machine can be dismantled in a few minutes with one small spanner and a pair of pliers. There are no bracing wires, consequently no tuning is necessary when the machine is put together again. This aeroplane is even smaller than the 'Austin Whippet,' which was described in these notes for March.

ALCOHOL *versus* PETROL.

To those constantly urging the production of alcohol in this country and in other portions of the British Empire as an antidote to the high price of petrol, a memorandum issued recently by the Fuel Research Board should prove interesting and instructive. According to this document the chances are but slender of producing in the United Kingdom on a commercial basis alcohol for motor-transport. The utilisation of wood waste is ruled out owing to the small quantity available, while the synthetic production of alcohol from calcium carbide is impossible without cheap power for the manufacture of the basic product. A third method, consisting of the recovery of ethylene from coke-oven and coal gas, and its conversion into alcohol, is considered to be still in the experimental stage. The manufacture of alcohol from barley, potatoes, and mangolds is next discussed, the figures being based upon the estimated consumption of petrol for this year, which is put at 250 million gallons. More than four million tons of barley, requiring $5\frac{1}{2}$ million acres of land, would be needed to produce a similar yield of alcohol, these figures being increased to $12\frac{1}{2}$ million tons (requiring two million acres) and 25 million tons (needing $1\frac{1}{4}$ million acres) for potatoes and mangolds respectively. The quantities of these three crops raised last year in the British Isles were 1,288,035 tons of barley, 6,312,000 tons of potatoes, and 7,769,000 tons of mangolds, the acreages being 1,870,087, 1,218,774, and 471,759 respectively. In view of the shortage for food-production the Board consider it unthinkable that land could be used for growing even a fraction of the quantities required. But apart from this aspect of the question, the cost for the raw materials only of producing alcohol from the crops specified, at average figures for last year, would be 7s. a gallon from barley, 8s. 6d. from potatoes, and 3s. from mangolds. Outside the United Kingdom molasses form a possible source of alcohol, but even if the total quantity available in the British Empire were treated, only 17 to 18 million gallons of 95 per cent. alcohol would result. It is admitted that large tracts of uncultivated and suitable land for the cultivation of plants containing starch or sugar exist within the Empire where labour is less costly than in this country, but it is thought that the provision of transport, fuel, and water might be more difficult and perhaps more costly; while anything in the nature of a foodstuff, wherever produced, is likely to command a price, as such, sufficiently high to make its use for the manufacture of power-alcohol prohibitive unless grown in quantities far in excess of any food requirements. The vast quantities of rapidly growing vegetation in tropical portions of the Empire would afford a practically inexhaustible reservoir of power-alcohol if a cheap and simple

chemical or bacteriological process for producing it were available and could be applied commercially on a very large scale, and research work in this direction has been initiated. The conclusion arrived at is that coal is the largest as well as the cheapest source of fuel for transport purposes, and it is suggested that by carbonising it at a temperature of about 600 degrees C., gas of twice the calorific value of town-gas would be available for the propulsion of omnibuses and passenger-cars for quick traffic if light yet safe containers could be constructed. The residual coke could be utilised in suction-gas producers and engines, the cost on a thermal unit basis being only one-seventh that of petrol at 3s. a gallon. Benzol and light naphtha would be available for air transport or light road-vehicles.

A SAFETY PETROL FILLER.

When the tank of a car, boat, or aeroplane is filled, the usual procedure is to empty into it through a funnel the requisite number of tins of petrol. If the tank be large, the process is tedious, while spirit is often wasted by splashing or overfilling. As every motorist knows, the outlet in the petrol tin is always turned uppermost when pouring, as this plan allows air to enter steadily instead of in gulps, as happens when the outlet is at the bottom. Petrol, or, for that matter, any other liquid, can only be poured slowly in this way, owing to the difficulty of getting air into the tin. Various 'fillers,' as they are called, have been devised to expedite the emptying of petrol tins into tanks, and to render the operation safe. One of the most effective is that described in this paragraph. This device consists of a curved spout made of brass, about six inches in length, which is attached to the petrol tin by a screwed collar. A small air-pipe is fastened to the outer end of the spout, and runs parallel with it for about half its length, when it passes through to the inside, and is continued to the inner end of the spout. Here is screwed on an extension which curves upwards to the top of the tin when in the pouring position, thus admitting a steady supply of air where it is wanted. No funnel is required with this device, as the end of the spout enters the filling-hole in the tank, and is provided with a fine gauze strainer. During the act of pouring, the outlet of the tin is at the bottom, and the contents run out very quickly. At a test made by the Royal Automobile Club the times taken to empty petrol tins with large and small orifices were $20\frac{3}{4}$ and $23\frac{3}{4}$ seconds respectively, to which must be added the times taken to attach and remove the filler, making the totals $28\frac{1}{2}$ seconds and $35\frac{3}{4}$ seconds. These compare favourably with $42\frac{3}{4}$ seconds and 1 minute 10 seconds for emptying the tins in the ordinary way. Another feature of the filler is that the moment the level in the tank reaches the end of the spout the

air-tube is sealed and the petrol automatically ceases to flow. With this device, therefore, it is impossible to overfill a tank. The spout is fitted with an adjustable clip which rests on the edge of the tank-inlet fitting, whereby the height to which the tank shall be filled can be predetermined.

'BRICKS WITHOUT STRAW.'

One of the earliest of recorded strikes was that of the Chosen People during the Captivity, when they were compelled to make 'bricks without straw.' The phrase has sorely puzzled Biblical commentators, and till quite recent years no adequate explanation of the importance of the use of straw in brickmaking was forthcoming. That the effect of the straw so used was considerable cannot be doubted, in view of the outcry the stoppage of its supply occasioned; yet how the straw came to be used, and in what manner its presence was essential to the success of the operation, yet remains to be proved. One of the most obvious suggestions, and one which (for lack of a better) has been generally accepted, is that the straw was used as a mechanical binding agent to hold the bricks together. (It must, of course, be remembered that these bricks were only sun-dried, and were not burned or 'fired' in the way our modern bricks are.) To the present day hair is sometimes used in making plaster; by its fibre it toughens the mass and holds it together. And so this explanation gained credit, notwithstanding that there is no direct evidence of the use of straw in this manner. Nor does any trace of the ancient use survive in Egypt, a country where many of the native customs are the same to-day as they were some three thousand years ago. Bricks from Pithom, one of the cities of the Captivity, have of late been subjected to a searching analysis. That the specimens are authentically bricks made by hand and sun-dried three thousand years ago, there is no doubt. But analytical and other investigations indicate no trace of straw in their composition. In fact, the only striking point about these bricks is that their analysis is almost identical with that of mud taken from the Nile quite recently—a remarkable comment upon the slowness with which nature makes her changes. Nile mud to-day is the same as Nile mud three thousand years ago; notwithstanding the great changes that period has seen in the history of mankind, in the history of the earth it is but as a day. The work of the American scientist Dr Acheson may, it is suggested, throw some new light on this puzzle. In the course of a research dealing with soluble lubricants, this chemist had occasion to examine some specimens of German and American clays, identical in chemical composition, but of quite different practical qualities. He found that the difference in their plasticity resulted from a difference in their preliminary

treatment. The more plastic clay, he discovered, contained a greater proportion of particles so fine that they cannot be settled from solution, or even filtered by ordinary methods—'colloidal' particles, as they are called by chemists. Treatment of raw clay by water containing an abundance of colloidal matter results in a greatly improved plasticity of the clay, for it is found that the colloidal matter acts protectively upon the finest clay particles, preventing them from aggregating into larger particles, as they naturally tend to do. So that if any method of preparation of the clay be adopted which will increase this action, the clay will gain in tenacity and strength. One such method, long adopted in some clay processes, is to treat the clay with water containing tannin. Dr Acheson, however, discovered that an infusion of straw also possessed this same property as tannin; indeed, straw itself contains nearly 50 per cent. of a water-soluble colloid. It is therefore suggested that the old brickmakers of the Captivity did not actually incorporate straw in their bricks, but that they treated their clayey Nile mud with an infusion of straw. Experiments have so far confirmed this theory that a treated sun-burned brick is said to be superior in strength and tenacity to a fully burned brick of untreated clay.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

SUNSET.

THE dusky garments of the Night
Are starred with jewels so dazzling bright
That as she lets her mantle fall,
Poor banished Day is held in thrall,
And, disobeying God's command
That darkness shall possess the land,
She hesitates, with finger-tips
In wonder on her parted lips;
Then, filled with feverish unrest
For fear that Earth should love Night best,
Shakes out her skirts of glowing dyes
And for an instant fills the skies
With hues of rainbow brilliance—bright
As birds of paradise in flight.
Thus, having satisfied her whim,
Smiling she sinks below the rim,
And leaves the peaceful Night to close
Earth's burning eyes in soft repose.

THE BLAIRS ROPE.

A TALE OF THE 'I' DETECTIVE FORCE.

By R. S. WARREN BELL.

PART I.

I.

IN the ear of Roger Ross, barrister-at-law, sitting in his chambers in the Temple one night, following a ring-up on the 'phone, sounded the silky, incisive, very-clearly-uttered consonant, 'S.'

Ross was a member of the recently established arm of Scotland Yard called 'The Intellectuals.' The formation of this force had been rendered necessary by the great increase of crime, especially among the upper classes. For, after the world conflict, a new type of criminal had emerged from the queerly-shaken-up and adulterated community known as Society—a criminal as innocent-looking as he was depraved, as smooth and retiring in manner as he was bold—nay, audacious—in action. To cope with him it had been found necessary to employ men of the social stratum he had wormed his way into, and a Home Secretary of enlightened views, broad outlook, and original methods had enrolled a band of men who for shrewdness and capability, for combining mental alertness with bodily activity and great courage, soon made themselves felt and feared.

Primarily, they were thinkers. They were educated men of a good social position. In their ranks were included doctors, lawyers, Civil servants, engineers, writers, and artists. One of them was a fashionable dancing-master, another a West-End estate agent. Of sure discretion and unimpeachable character, they were paid, some few a salary, the majority by results—sometimes (and inevitably) nothing; on occasion with a generosity that was a little overwhelming. For they were all workers, men who worked for their bread with their brains. A fee of five thousand pounds, for instance, proved a windfall indeed to a parliamentary reporter; but as he unmasked a gang of the cleverest rogues in Europe, who very nearly annexed a million of money, he cannot be said to have been over-rewarded.

The 'I's' did not attend at the 'Yard.' They never met in conclave, and did not know each other, but at times they worked in couples.

No. 514.—VOL. X.

[All Rights Reserved.]

OCTOBER 2, 1920.

(I may one day tell the strange tale of how one 'I' tracked another 'I'.) The head and director of them was a permanent official at the Home Office called Scathways. He was known to the Intellectuals as 'S.'

II.

Ross, a clean-shaven, personable, collected-looking man of thirty-five (and a bachelor withal), was immediately attentive.

'Oh, you, sir—yes!'

'Busy, Ross!'

'Not so busy as I'd like to be, sir.'

'I mean, you are not so busy but you can spare the time to go into a little matter! Our rule, you know, is never to interfere with a man's normal occupation.'

'Anything I have to do can wait.'

'Good! Now, do you know Sir Hugh Blairs, of Blairs Court, Shropshire?'

'I have only heard of him.'

'Oh! I rather wanted a man who had, if possible, the *entrée* to his house. However, you may be able to handle the thing, especially as you like to work everything out at your own table.'

'I prefer that way, sir—the mathematical.'

'Though generally physical co-operation is necessary. Well, Blairs, as you probably know, recently came in for the property. He succeeded his uncle, who went the pace rather, and left him a somewhat impoverished estate. His aunt, Lady Blairs, was also the antithesis of what you would call *saving*. She, by the way, when her tears for the late baronet were hardly dried, married Cryer, the Tea King'—

'He cries at you from every little grocer's window,' observed Ross.

'But the people who shed the tears are those who inadvertently find themselves drinking his tea. However, to be done with these pleasant-ries, Hugh Blairs has now taken up his residence at the old family barn in Shropshire. He is, in fact, entertaining his first house-party—a rather mixed lot, I believe—so mixed, apparently, that the celebrated Blairs Rope—the family diamonds—has already disappeared'—

'If they have started like this, how *will* they end?' mused Ross.

A gentle laugh greeted the remark. 'It may take the shape of a wholesome homœopathic dose for Sir Hugh!' observed Mr Scathways. 'Well, to proceed. It was taken from the safe. Blairs was proposing to give his guests a sight of it, and opening the safe with that purpose in view, found the rope *gone*. There had been no violence, you will observe—no blowing or drilling open or anything of that sort. But the Yard man concluded that an impression had been taken of the key—that Blairs' own key had not been used. It was a great shock to Blairs.'

'Had he shown the rope,' queried Ross, 'to any single member of the party before?'

'Why do you ask that?'

'Well, it is rather important one should know.'

'He had previously shown it to one guest only—a dear old lady named Mrs Jacobs, aunt to the girl he is going to marry.'

'Oh, is *she* there?'

'Yes. Her name is Elfin Serge. She is a very attractive girl of twenty-two, a little foreign in appearance, but not otherwise. There is no actual engagement yet, but everything points'—

'I see. You say the Court is a barn, and that the estate is impoverished. Would he give the old lady a sight of the jewels with the idea of impressing the girl—to whom she would, of course, enlarge on their splendour?'

'It is possible. This Mrs Jacobs, by the way, knows Lady Blairs, and through their acquaintance Sir Hugh came to meet the girl.'

'The old lady had probably seen the jewels before, then?'

'Possibly—if she had stayed at the Court.'

'And would have told the girl about them?'

'I see you are already forming a theory. It may interest you to know, then, that the Yard man—Evans—who has been down, includes the girl in his list of possible—suspects.'

'Indeed! He fancies the thief is a member of the house-party?'

The chief's smooth laugh sounded again. 'He said there were two or three people there who looked quite capable of committing the theft.'

'The fatal "mixture"! Does he suggest it might have been the work of a syndicate—people who have cultivated Blairs for some time with this object in view?'

'That probably crossed his mind. He put some tactful inquiries to Blairs about the guests, and, leaving out the worthy married couples who wouldn't steal a hair-pin and odd girls who *would*—but nothing else—he sorted them down to these:

'Miss Elfin Serge, whose movements before and after the theft he regards as suspicious.

'Mrs Jacobs, who, if her niece were impli-

cated, would be, he considers, a party to the deal, though he admits the old lady is nearly always asleep—waking, of course, for meals.

'Darius Hauptmann, a financier of sorts—the kind of fellow Blairs would borrow money from and employ to procure money.

'Edmund Cooper—Blairs' valet—an absolutely trustworthy fellow, Blairs says; never been known to help himself to a sixpence.

'These four. Evans—an excellent chap—is sure there is no other possible; and even at that the Serge aunt may be ruled out, he thinks'—

'And surely the niece?'

'There is not the slightest reason why the whole four shouldn't be ruled out, my friend, but if a person in the house is the guilty one, he is certain it is one of those I have tabulated.'

'What makes him think the girl might have taken it?' asked Ross.

'He doesn't think she did. He says these four are the only possible suspects, and he is certain somebody in the house took the necklace.'

'Why?'

'Owing to the time, the position of the room, the absence of any sign of breaking in, the stealth and cleanliness with which the whole affair was managed, and the fact that he found on Blairs' key a vestige of bread—bread-paste, as you are aware, being suitable for taking an impression.'

'By the way, there really is something "between" the girl and Blairs?' asked Ross.

'He pays her a great deal of attention.'

'She likes him?'

'Let us hope so, if it is her intention to marry him.'

Ross laughed over the dry answer. Then, 'Who is this Yard man?' he asked.

'Inspector Evans. Hardly a brilliant man, but competent. He will be with you in half-an-hour, and if you can let me have your solution by to-morrow night I shall be obliged. I have never yet taken you out of your chambers, you know, and after you have seen Evans the usual half-sheet of note-paper ought to prove large enough for your report. All I want from you is: "Which—and why?" Evans will do the rest. You understand?'

'Perfectly. Everything depends on what Evans tells me. Is he—er—pleasantly disposed to the "I's"?''

'He'd soon find himself enjoying a pension if he wasn't,' was the rather grim answer. 'Expect Evans shortly, then. So long!'

'So long, sir!'

'Oh—er—Ross!'

'Sir?'

'Thought I'd mention it. Blairs is agreeable to one of the "I's" working on this. The necklace is worth, roughly, sixty thousand pounds,

and I think you may look forward to a fee, say, of 5 per cent. of that amount if you are successful in restoring it.'

'I shall give the matter very careful thought, sir,' said Ross. And he put up the receiver.

There was some legal work requiring his attention on the table, but he had forgotten it. He was dreaming. The Bar road is a hard road to travel. At thirty-five he was earning barely four hundred a year, and the girl he wanted to marry—well, her father made every penny of four thousand. Now, *can* you take a girl—?

Ross sat quite still by his table, deep in thought, for half-an-hour. Then a knock sounded on his door.

'I shall give this matter my earnest attention,' he repeated, as he went to admit Evans.

III.

'Good-evening, sir,' said Detective-Inspector Evans.

There was a touch of sharpness about the address, which Ross did not miss. It suggested, 'Why I'm wasting my time calling on a blooming amateur like you I don't know, but orders are orders.'

Ross led the way into his snug sitting-room. 'Sit down, inspector,' he said, pulling a deep saddle-bag arm-chair into position for the caller. 'You'll take something, eh?' And Ross went to the sideboard.

'Thank you, sir; I don't mind if I do.'

Ross poured out two whiskies-and-sodas. He gave the policeman a stiff one; his own was largely soda. For he knew his 'bobby.' Evans had started as a policeman, and, owing to his extra sharpness, had been transferred to the detective department. But once a policeman, always a policeman—and the policeman likes his creature comforts.

'Well, inspector, and what of the diamonds? Are you on their track—really on their track?'

'I can't say I am, Mr Ross.'

'But,' said Ross, giving Evans a cigar, 'you rather think Mr Darius Hauptmann knows something about them?'

'I shouldn't be surprised,' admitted the policeman.

'And he has confederates?'

'That is an impression I, rightly or wrongly, got, sir.'

'Which one took the impression of the key, think you?'

'The valet, sir, I fancy.'

'And what of the old woman?'

'She may know what the young one is up to; she may not. The young lady must have a wing to shelter under, and the old lady may simply be that.'

'Quite so. Now, tell me, inspector, how you managed to arrive at these erroneous conclusions.'

The inspector started slightly.

'Of course,' he said, his heavy moustache

lifting in a slight sneer, 'I am talking to a very clever gentleman, but wouldn't it be as well to make sure they *are* erroneous, sir, before stating the fact?'

'Don't let us fall out, inspector,' said Ross. 'We are engaged in unravelling a mystery. If we succeed, it will be a "bit of good" for you as well as me. You have the handling of the case; I am only an adviser. Nobody will know how much or how little I advised, but when you retire from the force mention will be made in the press of your successful elucidation of "the Blairs Rope mystery"—won't it? Very well, what is the good of beating about the bush? Hauptmann, I repeat, did not take the stones. He is down there for quite another reason. Miss Serge is there to marry Sir Hugh, so why should she rob him of what will come into her possession—or at any rate fall to her use—when she is the mistress of the Court? And would the old lady deprive her niece's fair neck of its lawful adornment? As for the valet, for some years he has been the servant of a rather careless young master whom he could have robbed scores of times, had he liked—and yet there's not a thing against him. Why? Because he is attached to his master. These scapegrace fellows are often very likeable ones—and it's an easy, well-paid post. Why should the man risk years in a prison cell when he's so comfortable?'

'Well, sir, there's reason in what you say,' unwillingly admitted the detective; 'but I go by the evidence I collect. When I examined Sir Hugh's bunch of keys beneath a microscope, I found on more than one a trace of bread. This leads me to think the valet may have done it, and I'll tell you why.'

'Sir Hugh has a private bathing-place in his grounds, provided with dressing-boxes. One day, when Sir Hugh was bathing with Mr Hauptmann and one or two other gentlemen, he noticed his valet enter the dressing-box in which he had deposited his clothes, and at that moment Mr Hauptmann, who appeared to have got out of his depth, clutched hold of him, thus turning his attention from the valet. The two facts came out when I put a number of questions to Sir Hugh. He thought nothing of either circumstance at the time; but when he came to think over things closely, he remembered these incidents, and mentioned them to me.'

'Very well,' continued the inspector, taking a pull at his cigar. 'I had to ruffle his feelings a bit by inquiring about the movements of his lady guests, and I ascertained that the day after the bathing episode, so far as he could remember, Miss Serge and the old lady went to town for a day. And,' added the inspector, carefully touching the ash off his cigar, 'they went to town again the day after the loss of the jewels was discovered.' And the inspector leaned back in his chair with just a touch of triumph in his attitude.

'I see,' said Ross musingly. 'The first time to get the key cut, the second time to dispose of the "swag," eh?'

'It has that look. It may have been just visits to her dressmaker, as Miss Serge said.'

'How long a time,' Ross asked, 'elapsed between the discovery of Sir Hugh's loss and Miss Serge's visit to London?'

'Twenty-four hours exact.'

'And where would the stones be during that time? Had the local police, who, I understand, were at once summoned, insisted on searching every guest's room—or—it would have been awkward, inspector—what?'

'She hid them, I think, pretty safely,' said the inspector.

'Oh! You think Miss Serge did take them?'

The inspector smiled. 'You were very sharp, Mr Ross, with your "erroneous conclusions,"' he said. 'The young lady took the stones, sir.'

'Well,' said Ross, '*you've* been down there; I haven't. But I shall be surprised if what you state proves correct.'

'As you say,' said Evans, 'I've been down there. I've been down there a week. I've been down there in disguise—and I've found out things that way—as we often do.'

(Continued on page 709.)

WOLFE'S LOST HIGHLANDERS.

By VICTOR ROUSSEAU.

I.

IT was the charge of the Highlanders that drove the veterans of Picardy and Guienne across the Plains of Abraham, down the broad road now known as Grande Allée, and helter-skelter into Quebec on that September day of 1759 which decided the possession of Canada. These men, enlisted from among the clans which had been in revolt against the Hanoverian Crown only fourteen years before, then first demonstrated what an acquisition of fighting strength England had obtained when she gave her trust to her former enemies.

Among the Highland officers who participated in this first battle of the Plains were many bearing historic names that still exist in Lower Canada—Captain Nairn, the founder of Murray Bay, then known as the Malbaie Seignior, for which he and his descendants did homage to the governor-general yearly; Colonel Allan MacLean, of Fraser's Highlanders; and Captain Fraser, no doubt of the same regiment, a descendant of Simon Fraser, Lord Lovat, who laid his head upon the block after the defeat at Culloden.

The dying message of the gallant Montcalm, that he left Quebec to 'the generosity of the victors,' was justified. After the surrender the Highlanders quickly ingratiated themselves into the goodwill of the inhabitants. The winter of 1759-60 was unusually severe, and even the Highlanders suffered acutely in a temperature which ranges as low as thirty degrees below zero at times in winter. It is on record that the nuns of the Ursulines busied themselves knitting stockings for them.

Their ranks, thinned in this battle, were still more depleted in the second battle of the Plains, the following April, when Murray, pent up in turn, issued forth to give battle to De Lévis, but was forced to beat a retreat which almost lost him his stronghold.

What became of these Highlanders? History has little to say. It is only by a diligent research in many books that we can trace their history; and yet it is the blood of these men that flows in the veins of many of the ablest French-Canadians to-day. If they are lost as an entity, they have become veritably the bone and sinew of one of the most virile peoples in the world.

At the time of the conquest of Canada the French population hardly exceeded sixty thousand. The forfeited lands were parcelled out as seigniories. The villein took his corn to his seigneur's mill to be ground, paid tithe in kind, called yearly at the door of the parish church. The feudal system lasted unchanged until the year 1854, when it was abolished by Act of Parliament.

It is extraordinary that until the middle of last century the province of Quebec should have preserved this medieval order unchanged. Yet at the time of the Crimean War seigneurs still did homage *en franc-alleu noble, en censive, or en roture. Lods et ventes*—one-twelfth of the purchase-price of land or cattle—was the seigneur's perquisite, as well as the right of the *banal* mill—one-fourteenth of the villein's grinding; he had oven rights too, levied a *corvée* for public works, and on St Martin's Day waited in ceremony to receive his rent, if only a fat capon. Many of the new seigneurs were Highland officers, as the town and the seignior of Fraserville attest. They settled their own clansmen on their lands, giving them French wives in marriage. It was reasonable to suppose that the next generation would see the establishment of a strong Scottish element in Lower Canada.

II.

The Highlanders next appear upon the stage of history in the year 1775. The American Revolution was in full swing. Chambly and St John had fallen; Montgomery had taken Montreal, whence Carleton had escaped at night

aboard a fishing-smack; Arnold had traversed the forests of Maine and the Chaudière and appeared before the walls of Quebec, from which an enormous concourse watched the New England volunteers. Much badinage was exchanged too, and there was some extraordinary byplay when the Yankees derisively chased the skipping cannon-balls discharged from the parapets. The Continentals seemed irresistible, and there was talk of surrender.

But there was no talk when Sir Guy Carleton appeared to take command. It is to this brave and indomitable soldier, who, even in the darkest hours, refused to 'parley with traitors,' that Britain owes her Canadian Dominion. All Canada had fallen—all but the rock-fortress of Quebec, and that had bidden fair to surrender, like Montreal, without a blow. You will search long among the monuments of nonentities and others that grace Quebec before you find one of this great Englishman, masquerading as Lord Dorchester, among the bas-reliefs of the Provincial Parliament buildings. By some sad freak of history Carleton has been all but forgotten, as have his Highlanders. And yet they saved an empire on the last day of 1775.

The Highlanders, called in from their farms, responded to the number of twenty-one officers and two hundred and seven men—no bad muster after sixteen years of peace, not forgetting French wives of doubtful loyalty. They were formed into the regiment of the Royal Emigrants, commanded by Colonel Allan MacLean, second in charge of Quebec. Captain Malcolm Fraser appears again; and among other names may be mentioned those of Captain Campbell; Sergeant James Thompson, a giant, one of Wolfe's men, who had become Superintendent of Public Works, and later came into possession of Montgomery's sword; Sergeant Hugh M'Quarters of the artillery; and Colonel Hamilton of the Seamen's battalion. The breaches in the walls were closed, cannon mounted, palisades erected, and two handfuls of men prepared to fight for the fate of Canada again.

Now comes the story* of that mad attack, in a blinding snowstorm, on the last night of 1775. There are two approaches to the Upper Town, which stands on an almost vertical precipice at the angle of the St Lawrence and the St Charles. The plan of the besiegers, who were in possession of the Lower Town, was as follows: Arnold and Montgomery were to advance from different directions to the foot of Mountain Hill, one of these two roads, and there, uniting forces, they were to rush the defences and gain access to the Citadel. Montgomery's attempt may be dealt with briefly. Leading his column along the base of the cliffs, at *Prés-de-Ville* he encountered a barricade containing a single cannon, manned

by the redoubtable Sergeant M'Quarters and three or four sailors. At the first blast Montgomery fell dead, his column melted away, and the fight was ended.

Meanwhile, unconscious of Montgomery's fate, Arnold's men, wearing mottoes on their caps and moccasins stuffed with leaves, their matchlocks primed and held beneath their coats to keep the powder dry, were moving in single file beneath the precipice toward Mountain Hill. At the foot of Palace Hill—the second approach to Upper Town—they heard the alarm-bells of the city peal, and the drums beating to quarters. Pushing on to Sault-au-Matelot Street, they encountered a British blockhouse, before which Arnold fell, shot through the leg. Colonel Morgan, whose Virginians, it is curious to note, had rifled fusil-barrels at this date, took command. Planting a scaling-ladder, he leaped from the top of it to the muzzle of a gun, followed by his men. In a few moments the blockhouse was taken.

The American forces, now galled by musketry-fire from the heights above, where sharpshooters in casemates were picking them off by the light of fire-balls thrown up from the ramparts, dashed with fixed bayonets along Sault-au-Matelot. But at the corner of Des Sœurs Street and Mountain Hill they came upon a second blockhouse, of whose existence they had not known. Here Captain MacLeod, with thirty men, gave them a warm welcome. The blockhouse could not be stormed. Its defenders were being reinforced each moment; golden moments were passing while Morgan's men, taking refuge in the houses, waited for the arrival of the sledges which bore their artillery.

III.

It was two o'clock in the morning when Captain Fraser, who was in charge of the guard, saw two rockets go up from Cape Diamond, indicating that Montgomery's movement had been discovered by the picket on that bastion. Captain Fraser at once turned out the guard and hurried along St Louis Street, calling the alarm. Carleton, who slept under arms at the Récollets' Monastery, took command, and the drums beat the assembly. Colonel MacLean at once despatched a strong force to Cape Diamond, but soon came to the opinion that Montgomery's attack was a feint, and recalled a part of them. In the meantime Arnold's movement had been discovered, and MacLean sent a body of Highlanders under Captain Nairn, Seigneur of Malbaie, together with some seamen and English Militia, to issue from Palace Gate and take Arnold in the rear.

By some mistake—one of those omissions that so often decide the fate of battles—Arnold's rearguard, consisting of Dearborn's Company, had not been notified of the attack; consequently his flank was unprotected. Dearborn's men

* The writer is especially indebted for his details to the records of the Literary and Historical Society of Quebec.

first knew of the engagement when they heard the sound of firing, and encountered the wounded streaming back along the slippery banks of the ice-bound St Charles. While wounded and new-comers were hopelessly entangled, Nairn's men fell upon them out of Palace Gate, driving them like sheep, and swiftly recapturing the blockhouse, whereby the Americans, under Morgan, were effectively hemmed into the narrow confines of Sault-au-Matelot Street.

Now the battle approached its end. The British were already driving the Americans out of the houses, companies of French loyalists were firing on them from the wharves, Nairn and his men were coming on behind, while in front a mixed force of Highlanders, bluejackets, and French and English Militia, under Captains Campbell, Hamilton, MacDougall, Alexander, Layard, and Caldwell, came charging down Mountain Hill and sweeping through the blockhouse. The Americans were surrounded. Arms were thrown down. Soldiers rushed up to seize the side-arms of the officers, as prizes of war. A Captain Anderson leaped from the barrier and demanded Morgan's sword. Morgan shot him through the head, and backing against a wall, with the tears streaming down his cheeks, swore that it should not be taken. His own men, prisoners, besought him in vain. By this time the street was crowded with civilians, crawling up through the cellars on Sault-au-Matelot; men and women came clamouring about him, beseeching him to surrender, while the British soldiers waited. At last a priest among the crowd urged him to yield, and, reluctantly, Morgan gave his sword to him.

In this fight the Continental forces lost four hundred men, the British fifteen. It was the decisive battle for empire in Canada, and it was the Highlanders who turned the fortunes of the day. Had the wild assault succeeded, there is no doubt that to-day the 'Stars and Stripes' would float from the Rio Grande to Baffinland.

IV.

That is the last occasion on which Wolfe's Highlanders appear in history. That Scotsmen

continued active in the life of those parts we may glean from contemporary prints. A few years later 'Mr Bennie, the tailor from Edinburgh,' advertises in the *Quebec Chronicle* that 'ladies and gentlemen who will be so good as to favour him with their custom may depend upon being faithfully served on the shortest notice and in the newest fashion on the most reasonable terms.' And this quaint announcement may be culled from an issue of the seventeen-eighties: 'J. M'Aulay, Doctor of Physic, who has been regularly bred and practised several years in one of the principal cities of Europe, is lately arrived here. He is furnished with a compleat assortment of fresh medicines, which he will sell wholesale, at reasonable rates. As a good physician is a great blessing in any country, and much wanted in this, he hopes for that generous encouragement from the public which by the utmost exertion of his abilities and assiduity he will endeavour to merit.'

But Wolfe's Highlanders appear no longer on the screen of history. It is almost a tragedy—for Canada, more than any country abroad, is built upon the achievements of Scotsmen. It was Scots who established the great Hudson's Bay Company, and its founders and factors have been Scotsmen, from Mackenzie to Strathcona. In Parliament, in commerce, banking, shipbuilding, the Scotsman is still to the fore.

The dreams of Nairn and his contemporaries did not materialise. The French swamped the settlers. There are no Highland Scottish settlements in Lower Canada to-day.

And yet this little body, cut off amid an alien race, survives. There are French-speaking Campbells and Frasers in Quebec, and old people whose mother-tongue was Scottish. Or let the traveller take the boat down the St Lawrence, and get off at any of the coastal villages. Here are Maclarens, Harveys, Belleys (Baileys?), Fosters in plenty, though their speech is seventeenth-century Norman, and they have only a legend of their origin. They are French-Canadians—but every trait and gesture shows the inheritance of the men who made and saved Canada for Britain.

RADIUM AND RADIOACTIVITY.

ALTHOUGH amongst the youngest of the sciences, radioactivity has accomplished much during its short period of existence, and can justly claim to hold a great promise for the future. As late as 1896 it was practically unknown, but the discovery, by Röntgen, some little while previous, of the now familiar X-rays, and the recognition of the numerous uses to which they might be put, caused much attention to be directed towards this subject in general.

In the year 1896 M. Becquerel, a French chemist, in searching for further X-ray effects, noted that the rare metal uranium had with its salts a property, peculiar to itself, of emitting rays. This proved to be an epoch-making observation, for radioactivity may almost be said to have been born with it. Scientists were not slow in comprehending its true meaning; the investigations so initiated were actively pursued. First and foremost were M. and Mme. Curie,

who commenced a systematic examination of the uranium compounds in the light of their newly found property. Noticing that many of them had an activity greater than could be attributed to the uranium, they concluded that there must be present a substance whose power was much superior. Every means known to chemistry was employed to prepare it, but without success. The evidence was considered sufficiently strong to warrant a name—polonium—being given to the new metal. Later research has shown the accuracy of this reasoning; to-day impure polonium has been prepared, and, moreover, is known to be intensely radioactive.

Continuing with her experiments, Mme. Curie, in the course of time, detected another of these substances—radium. In comparison with the other radio-elements, radium salts are easy to prepare in a reasonably pure condition. Speaking absolutely, however, the processes are complicated and tedious, due to the fact that the metal is present only in very small quantities. The chief source—pitchblende—is a compound of uranium with oxygen, often admixed with iron, lead, and numerous other impurities. It occurs in Bohemia, America, and England. For experimental purposes, the Austrian Government generously presented Mme. Curie with a ton of residues from the State uranium manufactory at Joachimsthal, Bohemia. The proportion of radium is about 1 part in 600,000; from ten tons of the crude product approximately half an-ounce of the metal may be extracted. In the case of polonium the amount is much more minute. It is possible to recover only a mere fifteen-thousandth part of an ounce from fifteen tons of ore. These figures alone illustrate the obstacles which must be surmounted. Detected in the late 'nineties, pure radium remained unknown till 1910, when it was isolated by the use of electric current. Yet, in spite of these drawbacks, many chemists and physicists have entered the field of research, and a large mass of data has accumulated. More than thirty radio-elements have been investigated; the number is constantly on the increase. Their effects have been widespread. They have completely altered much of modern scientific theory, and many practical uses have been found for their emanations or rays.

Perhaps the most interesting feature of this group of metals lies in the strong light they throw on the construction of matter. For the last eight hundred years it has been the custom to regard the 'Transmutation of the Elements' as purely and simply a philosopher's dream. One may well marvel at the prophetic insight of the old alchemists, for radioactivity has shown that many of the so-called elemental substances are nothing but transition products, and that to a large extent the main idea was correct. (If a digression may be allowed, the recent discovery by French surgeons that the substitution of

monkey glands will prolong the span of life has placed another old and much-derided theory—'The Elixir of Life'—on a new footing.) It is now well established that the entire radioactive family is derived from either uranium or thorium. Any member may be looked upon as one of these after passage through several well-defined and successive periods. For the sake of convenience, they are divided into three classes, according to their several peculiarities. Of the three, the first is by far the most instructive. Starting from uranium, we find this metal decays, and in doing so emits rays. A new element is formed, Uranium X, the period of transformation being about eight thousand million years. In a much shorter space of time this changes to ionium, which, in turn, gives rise to radium. These gradual replacements continue through a series of eight similar materials, until polonium is reached. The product of polonium is now being carefully studied; it seems to be a metal having all the indications and appearances of ordinary lead. This is in itself a fundamental change, for if lead can be so formed there is every reason to suppose that all the other elements, such as iron, gold, sulphur, &c., are due to forces of this nature, acting during the past ages, or forces as yet undiscovered. Substantial corroboration of this view is afforded by the observation that, in disintegrating, nearly all radio-metals form, as a secondary product, helium, a gas that has come into prominence as a desirable substitute for hydrogen in the filling of airship and balloon envelopes. It would seem that in these curious, complex reactions scientists have a unique opportunity of seeing, on a small scale, the operation of those agencies responsible for the world's construction.

During the process of transformation large stores of energy are dissipated. In comparison with any known chemical reaction the supply is enormous. Radium gives off many million times the heat that could be obtained from the same weight of coal, oil, gas, or any other combustible used as a power agent. Chemistry supposes all matter as constituted of very small particles called atoms, which are further subdivided into electrons. These electrons form an atom by being held together by large forces, which are set free during disintegration. If matter could be treated to release this energy, there can be no doubt that a supply would be at hand that would absolutely dwarf the modern super-power station, with its expensive plant. Relatively, the beds of coal and the deposits of oil would be quite infinitesimal. Indeed, there are many who are of opinion that the advent of such a thing would be in the nature of a catastrophe, for the existence of this large mass of uncontrolled power might quite conceivably be a menace to the stability of the earth; and, moreover, it is quite impossible to restrain atomic energy. By the complicated system of motors,

switchgear, cables, and the large number of accessories, electricity is efficiently and safely harnessed to do useful work; again, if heat is required, then a fire may be lighted, more combustible be added should further heat be necessary, or the supply completely cut off by extinguishing the fire. There is no such means of harnessing the heat of radioactivity. Under no circumstance—thrown into water, heated, compressed, even immersed in liquid air—does radium's rate of disintegration and heat emission vary; that rate can neither be accelerated nor retarded. It is a very doubtful assertion to suggest that man, had he the key to this storehouse of natural power, could make use of it on any but a limited scale.

At the present time the application of radium as a source of heat is an economic impossibility for two reasons. Primarily, its rate of decay is slow and fixed; it follows that large masses would be necessary to meet the requirements of modern industry. Secondly, the supplies of the metal definitely known to be in existence are very small, a factor which, coupled with the expense of extraction, raises the price to a prohibitive figure. On the question of supply, a decisive answer cannot be given—no systematic search has been carried out, as is the case with coal and oil. In certain parts of the world, Canada particularly, a steady stream of the gas helium is continually escaping from the soil. There is only one cause to which the presence of this gas can be attributed—that is, the decomposition of a radioactive material. It is, therefore, concluded that deposits of one or other of these substances exist in the vicinity of the gas-wells, and if the quantity of the gas may be taken as a criterion, then the beds must be of a very extensive character. The tapping of these sources would in all probability be followed by a sensible reduction in the price of radium salts, allowing of a wider application of the rays. A somewhat similar line of argument has been adopted with reference to the sun, which, until recently, was generally assumed to be a collection of small luminous bodies gradually closing up into a coherent mass. By means of the spectro-scope, it has been ascertained that the sun is enclosed in a gaseous envelope, of which a large proportion is made up of helium. It seems, then, quite rational to assume that the solar heat is partly due to radioactivity, and that the sun is undergoing a transformation, on a parallel to the stages through which the earth has passed in the remote ages. A radioactive action requires a period of many millions of years for completion, and although the sun is, without doubt, cooling, its loss per annum, or even per century, is extremely small, when contrasted with the total heat it gives, on which a rather instructive and illuminating series of experiments has been carried out. It is computed that, if we assume the earth's total population to be fifteen hundred

millions, then each individual receives energy at the rate of eighty thousand horse-power. Surely a splendid example of the power latent in the atom, and, in a sense, a measure of what could be obtained if these sources were open to exploitation.

Radium emanations are divided into three distinct classes. Those of the first class are of absorbing scientific interest, as they consist of particles charged with electricity, which, when they give up their charges, become helium. It is on the properties of this type of ray that much of the theory depends for corroboration. All three classes are used in medicine, being closely allied to X-rays, though capable of greater variation, and possessed of two distinct advantages over them. X-ray plant is cumbersome and scattered, the bulbs are large, whilst big induction coils are essential for the high voltages used in therapeutic work. The radium apparatus is compact; the emanation, as received in a small glass tube, independently emits the rays. It is obvious that this method can be applied in cases where the use of X-rays would be awkward, owing to the large bulk. Further, there are not so many expensive instruments to maintain in a state of efficiency; for each operation a tube of emanation may be obtained from the central institution at which the radium for the area is stored.

The employment of the emanations in medicine has followed generally the lines adopted for X-rays, but the penetrative power is much greater. They may be used in radiography, giving very good results; but this is not common, owing to expense, and X-rays are almost universally employed in this class of work. In the treatment of skin complaints radium has found a notable sphere of activity. For example, under the influence of the rays much of the disfigurement caused by birthmarks will disappear. Unfortunately, the effects are not entirely confined to the skin; they go deeper, to the internal organs. The nerves, however, are not at all susceptible; otherwise treatment would be a more complicated and painful matter. Small sweat-glands and hair-follicles are practically burnt out by radium, thus providing a ready cure for that most contagious of scalp eruptions—ringworm. Great caution is necessary in this instance; over-exposure causes the hair-cells to be destroyed, and baldness results. Although healthy tissue offers a much greater resistance than does diseased, yet both are rapidly attacked, and it is of this valuable asset that such an extensive and successful application has been made in regard to ulcers. These may be quite cured, as also may tumours and cancers, if taken in their initial stages. Once they have obtained a firm footing in the body, radioactivity does not provide a cure, though it may curtail the rapidity of growth. From results it appears that the employment of the emanations has been very effective.

tive in tuberculosis of the bones and the joints, a complaint formerly very difficult to remedy. The action upon the eyes is curious. If the rays be directed upon the eyes of a person who is either blindfolded or suffering from cataract, the sensation of light is formed upon the retina, and the outlines of bodies placed between the eyes and the source of the rays may be readily distinguished.

In all therapeutic work, careful precautions must be observed both for the patients and by the operators themselves. Radium causes, through over-exposure, extremely painful burns, which ultimately develop into chronic skin disease. Many of the earlier demonstrators on X-rays died as a consequence of receiving these burns. It has been discovered that the rays

will not penetrate thicknesses of lead exceeding half-an-inch, and it is consequently the custom nowadays to wear coverings of silk loaded with a lead salt, which provides adequate protection for any but prolonged exposure. The emanations are very destructive of delicate scientific instruments. Apparently the effect is to cover them with an extremely thin film of the metal, which in order to be removed must be dissolved off by an acid. During the investigating of a radioactive material the appliances must be kept as far away as possible from it.

In industry a use has been found for radium in detecting blow-holes and flaws in castings; but here, even more than in medicine, it is only in a tentative stage, and must await the course of time for full development.

BROKEN LINKS.

By F. ST MARS, Author of *Pinion and Paw*, *Snapshots of the Wild*.

I

IN the beginning the trouble arose by Mrs Verclose going out of town temporarily. She went out of town when the moon was up; some people will understand what I mean, but—no matter. What did matter was that, being Mrs Verclose, she could not be bothered with Miss Berlinda. Wherefore Miss Berlinda was sent to board and lodge with the charwoman, she and her big pink bow, her willow-pattern saucer, her padded and hooded basket, and all things that were hers. She travelled—'twas but a tram-ride—in a hamper, without being consulted, and she expressed her feelings by scratching the charwoman's hand when she was let out. For this the charwoman presented her with what she called 'one under the snitch,' and Miss Berlinda never forgot it nor forgave. She was like that. It was the first 'one under the snitch' she had had in her life, you see, which shows the sheltered, artificial nature of that life up to then.

When Miss Berlinda had quite finished sneezing, she came out, glaring unspeakable things, from under the wreck of what had once been a bedstead, and examined the room. It was to be her home. Personally Miss Berlinda would have preferred a coal-cellar. Certainly there were four walls; a ceiling; a floor—if you looked where you trod; a table—bare—whose fourth leg had been part of a hop-pole; and a thing like a chair, whose fourth leg—it lay in a corner—had apparently been used as a weapon of offence and defence by that good lady the charwoman. Of course, there was also the bed; but the less said about the bed the better. And that was all, if you except the gin-bottle with a candle in it, and the gin-bottle with gin in it, in a corner. There was no sign of any milk in that 'home,' and there was no

scent—you know the wonderful scenting-gear of all the cats, and you know Miss Berlinda as a cat by now, of course—of any milk ever having entered said 'home' at any period, dim or remote, or of any milk ever being likely to enter that 'home' at any future date, dim or remote, either. As a matter of fact, Miss Berlinda's 'milk-money,' together with her board-money, was sunk, if I may be excused the expression, in the gin-bottle—not the one with the candle in it—in the corner.

Miss Berlinda smelt that bottle, and promptly got the one chair's detachable leg heaved at her head for her pains. She sneezed all over again at the gin; spat a feline, feminine, and fiery curse at the charwoman; and slid, not slowly, under the only cover in the room, the bedstead, again, where she remained—two flaming onyx orbs—for the best part of an hour, till the charwoman slid, not so gracefully as the cat, on to the floor, and her wig came off.

Miss Berlinda, be it here proclaimed, was the only other 'sandy' lady-cat. She was the one in forty thousand, in fact, and priceless; that is to say, it is against the rule for sandy cats to be of the feminine sex, these being all gentlemen, and the ladies being all tortoise-shells. Miss Berlinda was the exception that proved that rule, and, if the charwoman had only known it, worth enough gold to buy enough gin to kill even the charwoman with. But I don't suppose Miss Berlinda knew she was the one sandy female cat out of forty thousand tortoise-shells, and a rarity beyond gems, even though her opinion of herself was very high indeed.

During the next hour—the charwoman snoring—Miss Berlinda got the hang of that 'home' in the exact, mathematical, and precise way cats do upon first entering a place. It never appears to have been explained why they do so, but perhaps

it is to know to an inch where everything may be expected to be in the dark, and to provide against possible eventualities in the future. Anyway, the information, once gained, sticks.

At the end of that time a large, uncouth, and staggering male person entered that room by the simple process of kicking the door open, and dived straightway and at once for the gin-bottle and the chair-leg in the corner. At the same instant the charwoman, awaking miraculously by some extraordinary process of her own devising, did exactly likewise, and in equal silence. Both arrived, sliding, at exactly the same moment at the same goal, and Miss Berlinda made one dark curve round the door, and one straight streak down the stairs. Seen thus, or, rather, scarcely seen thus, for she moved 'some,' neck stretched, ears wide and turned back, body and tail and legs at greatest length and lowest level, she looked one weird object, and scarcely the complaisant personification of idle cosiness Mrs Verclose remembered her as. But there is a time for everything, and cats are no stoics, anyhow; they know only one law—the law of 'the better 'ole.' And, indeed, you will own that Miss Berlinda had cause for believing that she had reached zero in the matter of 'oles,' anyway, and that any change might be for the better.

II.

Miss Berlinda arrived in one hurried scoot, by way of an open door—all doors seemed to be open in that devil's place—at a backyard of unspeakable, stark filthiness. An intense moon in a dark sky cascaded down light of remarkable brilliancy, which showed Miss Berlinda, with one comprehensive 'cat's glance,' the horrible fact that in all that limelit scene there was neither blade of grass nor trunk of bush or tree—nothing at all that was Nature's—only bricks and mortar covered with an all-pervading, all-smothering grime.

Miss Berlinda took the wall, flying, and stopped—all claws scraping her back—by the skin of the teeth, from springing down upon the back of a lean, yellow beast cracking a bone on the far side below. It was, in local parlance, a 'long dog,' that beast which is a lurcher, which is a dog crossed with anything you like, so long as it is three parts greyhound. The 'long dog' said nothing, but sprang straight at her, and missed cracking her bones also by exactly two inches and three-quarters. That's your 'long dog.' I am not denying that Miss Berlinda was quite a little scared. She shot along the wall-top, and almost fell over at the corner upon two men of hooligan breed crouching in its inky shadow. Both developed belts from nowhere, with the instantaneousness of super-experts in belt production; and Miss Berlinda, as she took the turn, slewing over on one side, at right angles, heard the two belt-buckles strike the wall four inches behind her tucked-up hind-legs.

The end of that wall developed on the far side a male animal, in shadow, neither boy nor man quite, and a girl, also in shadow—they seemed to hug shadow like rats in these parts; and again switching off at right angles along another wall-top, Miss Berlinda had the pleasure of hearing half-a-brick flick the tip of her pink bow, as it spun by barely above her head.

Miss Berlinda continued, at speed—the lightning sprint of all the cat tribe when they are properly 'het up.' And the end of that sprint—it fetched her up all standing, upon her tail—was a head, appearing like a demon from a trap, in front of her over the edge of the wall.

The head was round, and it had two eyes, smouldering and alight with that desperate, hard, wild glitter peculiar to starvation. The head was propped upon four gaunt paws, the whole held together—more or less—by a skin stretched tight to slitting-point over a skeleton. Nature may at some remote period have intended this accident to be a cat, but man, it seemed, had made it a catastrophe.

Miss Berlinda knew, with the extraordinary instinct of her sex, that the head was a male, and she might conceivably, reasoning upon past experiences, have expected or suspected that it would court her. Its, or his, one and instant crazed rush, however, made her realise that he looked more like eating her, and she turned upon him, acting solely upon mother instinct, with that special fiendish fury reserved for the female in the wild. The cat, so called, collapsed under her onslaught like a bundle of sticks, and dropped on the far side of the wall in dead silence, and, oh horror! five more heads, each with the maniacal famine glare in its eyes, slid up to the first on the instant. This last nightmare was too much for the sleek, combed, cosy, lazy, hot-house Miss Berlinda. She fairly picked up her skirts, so to speak, and fled—a flickering, wavy, elusive line in the moonlight—till she fetched up, her heart in her mouth, her courage in her tail-tip, upon the summit of an embankment, clapped down flat, between gleaming chaired metals, her eyes nearly popping like champagne-corks at the sight of a towering, gigantic, roaring, thundering, one-eyed—and that eye green—monster, hurtling down upon her out of nowhere and the night.

There was one cataclysmal thunder, a blast of searing heat, an uproar as of an earthquake trampling past, a sucking, blinding wind, and—she was alone with one whirling newspaper, quakingly watching the red tail-light of the '9.40 down' receding and melting into the night. It was her first experience of a train, and by about half the length of her flattened body and tail it had very nearly been her last.

Miss Berlinda regained life after seconds, and squirmed to the side of the track, only to rebound as if she had touched off a land-mine, as another snorting, roaring mammoth of iron—two eyes

had this one, one green, one white—thundered almost upon her from the opposite direction.

After a time, when it had gone, Miss Berlinda, a flat something crouched on the edge of the embankment all among the signal-wires, came to life once more, in sections, dug her claws out of the ground, and examined herself tentatively from head to heel to see if any parts were broken or missing. None were, of course; and from habit, I suppose, being a cat, she started to clean, but seeming to recollect that, for once in her life, there was an urgency more urgent than cleaning or feeding even, she set off along the embankment with the air of a burglar quitting a police-station. There was nothing fat and 'comfy' about her then. She seemed to have been pulled out to great length, and to have developed extra large ears, cocked always behind. Her pink bow had worked round under her neck, and was getting most infernally in the way, and her rich ginger coat was not so clean as it might have been. But she did not care—not she. Her one urgent desire was to quit that lugubrious vicinity instantly—if not before—and to make good her 'get away,' at least before dawn. Dawn, she felt, in this stark wilderness of bricks and devils, would be too awful even to contemplate. Wherefore she shifted, only not running, because she knew she could not keep it up, and yet not properly walking, but effecting a compromise between the two, as does the hunted tiger from the beaten cover.

Trains passed her—for that was a line upon which they never went to sleep—with excruciating, reverberating uproars and flashings of lights that were almost physical agony to her sensitive, highly strung cat's brain; and once or twice she lost her head, shooting from point to point among the thundering confusion of the wheels, more like some masterless projectile than any live beast. But Fate must have had her in charge during those hours, for she never died quite, though it seemed at some moments that no power on earth could save her. Talk about nine lives! Say, but she must have had forty to draw upon in that night, for there were many lines and many trains, and a young fog came and added itself to the nightmare as the moon went down, and a pitch-darkness added itself to the fog, and fog-signals—which sent Miss Berlinda off in straight paralytic dashes, fifty yards to a dash—went off in all directions, and coke-fires and lanterns came and went in glaring splashes, clapping her to earth, or removing her yards, as if fired from a gun.

III.

Through it all, however, and in spite of all, there can be no doubt that at the back of her inscrutable feline mind was the honest and steady determination to return home—her real home, I mean, not the charwoman's horrible parody of one. How she proposed to find her way across

the uncharted and labyrinthine chaos of the great city any one can explain who cares to. Personally, I cannot; I prefer to fall back upon the word 'orientation' and look wise. Be these things as they may, however, call it orientation, chance, instinct, or what you will, the fact remains that Miss Berlinda did find her way—though her straight-ahead progress was slow and erratic—for some hours, and—up to a certain point.

That point was the junction where two railway systems branched, and where Miss Berlinda, who, with a cat's usual Oriental way of reasoning, had begun to get fairly well used to locomotives by then, was picking her dainty, supercilious way along the branch that led in the right direction for her home—Miss Berlinda, I say, met the night mail. They were proud of their night mail on that line, I think, which is why Miss Berlinda met it at about a mile a minute. Hitherto that night she had done business only with 'locals' and 'goods'—mere crawlers in railway society—and I suppose the night mail was above her calculations. Anyhow, it seems to have upset her sense of tameness, or whatever you like to call it, for she had barely time to throw herself backwards with one desperate, scuttering, twisting leap, as the flange of the ten-wheeled 'Atlantic' engine's off front-bogie wheel, that would have cut her neatly in half, brushed—literally brushed, mark you—her beautiful sandy coat.

The night mail took, perhaps, less time to hurtle past into the night than did Miss Berlinda to roll down the steep embankment, dazed, scared, and not quite certain whether she rolled in two parts or one. But it was the end of that roll, maybe, which really did it, for up to that point—though the thin links that bound her had been snapping, one by one—Miss Berlinda had remained painfully domestic through it all.

Now, however, Fate gave her a jolt. She fetched up at the bottom, and none too softly, against a brick wall. That brick wall enclosed a slaughter-house. Miss Berlinda's nose told her that, of course; but Fate had decreed that she should land up against an inlet—ventilation, drainage hole, or something—in the foot of that wall; and that, just at that precise moment, things of import were happening inside.

Before she could roll over and up instantly almost to her feet, cat fashion, Miss Berlinda was conscious of a terrific scrimmage within that inlet (or outlet, truly) against which her spotty ginger side lay, and more than instantly of a red-hot stab in that same side—a stab that sent her up into the air, spitting like a firework.

All wild creatures will usually fight with sudden fury if suddenly jostled; not because they necessarily want to, but because they are, as a rule, afraid the jostler will. And Miss Berlinda became, with that sudden shock of pain, a wild creature—the last link had snapped, in fact.

She fought. And the great gaunt devil of a brown rat coming out of that hole in the wall fought—indeed, he had to—and another brother devil following behind fought, and a sister devil following behind them fought too. They all had to; a watch-dog was on the far side, driving them.

The rats considered themselves cornered, and you know what a bad accident a cornered rat is. Miss Berlinda seemed to consider herself attacked, and you know the prickly Catherine-wheel an attacked cat can be. And between them they put up as ugly a close-fought, in-and-in, villainously cruel, strenuous 'worry' as ever shocked the night. It did not last long, luckily. It could not last long, flesh and blood being only what they are. No beasts could have stood it longer—and lived. Indeed, one of them—the leading rat—did not live, as it was; he died, bent into a bow, as they die who have a severed spine. And another of them died also, but next day, a ghastly wreck, put out of pain by his pals. And one of them lived. Also Miss Berlinda lived, though red in streaks, and grimy from head to padded toe, her pink bow a scarlet tatter, her eyes like live-coals. But it may have been that same pink bow that had saved her life, none-the-less, for you know how the rat people slash upwards from below with the cold chisel. Miss Berlinda lay down, stretched out beside her stretched-out dead rat, and gasped for breath. It was the first rat she had ever slain. She had never killed a mouse either, for the matter of that. The odds had been three to one, and she had had to rely entirely upon instinct in the fighting. It had cost her something, too, and she would carry the marks of that combat probably to her dying day.

IV.

Meanwhile there was one on the other side of the wall who plainly was not yet satisfied. The watch-dog had gone nearly mad during the fight, for he could see part of it and smell more, yet could no more than get his big nose into the hole through which the rats had gone.

Now that the fight was over, however, a little sense returned to him. He longed horribly to get out and slay impartially, rats or cat, or all four; he was indifferent which. Plainly, he could not get through the wall, or over it, but there might be another way.

The ragings and snuffings of him ceased, and Miss Berlinda continued her exhausted task of licking her wounds—they looked as if they had been gouged out with a sharp chisel—and getting back her breath. And as she did so the midnight main-line long-distance 'goods,' outward bound, pulled up slowly, and with much groaning protest, on the top of the embankment above her. Three sharp whistles from the big-humped locomotive, far up the track, indicated that the signal was against her, and she was saying so with impatient contempt.

Then the fog came down again, welt upon choking welt, and shut out everything—except, possibly, to Miss Berlinda, who may have been able to see what we could not—and all grew quiet again along the track, and the night was white, and shut in, and still.

Into this scene, then, the drumming of the watch-dog's galloping feet intruded, strangely magnified. He must have found a way out somewhere, and come round by the street.

Miss Berlinda heard him one instant, drew herself together like a compressed spring the next, beheld him the next, a smudged darkness darker than the surrounding dark, and heard the sound—it has no name that I know of—part growl, part snarl, entirely horrible—which a dog makes when he hurls himself 'all in' to the attack.

Miss Berlinda was not there when his jaws clashed to, but her talons were, and he acknowledged receipt with a whimpering, choked roar.

Then Miss Berlinda was on the top of the embankment, the watch-dog scattering a miniature avalanche of stones two feet in her rear.

She was under the hooded, sheeted trucks of the waiting long-distance 'goods,' the watch-dog snapping hairs from her tail-tip—he was so close.

She was playing forked lightning in and out under the trucks, the canine's stinking breath hot on her heaving flank.

Death hovered above the pair, waiting to swoop, and Miss Berlinda knew it, and where the swoop would land inside two tail-flicks, if—ah!

Miss Berlinda was on the chain of a coupling. It clanked as she left it, leaping for a buffer, and the dog's jaws hit it in mid-spring.

There was a frantic, furious scratching of claws as Miss Berlinda arrived on the top of the back of one truck, swayed, slipped, and recovered, with a wrenching twist of sheer despair. The locomotive far up the train broke the still night through with one sharp whistle. There was a sudden banging jerk all along the track as the truck-couplings tightened; and Miss Berlinda was shot, head first and spread-eagled, into the bowels of the truck she was on as the goods-train began to move.

Once having begun to move, that goods-train did not stop for hours and hours; and Miss Berlinda, crouched and glaring under the tarpaulin cover, saw no reason at all why she should budge. Moreover, a fine drizzle had begun, almost as soon as the houses were left behind, and the thick night over the dim fields became cold with wet.

Miss Berlinda had heard the ghastly howl of the watch-dog as she sprang into the goods-truck—which announced two facts: firstly, that the train had been started upon its long journey; secondly, that, by the same token, the dog had started upon a longer journey still. He had, in

fact, been cut into two unequal halves under the wheels.

After that, one gathers that pussy thought that she was alone; but she was wrong there, all the same.

Familiarity breeding contempt in cats as much as—if not more than—in most creatures, and hunger adding itself, Miss Berlinda proceeded anon—after the thirtieth mile-post was passed—to size up her ‘chariot of ill-ease.’ Investigation, with legs wide apart, and with rather drunken mien, revealed the goods-truck to be full of sacks of wheat, and—great claws and fangs!—mice! At least, her wonderful whiskers guiding her not too wonderful nose perhaps—but that’s a matter for question—she discovered five mice in four sacks. Apparently they were desirous of remaining in those four sacks, because the rattle, jolt, and roar of the ‘goods’ at her top speed seemed rather like the end of the world to them. Mice, however, are afflicted with a super-thirst—so are rats, and more so—and the rain, collecting in little puddles in the tarpaulin, must, I presume, have drawn them. Anyhow, they came out in time—one by one. They did not go back. Miss Berlinda interviewed them—one by one. Five, in all, she dealt with faithfully; and those she could discover, three in all, who would not come out, voting for a death by thirst rather than a death by accident, she tore out.

v.

This whole affair—and surely never was a hunting so strange—must have taken her some hours, and it was in that grim, raw, ‘down and out’ hour before the dawn, when they say life is at its lowest ebb, and she was just making herself cosy on a well-sheltered sack, after a way-up feed and a cool rain drink, when the main-line long-distance ‘goods’ and the west-bound mineral train, standing in her way—met.

Miss Berlinda arrived, asprawl and sailing,

upon the double thorn hedge, in the middle of sacks of corn, which burst like shrapnel, and in an uproar that was heard for miles. Behind her, over and over down the incline, came the trucks—some of the trucks; and Miss Berlinda, seeing them coming, did not linger in that hedge, though the thorns did their level best. She shot, like some red-hot six-inch shell, straight out of it on the far side, and—whew! W-e-ll, she shot straight into Madame la Fox, and—things happened.

The goods-trucks obliterated the hedge in stretches, and themselves into matchwood; they obliterated also five pairs of nesting birds, one weasel, one rabbit, and a field-mouse. They would have obliterated that feminine Reynard and that female feline if they could have reached them, but it did not matter, because the two were evidently, in the madness of fear, doing their best possible to obliterate one another; and when the lanterns came, and the trucks caught fire, and they ran away, the stark dawn, paling the lights, revealed two red horrors, each on three legs, crawling off through the lonely wood; but—*but*, mark you—it was Miss Berlinda who was dragging, as well as herself, the vixen’s rabbit.

And that is all. Miss Berlinda crawled off into that wood, and—well, she crawled off into that wood—and that’s all about it. No part or portion of her has been seen by mortal eye since; from that day to this—nothing. But there are some mortal eyes that would very much like to see her, for surely it can scarcely be her ghost that is responsible for the remnants of what have been fat bronzed pheasants, and the more or less disfranchised forms of rabbits, the wood-pigeons without stuffing, and the partridges reduced to blood and feathers, which Slaymore, the gamekeeper of that wood, discovers upon his lawful occasions from time to time.

That, however, is another yarn, and a red one.

VEILED KAFIRISTAN.

By IKBAL ALI SHAH, M.R.A.S., F.R.G.S.

i.

AFGHANISTAN has not unjustly been called a land of mystery, for little is known about that country, and whatever accounts do exist are not sufficiently definite to be satisfactory. And yet there is mystery within mystery, as the province of Kafiristan, which lies to the north-east of Khyber Pass, until recently was a completely veiled land—a region unknown to the Afghans as well as to the rest of the world.

This strip of the country (which one is tempted to term the Caucasus of the Middle East) is about one hundred miles long, and half

as much in breadth. Its boundaries are easily located and as easily remembered, for they have often figured before the Western world in connection with political complications. Kafiristan is bounded on the north by the Hindu Kush, a range of mountains closely associated with Alexander’s onset upon India. In the south-west we have the Kohistan of Kabul (highlands of Kabul) and the province of Lughman, where last year the Amir Habibullah Khan was murdered in his camp. Chitral and Swat cantons, familiar to us in connection with the Black Mountain expedition, mark the boundary of the Kafir land in the south-east; while Jellalabad province lies due south of that country.

Nowhere in Asia, probably, have the geographical conditions influenced the mind of the people so profoundly as in Kafiristan. The love of war and night forays, and a general contentment notwithstanding the scarcity of provisions, are singularly manifested in the characters of the Kafirs. Like other mountain races, they are conservative and intensely suspicious—suspicious of all foreigners, no matter in what sacred garb they may visit the country. A traveller in that part of the East is confronted with great difficulties, and runs much risk of losing his life; yet it is possible for one to pass unmolested through the Khyber defiles, or to reach the Ragistan of Bokhara without being unduly interfered with—provided, of course, that one grows a beard, speaks Pushto and Turki-Persian, assumes an Uzbek style, and does not direct a camera indiscreetly at every youth of the village. But the case with Kafiristan is different. You must think twice before you cross the Kafir's path. It is simply not possible to intrude into the country, be you never so venerable in appearance or open-handed in bestowing presents. A priestly cloak may impress the faithful in the tribal country or in Bokhara; but the Kafirs, having no fixed conception of religion and no tolerance for priestcraft, will not let any stranger enter their mountains under any guise.

II.

The physical aspect of Kafiristan is very similar to that of the Caucasus, and consists of a succession of long and narrow valleys, bounded by lofty and snow-covered mountains. These valleys are intersected by countless smaller ones, which open into the main depressions, and these again, in their turn, are connected with innumerable water-courses. Thus the whole area is nothing but a network of valleys and high mountains, ranging from sixteen thousand to twenty thousand feet. The slopes and the ravines are covered over with forests, containing trees of very large size. Oak, hazel, elder, zaitoon (wild olive), shisham (*Sisu dalbergia*) are the chief kinds. Several species of fir and pine also exist.

Within these natural defences the Kafirs of to-day live now as primitively as did their ancestors hundreds of years ago. Pickets composed of the surest *kaman dar* (bowmen) guard the country against every man who is not a Kafir. The life of these Kafir pickets is interesting, inasmuch as they get no pay, but receive as many arrows as they wish from their military headquarters at Kullum, a fort in the heart of Kafiristan. A liberal supply of arrows is considered as pay, for the pickets can kill animals at these outposts, and are allowed to barter skins and wool for goods in kind. By far the most important quarry is the deer called sarjzah, hunted for the sake of musk, which is a very useful article of barter. The appointment of

pickets is for life, and during service no leave is granted to them.

The Kafirs can neither write nor read, and possess no historical records; consequently their origin is still obscure. Some have assigned to them Hellenic ancestry; others take them to belong to the ancient Hindu stock; while they themselves trace their parentage to the Quraish Arabs. From the true Arabian stock of Quraish—the noblest amongst the Arab clans—they are poles apart; there is not the most distant similarity in features or in language. Their connection with the Greeks is equally unfounded, and there is enough anthropological and dialectical evidence to support the view that they are descendants of the early Aryan hordes which swept upon India some centuries ago, and have more in common with the Hindus, the Buddhists, the Persians, and the Tatars than with the Greeks or the Arabs.

The argument that the Kafirs belong to the Hindu cult is based on the superstitions and practices found in Kafiristan. However these ceremonies may have taken on local colour, they are admittedly traceable to the parent Vedic and the Parsee stock. These are not in any sense allied to the Arabs. All their rites and ceremonies are exotic in nature, probably imported from both East and West.

III.

With regard to the mineral production of these parts, the elevated regions of Kafiristan have ever been famous for the prodigious abundance of the precious metals, whether in ancient or in modern times. So it was under the rule of the Medes and the Persians; and Herodotus likewise informs us of this fact. So far as is at present known, the southern slopes of the Hindu Kush possess gold and silver. Fine gold-dust is washed down by rain and melting snow, and is deposited in the sandy beds of the Kashkar, the Alingar, the Nyrao, and the Kao, the principal rivers of Kafiristan. Efforts have been made to collect this gold, but the only method known to the Kafirs is to bury goatskins in the river-beds, allowing the hair free-play. In it the gold particles are entangled. A good quantity is being collected from the river Kashkar near Jellalabad, before it empties itself into the Kabul River. Strangely enough, the gold is much paler than is usual—almost a straw colour. The Kafirs are not very fond of occupying themselves in searching for gold, nor have they any real liking for the metal as a medium of barter; musk and live-stock serve their purpose better. Their self-sufficiency has stifled all efforts towards the prospecting and the working of mines. It is of interest to recall that in the district of Shamu, in the north of Kafiristan, where some gold is extracted, common belief still obtains that it was here in the olden days that the griffins kept watch over the gold-mines; and farther down the

river Alingar gold-making ants are believed to throw out earth amongst which large quantities of gold are found.

In passing from one valley to another the traveller is struck by the zest and the spirit with which the female section of the community takes part in agriculture. If a man is tilling one piece of land, in the next you will notice a woman handling the plough with equal dexterity. As there is no veiling of women in Kafiristan and the dress is almost the same for both sexes, at a distance it is difficult to distinguish which is which. In the valleys and where the land is sufficiently level, oxen are used for ploughing, but on account of the irregularity of the country the Kafirs sow their grain wherever possible. These cultivated parts mostly consist of narrow terraces or plateaus on the sides of the steep hills, sometimes natural, but more often artificial. Should the field be inaccessible to bullocks, the soil is worked by hand. The plough is of the time of Adam, the same wooden structure of triangular shape, with the same crude wooden point to it. The principal crop is wheat, and harvest takes place in the autumn. The grain is separated by oxen treading upon the ears.

Rain falls in copious showers, but never for any lengthy period. In winter snowstorms are very common, sometimes so severe as to block up the passes between valleys and isolate village from village for weeks together. On entering a valley, away up in the distance you notice clumps of stony structure nestling in the green verdure; these are in time recognised as houses, erected anyhow with rude stones. Defence being the object in view, these small colonies are as a rule situated on the slopes of hills, so that invaders may be discovered without difficulty, and the fearful winter blasts, snowstorms, and floods may not harm the villagers. Most of the houses are of one storey; three or four at the most in a village are of two storeys. Caves have also been used for habitation, not only for cattle and poultry, but even for human beings.

It is not always very easy to get up to these villages, for the approach to every one of them is guarded by a deep ravine in which a stream rushes down. The only way of crossing is by a swinging bridge. Inflated oxskins are sewn together and covered with matting. At the ends the bridge is made fast to the trunks of big trees. To an inexperienced person the bridge-crossing is fraught with danger. The structure is constantly kept in motion by the water of the stream; nor can sure-footedness be expected in walking on inflated skins. Fancy walking on huge air-cushions and looking down into a big foaming torrent! The Kafirs can run over such bridges without the least difficulty, but to a stranger a woollen rope is necessary to steady him, and as often as not he crawls on hands and feet.

IV.

There is no fixed law amongst the people of Kafiristan. The oldest man of the clan is elected as the chief, and the elders form his Cabinet of government. No punishment of a severe character is imposed, for the reason that there are no crimes of a grave nature recognised amongst the Kafirs. Theft is unknown. Adultery is not considered a crime. Murder is usually settled by arbitration and payment of a fine. The guilty person is summoned before the clan gathering, publicly asks forgiveness, throws down his weapon, and stamps his foot on it. All is then settled, and the man is acquitted.

The Kafirs are divided into eighteen tribes, and the designation given to them, *Siah Posh*, is derived, as a matter of fact, from their Muslim neighbours. The term is based upon the form of dress which the Kafirs wear. Their attire includes trousers very much like those worn by Turkish ladies; a shirt covers the upper part of the body; and over all is thrown a big coat of black goat's skin. In Persian *Siah* means black, and *Posh* means the wearer; hence the appellation of *Siah Posh* by which the Kafirs are known to this day. Men wear no head-dress. The women have a similar dress, with the addition of a skull-cap, under which the hair is pleated.

In physique the Kafirs are a hardy race, somewhat soft in outward looks, but war-like to the backbone. Their hair is of chestnut colour; they have brown eyes, and a complexion which would be considered fair even in Europe. They are tall and stately. Though great fighters who have defied the legions of Timur, they are yet people with a keen sense of enjoyment. Their large dreamy eyes give away the secret of their living, for the Kafirs are the greatest wine-bibbers in the East. Grapes grow in such abundance in the country that when fodder is scarce the cattle are not infrequently fed upon them. When the crop is gathered tons of grapes are thrown into large earthen tanks, men's feet tread the grapes, and the whole is left for some time, then boiled and left again to ferment. After a time the public supply is taken from these receptacles, as would be done with water in this country. These tanks of wine are public property, and any man may fill as many pitchers as he likes, whenever he likes. He may use the wine himself or give it to his ox. Baber has portrayed well this phase of Kafir life. 'In this sequestered tract of country,' he wrote in his *Memoirs*, 'grapes and fruits are produced in great abundance, and it also produces a large quantity of wine; but in making it they boil it. The people are wine-bibbers—they never pray, neither fear God nor man, and are infidels. So prevalent is the use of wine amongst these people that every Kafir has a *khig* or leathern bottle full of wine hung

round his neck, for they drink wine instead of water.'

Their method of slaughtering cattle is strange. The head of the animal is seized by a man, while a second strikes it a blow on the neck with a sword. If the head is severed—which is generally the case—the flesh is considered fit for consumption; but should the case be otherwise, then the carcass is given to the Baris, a people considered menials, held in the light of pariahs, who seem to be the remnant of the aboriginals of the country—the Paropamisadæ of the classical authors. All broken utensils are kept for Baris, who sometimes come and stand behind a person to eat whatever is left over. But should a Baris come in front of a Kafir while he is eating his food, then it is considered defilement. The Kafirs do not bury their dead, but place the corpse in a box and take it to the top of a hill and leave it there; the custom is not unlike the Parsee practice.

v.

The Kafirs are great enemies of their Muslim neighbours, and there is no greater glory for them than to waylay an Afghan and kill him. Once every year they hold a grand festival lasting for forty days. Great preparations are made for it. Large quantities of wine, clarified butter, and fruit are collected from every house. On the festival-day no one eats food at home, but all visit their relations and friends in rotation, remaining with them four or five days at a time. When the festival-day arrives, a large cauldron of clarified butter is heated, and around it cups are arranged. Every person who enters the house is expected to drink a cupful; otherwise it is accounted an insult. During the festival the villagers assemble and make merry. Men perform sword-dances, and the women fasten tiny bells round their waists and dance together. On the last day of the feast, which is called *Chilum Chaty*, all those who are desirous of making an inroad into the territories of their Muslim neighbours get up and stand on one side. Upon this one of the elders proceeds to harangue the audience on the deeds and prowess of their ancestors, recalling how many Muslims they had killed in their life-time, how many villages they had plundered, and exhorting his hearers to follow their example. When he has finished his address the people disperse to their homes, and the volunteers make preparation for their departure.

When the day comes for the warriors to set out, the villagers give them provisions and wine for their journey, and those requiring arms—chiefly bows and arrows and swords, but no fire-arms—are provided with weapons. Some conspicuous hill is then chosen on which a bonfire is to be lighted on the heroes' return. Fuel is heaped at the place, and no one is allowed to approach it, lest by accident or out of mischief

some one may set it alight without good cause. For twenty days the guerillas are out harassing and killing Afghans ere they return to their village, where the bonfire is duly lit. The whole village gathers to welcome the warriors. Those who have killed any Mussulmans are raised shoulder-high; others who have not been so fortunate are not allowed to sit in the assembly, and are excluded from participation in all public diversions. In their own homes, too, their food is handed to them over their shoulders. When they have succeeded in taking the life of an Afghan, they are again admitted to their rights as free men.

But in spite of this religious feud, if a Kafir says, 'This Muslim is my friend,' or a Muslim says, 'I am a friend of such-and-such a Kafir,' no harm befalls the Muslim, but inquiries are quickly made to determine the truth. If a Kafir and a Mussulman wish to become friends, as is sometimes the case with the people of Chitral and Badakhshan, they exchange weapons, and remain friends till the weapons are returned. Another custom is to kill a goat and draw the heart. Each contracting party then takes a portion, bows to the other, and touches his left breast with the point of his sword. The friendship is thus sealed.

The marriage customs of the Kafirs are also peculiar. The suitor discharges an arrow into the roof of the house of the man whose daughter he wishes to marry, and makes mention of the fact to the elder of the village. If the parties are agreeable, then the clan gathers in a circle. In the centre a goat is made to stand, while the bride takes her place at the head of the animal, and the bridegroom stands at the tail end. The elder addresses them, telling them to keep up the family tradition and behave in the manner of their grandsires towards the Muslims. The marriage is over, and the goat is given to the elder.

There is much to interest us in these Kafirs at Hindu Kush, and the rapid development of Afghanistan will doubtless lead to the unveiling of the country of this most fascinating people.

SHELL SOUNDS.

I HAVE a shell, a lovely shell,
Fished from the silver sea,
And oft within its hollow cell
I, listening, hear the solemn swell
Of ocean's harmony;
Of winds that leap
Wide sands, and sweep
Along green curling seas;
And screaming gulls
About the hulls
Of founder'd argosies.
And I have heard the measured knell
Of beacons tolling dread,
And caught within its sounding cell
Sad echoes of the fear that fell
On voices that are dead.

DOUGLAS CARSWELL.

Chambers's Journal

SEVENTH SERIES

FROM THE FO'C'SLE.

By BART KENNEDY.

I.

SAILORS are easy-going men with free, careless manners. They take life and things as they are. They worry not their heads about the ills that may arrive on the morrow. Sufficient for them are the concerns of the day in which they are actually living. They go on their way, minding neither what comes nor goes. They face life even as they face death—bravely. Fine lads are sailors.

And I am glad to see that they are coming in now for a bit of their own, so far as the seeing of the colour of money is concerned. For they are men who are indeed worth more than their salt. They are perhaps the most useful of all workers with the hands. Up and at it in all weathers. They never know what the next hour may bring. Up and at it through the hours of the day and the darkness. Four hours on and four hours off, working to the ring of bells.

In the old days Jack was scandalously treated in the matter of wages. The people who sent him forth on ships acted as though money were less than no object to our good friend Jack. It was as if they thought he was an artist with a soul of the out-size order—one who was above the consideration of mere lucre. His pay on the merry, bounding, flapping 'lime-juicer' was from two pounds ten to three pounds per month, with nice weevilly biscuits thrown in as an appetising and entrancing make-weight. On a Western Ocean steamboat he got four pounds a month, with biscuits in which the enticing little weevil harboured not. The biscuits had not reached the mossy ripe old age that the weevil loved, for the Western Ocean was crossed in from ten to fourteen days.

There were also packets, it may be remarked, where our good old friend John was treated in so interesting a manner that he skipped the ship when he got to the outer port. This was very considerate of him. For he assassinated two birds with one stone. He saved his skin, and at the same time he saved the owners of the ship the modest little bit they had contracted to give him when he got back to the dear old home port.

For his skipping of the ship there was a good,
No. 515.—VOL. X.

healthy, convincing reason. The logic that was applied to him would have appealed even to the most unintellectual person. In a word, the mates and the captains of these packets knocked our dear old pal John about so much that he was only too pleased to wave a fond farewell to the packet on the first opportunity. Punches and belaying-pin soup were the order of the day. The truth was that mates and captains worked in with the owners. They got their whack of the money out of which Jack was cheated. The whole business was what is vulgarly known as a put-up job.

(I should like to say here, parenthetically, that I speak as to the brutality that so often went on at sea, not from hearsay evidence, but from the evidence that is known as first-hand. And very much first-hand at that. And whenever I hear of a mutiny at sea my withers are very much unwrung. For I know what I know. I've had some.)

Things are much better now for Jack, so far as pay is concerned. He gets about eleven pounds where he got three in the days when the belaying-pin soup was ladled out so early and so often. This belaying-pin soup! It isn't ladled out at all in these present halcyon days! Of course not. No; many times no. To ladle it forth now would be rude and vulgar. It would be bad form. Yes, yes, human nature has flopped round. She was going due west. She is now going due east. Brutal captains and mates are as dead as the dear old dodo. White wings sprout now from the shoulders of captains and mates—or, at least, they are beginning to do so. John is invited now to tea-fights in the cabin. Well, well! we live in an age of richly carpeted progress.

The chances to ill-treat men at sea with impunity are now fewer. Perhaps that is a good deal of the reason why the traces of angel-wings are beginning to appear upon the officers' shoulders. It may be; it may not be. I merely put it forward as a suggestion.

One may think that sailors could resent the brutal treatment that was so often meted out to them. But if one thought this, one would think the thing that was very much wrong. If a mate struck a man, and that man struck him back, the mate could construe it into

[All Rights Reserved.]

OCTOBER 9, 1920.

mutiny, and could kill him on the spot. Or the man could be put in irons and brought to alleged justice when the ship made the next port. Wearing irons aboard ship is a cross between being in hell and being in jail. It is conducive to the kind of thought that inspires vigorous action when the psychological moment arrives.

II.

When the sailor was brought before the consul! Ah, that was the time! That was the time when that dear dame, Justice, took the bandage from her eyes and got in a little bit of fine artistic work. Our good friend John had as much chance with her as a small dog would have with an alligator if it met it in mid-stream.

The consul! He was the boy. He was the cuckoo, as the sailor puts it. He was the good, white-haired boy with the smooth white brow who saw to it that our good friend John got 'what for' from Dame Justice. In eleven cases out of ten Johnny came out of the small end of the horn. For he (the consul) was more than a man and a brother to the captain. They wined, or they grogged, together, and made it up as to the precise way that John should be put through the hoops. The sailor-man never got a dog's chance. No one ever dreamed of taking his word. For he was a vulgar, dishevelled, tough ruffian who ought to be given a free dance at the end of a rope! He was a bad man right from the drop of the hat.

It was only when there was a case of absolute murder on the high seas by the people aft—murder that could neither be got out of nor ignored—it was only then that the consul could be kicked into the tardy doing of his duty. He was always, as I say, against the sailor-man.

How it is now I know not, for I speak of the days of yore, and I admit also that I speak from the fo'castle standpoint. I hope he is better, though I 'hae ma doots.' He may have turned over a new leaf, or he may have got himself an entirely new book. I know not, so I cannot tell. I only know that in the old days consuls were the worst of all the enemies Jack had to contend with. They always held the candle for the devil. And, mind you, I except no nationality. Absolutely all consuls, of whatever race, breed, or calibre, were tarred with the same brush.

I know what went on at sea, for, as I have said, I've had some. I've been a sailor myself, a rough sort of sailor on steamers and fore-and-aft vessels. I have had the captain of a vessel threaten to strike me. To be threatened in this way makes a man who will fight see red. He would sooner be knocked dead than put up with the indignity. The captain did not make good his threat in my case, however, for I made him see that if he attempted it I should do him in,

and take the chances of what came after. We got to be friendly after that. He wasn't too bad a sort. His head had become a trifle swollen through hitting men who wouldn't hit back. Dear me, how time flies! That was some time ago. More than thirty years. It is almost as if it had happened in some other world. A long, long time ago. The sea was a rough business to follow in those days. There was nothing of the soft, cushy job about it. And still, in a kind of a way, I liked it. Or, to be more exact, there were times when I liked it. Yes, it was a rough business. And it's a rough business now, I'll be bound.

The first time I ever crossed the Western Ocean, I crossed it before the stick. I was the greenest of greenhorns, and if I had known what was in front of me, I should have jumped off the dock rather than have taken it on. My! oh my! It was an experience of the fearsome order. It was in the month of January, and the weather was worse than heavy. It was awful. The size of the seas was enough to make one quake. I had never been to sea before, and besides my being very sick, the nerve was knocked—or all but knocked—out of me. I felt the profoundest kind of pity for myself, and I vowed many a time and oft that if I ever got my feet again on dry land I would never leave it. I would be a landsman for good and all.

I was a Paddy West sailor. Old sailor-men will know what I mean, but for the benefit of those who do not, I may as well explain that a sailor of this kind simply meant a man who was signed on as an A.B. (able-bodied seaman) because the crew was a man or so short of the number that the law required before the ship was allowed to sail. The poor Paddy West sailor was usually an out-of-work man who had never been to sea. He was a kind of forlorn, helpless adventurer, so to speak. And as he was a useless and very-much-in-the-way kind of man, he got a rough time all round. He was knocked and pushed and thumped about.

Needless is it to remark that I got a rough time. But I prefer not to dwell upon it. Sufficient unto that far-off day was the evil thereof. That voyage lives in my mind now as a dim nightmare. It was not very dim then, however. No, indeed.

III.

Certain well-intentioned people have very odd views regarding the way sailors ought to be treated when they come ashore after a voyage. Jack has been subjected to the hardest kind of discipline from the weather, and from things and circumstances and man. He has been very much up against it. His natural instincts have been held in check, and these people of the good intentions feel that more discipline still is the nicest of nice things for

him, now that he has left the bounding billow. As a matter of fact, they want him to live the exact mathematically good life. He is expected to abjure wine, women, and song. His wages are burning a hole in his pocket; he wants to experience the exciting relaxations of life; and still he is advised to be good.

It goes without saying that our friend John does not see eye to eye with these people whose ambition it is to make him better than Providence made him. He gives them the eye that is not glad, and he goes forth on a 'bust.' He paints the town red. He circulates his money with free swiftness, which, according to the learned economists, is the right and proper thing for him to do. He has a rip-roaring good time all round, and quite often he winds up in the cloistral calm of the prison-cell.

He wakens up, refreshed but broke, and he goes forth blithely again to the bounding billow; that is, he goes forth as soon as the deities of law and order will allow him.

This is as it should be. Or, rather, it is as it is—which is far more to the point. Besides, if John looked not into the magic glass that inebriates, where on earth should we get sailors from? People with fat, stout bank-balances go not to sea. That is, they go not as sailors. No sailor worth his salt goes to sea till he is utterly and absolutely broke. It is then, and then only, that he listens to the siren sea-voice calling him.

However, these people of the good intention are not so bad, after all. They either do not know, or they ignore, Jack's real wants. But after Jack has had his fling, and he is on the rocks, they come to his rescue quite often. It is only fair to bear witness to this. And perhaps it is only fair to add that it is not possible for them to supply his real wants after he has come ashore from a voyage.

No, these Sailors' Home people are not bad people. In fact, they are all right. But in the nature of things they do not fill the bill for Jack when he comes ashore with his pocket full of wages.

IV.

I was in Frisco close on three years. In fact, I deserted a ship there. That port was the roughest and the worst in the whole wide world. The things that one heard of, and the things that one knew went on at the Front, were terrible. It was a great place for shanghaiing men. Indeed, I was very nearly shanghai'd there myself. You had to be careful when you were on the Front. Accepting drinks from oily-voiced strangers was dangerous. For often the merry knock-out drop was administered to a man under the cover of the drink fraternal. Yes, Frisco was the toughest port on earth. I wonder if it has changed for the better. . . .

The food was not always of the choicest at sea, but there was a certain thing that could not be

bettered anywhere. There was a certain thing that was the finest going. If you were the biggest millionaire possible you could not beat it.

It was the air! The fine, glorious, wonderful sea-air. It was the very essence of life itself. You were inhaling life! What mattered if the food were short? What mattered it if it were hardly eatable? The air made up for it. The glorious, splendid air.

It was not doled out to you by man. It was not hampered, or measured, or weighed. God gave it to you. None was there to challenge your right to it. There was no one to say, 'You shall only have so much.' It belonged to you as much as it would belong to a prince or a king—this wondrous, strong, healing air of the sea. It was the best thing that was going, and it was the most free. It was yours inalienably.

I remember meeting a young fellow once in Vancouver. He was from the north of England, and he had just left a British ship that had come from China. We talked about her in the abusing strain which sailors always adopt when discussing ships.

'Eh, lad,' he said, 't' food were awful. Nowt to eat. Only for t' air we'd 'a died.'

V.

You can always tell a man who has followed the sea, it matters not how long he has been away from it. There is something sound and vigorous about him. Or, at the very least, there is what might be called an echo of something sound and vigorous. The influence of the sea goes right to the core of one. It changes the whole physical being. And the mental being too.

You do not find mocking, cynical men amongst sailors. You do not find the atheistic, materialistic idiot who disbelieves in things just because his mind isn't big enough to grasp them. The immensity and the wondrousness of the sea put the sailor in key with a sense of the Infinite. It makes him realise that man is, after all, but a small thing in the vast and profound scheme of life. It matters not how dull he may be, he is made to feel this. It possesses him.

The water-world over which he sails day after day, day after day! It is immensely peopled with strange peoples. Down in the darkness, down and down and down, life is coming and going, and passing and passing. And from it there comes a mysterious radiation that passes into the sailor. Men who follow the sea show the influence of this in their eyes. The eyes of sailors are the strangest of all human eyes. They are not to be mistaken—strange eyes that see out into distances, and into profound depths.

At night when the sailor is on watch! He looks forth over the darkness. He listens; he is on the alert. He watches and hearkens for the death that may come at any time. For always there is danger. And to meet it, and to evade it, there must be eternal vigilance. It is the

price that must be paid. And it does not always suffice.

A night of stars! Glorious then is it to be on the deck of a ship. Glorious is it to watch the far-distant shining of the fire-worlds. Worlds of unimaginable mystery. The sailor is here on the deck of the ship looking up into an immensity that is at once a darkness and a place of wondrous shinings. He is sailing over darkness. He hears the sound of the waters as the bow of the ship cleaves through them. The waters are sounding out as a steady song. A deep, fine, splendid song. Yes, he is here on the waters of a world that is but as a speck in the universe, and is, at the same time, a world of vastness and mightiness. He is here on a frail thing, coming from the hand of man—a thing that, even so, endures and passes on its destined journey. A thing of smallness and still of greatness.

Even though he may not think consciously of these things, yet they enter into him and influence him. The wonderfulness and the mystery of life surround him. And he in the end becomes of it. He is marked with the sign of it. And, as I say, you will see this sign in his eyes—it matters not where you behold him. It matters not if it be in the darkest slum of a vast town, you will still behold this strange sign.

VI.

To be on the deck of a ship in a storm at sea is an experience at once terrible and magical. Death surrounds you. Death grips you, yet it possesses you not. The ship is struck and struck. It is as if foundering, but still it endures. It is a small, weak thing that is tossed and dashed about. And still it endures. You go along with the watch on deck, hauling on the halyards, tightening here, tightening there. It is as if the end may come at any moment. But you go along. And there comes to you a strange feeling. You find that you yourself gather strength from the contact with these hurtling, roaring elements. The wind gives to you power. The drench of the flying spray gives to you power. Death may come to you. But you care not. You go on with the watch on deck, hauling and hauling on the halyards, tightening here, tightening there.

Yes, death may come, and often it comes. Often the might of the storm smashes and breaks the ship, and she founders and goes down and down and down to death in the darkness. But you think not of this as you haul on the halyards. And even if you do, you care not. For in the storm at sea there is to the sailor, at times, a god-like stimulation. At times! Yes, I know, for I have felt it. I have been in the midst of it, and cared not for the thing that might come. I felt that I belonged to the elements—that I was of the elements.

But let me confess it. There have been times when I was afraid; times when terror seized

me. I remember a certain night. It was in the winter-time, and for days the weather had been ugly and heavy. I was with the watch on deck, when suddenly a hurricane smashed down upon us. It became pitch-black instantly. I could not see my hand before my face. Absolutely pitch-black. And the roaring of the wind was as the roarings of demons and monsters. It was as if all the frightful things of the depths had risen and were surrounding us: monstrous sentient things with stupendous, horrible voices; dreadful things of the air, and dreadful things of the waters; hideous fighting things of destruction.

I was stunned and confused. I could not move. I was bewildered. And still I sensed the monstrousness that surrounded me. I seemed to be alone with fighting things of horror. Though confused, a part of my consciousness was strangely active. To me these malignant things were sentient. They were fighting to destroy the ship and the beings thereon. Monstrous things of evil. And who is to say that these monstrous powers of the great waters and the wind were not sentient? Surely not you, nor I, nor any other. For we know not. We know not of the make or the scope of the powers that lie behind us. These powers were here in the world before we came. They are of the essence of things. And who is to say that they possess not a surer sentence than ever we ourselves possess? These dread storm-powers from out of which we have evolved! These powers that were here long, long before we came from out them! Who is to say that they are not frightful and terrible intelligences?

Man is not everything, nor anything near it. He is only a being going on a journey, even as are other beings. The way of his going is hidden from him. He is but a part of a tremendous life the springs of which are hidden from him. His intelligence is at best but a small, weak light. Before him and behind him is mystery. He is enclosed in it. The power to penetrate it is not given him. And, therefore, it is well for him not to be arrogant. It is well for him to take what comes. The most he can do is to ponder and to wonder.

Though he may not be always conscious of it, he learns this at sea.

VII.

It is not for any one to sum up clearly the kind of life that is lived by the man who follows the sea. It is a life that is at once vague and definite, and hard and cruel and beautiful. The life is as the sea itself, full of changing moods. There are days of beauty thereon, even as there are days of sullen half-darkness and menace. There are days that sing with the glory and wonder and magic of life; days when the sounds of the waters are as a mighty song, when the wind is as an angel of beneficence. Light, air,

and waters form a vast harmoniousness. The waves move evenly. A peaceful power is over all. Wonderful days are there at sea! Days when the soul of the sailor rises. To live in the midst of such a day at sea is to live in the midst of the power and the glow of life at its fullest. To live in the midst of such a day is to dream dreams of wonder. There comes into the faces

of the sailors a shining. There is an allaying of rancour. Gone are the hard looks and the scowls. The sailors are not as they are on the days of sullenness and menace. To them come softened visions of the past.

Yea, the sailor lives in the midst of glory and strangeness and wonder.

On certain days.

THE BLAIRS ROPE.

PART II.

IV.

THE detective was a tall, thin man. Through being out-of-doors a good deal he had a healthy colour, but he did not look like a countryman. Ross wondered what disguise he had adopted.

'I went down in khaki—it's a sure disguise,' explained Evans. 'I was a man in the battalion in which Sir Hugh was an officer; he was my company commander, and had promised to recommend me for a medal. Medals are got that way years after the event, you know, sir. I was down seeing him about it, and that was how he explained my presence. Being in the country, why not a day or two, as I was in no hurry? So he puts me up at the lodge—by the entrance-gates. Where better could I see everybody come in and go out? And I prowled about the village. Being a Tommy, what more natural than that I should go to the local pub?' Ross nodded. 'And they say things fall to the deserving,' added Evans, taking a long pull at his weed. 'Near the park—in it, in fact, a part of it—had been a military encampment, now abandoned. A nice mess it had made of the place, which I doubt will ever look the same again! One of the things the military left, because they couldn't take it away, was the incinerator. This is a fireplace for refuse, made of loose stones piled one on top of another. It is about as big as, and shaped like, a gate-legged drawing-room table. At the foot is an opening for starting the fire. There it stands, just as the military left it, full of half-burnt rubbish.'

'Well, a couple of miles away from this encampment is an aerodrome, and there is a good deal of flying practice. At this pub one day there called in one of the aerial gunners—a sergeant—and the conversation turned on how far from the earth a flying-man can distinguish moving objects below. I forget what the sergeant said—how many feet—but he said that one morning, flying very early, as they do sometimes, from fifteen hundred feet, it may have been, he had watched a woman walking across a field. He knew it was a woman by her skirts. All this, you know, was to settle an argument—he having mates with him who had also been

"up." Incidentally, he saw the woman stop by the incinerator—he spotted that—and stooped down. When I left the pub I went to the incinerator and poked about among the rubbish'—

'And found nothing?'

'As you say, sir. But it set me thinking. I had asked the airman what time he would be flying, and he had said it was soon after four. Early for a woman to be out, Mr Ross, unless she had something special to be out for! And a sure hiding-place.'

'You think Miss Serge "cached" the stones in the incinerator?'

'I have that suspicion.'

Ross mused over this. 'Well, inspector, your theory is as follows: Hauptmann and Miss Serge are confederates, and the valet their paid "hand." The valet took an impression of the safe-key while Sir Hugh Blairs was bathing; Miss Serge stole the necklace and conveyed it to town; and in due course Hauptmann will dispose of it?'

The detective inclined his head. 'Unless we get on its track while he is waiting for the hue and cry to cool.'

Ross slowly shook his head. 'You have not done so badly, inspector,' he said, 'and were not the case a peculiar one, you might be right; but I am sure Miss Serge did not steal the stones, I am sure Hauptmann didn't, and I am sure the valet did not take an impression of the key. He could have taken one any time when his master was in his bath indoors; in fact, he would have scores of opportunities. From the facts you offer I can deduce nothing, and I can only advise that you go down to Blairs Court again and renew your investigations.'

The inspector rose abruptly. 'I am obliged to you for your orders, Mr Ross. In reply, I am returning to headquarters with the information that you can do nothing to assist me—which being the case, I shall ask for a warrant to arrest, in the first instance, Edmund Cooper, the valet.'

'Sir Hugh will hardly consent to that, inspector. After all, you have practically no evidence on which to ask for an arrest-warrant, and the valet is his useful and trusted servant.'

'But I have already led him to suspect the man,' protested the inspector. 'To suspect all of them, in fact.'

'You have nipped a promising love-affair in the bud, then?'

'I had to. And as well, don't you think?'

'A great pity, to my mind.'

v.

As the inspector, hot and puzzled, looked at Ross, and Ross, in a brown study, gazed at the fire, the 'phone rang. Ross went to it.

'Yes! I am Mr Ross. Yes, he is here. All right.' Turning to Evans, he said, 'Head-quarters want to speak to you.'

Evans went. For about a minute he listened in silence. Then he said, 'Very well, sir,' and put up the receiver.

'Developments?' asked Ross.

'It has been put back,' murmured the detective.

Now he'd puzzle this fine gentleman!

'The necklace?'

'Yes.' Evans was looking at Ross with a twinkle in his eyes. 'Sir Hugh,' he went on, 'took Mr Hauptmann to the safe to show him where the casket containing the stones was kept. Opening the casket—there was the necklace.'

'The real one, this time,' purred Ross.

'Why'—The policeman stared hard at his host. 'You beat me, sir. What do you mean?'

Instead of replying, Ross went into the little lobby, and returned with his covert-coat and hat.

'Another peg?' he asked, his hand on the decanter. 'No? Well, now I'll see you through the gates. You'll be going down to Blairs by an early train, I presume?'

'I—I can't say,' the detective, at an entire loss, replied.

Ross closed his front-door, and led the way downstairs.

'Will you follow my instructions to the letter?' he asked the man.

'I suppose I must.'

They walked up to Fleet Street, Ross talking rapidly.

Arrived in the world outside the Temple, Ross held out his hand. 'I am going to my club,' he said, 'to get a little information. I shall see the man I want there. I shall be in my rooms at nine o'clock to-morrow—Thursday—night, awaiting a call from you at Blairs. I can then conclude the matter, as I wish, because I am going away on Friday—or propose to. Don't forget, will you? Get done all I have suggested by nine sharp. . . . Good-night.'

And they parted.

'Hang him!' muttered the detective, 'I believe he's right on the mark. But what a facer for him if he isn't!'

vi.

It was twenty-to-nine on the following night as Ross opened his door to admit Mr Scathways. The chief of the 'I's' bore a striking resemblance to his voice. He would be about sixty, but his years sat lightly on him; his hair, close-clipped,

was iron-gray, with still more iron than gray in it; his beardless, well-chiselled face was strong, yet mobile; his tall figure was erect, and he walked with the ease lent by excellent proportions.

It is fortunate for the world that such men as he, in quite welcome numbers, survive the ills of infancy, the perils sought in adventurous youth, and the maladies that accrue with middle years.

'You are very cosy here, Ross,' he said, glancing round the young man's room with approval. 'It is strange,' added the chief, sinking into a chair by the fire, 'how readily you fellows abandon this placidity for the unknown of matrimony.'

'A taste for gambling is deep-rooted in human nature, sir,' Ross smilingly replied.

'Well, to business. Evans is 'phoning you at nine, I understand?'

'To confirm my solution of the problem,' replied Ross with gentle arrogance.

'You are so sure, then?' The chief looked at his henchman with a touch of gravity. 'You know who the thief is?'

'I think I know who the person is that took the necklace.'

'Then it *was* a woman?'

'Yes.'

'And she had a confederate?'

'Two.'

'But,' said the chief, 'you told Evans he was wrong about Miss Serge.'

'He was.'

'Then what other woman could have taken it?'

'The old, fat aunt,' said Ross.

The chief of the 'I's' sat up a little straighter, for even he could be surprised.

'The aunt! But Evans had ruled her out. I saw him after you did, you know—as well as before.'

'I guessed he'd give you another call. Well, it was the aunt, as you'll see. It is nearly nine,' remarked Ross, consulting his watch.

'Just to fill up the interim,' said the chief, 'tell me how you arrived at that conclusion.' And he added, a thought anxiously, 'I don't want the Yard to have the laugh of us—as they will if you're wrong.'

'I'm not wrong,' said Ross. 'Let us go back to the beginning. Blairs meets Elfin Serge through her aunt, who is acquainted with *his* aunt. He invites Mrs Jacobs and her niece to stay at Blairs Court, and it is very evident what his idea is—to let the young lady see the place and understand the potentialities of the match he is about to propose. Not being quite certain of the girl, he proceeds to impress the aunt, who is pretty sure to have influence with the girl, by showing the old lady the famous family diamonds.'

'Yes?'

'When he next goes to his safe he discovers

that the necklace is missing. He communicates with the local police, who, wisely acknowledging it is beyond them, seek inspiration from Scotland Yard, who send down Evans. He takes a good look at the guests, and narrows down the possibles to Hauptmann—probably on account of his appearance, which is rather against him, poor fellow!—the girl, the aunt (as a make-weight), and the valet, and proceeds to find out all he can about the movements and the behaviour otherwise of the quartette. Quite by chance he haps across a bit of evidence from an early-flying airman, who noticed a woman by the incinerator in the abandoned military camp. He had learned Mrs Jacobs and her niece went to town the day after the discovery of the loss, just as they had gone the day following the bathing incident. Putting two and two together, he works it out thus: the valet got an impression of the key, and gave it to Miss Serge, who went to town and got a new key cut, returned, rose very early and bagged the jewels, and “cached” them in the incinerator, pending an opportunity to take them farther. She made that opportunity the next day. A week elapses, and the jewels are replaced in the safe—and at that point Evans is flabbergasted, beat to a frazzle.

‘And so, I confess, am I,’ put in the chief.

‘Well, sir,’ continued Ross, consulting his watch again, ‘I will tell you this—the first necklace was an imitation one, the second the real one. Does that convey anything to you?’

‘Nothing—except to marvel how you arrive at such a conjecture.’

‘It is not a conjecture; it is a certainty, as you will learn in about—er—three minutes’ time. I arrived at my conclusion thus: Wishing to impress the aunt, Blairs shows her the stones, and Mrs Jacobs, with a thousand years’ knowledge of such things trickling through her veins, spots them as spurious ones. With a little thought, saying nothing to him, she conceives how they got there—the old Lady Blairs, being hard up, had pawned the real ones, and substituted such a good imitation lot that only an expert would detect the fraud.’

Mr Scathways, engrossed in the expanding solution, drew a rather deeper breath than usual.

‘This little lot, thinks Mrs Jacobs,’ continued Ross, ‘are—as the breeze blows—to be worn by my girl, and as the members of my family, from Abraham downwards, have never liked to sport valueless gauds, I’ll have the real ones on my darling’s neck or know the reason why. So she writes to the ex-Lady Blairs, living in clover with her Tea King, and orders her to hand over the goods. Her ex-ladyship, who had doubtless intended to put things straight when she wormed the money out of her Tea King—whom she married, no doubt, partly for that reason—tells Aunt Jacobs to meet her in town, when she gives her her own key of the safe, and tells her to take the paste necklace out and bring

it up to her in London, when the real one will be handed over. This the aunt does; and so we gather that the lady by the incinerator was a much older lady than Miss Elfin, who doubtless knew nothing about the transaction at all, as it wasn’t likely that the old woman was going to explore the girl’s heart by telling her anything about it.’

The chief nodded approval.

‘But before the real one can be put back, the absence of the sham necklace is discovered, and the fat’s in the fire. The aunt now has to await her opportunity of replacing the thing, and at length finds a suitable moment.—But it is nine o’clock. The beggar’s late.’

‘But the valet and the bathing-box?’ queried Mr Scathways.

‘Taking his master a dry towel.’

‘The trace of bread on the key—or the other keys?’

‘The bunch might easily have come in contact with food.’

‘Hauptmann?’

‘Has, I have gathered, a keen desire to get into society with a large S, and so, if his services are useful to the young baronet, why, let it rip! An excellent pal to Blairs, I should say.’

‘And you told Evans’—

‘To see the aunt and make her tell Blairs all about it. It means giving the dowager away, but as things have fallen out, that can’t be avoided. She shouldn’t have helped herself to family property.’

VII.

The telephone’s insidious tinkle sounded. You talk about the heart-searchings a telegram will provoke, but are they not rivalled by the suspense hanging on a ‘phone’s little bell?

The chief took off the receiver. ‘Is that you, Inspector Evans? . . . At Blairs? . . . I am Mr Scathways.’ . . .

He listened, at intervals giving a slight nod. No further questions appeared to be necessary. A couple of minutes sufficed, and with a ‘Good-night’ he put up the receiver.

Ross had been watching him a little nervously.

‘Well, friend Ross, it did not fall out *quite* as you anticipated.’

The young man’s countenance dropped.

‘Yet in all essentials it *did*. The only difference is this: Evans, on arriving, found he had fellow-travellers in the shape of—guess.’

Ross shook his head.

‘The Tea King and the dowager! Brought her along to own up and clear the air.’

‘The best thing he could possibly have done,’ remarked Ross, his face clearing. ‘I wonder’—

The chief smiled. ‘I gathered from a homely remark of Evans’s that you needn’t wonder—the young people have arranged matters quite satisfactorily. And I fancy, from the cheerfulness of his tone, that the Tea King has behaved quite well to Evans—besides wanting to know the

address of anybody else who had assisted in the affair.'

'He didn't'—began Ross, a little scared.

'He did *not*, Mr Ross,' replied the chief. 'There is not a penny of commission coming to you this time, but—may I take the liberty?' (He filled two glasses that stood upon a silver tray near by.) 'I'd like to wish you joy on the

initiation of your "S" salary, since your abilities surely entitle you to one; and the toast is'—

'The new Lady Blairs!' cried the young man, his eyes kindling.

'And the quite-soon Mrs Roger Ross!' added the chief, taking the hand of his promising lieutenant in his own strong and friendly one.

THE END.

RECOLLECTIONS OF A NAVAL SECRETARY.

III.—JAPAN, 1872-75.

By C. E. GIFFORD, C.B., R.N.

I.

THE period of our visit to the East, 1872-75, was one of extreme interest in Japan, where the result of studying the customs of Western nations was beginning to make itself practically felt. It is easy now to realise how absolutely we visitors failed to understand then what was going on. We had no inkling of the profoundly serious views of Japanese statesmen, and were rather inclined to regard the movement as illustrating the extraordinary imitative ingenuity of the Japanese race. Inquiries made by them in Europe had led to the engagement of French military instructors, of German medical instructors and hospital doctors, of British naval instructors, and so on; but so little importance did we attach to the phenomenon that we were inclined to believe a report which was circulated that, as a result of the Franco-German War, the Japanese authorities had concluded that they had not made a wise choice of military instructors, and that to remedy this they were dressing their soldiers in helmets instead of *képis*, and arming them with needle-guns instead of with *chassepots*.

A craze for European clothes, at no-matter-what cost, had seized the nation, and the great clothing establishments of Hong-kong and Shanghai were cleared out to meet the demand. There was also a wild desire to possess Western animals. I was in our contractor's office at Shanghai when he received a telegram from Nagasaki: 'Send in first steamer every rabbit you can buy, except white with pink eyes and lop ears.' As much as eighty pounds was given at Yedo for a pair of rabbits, and the craze became so virulent that the traffic was checked by imperial edict.

Similarly with pigs. We were told at Kagosima (Satsuma country in the far west) of a man who sold his possessions and bought a pig from a steamer. For a time it paid him to have it carried about by two coolies, and exhibited; but this did not last long, and he found himself penniless and unable to dispose of or to feed his pig. He therefore committed *hara-*

kiri. History does not relate what became of the pig!

Sheep would not live in Japan; the grass was said to poison them. Each treaty port, therefore, had its 'Mutton Club,' which imported from China by every steamer a few sheep, and stall-fed them until they were needed for the table of club-members. Japanese beef, especially that from Kobé, was excellent.

II.

Japan had no steam fleet in 1871, and the engines of the few merchant steamers she possessed were in the charge of Europeans or Americans. There was, however, no intention of letting this state of things continue, and the Japanese were assiduous in studying the working of engines and boilers. One of their steamers trading between Yokohama and Hakodate had a Scottish engineer. As she was about to sail on one of her voyages, he was told that his services were no longer needed, and generously paid off. 'Nothing venture, nothing win;' the Japanese under-study had declared his readiness to assume charge of the engines, and the owners had approved of his taking the place of the Scotsman. The voyage to Yezo, extending over some days, was successfully accomplished, but on approaching Hakodate harbour the new engineer went on the bridge and told the captain that he much regretted he had forgotten how to stop the engines! He suggested that the captain should steer the ship round and round the bay whilst he was working down the steam-pressure, and not bring her up to the anchorage until the engines had ceased working. The suggestion was carried out, and the device proved successful.

There is an old story, often heard in the navy, which may, perhaps, be not inappropriately repeated here. A fine old Cornish seaman, known as Captain Johnny Borlase, commanded in the China squadron a corvette, fully rigged as a ship and fitted with screw engines. He was coming into port under steam and sail, steering for the anchorage indicated to him by signal from the admiral. Sail was gradually

shortened so as to reduce the ship's way and bring her up to her assigned berth; but, to the captain's intense astonishment, she ran past it. Suddenly the truth flashed upon him, and he blurted out, 'Oh dear! oh dear! I forgot I waur a steamer!'

I am reminded of a story of a lieutenant of the United States Navy who had brought across from San Francisco a very smart sailing-craft, to be stationed at Yokohama as a store-ship. Discussing with some of our officers the relative sailing-powers of their ships, he declared that, on furling sails before coming up to the Yokohama anchorage, he found his ship was carrying so much way that he had to run her twice round Yedo Bay (some sixty miles) before he could get her speed low enough to anchor!

I must be allowed to drag in here another story of an American naval officer in Japan which has always seemed to me to be typical of American humour. The Commander-in-Chief of their China squadron received from his wife, as a birthday present, a handsome fitted bag, which he said was to him the fifth wheel of a coach, but which turned out to be very suitable for the lady herself. So, when her birthday came, he presented her with a pair of gold-laced trousers, which, curiously enough, happened to fit him.

III.

Whenever we found ourselves in the presence of Japanese naval officers, we had to sharpen our wits to be able to answer their questions. Several of these recur to my memory. One of their captains asked, 'In the British Navy, suppose the captain of a man-of-war is a greater *daimio* than the First Lord of the Admiralty, how can the Admiralty give the ship orders? A Japanese captain could not accept orders from an inferior.' Another: 'When the Queen comes on board a British man-of-war, and the royal standard is hoisted, does the captain haul down the pennant?'

We had two young Japanese officers for a year or two on board the *Iron Duke* under the fleet paymaster's instruction. One of them was a very sensitive youth, most anxious to become an efficient paymaster; and we were equally anxious that he should do well, for we had in our minds the sad fate of a Japanese midshipman who had been under instruction in one of our frigates. After one of the regular examinations of all the midshipmen on board, he learned that he had taken a poor place in the list; so, unwilling to disgrace his country any further, he retired below to his sea-chest, spread the canvas cover of his chest on the deck to prevent its being soiled, and then committed *hara-kiri*. To our relief, our students were landed safely at Plymouth on the paying-off of the *Iron Duke*.

Our relations with all the Japanese with whom we had any dealings were of the most friendly

character, and we became much attached to them. The days when it was dangerous for Europeans to venture far beyond the European concessions were past and gone, and the farther we got into the country the greater kindness we met with. I was specially fortunate in this respect, having been sent up-country to the sulphur-springs of Ashinoyu (literally 'leg-bath') for the cure of a troublesome attack of eczema. And here let me say that the cure was miraculous, two or three days' treatment in this Jordan effecting what months of treatment in the Abana and Pharpar of our hospitals had shown no signs of doing.

Later, in September 1874, furnished with passes from the Governor of Nagasaki, Captain William Arthur and I crossed the Gulf of Omura. He on horseback, I in a chair, we travelled to Tsukasaki and Uresino, where were well-known sulphur-springs. We took with us an interpreter, who said he could cook, and put up at a pleasant tea-house in the main street of a pretty village. After our passport had been inspected at the Saibansho (police-station), we received from the Prince of Omura the key of his bathroom at the public baths, and an invitation to use it during our stay. This was a great boon, and specially suited our Western ideas of modesty, for we should otherwise have had to bathe in the company of the whole village. Even as it was, we were the objects of much curiosity, mainly, so our interpreter said, on account of the whiteness of our skins; wherever a crack in the wooden walls of our bathroom gave a view of the interior, there was an eye fixed upon us! I do not suggest that we were more truly modest than the troops of villagers who bathed in the afternoon in public; or than the two young girls of Tsukasaki whom we saw walking home from the baths during a downpour of rain, and keeping their clothes dry by stowing them all above the ribs of their one umbrella; or than the old couple whom we saw sitting outside their door in the village street up to their chins in warm water in a wooden tub. This is a mere matter of latitude and longitude, each country fixing its own standard of what constitutes modesty.

IV.

The good people of this part of Japan had but a very slight knowledge of Europeans. Our landlord was one of the disestablished Samurai class, the two-sworded fighting-men, retainers of the *daimios*. We asked him to dress himself in his war-paint, and show us how two swords were used. Our interpreter explained to us that he did not wish to comply, because he feared we might suspect treachery, and it was with difficulty that he could be persuaded to do as we wished.

We had brought with us from Nagasaki a supply of bread, Danish butter, jam, preserved milk, and a big bag of potatoes. Potatoes

had never been seen in the district, and we could not refuse our landlord's request to be allowed to have them for seed. In exchange he brought us a duck, a good supply of onions, and of auratum lily bulbs, which are grown for food, just as we grow potatoes, and which we found to be very good eating. The duck was our difficulty; our interpreter confessed himself ignorant as to the mode of cooking it, and neither my captain nor I knew what to do. However, we decided on a division of labour—he to pick the feathers and clean the bird, I to cook it, the interpreter looking on at our efforts. Bread, onions, lily-bulbs, all chopped up small and smothered in butter, seemed to make a good stuffing, and we rammed it home tight. The landlord produced a copper vessel, in which we melted more butter; this we set over a charcoal fire, waited till it sizzled, put our duck in the pan, and our trust in luck. This latter was too blind, for, as the inside butter began to melt and the bread, onions, and lily-bulbs to swell, the strain on the framework of the bird became too great, and a minor explosion occurred. Nevertheless, the result was excellent and the duck delicious. We discovered next day that we could have boiled the bird at the sulphur-spring, which was so hot that the villagers were accustomed to dip in nets full of eggs and vegetables for their evening meal, and pull them out ready cooked.

At Uresino we were fortunate enough to witness the marriage of the landlord of our tea-house to a local beauty. At 9 P.M. the bride arrived at a house across the street, where she was dressed in her best, and our tea-house doors were all closed as if for the night. At eleven the bride was brought across the street in a jinricksha, a second following with her trunks. The doors were ceremoniously thrown open, and the whole family assembled to receive her. The mother-in-law elect took her apart, blacked her teeth with a preparation of oak-galls, and cut off her eyebrows—two marks of a married woman. About 2 A.M. we were called by our interpreter—'The bride hath paced into the hall.' The family party, some eight or ten persons, were squatted on the floor in a circle, and then began endless drinking of healths. The bride handed a bowl of *sake* first to the mother-in-law, then to all the others; the bridegroom followed suit, and was imitated by all the members of the party, each presenting the bowl to all the others, at the same time bowing the forehead to the floor. Girls playing the *goto*, a sort of harp, kept up an incessant twanging. Half-an-hour of this satisfied our curiosity, and we retired upstairs.

At 7 A.M. the feast was still going on. We had seen a large quantity of salt fish being prepared, and concluded it had stimulated the thirst of the revellers, who, on learning that there were foreigners upstairs, decided to pay them a visit. Our interpreter routed out all but one, a tipsy old fellow, whom we could get rid of only by

giving him a libation of brandy, which choked him.

Next day the villagers attended a ceremony in the temple in honour of the Harvest God. There was a weird procession of mummers in the streets, three playing a sort of flute, and four beating kettledrums slung on bamboos, and gesticulating wildly all the time. The rear of the procession was brought up by a body of men beating really beautiful bronze gongs.

V.

Nagasaki was our favourite port in the south-west of Japan. It was here, after the visit of Mendez Pinto in 1543, that the Portuguese were allowed to found a settlement. Their traders were followed by Jesuit missionaries, who made a great number of converts; but about the beginning of the seventeenth century the Japanese rose against the Christian converts and massacred them by thousands. The island of Pappenberg, in the middle of the beautiful harbour of Nagasaki, was, according to legend, the scene of wholesale massacres. Its wooded heights were crowned with temples, and it was from a precipice near by them that the unhappy victims are said to have been hurled on to the rocks below. The island had always been considered sacred, and we found on the station an order prohibiting any person in the fleet from even landing on the beach. '*Autres temps, autres mœurs*;' we got up a regatta in Nagasaki harbour, in which Japanese boats took part very successfully, and Pappenberg beach was the chief scene of the festivities, whilst we rambled freely over the picturesque little island.

On one of our many visits to Nagasaki we found the town wrecked by a typhoon. The force of these storms is terrific, and we were fortunate in never meeting one while we were at sea in the *Salamis*. We narrowly escaped one in the *Iron Duke* off the south-west coast of Japan, managing to keep on its outside edge. Even so it was a grand sight. I had never seen such angry seas. A tea-clipper (*Black Adder*, I think) was towed into the Shanghai River when we were there, with her three masts clean snapped off about six feet above the deck; whilst at Hong-kong a gunboat was blown out of the water, and landed on the top of the boat-house belonging to the yacht club.

Our wanderings shortly after this took us to Hakodate, the chief town of the northern island of Yezo. At this time Japan was much concerned at the advance of Russia; already she had lost the island of Saghalin, and she was fearful lest Yezo should follow. It was very sparsely inhabited, and far more attractive than Saghalin; whilst its ports, open all through the winter, would have given Russia the outlet for her trade which she naturally coveted.

Japan therefore decided that Yezo must be populated, and the Government, having selected

a suitable site, sent workmen from the south to build a new city. Whilst we were lying at Hakodate a steamer arrived from Yokohama with 150 carpenters. She also brought one hundred women, a report having been sent down that there were not wives enough for the settlers.

The houses of Hakodate presented a very unusual appearance, the roofs being covered with green turfs, held down by ropes weighted with heavy stones. This not only kept the houses cool during the heat of summer, but prevented the roofs being carried away by the strong gales which prevail at some seasons of the year.

Our sportsmen found amusement at Hakodate. Near by were good snipe-marshes, where a long-legged midshipman, just arrived from home, shot a solitary snipe weighing $10\frac{1}{2}$ oz., thus breaking the record. The former champion, our First Lieutenant H. A. Digby, tramped that marsh for days, and eventually came on board radiant with a bird a quarter-ounce heavier! I found a little stream, from which I took, with a Devonshire cast of flies, some fair dishes of trout.

Shortly before our arrival at Hakodate a Japanese fanatic—one of the suppressed Samurai class—had crossed the strait from the southern island, having taken a vow that he would kill the first European he saw, and so be avenged for the troubles which he believed the Western nations were bringing upon his country, and especially on the Samurai class. Not long after landing he saw the newly arrived German Consul—a small man in delicate health—leaving his house. He drew one of his swords, and rushing up to the unfortunate German, literally hacked him in pieces. As if by magic, Hakodate harbour became full of foreign ships of war, including two German cruisers. On our arrival, a day or two after the event, our consul told us that the Japanese were profoundly impressed with the belief that we had come to bombard the town as an act of reprisal. A special commission was at once sent from Tokio, and the wretched murderer, after being tortured to extract full confession, was decapitated.

VI.

The penal laws of Japan were at this period very severe. A battalion of Royal Marines was stationed at Yokohama, and one of their officers lost from his hut a watch and chain and some money. He reported the theft to the Japanese police, who soon found the watch. The lieutenant was asked to give evidence before the court, which sentenced the thief to be executed, and refused to listen to the urgent prayer of the lieutenant that such a sentence might not be carried out. 'You told us,' said the judge, 'that your watch was worth fifteen pounds; by the laws of Japan a man who steals goods of the value of five dollars forfeits his life.' The execution was carried out.

Whilst on the subject of the Japanese laws I must write my recollections of an extraordinary trial which took place at Yedo (the capital, the name of which was changed to Tokyo in 1869). We were lying in the *Iron Duke* at Yokohama, and in the middle watch the officer on duty heard a splashing at the foot of the accommodation-ladder. He sent down the quartermaster to see what it was, and between them they fished a Chinaman out of the water. A Chinese steward was sent for to interpret, and it was found that the man had swum from a Peruvian coolie-ship, the *Maria Luz*, which, with six hundred Chinese coolies on board, bound to Peru, had anchored far out, hoping to escape port dues. The man claimed protection, on the ground that he had been shipped at Macao under false pretences, and had been badly treated on board the *Maria Luz*.

A few nights later another coolie swam to the *Iron Duke*.

They were handed over to the British Consul, and in due course their cases were taken up by the Japanese Government, and their claim to be set at liberty came up for trial before a Japanese court. English counsel were retained for the coolies and for the Peruvian authorities who had shipped them.

A claim was set up on behalf of the men that they were detained as slaves on board the coolie-ship, and that their landing on Japanese soil, where slavery was contrary to law, made them as free as if they had landed on British soil. The other side replied that such an argument was worthless, considering that Japan publicly recognised, in the Yoshiwara system, the vilest system of slavery known to the world; that under it parents sold their young daughters for money to people who kept them for a term of years, practically as slaves, for immoral purposes, in the Yoshiwaras.

The judge adjourned the trial for a week, before the expiration of which an imperial edict had been issued, abolishing the Yoshiwara system and ordering all the inmates to be set at liberty!

Counsel for the coolies was triumphant; not only were his two clients set at liberty, but the whole six hundred on board the *Maria Luz* were sent back to China at the expense of the Japanese Government. The Portuguese and Peruvian Governments protested, and the latter ordered three ironclads across to Japan; but the order was withdrawn, and the affair ended.

In course of time a handsome gold medal was sent to the *Iron Duke* by the Viceroy of Nan-king, on behalf of the Chinese Government, with an inscription on both sides in Chinese characters. On the face was 'To *Iron Duke*, the Captain of a British Man-of-War,' and on the reverse 'For benevolence and good-will' (or words to that effect—I write from memory).

(Continued on page 734.)

DR MARBOLD'S EXPERIMENT.

By ROBIN FORSYTHE.

I.

I WAS sitting in Dr Marbold's waiting-room. Some newspapers and magazines lay on the table, but I was feeling in no mood for reading. My mind at the moment was chiefly concerned with the prospect of at last seeing what kind of man Dr Marbold was.

I had heard so much about him in an allusive way—hints and odd remarks from which I could glean very little that was definite; idle chatter, which had, however, succeeded in giving me the impression that there was something vaguely sinister about the man. It had bred in me an indefinable mistrust of him, yet mingled with this mistrust was a conviction that he was skilful—amazingly, fiendishly skilful.

He had once, I knew, practised extensively, and had come to be considered an eminent authority on human psychology and diseases of the brain. Then had occurred that strange affair of Parker Burnaby, the American Steel King and multi-millionaire. Burnaby had been suffering from frightful hallucinations, and Dr Marbold had been entrusted with the task of trying to cure him. In this he had failed, for eventually Parker Burnaby died in a most mysterious fashion. And in the subsequent settling-up of the American's affairs it came to light that he had left Marbold nearly a million of money.

After inheriting this fortune, Dr Marbold had given himself up to research-work, and had narrowed down his practice solely to those cases which interested him. So that when I asked him for an appointment, giving him a brief outline of my ailment, I was rather doubtful whether he would grant my request. Much to my surprise, he replied that he would be delighted to see me, and it was in pursuance of his instructions that I was now sitting in his anteroom awaiting him.

As I lay back in his comfortable chair, idly ruminating, I all at once became aware of the presence of some one in the room, revealed to me by that subconscious and wholly inexplicable message which life, on occasions, flashes to life, either mentally, or physically, or conjointly, I know not which. I looked up, and was conscious mainly of a pair of eyes, and behind them a man—but the remainder of his personal appearance was entirely overshadowed by his eyes. I cannot adequately describe them in sober language; they were large, intensely brilliant, and shone as they looked through me with what, from lack of more precise words, I can only designate as a bronzine gleam. They were the eyes neither of a poet nor of a man of science, but a commingling of both; and predominant in their expression was a

suggestion of amazing insight and infinite power. I started suddenly, because, though expectant, I had neither heard nor seen his entrance.

'Mr Quinton,' he said, referring to my card. The voice was of light quality, but very musical, and before I could reply he added, 'You have come to consult me about a recurrent dream which is troubling you.'

Regaining my self-composure as rapidly as I could, for his uncannily silent entry into the room had somewhat unnerved me, I related to him the nature of my ailment. While I spoke he kept his glance fixed on my boots, and gave me opportunity to notice that in all other respects save his eyes he was a very ordinary-looking man. His cheeks were fresh-coloured, and as smooth and delicate as a woman's; his light, glossy hair was brushed sleekly over a nobly shaped skull. He wore a suit of gray tweed, and looked like your ideal young college athlete before the world of business and society has rubbed the bloom from his manhood. I was dumbfounded that so well-known a man in the world of medicine should look so wonderfully youthful. I felt that he could not possibly be older than twenty-six.

'You have been suffering from a recurrent dream which is making you uneasy; you are possibly afraid of some incipient mental trouble. Well, cease to worry about it; I can cure you very easily. I can assure you that you will never be troubled by it again. Will you call again to-night at 9.30—that will give you time to get here after dinner—and I shall put you under treatment? *Au revoir!*'

A flash from those eyes, an electrical hand-shake, and he had opened the front-door and let me out. I was half-way home again before I was fully aware that I had never definitely stated that I should return at 9.30 to undergo his treatment. I was also aware of the fact that I should certainly be there!

II.

Punctually at 9.30 I arrived, and was at once ushered into Dr Marbold's surgery, which was situated on the first floor. This surgery was a spacious room, with walls and floors of spotlessly white tiles, and lit with movable clusters of powerful electric lights. Rows of shelves, laden with glittering glass-stoppered bottles lined the walls, and here and there about the room stood air-tight glass cases in which gleamed silver-bright instruments of fantastic shapes, lying on crystal-clear slabs, things of nervous and grimly morbid beauty. Through tightly closed glass doors could be obtained a view of another room and a ghostly glimpse of a marble operating-table,

with a rolled-up blanket lying thereon. Around the tiled walls of this farther room were more shelves, laden with glass tanks of antiseptic fluid, in which soaked tightly twisted towels. I glanced round quickly for Dr Marbold, and found him, dressed in snowy ducks, bending over a high-power microscope, and making a drawing of what he discerned beneath its magic lens. On his right was an electrical apparatus with a fine glass globe, which I knew to be an X-Ray installation, and not far from it stood a heavy steel safe.

At the sound of my footfall Dr Marbold raised his head from his task and shot me a swift, arresting glance over his shoulder. Brief as was the duration of that glance, it awoke in me again the knowledge of the power of his eye. It was dynamic, and seemed to seize me physically and hold me, and switch off again as he returned to a final observation through the shining brass tube of his microscope. Then he left the table and came over to me with short, brisk steps, his patent-leather shoes winking and flashing and winking again in the brilliant light. He took my hand, shook it, and, without letting it go, led me over to a chair beneath one of those blinding electric clusters.

'Sit down, Mr Quinton, and have a cigarette,' he said, handing me over a massive silver box full of choice Russian cigarettes.

'I'm glad you like them,' he said, reading my thoughts so easily that I felt intensely annoyed.

'I'm not particularly fond of Russian cigarettes,' I lied, with that sense of antagonism which a man feels towards some one who has suddenly and ruthlessly leaped into the guarded secrecy of his mind.

'Please don't be annoyed with me,' he said quietly. 'I have specialised in human psychology, and if I appear rude, it is simply because I have progressed so far that at times I forget conventional good manners. I could see at once that you liked my cigarettes, and I know that you denied the fact because I surprised your thoughts. Eh! am I right?' He looked at me and smiled. There was a wondrous warmth and geniality in his smile; it came like a ray of sunshine, and seemed to brighten the world within me.

'You are quite right, Dr Marbold,' I said, feeling mollified, and, to turn the conversation, asked, 'Are you busy over some disease germ with your microscope?'

'Yes, yes, always busy,' he said curtly, almost rudely, and his whole mind seemed at once a closed book to me. Excusing himself, he abruptly left the room and went downstairs, where I heard him telling his servants that they might go. On his return he explained to me that he always sent his servants home at night, because their presence in the house interfered with his work. Then he took a chair, and sitting down close to me, looked me full in the face. I turned my

gaze away, because I felt that he was peering into me and through me as if I were as transparent as one of his glass jars.

'Before we talk about your dream, Mr Quinton, I want to discuss rather an unusual subject with you. I see before me a man whom I should like to have beside me in a tight corner. Courage is one of your strong points!'

'You flatter me, doctor,' I said, feeling extremely uneasy under his compliments, though he spoke without the faintest display of any desire to please; he spoke as if he merely expressed his thoughts to an empty room.

'Have you ever been face to face with death?' he asked in a cold, almost toneless, voice.

The question gripped me with sudden alarm. What was this strange man with the extraordinary manner and the marvellous eyes driving at? Was he desirous of trying one of his diabolical experiments on me? I strove to retain my self-possession.

'Once or twice, when big-game hunting, I have had a narrow squeak,' I replied, as unconcerned as possible; 'but why do you want to know?'

'Would you care to face it again with the same chances of coming out unscathed?'

'I might in the same pursuit; a man must take risks when he is out to kill.'

'Would you in the interests of science?' he asked.

'I am not a scientific man,' I argued.

'No, I understand that; but apart from the question of science altogether, you must have a taste for danger; it evidently adds salt to your existence.'

'I shall be pleased if you will kindly tell me the object of your questioning, doctor,' I replied, looking him full in the face.

'I am about to tell you,' he said, returning my look of challenge, and his glance seemed to clothe me as if in a flame. 'In the first place, do you know anything about hypnotism?'

'Very little beyond what I have seen in stage displays,' I replied.

He burst into loud, scornful laughter. 'Then you know nothing at all. Stage displays are invariably showman's trickery. I have been a student of the art all my professional life. Long ago I passed beyond the old ideas of suggestion, and there is very little that I do not know about it now. Well, to get to my subject: a week ago I hypnotised a man, and told him during the hypnotic trance that he was to come here to-night at ten o'clock precisely and murder me with a hunting-knife, which I know he possesses.'

Dr Marbold ceased speaking and looked up in my face to see the effect of this utterance. As I sat absolutely speechless, he continued:

'Then I wakened him. In a quarter of an hour I shall know the result of my experiment; I shall know whether my will, transferred to him, is strong enough to overcome his moral scruples

and make him commit a crime. It is a supreme test! For years I have desisted from it through a dread of consequences. At last the overpowering desire for knowledge has brushed away all my scruples and fears, and I have succumbed to the temptation.'

III.

For some moments I sat as if in a dream, my mind striving to grapple swiftly and comprehensively with all the issues that the doctor's statement raised. Was he a scientist gone mad? If he was sane, there seemed an element of real nobility in his thus risking his life in an eager search after knowledge. Somehow, I had some strange but strong misgivings as to his veracity; unaccountably, I felt that there was more beneath this experiment than a talk of science and its interests—something more vitally personal to the doctor himself. Besides, there was the other man! What would happen to him were he to succeed in committing a murder for which he was not in the least morally responsible? He might go to the gallows! In a fever of apprehension, my thoughts flew to the possibility of the experiment succeeding. Could a man be hypnotised and, when awake again, carry out a command given during the trance? I looked up, and discovered Dr Marbold sitting with a faint smile on his lips. I could see that he was following my thoughts as if he were watching the actual physical movement of living things before him.

'You are considering whether my experiment is feasible,' he said. 'I may tell you that post-hypnotic suggestion, the old technical term for a command which the operator wishes to be carried out after the subject has been awakened, has been known to science for many years. I have travelled along this line of research farther than the old practitioners' wildest dreams. Nobody, to my knowledge, has ever carried the idea so far as I have done in this instance.'

'What if your subject murders you?' I asked bluntly.

'I shall try to prevent that cheerless occurrence,' replied the doctor, and a strident, spiteful note rose in his voice and made me glance up in his face. I saw there a most ghastly and unexpected change. His cheeks were all drawn in muscular tension, his eyes flaming with ungovernable hate and malignant power, his lips jammed down into a thin, hard, cruel line. It was the face of a devil!

'You see why I commanded him to commit the crime with a hunting-knife?' he asked.

'To give yourself a chance of preventing its successful accomplishment by grappling with him,' I returned.

'Just so; and further to obviate being killed, I have decided that you are to stay and assist me in securing my coveted knowledge.'

The words were spoken with the vehemence

of an overpowering command; they seemed to shoot swiftly into my inmost mind and nullify all my will. I strove to reply, to intimate that I intended to do nothing of the sort, that I could not on any account participate in such a serious affair, but my tongue was powerless and no words came. After a period I again strove to speak, but anything in the nature of contradiction or in opposition to his scheme died on my lips, leaving me a helpless and unwilling servant to his every behest. A little while longer, and I seemed to concur altogether with his demands, and when I spoke it was merely in a conversational tone.

'Who is the man?' I asked quite casually, as if it were a matter of indifference to me now whether he murdered half a nation.

'Gerald Naunton. I think you know him.'

'Good heavens!' I exclaimed with astonishment. 'Why, Dr Marbold, he was your rival for the hand of Cicely Mapleton, and a successful rival, too! Their engagement was made public a week ago.'

'Yes, I'm quite aware of that,' smiled the doctor, his face assuming an expression which I never wish to see again on human countenance.

'It's a plot—a fiendish, hellish plot—to ruin him!' I shouted, momentarily fighting free of his influence; but once again he fixed on me that extraordinary gaze of concentrated command and irresistible will. I strove to protest. A warm, thrilling tide of feeling, insuperable in its might, swept over me, and though I was perfectly cognisant of my antagonism, I inwardly began to agree complacently with Dr Marbold's nefarious scheme.

IV.

'This is my plan, Mr Quinton,' said the doctor, in slow, measured tones. 'I have not done with Gerald Naunton yet. My revenge is at hand. He has come in my way, brooked my ill-will, thwarted my passion. He must be removed. Ever since his engagement I have fervently longed to kill him. Now that I have devised a plan by which killing is no murder, I'm going to satiate my thirst for his life. I'm not such a fool as to think I can do Naunton to death by any of the stupid methods of ordinary criminals without being detected. I have too much self-respect to allow myself to be ignominiously hanged. As for justification, I am satisfied that there is no harm in removing a moneyed loafer from a world where loafers are so much waste!'

'You are completely justified,' said my lips, while my conscience looked on in an agony of contrition at this horrible dual action of my mind. I was powerless to grapple with and overthrow this fiend's superimposed will.

'I thought you would agree,' he remarked with satisfaction. 'But listen to the rest of my plot; the artistry of it will delight you. Before Naunton sets forth to-night, he will write and

leave behind him a letter accusing me of divulging some of his dishonest financial transactions to his betrothed, and setting down his intention to kill me in revenge. I know nothing of his financial affairs, I may tell you; but a jury must have a motive for the attempted murder, and I have made him supply one. When he arrives here with his knife, I shall simply shoot him down. Of course, I could have willed him to kill himself, but his sense of self-preservation would have fought to the last against my commands, and the plan might possibly have gone awry. No, that would not do; I take no chances. Besides, I want to kill him with my own hand. I shall kill him! I shall kill him!

Dr Marbold shrieked out these words with such an intensity of hate that his voice rose to a thin, piping wail, most terrible to hear.

'What if he comes armed with a revolver?' I asked.

'That may occur, but the contingency is remote, and the risk is worth running when I think of the pleasure it will afford me to destroy him. Here is where you will prove useful. I have enlisted your services, not only as a witness in my favour after the affair is over, but also as an accomplice who is to diminish the chances of my scheme proving fatal to me. You are to stand behind that Japanese screen with a revolver, and as soon as Naunton appears armed with anything but a knife, you are to shoot. But, remember, if he carries a knife, leave him to me!'

He handed me a cold, shining, blue weapon, and with inward consternation and horror I watched my physical self rise, cross the room, and take up a position behind the screen.

I glanced up at the clock. It was five minutes to ten. In another five minutes I might be a murderer! I felt my limbs grow moist with the chill perspiration of fear; my teeth began to chatter noisily in my head; I thought that I was going to faint, but that goading, driving, relentless force which Marbold had planted within me was in a most marvellous way holding my unwilling physical powers up to the point of action. I even practised aiming at a point midway between the door and the spot where Dr Marbold stood behind a big steel safe with just his head and shoulders exposed to view.

V.

That five minutes of tense expectancy seemed to me the flight of an æon of time, and every moment was a moment of poignant, pulsating pain. Was that minute-hand moving, or was even Time frozen into motionless horror by this pending, monstrous crime?

Hush! What was that? The outer door had been quietly opened and as quietly closed. I listened in an anguish of intentness. Footsteps came along the tiled floor of the hall, sounding hollow and sonorous through the silent house; and then followed the hardly audible thud, thud

of the same feet as they ascended the thickly carpeted stair. I cocked my revolver and waited—waited as eagerly as ever man waited in ambush for his bitterest foe, while my real self shrank within me in a torment of self-loathing and self-recrimination.

Thud, thud, thud, came the advancing footsteps, and then followed a silence. I knew what that silence meant. Naunton had reached the top of the stairs, and was standing hesitant on the large wolf-skin rug on the landing. Again there followed the sound of soft, stealthy footfalls drawing nearer and nearer. He was at the door! The handle turned gently, the door opened, and a man entered.

It was Naunton, but Naunton transfigured, for his face was the flaccid, expressionless face of a somnambulist. I immediately covered his heart with my revolver. He turned about and gazed round as if in search of Dr Marbold, and in his hand there flashed a long and heavy hunting-knife. My weapon fell listlessly to my side, and I remained as motionless as marble behind the screen, absorbed in watching the crouching, tigerish approach of Naunton, for he had discovered his intended victim standing waiting behind the heavy steel safe, with levelled revolver and coldly smiling face.

'At last!' exclaimed Naunton fiercely, and my real self felt a keen pang of pity for him as he unflinchingly approached inevitable death. The whole thing was inhumanly, brutally unfair.

'You dog!' roared Dr Marbold with a vehement oath; 'take that!' He callously thrust his weapon close into Naunton's face and pulled the trigger. I expected to see half of Naunton's face disappear, but there followed a helpless little click as the hammer drove forward into the empty chamber.

'Good God, I have forgotten to load them!' came a hoarse, broken mutter from Marbold. He moved swiftly from behind the safe; glanced about him to see if there was any loophole of escape; tried to rush back. But Naunton, with a bound, closed in on him and brought him to bay as a terrier drives a rat into a corner. I saw Marbold fence for an opportunity to grapple with his relentless opponent. Naunton raised his right arm; the knife flashed for an instant above his head, then shot in a swift bright arc straight to his victim's heart. The light died from the doctor's eyes, his arms flew up jerkily, and his body sank to the floor without a groan.

Naunton left the knife in Dr Marbold's breast, and turning swiftly on his heel, stole quietly past my screen and out of the room. I seized the opportunity of looking closely at his face; it was still the face of a man in a hypnotic trance. I listened for his retreating footsteps, but, strangely enough, neither heard him descend the stair nor cross the tiled floor of the hall.

I glanced across to where Dr Marbold lay. For some moments he remained deathly still;

then he strove to raise himself to his elbow. He returned my glance and smiled—but it was a smile of supreme triumph!

'My experiment has succeeded!' he muttered.

A sudden tremor, convulsive and jerky, passed over his frame; he fell back heavily, and the life went out of him. At that moment something snapped in my brain, like the abrupt severance of an overstrained wire, and I was conscious that his power over me had fled for ever.

VI.

Emerging from my hiding-place, I crossed over to where the doctor lay motionless on the tiled surgery floor, near the heavy steel safe. I stooped to lift him, and then stepped back, speechless and aghast. Where was Nauntou's hunting-knife, and where the wound it had inflicted? There was neither knife nor trace of wound anywhere about Dr Marbold's frame. How could this be? I looked about for the revolver Dr Marbold had used, and then for my own weapon. I made an exhaustive search; they were not to be found!

Could it be possible that Marbold had only fainted? I bent over him and listened for a trace of a heart-beat. I brought a mirror and held it above his mouth for evidence of faint breathing. In vain—Dr Marbold was dead!

I picked up the limp figure in my arms, gently laid it on a couch against the wall of the surgery, and rushed out of the house for medical assistance. Within half-an-hour I was travelling back to Dr Marbold's as fast as a neighbouring physician's car could speed. On the way I told my companion of the whole affair in detail as it had occurred, but he gave me no satisfaction as to whether he believed me or not.

On our arrival, after a brief examination, the doctor assured me that Marbold had indubitably died of aneurism of the heart; and this opinion was confirmed at the post-mortem ordered by the coroner. At the time I made no public statement of what I had seen occur. I should probably have been considered insane if I had. Some weeks afterwards I spoke to Nauntou about my strange experience. He only laughed incredulously at my story, and proved to me beyond doubt that at ten o'clock on the night of Dr Marbold's death he was at a theatre with his fiancée. He confessed, however, to having experienced a most extraordinary absent-mindedness about that hour, and remembered absolutely nothing of the second act of the play.

VII.

A sequel to my extraordinary adventure came about three months after Dr Marbold's death. Marcel Lafournier, one of the most brilliant intellects in the medical profession of France to-day, called on me.

'I am one of Dr Marbold's executors,' he in-

formed me, 'and he has bequeathed to me, his friend, all the valuable memoranda he had collected on the subject to which we have both devoted our lives. I have here a letter from him, written a week before his death, which may interest you, for he tells me therein that he was going to make you an unwilling participator in his last great experiment.'

Lafournier drew the letter from his pocket-book and handed it to me. With trembling hand I held it close to my study lamp and read:

'MY DEAR OLD MARCEL,—I am writing to tell you that my whole career is ruined. The woman I love has rejected me. I have decided, therefore, to end a life which can only be a source of misery to me. Yet I can make my end not altogether a case of vulgar suicide, for I am about to put my faith in our common subject of study to its extreme test, and sacrifice myself on the altar of Science. I am going to hypnotise myself into the belief that I shall be murdered in a desperate struggle with my rival. You know the enormous difficulties which such an experiment will entail, but I am sanguine of success. I shall ensure that the end be witnessed by John Quinton, the well-known big-game hunter, who is shortly to be one of my patients. Chance has been kind to place him at my disposal, for he will be able to make trustworthy observations at a most critical moment. If my experiment succeeds, you must call on him and get all the details of the affair. Carry on my studies, Marcel, from the point at which I leave them. Good-bye!'

'How extraordinary!' was all I could exclaim.

'He was a great genius,' replied Marcel Lafournier, brushing the tears from his eyes.

After the Frenchman's departure, I mused on the version of the story he had received from Dr Marbold. It differed in many particulars from my own. After mature consideration, I can only account for this variance by concluding that Dr Marbold's hatred of Nauntou came to the surface, in spite of himself, during his self-hypnosis, and tinged, in minor details, the general trend of his experiment. I'm afraid, however, that I shall never solve the mystery to my entire satisfaction.

THE GOLDEN GIRL.

THOU gipsy, dance—I love to see thy grace:
In scarlet dress, thou seem'st a fluttering leaf
From Autumn's hair. Thy brown, yet fragile, face
Is glowing now, and swifter still thy feet
Are floating where the shadows interlace.

The sunbeams are thy kin, their sister, thou!
Dance in the sun, and do not seek the shade,
O girl with golden arms and gleaming brow:
If I should kiss thy mouth, wouldst suffer me?
Or kiss again? Or direct vengeance vow?

YVONNE

By ANDREW W. ARNOLD, Author of *The Attack on the Farm*, *The Colonel's Murillo*, &c.

PART I.

I.

THOUGH I was but a child of about ten years of age at the time, I can remember, as clearly as if it were yesterday, seeing my parents and my elder brother and sister sail away from Le Havre to America one cold December day in 1798. We saw the outline of the great ship become fainter and fainter, as she went towards the setting sun, and gradually disappear in the dusk; and then my sister Julie and I returned to Paris with Aunt Hortense and her brother, Uncle Jean, who was one of the most famous doctors in Paris, and our dear old nurse Elise. Alas! nothing was ever heard of that ship again.

There were few more ancient or more powerful families down in the district of the Garonne than we De Prévilles. But families, like nations, rise and fall, and ours had become of minor account, when one Hugo, in the seventeenth century, brought it back to its former power and splendour. Fleeing the country on account of a duel (for his victim had royal blood in his veins), this dare-devil went off to the Indies, returning only after many years, but then with a huge fortune, which, for convenience, he had turned into diamonds and rubies. Some of the diamonds were sold to bring up the estates to their former level, but the rubies were always kept. Then the Counts de Prévile became as powerful as of yore.

The land adjoining our property was owned by the De Fresnoyes. They were an old Huguenot family, and had fought with us under Henri IV.; but they were poor. Both Denise and Hortense de Fresnoye were famed throughout the district for their beauty. Denise became my mother; Hortense married, at seventeen, a very rich young Genoese banker, and secondly an enormously wealthy Dutchman, Baron Taldevelde, whose splendid *hôtel* was in the Rue Dominique, not far from that of the Duc de Luynes. There were few finer connoisseurs of works of art than the late baron, and his house was filled with bronzes and tapestries and pictures. Of the last-mentioned, naturally, those by Dutch masters were the finest. In

this beautiful abode, thanks to her ample fortune, my aunt lived in great state.

At first, down in our out-of-the-way district in the Garonne, little attention was paid to the rumours of the Revolution; indeed, my father thought it never would affect him, for he was loved by those dependent upon him. But Mirabeau had lighted the torch in the south, and it spread like wildfire. Rogues with little or nothing to lose soon saw there was money to be made by what they called Progress, Liberty, Equality, and so forth, and their example has often been copied since, in other countries and other times.

Among the scum who rose to the surface was one Jacques Martignac, who by his eloquence acquired great influence in the district. He was only a lawyer's clerk, but unfortunately he was in the office of the notary of my father, and knew all our private affairs. Soon companies of *brigands* were roving the country, burning churches and châteaux, and murdering and ill-treating indiscriminately the innocent and the guilty. It was this Jacques Martignac who, for his own ends, as I knew years after, first gave my father warning of what would be his fate, and thereby undoubtedly saved his life, enabling him to flee to Bordeaux, and thence to England. There he dropped his title and sold his rubies for 250,000 francs; and when the country had settled down he went into commerce at Le Havre, where he was very successful. But successful as he was, his younger brother in America was even more so, and it was by the latter's advice that my father started on his fatal journey to that country. Ere he departed he made my uncle and aunt our guardians, and left us children 100,000 francs each in *rentes*.

II.

Naturally for some little time Julie and I were sad at parting from our parents, but we could not have had any one more kind and good to look after us than our aunt Hortense, who, having no children of her own, simply doted on us.

As the man who, my aunt and we children

OCTOBER 16, 1920.

thought, had from sheer kindness saved our father's life, Jacques Martignac, whenever he came to Paris, always received a very warm welcome. He had now become a *Gros Bonnet*, and had actually bought our old château; and, being ambitious, he thought it would give a *cachet* to his daughter to finish her education in Paris. So it happened that when I was about sixteen and the girl a little younger, Martignac and his wife came to consult the baroness about a school for her, with the result that she was sent to the same school as my sister.

This was the first time I saw Yvonne. I was but a lad. I can't say I noticed her much, except that she was very shy. I only remember she had a dark olive complexion and dark brown eyes. On account of the distance, Yvonne went home but once a year, and so she became quite one of the family. From the very first my aunt had been taken by her gentle disposition, and, for a child, her extraordinarily thoughtful kindness towards others. Then came the time for me to go to the Military Academy; and when I was about eighteen I started on my first campaign as a sub-lieutenant in the Hussars—a campaign that was to end so quickly in the glorious victory of Jena; but, short as it was, I was fortunate enough to be mentioned in despatches.

For more than two years I remained in Germany. After the appalling ugliness of the North German women, no wonder I was struck by the beauty of Yvonne, now no longer a mere girl. Reserved, perhaps, she might be, but all the *gaucherie* of the schoolgirl had passed, and I was not surprised at my aunt's love and admiration for her. Besides, the baroness was very fond of music, and Yvonne had a most beautiful voice. Luckily for me, my regiment was quartered at Vincennes, so that even when my furlough was over I could still enjoy the continual round of gaieties that we young officers had showered upon us. Without exactly feeling in love with Yvonne, I always found pleasure in her society; the smile of welcome with which she greeted me, so open and sincere, flattered me, used as I was to flattery. It was only when I had to part from her, on our being very suddenly ordered to start for the campaign of Wagram, that I really knew how I loved her.

The day before happened to be the *fête* day of my sister. Any excuse, to my kind-hearted, pleasure-loving aunt, was good enough for a grand ball, and this was one of more than usual brilliance. Though we were starting on the morrow, our colonel, who was a frequent visitor of my aunt's—he fully appreciated the powers of her celebrated *chef*, and her fine cellar—had given me and a few of my brother-officers permission to attend.

The ball was over, and only my greatest friend, Pierre de Chaumonart, and I remained. I had on a new uniform. Something had come up

about it, and my sister Julie had observed lightly I must prove myself worthy of it.

'What a silly thing to say!' said Yvonne warmly. 'Has he not done so already? Just as if he would do anything else!'

'You are quite right,' said my uncle.

'I kiss your hand for that, Yvonne.'

'Bah!' said Julie, as I took Yvonne's little hand in mine; 'take her lips while you have the chance;' and she pushed the blushing girl right into my arms. So I did.

While Yvonne pretended annoyance, her bright eyes frankly showed her pleasure; and as for me, I could not for many a day help thinking of the kiss I had so luckily been able to obtain. Then, for the first time, I understood what Yvonne really was to me. The voice, to the lover, tells a good deal, but the eyes tell far more, and often afterwards I remembered how hers had lighted up at my approach. I loved to dwell on that, as it gave me reason to hope our love was mutual.

My aunt was always very exigent that I should write to her, and I wrote as often as I could. I suppose my feelings came out in my letters, for she told me that they were singularly uninteresting, and with gentle sarcasm minutely described how Yvonne passed her time. I was pleased to hear all such details, but I did not see the irony of my aunt's chronicle.

We took part in the battle of Easling. Then came the battle of Wagram, when my horse was shot under me and I came down with a horrible crash, breaking (as I found out afterwards) my collar-bone. For a time I was dazed, but on coming round I heard a feeble cry quite near me. I knew it was the voice of De Chaumonart, and with an effort I got to him. With his practical common-sense, my uncle had taught me what I ought to do in case of a wound or a fracture. My friend was as white as a sheet; a little longer and he would have passed away. I saw that an artery in the leg had been severed. But I knew exactly what to do till help came, and without a doubt I saved his life. Nothing could have exceeded the gratitude of De Chaumonart and that of his two old aunts—he was an orphan—and long after I had forgotten the incident they nobly repaid me.

When writing to the baroness I purposely said nothing about being injured, for she had a very highly strung and sensitive disposition, and I did not want to distress her; and she would have known nothing about it if it had not been for these two good ladies, who happened to be in Paris, and who told her everything. They had hardly left her when Martignac and his wife arrived. Both remarked to my aunt that Yvonne looked pale. She told them that I was in hospital, and therefore the girl had some reason to be pale, and there and then proposed that I should marry Yvonne.

Whether they were really as much surprised

as they appeared to be at this sudden proposal that their daughter should become the Countess de Prévaille, these bourgeois *parvenus* made no attempt to hide their delight. Apart from the position the marriage would give them, they knew the great wealth of the baroness, and they consented at once. As a lawyer, Martignac suggested that the settlements should be drawn out; and my uncle, however much he disliked Martignac (a dislike I could not understand in those days), agreed with him. But my aunt would not consent to put her hand to anything, and only by word of mouth promised to settle on me an ample allowance when the marriage took place; so, unfortunately for us, it came to pass that no settlements were put on paper.

Thus, without my actually knowing anything about it, I found myself betrothed to her whom I loved above all else on earth.

Whatever pain and suffering I may have had in the hospital, all passed away like a shadow when, one bright July day, I received a letter from my aunt telling the good news, and, what was even better, a little note from Yvonne saying how happy she was. As for me, I seemed to be in a dream. Alas! though the campaign was over, we remained in Germany, and I could not get leave till we returned to France the following year. Ah, what a happy home-coming that was!

'You gave me one kiss, *ma chérie*,' I cried, 'as we parted. I lived for months on the memory of that. Now I am going to have a dozen as we meet.'

'I think, Henri,' she replied shyly, with a blush, 'that it was you who kissed me; but,' she continued, throwing her arms round my neck, 'I will return it.'

If she was pretty when I left her, her beauty was nothing to what it was now. Her graceful form had developed; the sparkling eyes were brighter than ever.

III.

It had been arranged that we should all go and visit her parents in the old home of my ancestors, which both I and my sister naturally wished to see. In other circumstances I might have looked upon its old gray walls and turrets with a sense of bitterness, since it was in the possession of others, but with Yvonne beside me that feeling was softened down. Unfortunately, I received orders to rejoin my regiment at Perpignan, *en route* for Spain, to reinforce the troops under Marshal Suchet. We had now a new colonel. My aunt had used her influence to get him the appointment. She had done this as much in my interest as in his, as she knew it would be a good thing for me if my commanding officer were under some obligation to her. Colonel Delmartin was not a rich man, and he had hoped we should be sent to Russia, being well aware of the riches of Moscow. He was

anything but pleased, therefore, at our destination, especially to serve under Suchet. However, when we had left France over a year it fell to the lot of Pierre de Chaumonart (who had risen to be the captain of my squadron) and myself to give him the best piece of luck that he ever had in his life.

Fortunately we were then in a division whose headquarters were at Alcañiz, or this *coup* would never have succeeded. We were in a very desolate part of the country, at a place called Villarlengo, a few leagues to the south-west of Alcañiz. We had not been there long when our spies brought us word that the celebrated guerilla chief, Rodrigo Zalleno, better known throughout the province as Lagartillo ('the Little Lizard'), was busy on the other side of the mountains getting many men together, apart from some Spanish regulars. Whereupon our colonel took it into his head to send my squadron under De Chaumonart to reconnoitre. Our road took us through a long, winding valley known as El Val de Halcon (hawk). On reaching the end of it we saw before us a large, fertile valley, several leagues in length and about three leagues across; while dotted here and there were a few small farms and woods, and, beyond, purple mountains again. Carefully we surveyed the whole country through our telescopes.

'I don't care for this business, De Prévaille. I don't like the look of the country,' said Pierre. 'I don't mean to go far to-day. Do you see that little farm opposite? We will bivouac there to-night. This valley might prove a regular rat-trap. The road that we have come by is the only way of retreat, and I mean to keep near it. I propose to stay here. You will take forty men and go about two leagues to the right toward the north, and Duchamel' (his sub-lieutenant) 'will go to the left; and then you will both return. Remain out of sight as much as you can, but keep your eyes open.'

So I set off till I came to a narrow ravine in the midst of a chestnut wood, which was about the distance ordered. Apart from a few peasants below me, not a soul was seen. On my rejoining De Chaumonart, as soon as dusk had come on we made for the little farm. We had heard so many stories of sentries being found murdered in Spain that double guards were placed. I give these particulars to prove that what followed was through no fault of De Chaumonart's.

The dawn was just breaking when double shots rang out from a coppice to the south about one hundred and fifty metres from us, and in another moment '*L'Alerte*' was sounded.

'*Sacrebleu!*' exclaimed Pierre, springing up. 'If the horses stampede we are done for. You keep the devils off, and I will see about them.' He took half the men with him, and I took command of the rest.

The two who had been on guard by the

coppice were racing across the open towards us, and had almost gained their objective, when quite a hundred regulars, with some guerillas among them, came out of the wood. I seized two carbines myself, and jumped into a long, empty forage-cart with some of the men. Kneeling down, we shot two of their leaders, and wounded another. From every window we gave them such a warm welcome—at that range we could hardly miss—that the bulk fled right and left, and not a dozen got within twenty metres of the building. Then, as De Chaumonart came round from the rear, all those that had kept advancing were soon running like hares before him. I ordered our men to mount, and in a moment we were following the others.

On my rejoining him, De Chaumonart was just ordering some of the men to dismount and follow the Spaniards into the wood, when a trooper gave the alarm, and we saw at least one hundred and fifty of their cavalry coming towards the farm from the south.

'*Mon Dieu*, we will soon settle them!' cried Pierre; and, wheeling round, by galloping as fast as we could we got to the farm first. 'Are all your carbines loaded?' asked De Chaumonart calmly.

Many were, but more were not. Our halting seemed to make the Spaniards hesitate. They slackened their pace, and wheeled round within a hundred metres of us. But the movement was badly executed—the Spaniards were never famous for drill. While they were all in a bunch we poured a volley into them as they turned towards the Val de Halcon, and then we set off in pursuit as fast as we could.

IV.

All had gone well up to now, but, just as we thought we had them at our mercy (for our horses were fresher than theirs), at the very entrance of the valley a murderous fire was opened upon us—in fact, too soon, as even some of the Spaniards were hit. In a moment both De Chaumonart and I saw we were trapped. '*La Retraite*' rang out; we wheeled and turned, with many an empty saddle.

But this was not the worst. Behind us, from the original coppice whence the attack had begun, we saw a hundred more dragoons coming up. They had been in fours, but they broke into line, and so did we. We now had the advantage of the ground. I fancy they realised that; but we gave them little time to think, and rode straight at them. Sabring right and left, I only know that for my part I went right through them. My spirits rose with the danger and the excitement. Turning again, I rode straight at the nearest, emptying my pistol successfully at an officer who seemed half-dazed. All around were confused *mêlées*. Our men were fighting and chasing some of our foes here and there, and soon the 'Canaries' were flying in all directions.

Whether the famous 'Little Lizard' was really present or not I cannot say, but now for the first time we saw a monk, who was evidently a leader, hastening with some guerillas to another coppice, which he gained, alas! before we could intercept him; and ere we could get out of range they opened fire upon us. They wounded only a few, but they succeeded in scattering us. Seeing Pierre and two or three men, I raced after them. I let them keep on till they reached some woods, when, coming up with them, I told De Chaumonart of the ravine. I knew we could reach it long before the guerillas; and as for their cavalry, we knew they had had a lesson which would make them leave us alone for a time.

'Is it far?' asked Pierre, as I rode up beside him.

'*Ciel!*' I exclaimed. 'Are you wounded?' as I saw the white, haggard face and the way he leaned forward.

'Slightly; but it's not that. It is an old wound, I fear.'

Luckily I had some *agua fuerte*, and that restored him a little; but he remained silent, and we proceeded at a gentle trot, finally arriving at the mouth of the little ravine. It was but a simple bridle-path, with very steep and irregular sides, and a clear, murmuring stream at the bottom. We had got to the top, when at a short distance we saw a calvary, erected, according to the custom of the country, for those who passed to stop and pray for the soul of some unfortunate wretch who had been murdered at that spot. Quite close to it we were surprised to see two donkeys, a fine white one with most beautiful trappings—even the tassels were of silk—and a brown one. For the moment no owners were to be seen, till suddenly we came upon a cave at the side of the calvary, from which a brown monk, followed by a black Dominican, rushed forth in an excited state.

'Get back,' I shouted. 'Get back or you are dead men.'

The sight of my pistol was enough.

'What luck!' said De Chaumonart, with a little of his old animation. 'They will be fine hostages.'

Dismounting, we entered the cavern, leaving our men on guard outside. It was so dark at first that we were unable to make out anything; but we soon found that, apart from the Dominican, to whom great respect was paid, there were two others. They were almost too terrified at first to speak; then they told us to pursue our journey, and they would pray for our protection. De Chaumonart bluntly told them we were going to rest and look round first, and even in that dim light I saw on their faces the anxiety that his words produced.

In a very short time we had plenty of food, some splendid old wine, and even cigars. Before we commenced our meal, however, I bandaged a

slight wound on De Chaumonart's shoulder, which was of trifling account, but the old internal injury, which I suppose had been opened by his recent exertions, was what caused me anxiety, for, alas! I knew I could do little to alleviate that.

All this time the three monks had remained at the back in a group, conversing in whispers.

'I don't understand this,' said Pierre, after we had finished the best meal we had had for many a day. 'We will search the place high and low.'

With the aid of some altar candles we did so, and in the inner part we found stout oak chests stuffed full of vestments and church-plate, to say nothing of some long boxes in which pictures were rolled up. It was a veritable Aladdin's Cave. Haphazard, one or two of the boxes were opened. The first thing that met our gaze was a beautiful white enamel dove with fine ruby eyes, and round its neck a collar of the finest rubies and sapphires. Pertaining to it were three rings of silver-gilt of various sizes, which had chains attached to them; and they in turn had a far thicker and stronger plain silver chain, quite black with age, so that the whole could be suspended from the roof; while beside it was a reliquary in the form of a cross, of silver-gilt of the finest workmanship, and studded with the rarest gems.

'*Mon Dieu! c'est dur, c'est dur,*' exclaimed

De Chaumonart, a sudden spasm of pain coming over him.

'What is hard, my dear fellow?'

'Nothing—nothing,' he said testily. 'But look here,' he continued; 'I am in command, and I am going to have those two, and I give them to you. I feel I shall never leave this deuced place.'

'Don't get that idea into your head. Listen to me; you will be all right, but you must keep very quiet. It is not seven yet. I will put on the habit of one of the monks. You have three men with you. As the crow flies we are not a great distance really from our quarters. I shall be back with half the regiment by to-night or early to-morrow.'

'*Ma foi!* it's risky,' he replied. 'You will never get there.'

'I'll save your life if I can. The "*major*" will soon set you right. We shall bring carts as far as we can, and a stretcher for you.'

Our horses had been left outside, but fearing they might be seen, we brought them in. For safety the monks were bound hand-and-foot; if only one had escaped the whole country-side would have been aflame. Then, after a tender adieu—for I had no greater friend than Pierre—I put on the brown habit and the sandals of one of the monks and started on the brown donkey.

(Continued on page 742.)

THOMAS BEWICK, ENGRAVER AND MORALIST.

By Rev. GEORGE AITKEN, B.D.

IT is a common remark that some men who have gained a secure niche in the temple of fame have become for most people merely a name and a reputation, and are known only to the specialists. To put the matter to a practical test, how many of our readers can fill in the suggestion of the well-known title, *Bewick's British Birds*? Yet Bewick is one of the original geniuses in the history of art, and his autobiography, written at the age of seventy, is a delicious discovery to those who interest themselves in the difficult art of self-portraiture.

There is a tendency for artists of unusual gifts to reside in an environment where they may best develop their powers and find a congenial social circle. Bewick chose to remain in the neighbourhood where he was born, and the two foci of his life are the pleasant hillsides of Eltringham on the river Tyne, where he saw the light in 1753, and the city of Newcastle, to which he came as apprentice-engraver in 1767. Since his time vast changes have taken place in the district. Cherryburn, his birthplace, still stands, somewhat altered, and the seasons touch it as before with magic fingers. But the city has grown beyond recognition. If the reader wishes to form a mental

picture of Newcastle as it appeared to Bewick, he must wipe out the memory of its huge, dingy railway-station, the wilderness of red-brick houses, and the pall of smoke from innumerable chimney-stacks. In the eighteenth century the city was encircled by the ancient wall, within which were quaint houses, sequestered gardens, and orchards. The Tyne ran clear to the sea, and was spanned by a medieval bridge. On summer evenings the inhabitants would leave by the West Gate and stroll through the fields to the little village of Elswick. Of Bewick's Newcastle the only complete remains are the gate and keep of the old castle and the cathedral of St Nicholas, beside the south-east corner of which, near the door of a large modern building, a bust of the artist has been placed to commemorate the spot where his workshop used to stand.

We shall not dwell longer on the details of his career. He was content in his chosen task, and happiness has no history. The long catalogue of exquisite miniatures that bear his name are evidence of his successful absorption in the art which, in a true sense, became his very life. It is the way with such rich, self-contained, upright natures to mellow with the passage of years, and

a portrait of Bewick, in a painting by James Ramsay called 'The Lost Child,' impresses even a casual observer. He is clad in the dress of the period—cut-away coat, knee-breeches, white stockings and black shoes, ruffle at neck, and a tall hat thrust well back on the capacious head; but the most striking feature is formed by the eyes, set deeply in a strong, kindly face, penetrating and far apart under the high forehead. You can see this portly old gentleman walk along the streets, conscious of himself, but frank to his fellows; a man of genius who had been content all his days to move about quietly amongst his own folk, much respected. In 1828 he died, and was laid to rest in the family burial-place at Ovingham by the Tyne, under the morning shadow of the church-tower.

For varied and pleasing scenery, the valley of the Tyne will hold its own with that of any river in the kingdom. Its lower reaches have been invaded by the unlovely tread of modern industrialism, but in the middle of the eighteenth century it was a strath full of melodious beauty, sheltering and feeding a wide variety of birds, beasts, and fishes. Bewick came to know them all, treating them at first, as the 'young barbarian' usually does, with a thoughtless unkindness, but soon acquiring a human interest in their habits and appearance. His case is similar to that of countless lads reared in the country, except that this boy had the instinct to draw what his eyes fell upon. 'The margins of my schoolbooks,' he writes in the *Autobiography*, 'and every space of spare and blank paper became filled with various kinds of devices or scenes I had met with. As soon as I had filled all the blank spaces in my books, I had recourse to the gravestones and the floor of the church-porch with a bit of chalk. At that time I had never heard of the word "drawing," nor did I know of any other paintings besides the king's arms in the church, and the signs in Ovingham of the Black Bull, the White Horse, the Salmon, and the Hounds and Hare.' So decided a talent must make way for itself, and, though the lad took an artist's pride in the miscellaneous subjects set before him by his master, it is with the illustrations to an edition of Gay's *Fables* that his real powers show themselves. The fable, it will be noticed, makes large use of animals and birds as vehicles of moral truth, and the apprentice was thus able to draw upon a world of natural history familiar to him since childhood. With gods and goddesses and the other appurtenances of classical fable-land he never was at home, but in graving the creatures of the natural world he became more and more a master. It is something else than a coincidence that the age which saw a return to nature in literature in the work of William Cowper and Robert Burns saw also the appearance of a first-rank artist who copied his pictures from the living object.

The year 1784 is important in Bewick's life.

He began a series of designs for a book entitled *The General History of Quadrupeds*. The beasts native to his own land gave him no trouble, but his ingenuity was sharply exercised over those inhabiting foreign countries. He acknowledges his debt to Buffon, the French naturalist, and the advent of a travelling menagerie was hailed with delight. Nor was he without his difficulties even when the living specimens were at hand. He received a commission to sketch a bull belonging to the Chillingham herd of white wild cattle in Northumberland. Let him tell the story of how he observed these animals at close range. 'I could make no drawing of the bull while he, along with the rest of the herd, was wheeling about, and then fronting us. I was therefore obliged to endeavour to see one which had been conquered by his rival, and driven to seek shelter alone, in quarry-holes or in the woods; and in order to get a good look at one of this description, I was under the necessity of creeping on my hands and knees to leeward and out of his sight, and I thus got a sketch from which I made my drawing on the wood.' This picture of the Chillingham bull he thought his masterpiece, and no one who has seen it will deny the nobility of the subject or the rare skill with which it is drawn. In 1797 appeared the first volume of his most famous work, *The History of British Birds*. How lovingly portrayed they are! With what feeling the background is harmonised to the feathered subjects! Modern photography has produced artistic studies in bird-life, the result of patient waiting, often for days together, till a favourable chance came; but none are more alive than the best cuts done by the hand of Bewick over a century ago. Each picture is a miniature, occupying only an inch or two of wooden surface, and rivalling Meissonnier himself in pre-Raphaelite accuracy and finish. No verbal description can convey any adequate idea of their charm, and our wonder increases when we remember the circumstances under which they were done, and see the simple boxes of graving-tools as they lie displayed to a passing visitor under glass cases in the public collections of Newcastle.

One may well believe that wood-engraving was the earliest of the arts, inasmuch as its materials could be found everywhere. A sharp stone applied to the smooth bark of a tree, and, lo! a picture. We know that it was employed by ancient races, but its elevation to the position of a fine art belongs to the sixteenth century, when Albrecht Dürer used it to produce his weird and uncouth woodcuts, and Hans Holbein wrought on the same material his arrestingly beautiful and human designs. After those famous years the art fell into the background, till it was revived and developed by Thomas Bewick of Newcastle. It can be claimed for him that he made the process easier, and brought

the artist into more direct touch with the medium of expression. Put simply, the change is as follows. Before his time, the artist only drew the picture on wood, leaving it to mechanical workmen to cut out the surfaces between the lines. Bewick treated the empty block as a black surface, a background, as it were, out of which to carve the white lines which make the picture. He was thus at once designer and executor, and could bring to bear directly on his conceptions all the feeling, thought, and skill that he possessed. This invention, simple as it seems, revolutionised the art, and we have reason for saying that Thomas Bewick is 'the father of wood-engraving.'

Readers of the *Autobiography* already mentioned will have deduced that there was a didactic strain in Bewick's composition. This is proved by a study of the tailpieces which fill up blanks in the pages of his *Quadrupeds* and *British Birds*. One authority goes so far as to say that these little sketches will be his enduring claim to artistic immortality, since in the nature of things, as knowledge grows, his work as engraver will be superseded. Bewick gave much thought to these vignettes. As he lay upon his deathbed he was asked, in one of his waking moments, what had been occupying his mind. 'I have been devising subjects for some new tailpieces,' he replied. The writer confesses that the discovery of these pictures gave him a thrill of unaccustomed surprise. Here is a series of engravings depicting scenes from country life, summer and winter, episodes of field sports, chief amongst them angling, as befits an artist who lived all his days on the banks of a river. They are wrought with exquisite patience and skill, and many of them represent actual glimpses of Tyneside as they may still be seen between Cherryburn and the city. The last sketch shows his birthplace on the hill, and a funeral procession wending its way to the river, where a boat, rowed by two men, draws near to the landing-stage to receive the coffin and the mourners.

It is noticeable that none of the scenes deals with city life—a proof, if we needed one, that his heart was amidst the fields. The tailpieces establish Bewick's place as a companion of Hogarth with his satiric humour and serious wit, a precursor of Landseer in his sympathy with the lower creatures. It is evident that he feels for the poor and those who refuse to live within conventional limits. The poacher is seen making his heavy way across a snow-covered field. A tramp with a wooden leg shares his bite of food with a dog, just outside a large house, the peacock strutting about on the wall symbolising the exclusive pride of its owners. A woman has refused the appeal of two mendicants, and they quit the garden, leaving wide open the gate, through which come fowls, followed by swine; and, whilst the housewife pins clothes to a line, the intruders are busy undoing all her labour with those spread on

the grass! Sometimes we see the element in Bewick's nature in which he resembles Dürer. A sledge, drawn by two goats, has a repulsive driver—Death himself in flowing robes. A man on his way home, perhaps none too clear-headed, sees a clump of trees in the form of monsters grinning at him. By constitution and habit a wise man, though he lived in a coarse age, Bewick has no patience with excess, and many a time he shows his attitude of repugnance. The drunken miller sprawls on his back under a shrub, whilst a stone close at hand bears the date '4th June 1795,' indicating that the patriotic fool has been drinking too many healths to King George on his birthday. A horse is running away, and three boys who occupy the cart hold on to its sides in terror, whilst a fourth has fallen out behind. We learn from the sign-board on a house near at hand, and the appearance of the man who has issued from it, that this perilous incident arises from his lingering too long in the tavern. Nor does the artist hesitate to introduce personalities for castigation. A driver, whose cart has stuck under the gallows erected by the wayside, turns round to see behind him a demon! The allusion, we are told, is to a dishonest coal-dealer upon whom the artist revenged himself in this quaint fashion. The device was effective. 'He confessed his guilt,' remarks Bewick (can we not hear his chuckle?), 'and on his knees implored pardon.' Children, too, have their place in this amazing series. The artist loved them, and his earlier woodcuts of select scenes from the Bible, and a volume called *Tommy Trip's History of Beasts and Birds*, opened out a new era in the illustration of young people's books. One vignette shows a toddling child in a field about to tug the flowing tail of a horse, his distracted mother meanwhile making her rapid way towards him over the stile.

Like J. E. Millais in some of his pictures, Bewick's quick eye for effect has seized incidents at a crucial point before the issue is decided. He has what may be named 'the humour of situations.' This method adds to the piquancy of not a few, as in the case of a man fording a river with his cow in order to save the toll at the bridge in the background. In midstream he rues his action, and would turn back but that the animal has other intentions, and the owner pulls helplessly at her tail, his hat meanwhile sailing downstream on the current! The pathos, too, of human life stands out in the tailpieces. A donkey rubs his back across a pillar erected to record some 'splendid victory.' A sailor, on a rocky shore kneels in prayer as the waves creep towards his feet. Leslie the painter chooses this scene for mention as revealing Bewick's power of subduing the mind by emphasising the uncertainty of human things. A broken boat lying on the shore is a threadbare theme, but does it not suggest thoughts which carry the spectator among 'the tears of things'? This was the class of

Bewick's pictures that haunted Charlotte Brontë in her 'teens, and she has dwelt on their effects in the first chapter of *Jane Eyre*, where the lonely, ill-used child passes the slow hours of a rainy day looking over the illustrations to *The History of British Birds*.

But fine as all these and many others are, we feel the throb of passion most clearly when the tailpieces depict cruelty to animals. Over and over again Bewick has repeated the great lesson of sympathy towards the creatures which are in man's power. A currier, with a grin on his coarse face, looks at a terrified dog scampering away with a kettle tied to its tail, and pursued by three ragged urchins. Two lads have hanged a dog to the lowest limb of a tree, and sit watching it die, and in the distance, behind their backs, stands the gallows! 'The Snow Cottage' is one of the best known of all Bewick's works. A ruined house is surrounded by a bare, wintry landscape, and in the foreground a gaunt, tottering ewe gnaws the bristles of a

broom, her lamb digging into the empty teats. Could expression go further? The engraving is composed of the simplest materials, but its appeal is irresistible. Just before he died Bewick was at work on his largest block, 'Waiting for Death.' A lean-ribbed hack stands in the rain in an exposed field above a village, the very embodiment of exhaustion and wretchedness. The sorrows of dumb animals seem to have been a lifelong obsession with him, for as far back as 1785—forty-three years before he executed this engraving—he had described as 'the service of unfeeling avarice and folly' the lot of such a horse in the possession of one Skinfint, a horse-dealer. He meant to dedicate the picture to the Society for the Prevention of Cruelty to Animals, and hoped that it would hang in many a cottage to remind people of their duty to faithful and defenceless creatures. Thus did he use his art as a lesson-book, confirming his own words: 'O, this is a bonny world as God made it, but men make a pack-horse of Providence.'

A BRACE OF TIGERS.

By C. G. NURSE.

PART I.

I.

TO a keen sportsman who has spent many years in India the prospect of leaving that country finally without killing a tiger is as humiliating as it must be to a young lady of some pretensions to good looks to settle down to spinsterhood without having had an offer of marriage. During the days of my youth I had made several attempts after tiger without success, though on one occasion I managed to give the finishing-touch to one which had been previously wounded by a brother-sportsman. But for a number of years fate had decreed that I should serve near the frontier, or in stations far removed from the haunts of the larger carnivora, and consequently, until nearly the close of my Indian career, I had never had the satisfaction of bringing one down to my own rifle. When, therefore, I found myself under orders to take over the command of a regiment at Jubbulpore, in the Central Provinces, one of my first thoughts was that at last I ought to have a fair chance of bagging a tiger.

At the time of my arrival in my new station the hot weather was too far advanced for me to hope for any success till after the rains, and I therefore contented myself with making inquiries regarding local conditions and suitable localities, with a view to taking advantage of such opportunities as might occur during the following season. In the Central Provinces there are certain forest rules laid down by authority, and the whole of the jungles are, for shooting pur-

poses, divided into 'blocks' of various sizes, running up to 150 or 200 square miles. Any British officer or civilian may, on payment of the necessary fee, reserve for one month the shooting rights over an area that has not already been allotted. Many of the 'blocks' are, however, of little or no use for big game, and as the jungle is in a condition for shooting only from December to May or June, there is naturally a considerable demand for the best localities during these months. I managed to ascertain from a friend, who had recently been transferred elsewhere, the names of several suitable 'blocks' of jungle, one of which—and in his opinion the best—was known as the Khitauli area. So I determined to make every effort to secure the shooting rights over this jungle as soon as the season was ripe for the pursuit of big game.

The nature of the undergrowth in the Central Provinces renders elephants quite unsuitable for shooting purposes, and the universal custom is to shoot from a *machàn*, or shooting-platform, securely fastened to a tree at some height from the ground. The *machàn* itself is rather like a child's bedstead, and is easily made by any native carpenter. A light ladder is useful for the purpose of ascent; and the necessary rifles and ammunition complete the sportsman's equipment.

There is, however, one matter, in addition to the provision of the requisite equipment, which no one who hopes for success at big-game shooting in India can afford to neglect—namely, to establish good relations with the district officials, including

the local officers of the Police and Forest Departments. If any one attempts the pursuit of big game without the aid of the local officials, the natives will at once assume that he is not a *persona grata* to the powers that be: beaters will not be forthcoming, petty supplies will be difficult to obtain, and every obstacle that subtle Eastern minds can conceive will be placed in the way of the sportsman. Arm-chair critics may imagine that the natives would be only too glad to be rid of such unwelcome neighbours as tigers, but this is by no means invariably the case. The crops on land situated just outside jungles often suffer terribly from the incursions of deer and pig, and the presence of a tiger or two serves to keep down the number of these depredators. The great majority of tigers prey chiefly on wild animals, and so long as they do not take to killing cattle or human beings, the local natives are usually quite satisfied to leave them alone.

By payment of the modest sum of fifteen rupees, I succeeded in reserving the Khitauli jungle, an area of perhaps a hundred square miles, for the month of February. I was already, thanks to a common taste for 'bridge,' on the best of terms with the Deputy Commissioner and the District Superintendent of Police, but I determined to go and see the latter officer to ask for the active co-operation of such of his subordinates as might be stationed in the neighbourhood of my proposed shooting-ground. He gave me a 'chit' to the inspector of the Khitauli subdivision, saying, 'My dear colonel, you can tell him that if he does not assist you to the best of his ability, I'll wring his neck. But I can show you a tiger much nearer than Khitauli.'

He led the way into the compound, where a tigress, about three parts grown, was tethered by what seemed to me an absurdly weak chain.

'She's as tame as a dog,' remarked the D.S.P. 'I have had her since she was a few days old; in fact, I brought her up on a bottle at first. But I shall soon have to get rid of her, as she will be getting dangerous.'

The tigress recognised her master, and even permitted me to stroke her. The D.S.P. let her loose for a bit, and she gambolled about the lawn like an immense cat. I left him playing with her, and went to call on the Forest Officer, who promised me all possible assistance from the forest 'rangers' in the Khitauli district.

The only matter that remained to be arranged was the provision of a few young buffaloes, to be tied up in various parts of the jungle as 'baits' for tigers. The majority of the natives of this part of India are Hindus, and they strongly object to young bullocks being sold as 'baits,' but their objection does not extend to the use of buffaloes for the same purpose. The purchase of the necessary buffaloes could best be effected near the shooting-ground, so I handed over a hundred rupees to my orderly, and sent him out to Khitauli for that purpose, with orders

to get into touch with the local *shikaris*, and to prospect generally.

Mahomed Khan, my orderly, was something of a personality. Standing about six feet three, of spare build and very active habits, with all the instincts of a sportsman, he was an ideal man for my purpose. He was a Punjabi Mohammedan, and the natives of the Central Provinces, who are for the most part small men, respected him on account of his commanding stature and dictatorial manner. But he was not without a certain amount of *suaviter in modo*, and often managed to obtain, by small gifts of tobacco, information regarding game prospects which was exceedingly useful to me.

II.

About a week after the departure of Mahomed Khan, I received from him a very ill-spelt and ungrammatical letter in Urdu telling me that he had made the necessary arrangements, and urging me to come out as soon as possible. I therefore obtained ten days' leave, and set out for Khitauli, taking with me my native servant Jaisukh, a horse, my gun and rifles, and a supply of food. At the nearest station, which is ten miles from Khitauli, I found Mahomed Khan waiting for me.

'Well, Mahomed Khan,' I said, as I replied to his salute, 'what news? Are there any tiger about?'

'The jungle people report tiger.'

'What about buffaloes?'

'*Huzir*, I have bought twelve, of which six are tied up in various parts of the jungle, and I am keeping the rest in "support."' (He used the English word, made familiar to him by his military training.)

The well-marked track from the station to Khitauli ran chiefly through a thin belt of forest, but here and there was a small village, with a few acres of cultivation, the crops including tobacco for local consumption. I saw a couple of doe *sambur*, but nothing else in the way of game except a few green pigeons. Khitauli proved to be a large village, consisting of some 200 or 300 houses, of which the great majority were of the usual Indian type, with mud walls and tiled roofs. The few *pucka* (brick built) buildings included the local school, in which I could hear the boys repeating the multiplication table in a kind of chorus as I passed. I had permission to occupy the Forest Officers' rest-house, a roughly built but commodious building on the outskirts of the village. Here I took up my quarters, and spent the rest of the day in interviewing the local *shikaris* and settling my plans.

After the preliminary arrangements for a tiger-shoot have been made, the period of waiting until a 'kill' is reported requires the exercise of some patience. One has to remain on the spot, at any rate in the mornings, so as to receive reports

from the men who have been detailed to visit the different 'baits.' To disturb, by beating for less important game, any part of the jungle where there may be a tiger may prove absolutely fatal to one's chances of success, but one can usually get a little small-game shooting either on the outskirts of the jungle or in the fields close at hand. I managed to get a few peafowl and jungle-fowl by having them beaten across a ravine, where they afforded excellent shots. In most parts of India the natives object to peafowl being shot; but here they had no such objection, and I was glad enough to get a change from the inevitable *murghi* (fowl) and goat's flesh, which were all that was procurable in the small *bazar*.

I had plenty of opportunity of studying the inhabitants of Khitauli and the neighbouring villages, who were chiefly Hindus of the cultivating class. Like most sportsmen who have come into close contact with Indian peasants, I have a strong liking for these simple and unpretending people. During the past year there had been a partial failure of the crops, and though the Government had remitted a considerable proportion of the land revenue, there was a good deal of local distress. For this reason I never had any difficulty in obtaining beaters, as the poorer classes were glad enough to earn even a few annas to supplement their scanty resources. The customary rate of pay for beaters seemed ridiculously small if judged by European standards; two annas (twopence) a day was the recognised local rate for beating for small game, and three or four annas for big game. Of course, the local *shikaris* and headmen expected *backshish* in the event of a successful day, and as one had to employ large numbers of beaters, expenses mounted up.

My licence entitled me to kill a *sambur* (the Indian elk), and as I had ascertained that there were a few in a part of the jungle where I was not likely to disturb larger game, I determined to have a beat in the hope of getting one. I asked for 100 beaters from the nearest villages, but when I counted the candidates for employment, I found that they numbered 190. I did not wish to send any of them away disappointed, so I took the whole crowd with me, having first issued to each of them a gun-wad—I had bought a couple of boxes of these for the purpose. The wad would be carefully tied up by each man in the end of his *pugri*, or elsewhere in his scanty clothing, and produced in the evening as a voucher that he had 'borne the heat and burden of the day.' This precaution is necessary to prevent loafers who have taken no part in the proceedings turning up at the time of payment and demanding wages for services not rendered. I never fired my rifle on this occasion, as I saw only a couple of hinds; but on the way back Mahomed Khan, who was always looking after my interests, gave orders that each man should carry in a large log 'for

the *sahib's* fire,' and thus my fuel for the rest of my stay cost me nothing.

Towards the end of my leave a tiger was reported to have killed one of my 'baits' about eight miles from my headquarters. A beat was organised, but I was doomed to disappointment, as the only animal of any size that appeared was a bear, which, of course, I would not fire at while there was any chance of larger game. However, after I had given up all hopes of seeing a tiger, I arranged to beat for the bear. He was duly driven towards the tree where I was sitting; but my first shot only wounded him, and he broke back among the beaters, who with one accord made for trees. The Indian sloth bear is a formidable beast when wounded, and one of my beaters bore evidence of this on his own person, as he had lost nearly half his face from an attack by a bear some years previously. When I got down from my tree to walk up to the wounded animal, the men all shouted, '*Khabardar* [Take care], *sahib*!' but a few of the bolder spirits advanced with me, and the bear was soon located and shot.

III.

So far my efforts to obtain a tiger had been unsuccessful, but I determined on one more attempt before taking leave to England. I had managed to reserve the Khitauli jungle for the month of April, and sent out Mahomed Khan to make the usual arrangements. The young buffaloes that remained from my previous trip had been entrusted to the care of a native, and had been daily driven out to pasture with the village herds, for which services I paid a small sum monthly. The local natives had proved very honest, and not one of my animals was reported to have died, as I expected would be the case, judging from what usually happens in other parts of India.

A few days after my arrival on my second visit, Mahomed Khan came to my quarters in a great state of excitement, saying, '*Huzur*, there is news.'

'What news?' I inquired.

'The *sahib* knows where a buffalo was tied up near the stream about three miles from here. The man who goes every morning to feed it has just come back, and says it was killed during the night.'

'All right. What about beaters?'

'Rama [the local *shikari*] is in the village collecting them.'

'How many did you say would be required?'

'About a hundred. They ought to be here in an hour or so.'

By the time I had seen to my rifle and ammunition, and arranged for a lunch-basket, the beaters had begun to arrive, and were squatting about in the shade. I was in no hurry, as no experienced sportsman attempts to beat for a tiger till midday, up to which time Master Tiger is on

the alert, and ready to move off if he hears any unusual sounds in his vicinity. But by about noon, especially if he has had a good meal, the beast usually becomes drowsy, and takes up a position for a siesta in some secluded spot at no great distance from water.

It never rains but it pours; and while the beaters were assembling, a couple of men arrived from a village about ten miles distant, and reported that a cow had been killed out of the local herd on the previous evening, and urged me to come and beat for the tiger. Owing to the distance, however, it would be impossible to attempt to beat both jungles on the same day, so I decided to go after the tiger first reported on that day, and try next day for the other. The day's beat proved unsuccessful, although, judging from the state of the 'kill,' and the 'pugs' (footprints) of the tiger, the animal could not have left the neighbourhood more than a few hours.

Next morning I started for the other locality, without much hope of a satisfactory result, as it was more than thirty-six hours since the cow had been killed, and it seemed probable that the tiger had moved elsewhere. However, I did not wish to miss a chance, as I should in any case have to pay the beaters, for the engagement of whom I had arranged the previous day. The village where the kill had occurred was a small one, and could supply only a limited number of men, so I took with me about fifty of the Khitauli natives, and started off on horseback, accompanied, of course, by Mahomed Khan, who carried a spare rifle to be used in case of emergency.

When I arrived near the village I was met by the local *shikari*, who escorted me to the place where the remains of the cow had been dragged by the tiger, which was supposed to be still in the vicinity, and probably in a patch of thick jungle which was pointed out to me. We discussed our plan of operations, and, in order to select a suitable spot for my *machùn*, I ascended a slight hill to have a good look round. As I approached the summit Mahomed Khan said in a low but excited tone, '*Sahib*, I have just seen a tiger over there.'

'All right; keep quiet,' I said, looking in the direction indicated, where I could see nothing. I did not in the least believe him, as he was accustomed to romance a bit at times; but in any case it was necessary to keep as quiet as possible, so as not to alarm the tiger if he were anywhere in the neighbourhood. From the top of the hill I could see the lie of the ground fairly well. The portion of the jungle where the local men believed the tiger to be lying was separated from the main forest by the bed of a stream some forty or fifty yards wide. This was evidently during the rains a raging torrent, but at present it contained only a comparatively small trickle of water along the right bank, the remainder of the bed being quite dry and sandy. At one place the stream made a slight bend, and here I decided to place my *machùn*, as I should have a clear field of view in front and on both sides. A fringe of trees and bushes on the right bank would afford points of vantage for the 'stops.'

(Continued on page 749.)

A CORRESPONDENT OF JANE AUSTEN.

By A. FRANCIS STEUART.

LITTLE though the great Jane Austen was known to the public during her lifetime, she had her modicum of recognition. She was able to discover that the Prince Regent had 'read and admired' all her publications, and was permitted to dedicate *Emma* to him; and she was soon to know that she had another warm adorer in the 'fashionable world.'

This was Frances Talbot, Countess of Morley. She evidently was an early admirer of 'The Immortal Jane,' as the latter wrote, in 1814, to her brother, Charles Austen, about another sailor brother: 'Poor fellow! not a present! I have a great mind to send him all the twelve copies [of *Emma*] which were to have been dispersed among my near connections, beginning with the Prince Regent and ending with Countess Morley;' and Lady Morley wrote to the authoress from Saltram, 27th December 1815:

'MADAM,—I have been most anxiously waiting for an introduction to *Emma*, and am infinitely obliged to you for your kind recollection of me,

which will procure me the pleasure of her acquaintance some days sooner than I should otherwise have had it. I am already become intimate with the Woodhouse family, and feel that they will not amuse and interest me less than the Bennetts, Bertrams, Norrises, and all their admirable predecessors. I can give them no higher praise. I am, Madam, your much obliged,
F. MORLEY.'

To this Jane replied, on 31st December, with a letter of thanks, and added: 'It encourages me to depend on the same share of general good opinion which *Emma's* predecessors have experienced, and to believe that I have not yet, as almost every writer of fancy does sooner or later, over-written myself.'

It does not appear that Miss Austen and Lady Morley ever met. The latter was intimate with Lady Granville Leveson-Gower, *née* Lady Harriet Cavendish, an admirer (*vide* her charming letters) of *Pride and Prejudice*.

If one is allowed a digression here, it is on the

name of this book. Miss Austen probably found it in the work of her sister-author, Miss Burney's *Cecilia*; but the phrase occurs earlier, in Gibbon's *Decline and Fall* (vol. i., chap. 2), and who shall say that Miss Austen was not one of his readers also?

Lady Harriet Leveson-Gower (Countess Granville) was also early introduced to the works of Miss Austen; they were read at Althorp, the seat of her uncle, Lord Spencer. Her aunt, Lady Beborough, wrote, 25th November 1811, to Lord Granville (whom the niece ultimately married): 'Have you read *Sense and Sensibility*? It is a clever novel. They were full of it at Althorp, and tho' it ends stupidly, I was much amused by it.'

And now we come to Lady Morley herself. She was Frances, daughter of Thomas Talbot of Wymondham, Norfolk, and, when very young, married, 23rd August 1809, John Parker, Viscount Boringdon of North Morton, created Earl of Morley, 29th November 1815. Lord Boringdon (known as 'Borino' to his friends) had been married before, to Lady Augusta Fane—a sister of the great heiress, Sarah, Countess of Jersey (generally called 'Silence'); but she eloped with Sir Arthur Paget, and was divorced in 1809, leaving one son, to whom her successor, until his death in 1817 by an accident, proved a devoted step-mother. Lady Morley was Châtelaine of Saltram, in Devonshire, and on her marriage entered *le beau monde*, presiding over the hospitality there, as well as the world of letters, in which she was already so well known that Miss Mitford attributed the authorship of Miss Austen's first two novels to her—an immense honour.

We learn much about Lady Morley's charm from Lady Granville's correspondence. In 1815 she wrote to her sister, Lady Georgina Morpeth: 'I dined at Holland House. . . . Mr Sheridan was there in his best, discussing all the young women of his acquaintance with much phrase and some little cuts. He says, "Silence [Lady Jersey] is a pretty, pushing babbling stream, never stagnant. Lady Borino, his favourite, has hit the line between good-natured frankness and vulgarity, just touch and run." She tells us that Lady Morley was much in Paris, in the set of Madame de Staël and Madame Récamier; that at Saltram she had 'high spirits but not overpowering;' and that in London, in 1817, 'Lady Morley is a great comfort to me. She came last night, looking beautiful in a white hat and feathers, with a Marie Stuart ruff.' So much was the pleasure Lady Granville had in her society that in 1821 she wrote: 'Lady Morley *fait mes délices*, and after her departure I mean to end my *soirées*.' And next year we have this eulogium:

'What an adorable woman Lady Morley is! Never did any one person unite so much, pretend to so little, so bright, all the comfort of

solidity, and all the ease of *légèreté*. I esteem her, I love her, admire her, but it is impossible to praise her as she deserves.'

But it was not only Lady Granville that sang Lady Morley's praises. In the Holland House circle she met Sydney Smith, and he at once succumbed to her wit. He wrote:

'I believe our friend Lady Morley has hit upon the right plan in dining modestly at two. When we are absorbed in side-dishes and perplexed with variety of wines, she sits among us lightly flirting with a potato, in full possession of her faculties and at liberty to make the best use of them—a liberty, it must be owned, she does not neglect, for how agreeable she is! I like Lady Morley; she is what I call *good company*.'

Nor did she hesitate to break a lance with the Rev. Sydney when he enunciated the scientific fact that no baby was ever born a Quaker. Lady Morley riposted at once:

'That the Bluecoat boy should be the larva of the Quaker in Great Britain is possible, and even probable; but we must take a wider view of the question, and here, I confess, I am bewildered by doubts and difficulties. The Bluecoat is an indigenous animal—not so the Quaker. . . . No one has seen a Quaker baby. And as to Sir R. Ker Porter. He has travelled over the whole habitable globe, . . . and yet he never saw a Quaker baby; and what is new and most striking, never did he see a Quaker lady in a situation which gave hope that a Quaker baby might be seen hereafter. . . . But let us not be checked or cast down; truth is the end and object of our research. Let us not bate one jot of heart and hope, but still bear up and steer our course right onward.'

It was to her that Sydney Smith wrote in 1831: 'I went to court, and, horrible to relate! with strings to my shoes instead of buckles—not from Jacobinism, but ignorance. I saw two or three Tory lords looking at me with dismay, was informed by the clerk of the closet of my sin, and gathering my sacerdotal petticoats about me (like a lady conscious of thick ankles), I escaped further observation.' And when, in 1832, he took possession of his preferment and entered Amen Corner, he asked her to come to his Sunday dinners 'to six clergymen and six singing-men at one o'clock. Do me the favour to drop in as *Mrs Morley*.' Later (in 1840) he wrote: 'I am always glad when London-time arrives. It always seems in the country as if Joshua were at work and had stopped the sun. You, dear Lady Morley, have the reverse of Joshua's talent, and accelerate the course of that luminary:

By force prophetic Joshua stopp'd the sun,
But Morley hastens on his course with fun,
And listeners scarce believe the day is done.

Rumours have reached us of your dramatic fame.'
It is sad that Lady Morley's 'beautiful hand'

does not appear in any known print, or her fine eyes—which were said by the Bishop of Exeter to hurt her (from cold) as ‘a judgment for the mischief they had done’—in any accessible picture; but some of her works do remain, for later in life she also tried her hand at novel-writing. In 1834 there appeared a book called *Dacre, a Novel*, edited by the Countess of Morley, 12mo, which was well received by the *Edinburgh Review* of July, and by the *Quarterly* of November in that year. Though Lady Morley had a large hand in it, we now (since Miss Eden’s letters have appeared) know that it was mainly written by Mrs Lister (afterwards Lady Theresa Lewis, née Villiers) and her husband, ‘a refined and accomplished gentleman of literary tastes.’ Although—as Jane Austen might have said—it was ‘pleasing but not capital,’ it obtained, as Professor Saintsbury points out, more adulation and notice than D’Israeli’s early novels. Lady Morley wrote a later book, in two volumes, in 1852, *A Man without a Name*; a poem, ‘The Nose,’ in six stanzas; and—a skilful artist—illustrated two squibs: the second *The Flying Burgomaster*, a *Legend of the Black Forest*, while the earlier one (1829), *Portraits of the Spruggins Family*; Arranged by Richard Sucklethumbkin Spruggins, Esq., gained for its author the contemporary praise of Joseph Jekyll that ‘the comical Countess is Hogarth in petticoats.’ The portraits are really amusing, as he says, ‘from their own ancestors, who were aldermen in the reign of Henry VII., to the young cub of the two families entered at Christ Church, Oxford, last month.’ The letterpress is whimsical and delightful. The initial coat of arms containing an honourable augmentation ‘granted by King Charles the Second to Sir Solomon Sucklethumbkin, Knt., on his presenting to that monarch his great national plan for purifying the waters of the Thames by ignition.’ We draw attention to the portraits also of the Puritan Spruggins, who published ‘a very edifying tract entitled—“Sandpaper to polish ye snuffers of the onlie tru candlestick,”’ and to that of Cynthia Spruggins—represented leading a lamb—who, ‘far too refined to engage in the ordinary pursuits of this turbulent world, . . . passed her innocuous life in administering to the comforts of the brute creation, and admiring the works of nature. She died a spinster.’ There is also a character sketch of the Rev. Theophilus Spruggins, ‘much addicted to literary pursuits,’ all, as Jekyll said, ‘in the various English of the times, and the costume of the different periods admirably accurate.’

Lady Morley became a widow in 1840. Her one son, Edmund, second Earl of Morley, gave her the satisfaction of providing her by marriage with the daughter she wished. In 1842 his cousin, Lord Clarendon, wrote: ‘Morley is going to be married to Mrs Coryton, who is his second cousin and a widow. A more delightful, amiable person does not exist, and he has made a most

judicious choice. Lady Morley is quite beside herself with joy. It is just the marriage for him. That makes her perfectly happy, as I know you will be glad to hear;’ and perfectly happy and contented she remained until her death, on 7th December 1857.

As her letters are none too common, it is permissible to quote three to Horace Walpole’s Miss Berry, to show how Lady Morley loved her and her sister, and tried at their vast ages to give them heart.

On 24th November 1844 she wrote:

‘I daresay ‘tis a very good thing to be stowed away in a well-fortified castle [perhaps Catherine Morland thought so too—once!], but I don’t think it cheerful in these piping times of peace. Magnificence is always melancholy to me. Here I sit at this present writing, choked up with velvets and satins and mirrors, and gold and silver and precious stones. There is my bed! redolent of damasks and carvings, with crowns of gold on the top, as if it were all prepared for a Royal Corpse to lie in state. I feel afraid of stepping into it, and have serious thoughts of passing my night on the sofa. Then, when I try to cheer my spirits by looking out of my window, I see nothing but hornworks, and breastworks, and bastions, and chevaux-de-frises. . . . All the sweet face of nature shut out; not a bit of green grass or trees to be seen. I’d rather be a frog (*not* a toad), and live upon the vapour of a dunghill (provided it commanded a pretty prospect of the surrounding scenery) than pass my life in a fortified castle.’

The next is from Saltram, 27th February 1848:

‘You are surrounded, almost as you were in your youth, by those who admire you and love you with all their hearts and souls. You have a volume of past events in your memory to interest you at all times; you have still a cheerful *enjoying* spirit, and, above all, that blessed hope that, as this world and its pleasures draw to a close, a far, far higher state of enjoyment awaits you.’

And this is the last, also from Saltram, 3rd December 1848:

‘My ammunition is saved by your small dispatch received this morning, by which I may infer that you are pretty flourishing, as you only refer to your eighty-sixth ailment, which I hold to be a very light matter, and to *you* above all people—with your ears and your eyes, and your limbs and your mind, and your zest, and your capabilities of enjoyment all alive and kicking, as if you were eighteen instead of eighty-five. . . . God bless you, my dearest Miss Berry. It will be a great pleasure to find oneself knocking at the door of 8 Curzon Street. Best of loves to Miss Agnes.’

And with this charming letter—fragrant now as when it was scented and delivered—we may take leave of ‘dear Lady Morley.’

RECOLLECTIONS OF A NAVAL SECRETARY.

JAPAN.—*continued.*

VII.

WE paid a visit to Kagosima, the fortified town which in 1863—ten years previously—had been burned by the British squadron under Admiral Kuper, on account of the refusal of the Prince of Satsuma to pay an indemnity for the murder by his followers of some English residents.

It was well that our people should have considered that British honour was avenged, for we found that the Kagosima folk still sang songs descriptive of the driving away of the British squadron! It appears that the flagship steamed past the sea-forts, which are close to navigable water, set fire to the town by shell, and at once put to sea, whilst almost the first shot from the fort (according to the local version of the incident) took off the heads of her captain and her commander!

We had a very friendly reception, especially from a large class of young Japanese who were studying English, and who took advantage of our arrival to test their progress. Each carried a vocabulary and a grammar, carefully wrapped up in a bit of silk. There was a sameness in their conversation, which began with 'I beg your pardon; what is your name?' or 'I am very glad to make your acquaintance;' but they were very polite, intelligent young men.

We were regaled by some *daimios* with tea and sponge-cakes, in lovely gardens, ornamented with miniature bridges, temples, and trees, and backed by a hill six hundred or eight hundred feet high, clothed in grand trees and the densest foliage. Close to these delightful gardens was an enormous cotton-mill, freshly imported from Lancashire.

Our cruisers in Japanese waters took us more than once through the beautiful Inland Sea. At its western end it is entered through the very narrow straits of Shimonoseki, which are at one part only six hundred yards wide, and hemmed in by hills wooded to the water's edge.

It was here, in 1846, that Admiral Kuper's ships bombarded the forts of Shimonoseki as a punishment for their treachery in firing upon European ships.

We anchored off the town, and found that the inhabitants were afraid to come on board, though they surrounded us in boats; and when we landed, the women and children scuttled away from us. Curiosity, however, soon got the better of timidity; and when, after scrambling to the top of the hill, we returned to the ship, we found crowds on board. They were of all ages, from decrepit old men and women to babies slung on their mothers' backs. Young

men and boys had mounted to the tops, and the girls were so much in love with their own faces as reflected in our mirrors—they had only polished metal looking-glasses—that we could not get into our cabins. Fortunately our stay was only a short one, for on the morning after our arrival they were on board again by seven o'clock!

The cruise through the Island Sea was delightful; we anchored daily in time to land and scramble before dinner to the top of the highest neighbouring hill. At Awasima, from an elevation of six hundred feet, we counted seventy islands, all beautifully wooded, and some with tea-plantations.

From Kobe, a flourishing treaty port at the eastern entrance of the Inland Sea, we made pleasant excursions into the hill country, including an expedition to the Temple of the Moon, which is built on the top of a hill two thousand feet high at the back of the town. At the foot of the hill there was a shrine containing a picture of the future state, with a large zigzag wall down the middle of the picture dividing the cursed from the blest. The cursed were being tortured by every possible means, while the blest were rowing in boats on a lake with *musumes* (girls), or sitting in verandas gambling and drinking *sake*. At Arima, a pretty village built round a babbling spring of warm chalybeate water, and celebrated for its ornamental basket-work, we found pleasant quarters in the temple itself. The ecclesiastical person in charge was a Buddhist priestess, a vestal virgin of about fifty, with whom we made futile attempts to carry on conversation with the aid of a dictionary. We spent a week in the temple, living principally on boiled cucumbers, brinjals (egg-plant), marrows, potatoes, beans, spinach, rice, and auratum lily bulbs—a truly wholesome diet.

These little expeditions into the interior were very interesting, especially when we could get far enough beyond the beaten tracks of Europeans to see the village life of Japan, unaffected by the inroads of foreigners.

VIII.

A pleasant trip from Yokohama was to Oôyama (the Great Mountain) and the silk-worm district. Captain Huntley Walsh, of the Marine battalion, catered for us, and sent two pack-horses ahead with our baggage and food. We could trust to the country only for rice and eggs, so we took hams, bread, soups, and a crate of fowls. We started, a party of five, at daybreak in July 1872, walked ten miles before the heat of the day, and then journeyed on in jinrickshas;

but our men refused to have their little vehicles ferried across a broad, rapid-running stream, and we had a further tramp of ten miles before reaching the foot of Oöyama. After our twenty-mile walk, we were not pleased to find that the village of Oöyama extended about three miles up a ravine, and that we had to mount an interminable flight of steps to reach the tea-house where our horses were put up. We rolled into a sparkling stream which ran at the back of the tea-house, and then set to work to cook our dinner.

Life in a Japanese tea-house in summer would be much pleasanter were it not for the fleas (*nomi*, they call them) which swarm everywhere, and are apparently devoted to English blood. We could protect ourselves against the mosquitoes, but it was not until after some experience of the misery of nights spent on the matted floor (there are no bedsteads) that we learned that a hammock is the only means of escape from these pests.

Next day we mounted to the Higher Monastery, four thousand feet above sea-level; but here the fog came down on us, and we failed to reach the summit of the mountain.

We met numerous parties of pilgrims coming down. There are little shrines about every fifty yards of the way, with seats to rest on.

Our third day saw us at Menonge, a village at that time rarely visited by Europeans, where we were the objects of much curiosity. Perhaps our costume of a Japanese kimono over cricketing-flannels—adopted as being very cool and comfortable in the hot weather—may have given some cause for this. From Menonge we walked to the charming village of Miyanoshta, the centre of the silk district; our way led us through a grand gorge, the hills rising one thousand feet on either side of the path. A fine stream runs past Miyanoshta; we bathed, and I caught a few fish for supper. I might have had a better dish, but my angler's pride would not admit of my using silkworm grubs as bait, and the fish were evidently strangers to my Devonshire flies, and too conservative to take kindly to them.

The whole population was engaged in winding off silk from cocoons, and in caring for the mulberry-trees, which cover many miles of country.

Here, as at Arima and elsewhere, we were accommodated in the temple. The priest brought us the visitors' book, and proudly pointed to its contents, which spoke freely of the doings of the 'bad old priest.' The shrine was screened off; the images had been removed to an outhouse; and the priest was allowed to take in visitors at a charge of a *boo* (a shilling) a day apiece for lodgings. A steep bank at the back of the temple was resplendent with auratum lilies, and the surrounding country was full of flowering shrubs.

Two days passed very pleasantly amongst these lovely hills, and we were sorry when the time came for us to return to the plains and make our way back to Yokohama.

IX.

Early in 1874 Japan took advantage of the first opportunity of putting to the test the fighting efficiency of her French-drilled troops. A rebellion broke out in the west, but the two-sworded men engaged in it were soon mowed down by the rifles of the new regiments.

Later in the year a dispute arose between Japan and China, which led to the former invading Formosa, a beautiful fertile island lying south of Japan and off the coast of China. Japan bought up all the old steamers that she could lay her hands upon, and landed some thirty thousand of her new infantry at Takau, the chief town in the south of the island.

The origin of the dispute was curious. The Loochoo group of islands, situated to the south of Japan, were in the unhappy position of paying tribute to Japan and to China—both countries laid claim to them. The island of Formosa, belonging to China, had never been fully occupied by that country, and the aborigines, who were cannibals, still roamed at large in the hill country. We had personal experience of this, for at Su-au Bay, in the north-east corner of the island, when we started off one day for a country walk, we were warned back, and assured we were risking our lives.

These savages hated the sight of a pigtail, which they regarded as the distinguishing mark of the nation which was oppressing them and depriving them of their territory.

Now it so happened that the Loochooans too wore pigtails. One of their junks was wrecked on the south-east coast of Formosa. The crew swam ashore, and the savages, always on the look-out for revenge (and incidentally for food), seeing, as they supposed, some of their enemies, pigtailed Chinamen, at their mercy, forthwith clubbed and ate them.

Japan claimed from China an indemnity, which of course the latter refused to pay, not admitting the Japanese right to sovereignty over the Loochoo Islands; whereupon Japan, perhaps not averse from testing the efficiency of her new European-drilled and armed troops, landed an expedition at Takau.

The savages, for their part, protested that they would not have eaten the Loochooans had they not believed them to be Chinamen, and expressed regret. China took no military steps towards ejecting the intruders; and the Japanese, having no foe to fight, set to work road-making. The summer came on, bringing fever with it, and there was great mortality amongst the troops, who became very anxious to get back to Japan.

China persisted in her refusal to pay an indemnity, and a deadlock ensued, which was put an end to by the diplomacy of the British Minister at Peking, Sir Thomas Wade. He had an intimate knowledge of the Chinese character, and great influence in Peking, and suggested a solution which, while saving China's face, would satisfy the Japanese demand. It was that China should pay Japan for the work which her troops had done in making military roads in Formosa, the amount of the payment being the same as that claimed as indemnity! Both sides accepted the suggestion, and the Japanese returned home.

X.

Formosa furnishes a good instance of the effect of the sea on climate. It is separated from the mainland of China by a channel only a few miles in width; but this is sufficient to protect the island from the hard winter which is met with on the opposite China coast. We saw great farms of pine-apples, magnificent tree ferns (even in the extreme north of the island), and other tropical and sub-tropical plants, which would not have survived a Chinese winter.

From Tamsui we started under the guidance of Mr Baber (the British Consular Officer, who later made a celebrated journey through China and Burma), and ascended a beautiful river which ran across the north-east corner of the island. We rejoined the *Salamis* at Su-au Bay. Mr Baber wished to test the truth of a native report that across this part of Formosa there was a subterranean passage, which had never been explored by Europeans.

We accordingly made up a search-party, requisitioned the boatswain for cordage and lanterns, donned our oldest clothes, and packed some provisions.

The entrance to the subterranean way was said to be concealed by a temple, but Mr Baber found no difficulty in obtaining permission from the priests for us to explore. From the temple, an insignificant little building, we passed into a dark, damp passage. Here we found, kneeling in a niche in the rock through which this tunnel passed, a contemplative priest, looking almost as much mildewed as were his surroundings. The priests of the temple were said to take turns in occupying this niche day and night. The passage opened into a vast cavern, at the far extremity of which appeared what we took to be the entrance to the subterranean way; but it turned out to be only a crack which led some ten or twenty feet into the rock, and then stopped abruptly. We searched in vain; there was no outlet except the passage by which we had come, and the myth was exploded.

Mr Baber was preparing interesting Formosa exhibits for the Vienna Exhibition. One showed the native mode of fishing in the fresh-water

streams. A canoe is used for the purpose, and is anchored, bow and stern, across the stream. The top part of the side of the boat facing upstream is fitted on hinges so that it can be turned outwards, forming a sloping shelf under the water. This shelf, which at the hinges is a few inches above the level of the water, is painted white. Running along the whole length of the opposite gunwale rises a net about two feet high. Fishing takes place at night; the hinged side is turned out; and torches are lighted at the bow and stern, where the fishermen seat themselves and bide events. The fish, attracted by the lights, swim rapidly towards them. The white sloping surface of the shelf is not visible to them, and their momentum carries them up it and into the canoe, while the net prevents their escape over the opposite gunwale. I am sorry that we had no chance of seeing the boat at work, but we were assured it is a successful mode of fishing.

Another exhibit was a very rough method of extracting camphor from the wood of the camphor-trees which abound in the island, and supply a large proportion of the world's needs. Unfortunately it involved burning the wood.

MAGIC CASEMENTS.

To mortals 'tis not always given
To see the fairy path.
But it may be, when the glen below,
Mist-filled, is lit by the sunset glow,
And the fitful light blown to and fro—
In the evening's aftermath—
By the breeze; and the clouds are riven,
So that mayhap afar
You can see the black rock's beetling face,
Built as it were to encircle space,
And you think by chance you can almost trace
That gate that stands ajar
Where the pathway enters. And the fairy train
Sweeps in, in its pride,
To the garden fashioned beyond the ken,
Untrod by the feet of mortal men,
A flower-clad mead in a lonesome glen.
For a peep inside
You would give your soul, and to catch the strain
Of the fairy phantasy
Of music and dancing, for in bower and glade,
By the golden birch-trees overlaid,
The fairies wander, in sun and shade,
In sportive ecstasy.
And just perchance you see them beckoning
For you to follow,
To join the revels that evening bright,
Lit by the glowing sunset light,
Until at last the summer night
Sleeps o'er the hollow.
Dance on, dear fairies, dance and sing
By night and day;
And now and then let mortals see
That life, and love, and melody
Will make the earth an Arcady
For ever and aye.

J. M. H.

Chambers's Journal

SEVENTH SERIES

BRITISH FLAX FOR BRITISH LINEN.

By ALFRED S. MOORE, M.Text.Inst.

I.

THE test of leadership is doing things which other countries with similar economic problems will be doing a little later, but are not able and ready to do yet; and 'one of the best indications of the nature and extent of a country's leadership is to be found in the character of the goods which she exports, and of those which she imports.' Judged by this sound criterion of Professor Marshall, it must be to the credit of the United Kingdom that she has gained the leadership of the world in respect of her textile manufactures of cotton and linen. The value of her exports of the twain—totalling over £140,000,000 for 1918—represents more than one-fourth of the value of our entire exports of all manufactures, and contributes to our national revenue a sum that must make all other nations envious. This value is irrespective, too, of the millions in Lancashire and Ulster to whom the sister-textiles provide subsistence and happiness.

Singularly enough, while the public understand that Lancashire cotton goods have their basis in foreign cotton, to many it may seem irreconcilable that what is styled as 'pure Irish linen' is in probably nine cases out of ten made from foreign imported flax. Yet there was a time when Ireland supplied almost all the flax necessary for her linen manufacture, which is practically that of the United Kingdom. In fact, during 1864 there were 300,000 acres under flax in the Emerald Isle, producing about 60,000 tons of fibre, but gradually the cheaper foreign flax imported displaced the Irish-grown flax, until in 1898 only 34,500 acres were sown, yielding merely 6284 tons of fibre towards the total of about 115,000 tons requisite in a normal year as the raw material for 'Irish' linen. Even earlier than 1864 this foreign blight was beginning to kill home-grown flax.

It must be admitted that flax is a crop calling for much care, and the high price of corn attracted farmers to take up that cereal in preference. Moreover, the Treaty of Paris made British ports free to fibre produced in Russia at very low prices, because of the favourable land-tenure conditions there, together with low wages. Improved methods were also being evolved and practised

in Holland and Belgium, and they were guarded closely as secrets against the foreigner. In consequence of these improvements the fibre sent into the English market by these countries commanded, by reason of its superior spinning qualities, more than double the price of the home-grown commodity.

In Scotland, too, flax had been grown at one time in considerable quantities. In 1812 about 5000 acres were grown, worth (at £20 an acre) £100,000. After the Treaty of Paris great complaints were voiced about the growth of flax at home having ceased, and strong recommendations made to renew it. It was calculated that £48 to £56 a ton could then be got for Scottish flax, which would pay the grower well. Nevertheless, the price at which coarse Russian flax could be imported left the farmer no choice but to relinquish this crop, until it dropped to merely a few hundred acres. During recent years there have been some attempts at a revival of flax-growing in Scotland.

In manufacturing linens the Scottish makers cling rather to the production of the heavier makes, such as damasks and canvas, whereas the Irish weavers produce not only these, but cambrics, batiste, and the very fine grades for which Irish flaxes are highly suitable. So Scotland, depending almost wholly on Russia for her raw supplies, now finds that through the *débâcle* of that unfortunate country her once-famous linen industry has dwindled to be rather a name than a reality.

To revert to the growing of flax in Ireland. For the period 1906-10 the average crop weighed around 10,000 tons. Stimulated by Government guarantees and the defection of Russia during the war, the area was increased in 1916 to 91,454 acres; in 1917 a further area in production gave as much as 15,362 tons; while the following year witnessed another increase in acreage. Yet the result was disappointing, only 15,703 tons of fibre resulting. Last year's realisation was somewhat better at 17,990 tons; and now that present prices are as much as £500 per ton, with the certainty of an increase (probably to £600) a year hence, cultivation of the useful fibre must be largely stimulated. In fact, it is affirmed that since it will require fully four times the equivalent of a normal year's linen production

to bring up to level the linen requirements of the world, the price for flax fibre cannot come much below £550 per ton for some years to come. And the price only seven years ago was just one-tenth of that figure.

On referring to a table of sources of flax-supplies it will be seen that Russia before the war furnished over two-thirds—about 81,567 tons out of a total of 115,876 tons (the quantity requisite in 1913)—of the raw material supply for the British linen manufacture. Russia's collapse meant the complete stoppage of imports from that disastrously disorganised land. Further, the supplies derived from Belgium and France—18,278 tons in the pre-war year—were also cut off, while the Dutch Government retained for home use its usual 2000 tons contribution. By deduction, then, all left to keep the British linen industry going was the 17,990 tons of home-grown Irish fibre, supplemented by a few hundred tons obtained from Canada and British East Africa.

To carry on such an industry as is the Irish linen manufacture—the third of our great national textile industries in value of its exports, an industry employing no fewer than 120,000 operatives—with stocks of raw material thus reduced to a minimum has meant that other materials, such as hemp and cotton, have had perforce to be used, either in admixture with flax in 'union' cloths, or as substitutes. Moreover, to keep the mills open it has been necessary to cut down the working hours, though it is to the credit of the manufacturers that they continue paying full wages until matters improve. The outlook is precarious; in July there was only 3000 tons or so of fibre available to last until October.

II.

It might be asked if this shortage could not have been foreseen and guarded against. Frankly it may be admitted that the present acute crisis has been brought about to some extent by the neglect during recent years of the vast resources of our colonies, just as had been customary for three-quarters of a century. Some State departments are conservative in their defects rather than in their virtues.

It has been said by an experienced parliamentarian that if you want a grievance absolutely forgotten in limbo, there is no better method than to spend £20,000 on a Commission. Soon after the war began such a Commission was appointed with the pretentious *raison d'être* of providing textile raw material supplies for after the war. Naturally the provision of flax was included, and after a year's alleged deliberations the conclusion arrived at was that Canada and India appeared fitted to provide flax. However, that finding was so much verbiage, at the wasteful expense of the public, since not a scrap was done practically to carry that recommendation into effect.

This precious resolution was given out in

January 1917, and had the Commission insisted on resolute instant action the British linen industry would to-day be prosperous, instead of plunged in a morass of fatality and uncertainty. In fact, while the Commission casually referred to the capabilities of India and Canada for flax-growing, officialdom took upon itself the idea of what seems to me a wild-goose flax-growing scheme in England.

Flax is not an exotic, for it will grow in most parts of the world if properly cared for. On suitable soil, after due preparation, it can be successfully grown in many regions within the British Empire. Although none has been cultivated in India during recent years, it was formerly raised there. So far back as 1859 a Parliamentary Committee had abundant evidence of its profitable possibilities. In 1854 there were 250,000 acres under cultivation in India, and some of the fibre was sent to Belfast. It cost on quay at its landing £30 per ton, but was so good that it was quickly bought up at £50. If this was possible then, surely its import now would pay tenfold better. Even in 1918 the *Indian Industrial Handbook* gives this expert verdict: 'Numerous experiments have shown that there are possibilities in Hindostan for flax production on a considerable scale.'

Wherever flax-growing has been adopted in the British Colonies, its development is due entirely to the Colonial Governments concerned, and not to the home departments, which might logically be considered as its rightful patrons. In Canada it has become a permanent industry, especially in Ontario, and has encouraged the Dominion to embark in linen-weaving also. Canadian flax is now recognised as an expanding and important factor on the Irish flax-markets, and for coarse fabrics is very suitable. Its possibilities are, indeed, valued so much that many of the leading Ulster linen manufacturers have leased large tracts of land in Canada for flax production.

Another new source of supplies in course of development is British East Africa, where flax can be grown very successfully in the upland regions. Although the enterprise dates back only a few years, the quality has been proved little inferior to that produced in Belgium. The area under flax is believed to be about 4000 acres, and a much larger area would probably have been planted but for the difficulty in importing machinery. The chief drawbacks are lack of organised labour and of white settlers, who can combine most profitably other products such as sugar, coffee, and cotton. However, during the past year very many intelligent young men, mainly ex-officers, have served a novitiate at the very excellent Municipal Textile Institute in Belfast, which must prove of immense service to them in British East Africa.

We know that flax will grow in almost any place; so, looking at the big patch which Aus-

tralia represents on the map of the world, exceeding Europe if you leave out the Hispano-Portuguese peninsula, it would appear strange to an observer that the cultivation of linen's raw material has not been attempted there on a very large scale. Hitherto, through lack of knowledge of the preparatory treatment, very little flax has been grown in the Antipodes; but now, as a result of the Conference of Agricultural Scientists convened in 1917, which urged the Government to persist in encouragement by means of guarantees for the raw fibre, wonderful results have been achieved, and the prospects are still rosy. Despite adversely dry weather, over 1800 tons, representing the 1918 crop, were delivered at the mills, and last season saw a great increase. As was inevitable in what to many of the growers was an entirely new venture, the lack of the necessary experience militated against a very high standard and complete success. However, it was estimated that products to the value of £25,000 resulted. As an inducement to growers the Government now guarantees £5 per ton for raw fibre, as well as an offer to purchase at £170 per ton, c.i.f. (albeit most growers will prefer to ship to Ireland and pocket the difference between the possible quotation there, on the upper side of £550, and the Commonwealth price).

Having reviewed the probable sources of future flax-supplies to endeavour to meet the enormous cumulative demand for linens over the next half-dozen years, we arrive at the deduction that British Colonies must be encouraged very much more substantially. We recognise that the United Kingdom holds the world's lead in linen production, and we must keep that primiership. Immediately before the war Austria was running a neck-and-neck race with the Irish trade in quality of linens; and now Germany's reconstruction, with the backing of

the immense supplies of fibre so readily obtained from Russia (her immediate neighbour), may mean a challenge to us in quantity. Even with the very attenuated exports of linen goods possible last year—the United States usually takes half of our total foreign exports—their value probably exceeded fourteen millions sterling, while our home consumption accounted for over three millions sterling more.

Linen is the aristocrat of textiles by reason of its price. It has hitherto been costly in production, but mechanical pulling inventions and the more general increase of the factory system of cultivation and preparation, together with greater supplies, would do much to make the demand for linen goods at least fourfold what it is. There need be little fear of renewed competition from Russia, where cheap labour has received its *coup de grâce*, and both transport charges and taxes must be immensely adverse.

Let it be emphasised, too, that linseed, which is so valuable a commercial commodity—whether it be as oil for paints, linoleum, and other uses, or as oil-cake for stock-feeding—comes from the same plant as the delicate sinewy fibre which goes to make the dainty *lingerie* of the lady of fashion. Yet our imports of linseed and flax combined for 1915 amounted to the gigantic total of £12,529,340. Fully 85 per cent of this big sum went to foreigners—and for commodities which the overseas Empire, given half a chance and encouragement, could readily and willingly supply. Let us be patriotic above all things. In our hour of need the British Dominions and Colonies and India did not fail us in supplies either of men or materials—as certain foreign countries did so lamentably. A mighty national movement is in progress to free the British cotton industry from foreign control. Why not institute a similar movement to end our dependence on foreign flax-supplies?

RECOLLECTIONS OF A NAVAL SECRETARY.

IV.—RUSSIAN TARTARY (EASTERN SIBERIA), 1873-74.

By C. E. GIFFORD, C.B., R.N.

I.

SINCE the Russo-Japanese War, people in the British Isles have become more familiar with the geography of the north-eastern coast of Asia, but at the time of which I am writing it was well, when one spoke of the charms of a summer cruise to the ports of Russian Tartary, to add, 'That's in Eastern Siberia, you know, north of Korea, which, you may recollect, sticks out on the map just opposite Japan.'

In the hot seasons of 1873 and 1874 the tranquil state of affairs in the Far East set the admiral free to spend a few weeks in this remote part of his command. The summer

climate of Russian Tartary leaves nothing to be desired, but in winter the cold is very severe; for seven or eight months every year its great river, the Amur, is frozen, and access by sea to Nicolaevsk, the place of residence of the governor-general of Eastern Siberia and the headquarters of the convict establishments, is barred by ice. Little wonder, therefore, that the Russian Government was anxious to get possession of a warmer port in the south.

At the time of our visit, in 1873, a new town of Vladivostok was being built, with a view to the establishment there of a naval station, and the transference of the headquarters from Nicolaevsk.

Vladivostok harbour, which was known either

as Port May or Victoria Bay—when it wasn't called the Golden Horn of the East—was admirably suited to be a naval station, except that it was closed by ice about four months each year.

The climate of this part of Eastern Asia is a marked illustration of the comparative effect on temperature of sea and land. Nicolaevsk and Liverpool are in much the same latitude—about fifty-three degrees north—Nicolaevsk, with the whole continents of Asia and Europe at its back, is open to water-borne trade during only four or five months out of the twelve; Liverpool, thanks to the Atlantic and its warm ocean currents, has no closed season.

On our way across the Sea of Japan we called at the beautiful Tsushima Islands, a group which afterwards gave its name to the destructive naval action wherein the Japanese Fleet sank the Russian. A quiet, peaceful harbour, a beautiful little temple on a tiny islet, with its base washed by the sea, and a village of fishermen, remain in my recollection. Somewhere in the 'sixties a cruiser of the Russian Asiatic squadron, which made the Tsushima Islands a place of call, had set up a carpenter's and blacksmith's shop on shore in this secluded spot—a natural first step towards occupation. Admiral Sir James Hope arrived in the *Impérieuse*, and those who remember how thoroughly he deserved the description of *suaviter in modo, fortiter in re*, will not be astonished to read that his intimation to the Russian captain that the islands belonged to Japan, and that this action could not be regarded as friendly, was immediately followed by the departure of the Russian cruiser with its carpenter's and blacksmith's shop on board! Forty years later these islands furnished shelter for Admiral Togo's fleet, and the base from which he fell upon and destroyed the Russian Fleet under Admiral Rozhdestvenski.

At the period of our visit there were two thousand Russian cavalry at Possiette, on the Tumen Ula River, which formed the boundary between Russian territory and Korea. We met some of their officers at Castries Bay; they complained of their absolute banishment from civilisation, there not being even a village near their camp. The private soldiers were all sons of Siberian prisoners, but the officers belonged to the European Russian army. Often, they said, they could get no meat for a whole week, and nothing remained for them but to drink!

II.

We had been led to expect splendid salmon-fishing in the rivers of Russian Tartary, but not a salmon was taken with the rod, though we caught some nice fish near Vladivostok. It was the spawning season for salmon, and the rivers were full of spent fish. From Barracouta harbour we steamed in our pinnace some miles up a promising stream, and then walked with our fishing-rods across a big bend of the river.

Here we hoped to find fresh water and a chance of a salmon. On getting near the upper water, however, we were nearly poisoned by the smell of decayed fish; there were hundreds of salmon dead and dying, some on the shingles where the falling stream had left them high and dry, some brought up by overhanging stumps, some floating helplessly down with the stream. Fortunately a Gilyak, one of the aborigines of this part of Tartary, came downstream in a dug-out canoe; we hailed him, jumped into his boat, buried our noses in our handkerchiefs, and dropped down the river until we reached our steamboat and pure air.

Later, at Nicolaevsk, on the Amur River, we saw canoes laden to the gunwale with salmon. A very large number are dried in the sun as food for the convicts, who would doubtless welcome a regulation such as those which in the old days protected apprentices and servants from a surfeit of salmon. So plentiful and cheap were they that for a dollar the admiral's steward bought fifty clean-run fish, averaging fifteen pounds, which works out at about twelve shillings a ton! This marvellous wealth of fish is equalled in some of the streams of Alaska, and it has more than once happened that looks of doubt on the faces of my hearers as to the strict accuracy of my tale of the salmon of the Amur have disappeared on the story's being capped by a visitor to the Mackenzie River, on the opposite side of Behring Strait, where a similar state of things exists.

At Vladivostok the officers of the Russian corvette *Bogatyr* organised a deer-drive for us on the little island which lies at the entrance to the harbour. Two hundred of their bluejackets were the beaters; but there was more goodwill than good sport, and the bag was not heavy.

The Danish head of the telegraphs at Vladivostok, a keen sportsman, took us to a stream where we had good fly-fishing. Notwithstanding the night-poaching of the Russian soldiers, we landed a nice basketful of salmon-pearl and trout; but our nerves were kept on the strain the whole day by the tales told by our guide of tigers and panthers found in the neighbourhood of the river, and we were in constant expectation of seeing panthers crouching on the boughs of the trees overhanging the stream. We had full confirmation of the existence of tigers from seeing the skins of some freshly shot beasts drying on the churchyard railings! A soldier working at the brick-kilns in the woods where we were had recently been decorated for valour in having cut with a pocket-knife the throat of a tiger which had leapt on him and fixed its claws in his shoulders. Trout-fishing was not, in these conditions, the peaceful amusement contemplated by the followers of honest Izaak Walton, but the only inroad made on us in these wild regions was that of the freshwater crabs, which, discovering that we had left

our fish in landing-nets just awash to keep them fresh, made a meal of them.

We found splendid harbours on this coast besides Vladivostok, especially St Vladimir, Olga, and Barracouta, at each of which was a detachment of four or five Russian soldiers in military occupation. Beyond the log huts in which they lived, there was no sign of civilisation; not a square yard of ground cultivated, no clearance of the primeval forest which surrounded them, extending to the water's edge. Their food was sent to them from headquarters. A little gardening and poultry-breeding would have relieved the dull monotony of the lives of these unhappy soldiers.

Two or three of the aborigines (Gilyaks) came alongside us with salmon, which they were anxious to barter for clothing; money had no value for them, but an old pair of seaman's serge trousers was gratefully accepted in exchange for a twenty-five pound fish.

III.

Our admiral was determined to reach Nicolaevsk, but was not encouraged to do so by the Russian naval authorities, who said they could not get a pilot for him in less than a fortnight. The navigating officer of the *Dwarf* gunboat expressed his readiness to pilot her, and took us safely from Castries Bay to the Amur River, spending much of his time at the jib-boom end, looking out for shoals.

The Amur is a grand river, navigable for about two thousand miles. The town of Nicolaevsk is absolutely unattractive. There were said to be fourteen thousand convicts in the province, chiefly employed in gold-mines on the mainland, and in the coal-mines of Saghalin, the coal-mining being the more severe form of labour, reserved for the worst characters.

Quite unintentionally we were present, though for a moment only, at the knouting of the last of three convicts who, for the murder of two women, had been sentenced to receive thirty-two blows of the knout, and to be sent for the remainder of their lives to Saghalin.

The *Iron Duke* coaled at Dui, and one of the convicts there smuggled on board a letter, which was given to me on my return to her at Nagasaki, and of which the following is a copy:

'I will permit to pray to the Sir Captain and the company of Officers on board H.M.S. *Iron Duke* to read and answer the following lines: Being a convict and being deprived from every pay from the Government, only with feet and winter clowthes, I pray the Officers do not refuse me as a work of misericorde, some chops some clowthes some tobacco and in general what they could to give to a poor fellow who is no in possibility even to gain his living only by that what give the Government. I pray at the last to pardon but in God's sake I pray to help me.'

I have mentioned how isolated Nicolaevsk was. To test this, I posted there on 31st August 1873, a letter marked by the officials 'By Dog Post, via Moscow,' and it reached Cornwall on 29th January 1874, five months in course of post. We were told that in winter the snow made sledge-travelling more rapid than the summer dog-post.

The governor-general of Eastern Siberia at this time was Admiral Crown. I don't know how he spelt his name, but seeing that a post-office official at Nicolaevsk, on a receipt for my registered letter for Cornwall, spelt Gifford 'Tueperegy,' I fear to venture on any attempt to spell a Russian name, even when pronounced so simply as 'Crown.'

IV.

On paying an official call on his Excellency—who, by the way, was born in London and spoke English perfectly—our admiral said he wished to confess and ask forgiveness for a peccadillo committed by us at Barracouta harbour. 'You know, admiral,' said Sir Charles Shadwell, 'how reckless young officers are at times, and how many cutters' masts and studding-sail booms they carry away. In the absence of any Russian authority from whom we could have asked permission, we helped ourselves to a few young pines from your boundless forests.' The only reply was, 'The export of timber from Eastern Siberia is strictly prohibited.'

On our way south we again spent a few days in Barracouta harbour, and orders were given that on no account were any spars to be cut; but, alas! the thoughtless act of a chaplain destroyed more timber than would have supplied boats' masts and studding-sail booms for the fleets of the world. He landed on Saturday afternoon, and lighted a fire. Before going off to his ship he beat it out with his cane—at least he thought he had done so. Next morning the Russian soldiers came on board the *Iron Duke* to say that the fire was still burning and would spread. In consequence of this the crew of the chaplain's ship spent all that Sunday afternoon (usually devoted to sleep) in passing water in buckets from the beach, and pouring it on the smouldering fire. At sunset it was reported to have been extinguished, and the crew were re-embarked. Next day was that of the fishing expedition already mentioned, and on our rounding the point at the mouth of the river, just before dark, an enormous conflagration came in sight. A strong breeze had sprung up, the smouldering moss and tinder—in places two or three feet deep—had burst into flame, and in every direction, so far as we could see, the forest was ablaze. All we could do was to cut down the trees near the soldiers' huts and dig a deep trench. This occupied some four hundred men all the next day. Our interpreter asked the Russian corporal how long he thought the

forest fire would burn; the reply was, 'There will be snow in six weeks.'

The sequel to the story is very sad. The chaplain, who was grievously distressed at the calamitous result of his thoughtless action, was invalidated for melancholia. On the passage to England in the mail steamer he disappeared, and was supposed to have been drowned.

At St Vladimir Bay the flagship gave a picnic, inviting the officers of the ships of our little squadron. Our sportsmen landed early in the hope of providing the luxuries of our somewhat ambitious menu. We bargained for salmon, turbot, trout, venison, deer's liver, wild duck

and teal. Turbot, in large quantities, and teal were forthcoming, but for the rest Crosse and Blackwell had to provide substitutes.

At noon our Commander-in-Chief arrived, and was received by a salute of fifteen guns from the sportsmen, drawn up as saluting-party and guard of honour, under the command of our gunnery lieutenant, (the late Admiral Sir) Charles Drury. Such a motley crew surely never before formed a guard of honour to a British admiral! The officer in command had fallen into the river, and his trousers were drying in the sun, but a rug and a leather waist-belt converted him into a passable Highlander.

Y V O N N E.

PART II.

v.

IN spite of the enormous plunder, I was depressed by De Chaumonart's state, and I could not at first get him out of my thoughts; but I soon began to realise that I was not very comfortable. It has been said that a certain monk was once canonised because he made a vow, and kept it, that he would not wash himself for seven years. I fancy that the owner of the habit I had on had made a similar vow, for I felt I was being bitten all over.

The path was descending now before me, and I came to a large, desolate plain. Below me was the little stream. I could stand the torture no longer. I tied the donkey up near where I saw a pool, and shook and shook the garment, and then placed it under the water, and finally had a bath myself. Thoroughly refreshed, I put the habit on again, soaking wet as it was, for I knew a Spanish sun (it was already rising) would soon dry it; moreover, I took care, as I had no tonsure, to put the cowl up. I was about to proceed, when, away to the left, I saw a young fellow coming with light step towards me. As he got nearer I saw that he had both a handsome and a pleasant face, and was evidently dressed all in his best.

'Good-morning, father,' he said.

'*Pax vobiscum*, my son,' I replied. 'Tell me how far I am from Villarlunga, and which way do I go?'

Nearly two years in the country had made me speak Spanish fairly well, but I saw he detected my foreign accent, and a slight look of suspicion came over his face.

'I should not advise you to go there; it is full of those Gavochoes.'

'That is why I am going.' Then, purposely looking right and left in a mysterious way, I almost whispered, 'I am English, my son.'

'English!' he exclaimed, with a lengthening face, and raising his hand to cross himself. 'But I thought they were all heretics.'

'Not all, my son, by any means. I come from Ireland, where most of my enlightened countrymen belong to Holy Church. My sacred habit will enable me to mingle with those savages who have invaded your country, and the sooner I can get to Villarlunga the better, as time is precious.'

Perfectly satisfied, he told me he was going in the same direction, but not so far, himself. Unfortunately we should have to make a great detour, because of *la tierra de los Demonios*, or the Land of Evil Spirits, and he pointed out a large slate cross on the borders of the sterile land before us.* This was a surprise, and not a pleasant one; but in such a case audacity is everything.

'That is nothing to me, my son. It is within my power to drive away spirits and devils; and, moreover, you will be perfectly safe under my protection.'

'I am going to the village of my fiancée, where there is a *festa*, and I will gladly come under your protection. We shall save nearly two leagues. It will be such a surprise for her to see me arrive so early.'

Assuming a grave air as soon as we had reached the foot of the cross, I said, 'Now, my son, kneel down and cross yourself.' Latin was not one of my strong points. It was not required for a military education, but I knew that De Chaumonart's life, and my own too perhaps, depended upon this enterprise being executed quickly. So, kneeling beside him, in a solemn voice I chanted, '*Benedicite nos, Domine, Dulce et decorum est pro patria mori, Balbus muram ædificat, nulli secundus*,' and a few regimental mottoes and three or four more Latin tags I remembered, concluding with a solemn 'Amen.'

My companion looked scared at first, but soon,

* 'A rude slate cross marks the enchanted ground of the Batuecas, the haunt of demons, so that every shepherd shunned it.'—*Life of Santa Teresa*, by Mrs Cunningham Graham.

with a brisk step, he was walking beside me; and it was not long ere he had told me all his family affairs. But it was when he came to speak of the *festa* that was to take place that day, and how they were going to dance that night, and how, whether it was a *jota*, a *malagueño*, or any other dance, no one could equal his Mercedes, that he became quite animated. I listened to all his rhapsodies with sympathy, for every word he said regarding his inamorata I might have applied to my own Yvonne.

'See here,' he said; 'what do you think of these little shoes? I have had one of hers matched.'

They were certainly pretty little articles, made of the finest black kid, with little pink ribbon bows like butterflies on them. I expressed my admiration; but as for their smallness, I said, much depended on the height of the wearer.

'You are right,' he answered; 'that is the wonderful part about her, for she is a fair height. I would like her neither taller nor shorter; she is just perfection.'

'Well, the handsomest woman,' I remarked—'I don't say the prettiest—that I have met in this country I saw at Lerida. I was told that as regards temper she was a perfect fiend, but I know that she had a wonderful contralto voice, and played the guitar better than any woman I ever heard play it. But her feet were her weak point—she had such very fine ankles. She knew it, too, and always wore very long skirts, and'—

An intensely interested but peculiar look had come over the countenance of the young fellow. I stopped suddenly—I saw I had made a *faux pas*. I had quite forgotten my rôle of a monk.

'It had nothing to do with me,' I hastened to explain. 'I had to go and see her, you must understand, on behalf of a friend who loved her. I told him to resist temptation, that beauty fades as the flowers of the field.' After that I took very good care not to talk about *le beau sexe* and their peculiarities, but I thought afterwards that the animated conversation we had—his father was a horse-dealer—on the various ways of filing horses' teeth to enable them to be palmed off as younger than they were was hardly in keeping with my ecclesiastical character. I was about to ask if he had ever seen a mule's teeth filed, when we suddenly saw a few trees and some very green grass, and hurried towards the spot, as we were both hungry. I was well provided with some venison, wine, and cigars, and he had bread and ham.

'*Cielo*, father!' he said, 'I have never tasted such old wine. I should not like to take much of it. I know now the truth of our proverb, "If you drink it with water, you lose your wine; if you don't, you lose your head"—though, of course, it is nothing to you religious.'

'It will make you dance well to-night,' I answered with a laugh.

The cigars were equally to his liking.

Time was precious, so we hurried on, and soon after saw another slate cross. We now knew that we were off the haunted ground. And then, to my horror, we had not gone far when I saw a monk approaching.

'Ah, here comes Brother Antonio. He seems in a hurry,' said my friend.

'Thank God for that,' I thought to myself, feeling very uneasy. However, I had my fright for nothing.

'*Pax vobiscum*, brother,' he said, keeping his eyes on the ground in the regulation way and muttering what sounded like a verse of the psalms.

'*Pax vobiscum*, brother,' I replied, '*Deo gratias. Arma virumque cano, Trojæ qui primus ab oris.*'

Mutually edified, we passed on, and I breathed freely once more. Then my young friend told me that our paths were now in different directions. Though I was glad inwardly that it was so, I was deeply touched by his concern for my safety.

'You English,' he said, 'are brave—very brave; but father says—and you must not mind my telling you—that you are equally simple. You think every one is as honest as yourselves; wherefore any one can fool you—at least for a time. Those French devils are very different; they shoot any one they think a spy, and talk about it afterwards.'

I thanked him sincerely for his warning, and reassured him; and after I had learned the shortest route, we parted with many a good wish.

VI.

My arrival at headquarters in my new garb was naturally greeted with loud laughter by my brother-officers. The information I gave the colonel, and the production from my pocket of the reliquary cross and the beautiful white dove, had an instantaneous effect. My chief could hardly believe his ears at the story of the plunder to be got if, as I pressed upon him, we could only get to the cave in time. The loss of our men during the night had to be seen to, and as the senior officer of all the troops at Villarlunga, he would to a certain extent be held responsible. Accordingly two hundred infantry and half a squadron of our men were sent off at once by the Val de Halcon to find or rescue our wounded; and within half-an-hour the colonel, with one hundred and fifty men, had started for the cave.

Such was the colonel's eagerness that he rode beside me as I acted as guide. To our surprise, on reaching the cave we learned that no attack from the guerillas had taken place; but, alas! within a few hours of my departure my poor comrade had passed away. The monks had had writing materials, and feeling his end approaching, Pierre had written two letters—one to the colonel asking him, as I had been the means of discovering the cave, to allow me to have the

reliquary cross and the dove. Though this was irregular, I may say that the colonel and my brother-officers were so delighted with their luck that they unanimously agreed to Pierre's request. The other was to a M. Lassenot, notary in Paris. This he wished me to deliver, if possible, with my own hand. I kept it carefully, little guessing its contents. Had I known, how much anxiety should I have been spared!

How can I describe the richness of our *trouvaille*? For leagues round all the valuables from monasteries, churches, and convents had been placed in that wild, deserted spot, unmarked on any map. The supposed haunted ground gave it additional safety, as few of the superstitious peasantry, or even guerillas, cared to approach it. I had taken care to have some mules with us, but we had to carry a good deal ourselves, so great was the spoil.

Death is such a common incident in a soldier's life that only passing attention is paid to it; but the loss of De Chaumonart prevented me from entering into the riotous enjoyment of both men and officers as we returned, and the warm congratulations I received gave me little pleasure. By the death of De Chaumonart I now found myself a captain.

There was not one of my comrades, apart perhaps from the *médecin-major*, who was any judge of pictures or works of art. (Workmanship went for nothing, if only an article was of pure gold, and had jewels on it. For my part, I secured a very beautiful Italian ewer and salver.) At any rate I did know something of Dutch pictures, because my aunt had so many. Every Madonna to most of my comrades was a Murillo, and every portrait a Velasquez; but little was thought of a picture of the wife of a burgomaster, with a beautiful background. It was this background which made me choose it, because, strange to say, it was the very same as in one that my aunt had. And this, as it turned out, was the best picture of all.

Apart from pictures and vestments, about two hundred thousand pesetas were found in the cave; and we also found on the Dominican the equivalent of fourteen thousand pesetas. Half of all this specie, according to the custom, went to the officers, and half to the men, and my share as the junior captain was four thousand pesetas.

It was soon after this that I was wounded, and it was three months before I was fit for service; but the worst of it was that I could not attend the wedding of my sister, who had married a very rich, handsome young fellow in the Diplomatic Service. I would have given anything to have gone to it, as Yvonne was her chief bridesmaid.

VII.

Fortune up to now had been very kind to me, but I was destined to know by the autumn of 1813 that her wheel could turn.

I had hardly returned to my duties when I received, to my surprise, a letter from Jacques Martignac. I almost feared to open it, dreading that perhaps Yvonne was ill; but I was still more surprised when I read it. He told me that my aunt, soon after my sister's wedding, had been taken very ill. He had had to go to Paris, but had not been admitted. It was a case of nerves. She was under the impression that she had led a very frivolous, useless life, and now thought, for the sake of her soul, she ought to forsake all the vanities of the world and seek seclusion in some convent abroad—where, without a doubt, he added, they would get every sou out of her. Then he reminded me that he had wished the marriage-settlements drawn up in a legal, binding way, but the baroness would not consent; so, as a very eligible suitor, a large neighbouring landowner, named Morot, wished to marry Yvonne, I might consider my *fiançailles* with her cancelled.

For a time I was stupefied with grief and anger by this epistle, and nearly impotent with rage. Such villainy seemed unbelievable. The guerillas came in for a fair share of my anger, because I knew letters from Yvonne and my uncle must have been intercepted. I had had till then no inkling of my aunt's illness. As regards her money, my aunt had a perfect right to do what she liked with that; but that I should be robbed of Yvonne, through no fault of my own, was like losing a limb. But, knowing her as I did, I did not believe that Yvonne would consent to marry any one else—that was the only consolation I had. In any case, I had, like my sister, more than five thousand francs a year of my own, besides my pay.

Now, for the first time, I was thankful I had got some loot, though I had no real idea of what I should get for it. I went at once to the colonel and asked for leave. As he was indebted to the baroness, while he could not grant my request immediately, he promised to do so as soon as ever he could. Though I was disappointed at the time, it was a good thing that he did not let me go at once, as I should have missed a letter I received shortly afterwards from my darling Yvonne. She wrote in a very down-hearted way, but told me not to have the slightest fear of her marrying any one else. She begged me to try to get leave as quickly as I could, and told me to send letters to the address of a schoolfellow of hers who lived near to her. This letter caused the world to look brighter; and it was soon to look brighter still, because not long afterwards the colonel sent for me and told me that a large convoy was leaving Lerida, that he was going to send his pictures and other valuables to France, and that I was to go with them and deliver them safely to his wife.

Our progress, of course, was slow, as we had many wounded and wagon-loads of loot; but

once we had crossed the frontier, I set off for Paris as fast as I could post.

VIII.

Having safely deposited the pictures, &c., and many thousands of francs, with the colonel's wife, I went off to see my uncle Jean before visiting my aunt Hortense. I found my uncle and aunt in the *salon* in company with a Monsieur de Courcy. I was vexed at first that he was there; but I was glad afterwards, as he had been an intimate friend of Baron Taldevelde, and was one of the finest judges of works of art in Paris. He was really one of the old nobility, but had dropped his title, having lost money and estates by the Revolution. His fine taste had proved of service to him, and he had eventually become a dealer in works of art. Naturally he asked me if I had brought back any pictures, and I told him I had chosen a Dutch one, simply because it had the same background as one that my aunt had in her *salle à manger*, but I did not know the name of the artist.

'If it is the one by the window,' said my uncle, 'it is a burgomaster by Holbein.'

'Is it a woman's portrait?' exclaimed De Courcy excitedly.

'Yes; and an ugly one, too.'

'*Mon Dieu!* then that is the burgomaster's wife. That makes a pair. I will give forty thousand francs for it.'

'If it completes the pair,' I said, 'I shall give it to my aunt. She has been very good to me.' So we went down to see it.

They were all so enraptured with the picture that it was some time before they could look at anything else. The dove,* it appeared, was very rare. De Courcy said, for himself, he knew of only two—one in the Louvre, taken from the Abbey of St Denis during the Revolution, and one given by the Pope to Maria Theresa, which was in Vienna. This latter was larger and covered with jewels, but the workmanship was not so fine. The reliquary cross, too, he said, was very rare. The ewer and the salver, I was informed, were made by a pupil of Benvenuto Cellini, and he offered to give me sixty thousand francs for the four articles, which, by my uncle's advice—for I knew little about such matters—I took. Nor did it worry me when I learned afterwards that he sold them for eighty-five thousand francs, because I knew that the Jews would not have given me twenty thousand, and would not have been content without getting more profit than De Courcy did. My aunt was more interested in the vestments and the embroideries, and my uncle in a number of the coins, and I gladly presented them with some of the best. Thus the time went by, and it was late ere we were alone.

'Now listen to me, Henri,' said my uncle after I had told him all my troubles. 'As for Yvonne, you could not marry a more charming girl—as a doctor I am used to studying character, and I will say that of her—but as regards the villainy of her father, I am not in the least surprised.'

'Well, I am, uncle, because I have always understood he saved my father's and mother's lives.'

'I will tell you what I have never told you before; nor does your aunt know the facts even now. Had she known, you would never have been the fiancé of Yvonne. I have lived in terrible times. I learned, for one thing, as a young man, when a chance word might take a man to the guillotine, to hold my tongue; secondly, it was your father's wish that I should tell you the facts when you were older. All the district knew about those rubies. Your mother wore them when the *Parlement* at Toulouse was opened, and when your parents went to the Court at Versailles, as it was the custom for the nobility to do in those days. When the Revolution broke out, Martignac saw his chance. "I will keep *Messieurs les Brigands* away for a week," he said to your father, "on condition that I have half the rubies."

'Your father's first impulse was to knock him down, but common-sense prevailed. You were not two years old; your sister Julie was not born till six weeks later. He thought of your mother and your other brother and sister, and he fetched the gems. They were the foundation of his own fortune, and of Martignac's too, for the matter of that. But your father was always very sensitive about it. No man was really braver, but still he had the idea he had shown no courage, whereas he had reason on his side, and he saved his family by yielding to the rogue.

'Now comes the question of your aunt's health, which has brought this misfortune upon you. Her life has been one round of everlasting gaiety, and she has paid for it. I have done what I can, and she has had the very best advice in Paris; but these *maladies des nerfs* are always difficult. The festivities connected with Julie's wedding were the climax. It was after that that unfortunately she fell under the influence of a very handsome, clever, and eloquent preacher, the Abbé Ladrez. He came continually to the house, and while he drank the choicest wines and enjoyed all the finest dishes made by her famous *chef*, this charlatan impressed upon her the emptiness of human pleasures—so much so that she thought she ought to retire into a convent. That, however, would not have suited him at all—her wine and table were too good. Besides, he would not be able to get the money from her that he said was for the poor. He judged that once she was in a convent the sisterhood would not only get the greater part of her

* Pugin's *Glossary of Ecclesiastical Art*.

income, but would, when she was on her death-bed, secure the capital, to get her soul out of purgatory. She would have to pay for what has wittily been called a "spiritual fire insurance." So Monsieur l'Abbé kept her from that.

'However, from a friend in the secret police I found out a few particulars about this clever and eloquent abbé. He had many other lady admirers, some much younger than your aunt,

if not so rich. I wrote a short note to the archbishop. Hortense is not likely to see him again. I really believe that the pleasure she will have in seeing you will do more than any physician can do for her. But you must say nothing, till I tell you, about your engagement being broken off. The shock would do her harm, as she is bent upon the marriage.'

HABITS AND CHARACTERS OF BRITISH WILD ANIMALS.

VII.—THE FOX.*

By H. MORTIMER BATTEN.

I.

IN the wilderness only the fittest survive. The jackal and the wolf are gone; but because the fox is the wisest of his race, because he has proved best able to adapt himself to changing conditions, he has lived on as the lone and last survivor of his tribe.

There is only one species of fox in the British Isles, the common Red or Royal Fox. The beautiful silver, the black, and the cross fox furs, so much prized as robes of fashion, are merely northern colour-freaks of the red fox. Thus a red vixen may produce cubs of different varieties, one of them being worth as much as five hundred pounds for its pelt, while the remainder of the litter may be worth only a few shillings apiece.

Similarly the strong and wiry mountain-fox of the north, dreaded by keepers and shepherds alike, is a red fox whose wild and rugged surroundings have changed his habits and his form, so that he would seem quite a different creature from, say, the foxes of Leicestershire and the New Forest.

Black fox pelts are so much prized solely on account of their rarity, for they are certainly not more beautiful than the red pelts. See our common fox in his autumnal coat, shaded with gold and russet, and even touched with silver, and you will think him the most beautifully clothed of all living things; and were he as rare as the far northern varieties, his coat would be the apparel of kings.

The length of head and body in an average dog-fox is about 3 feet, tail 1 foot 2 or 3 inches; 3 feet 6 inches is a big fox.

When foxes are reared in captivity in a hunting country the tails of the vixens are often docked before the animals are liberated, so that hounds will have difficulty in following their scent-trail,

and they will thus survive to breed and multiply. Whence comes this mysterious scent which hounds so easily follow? Not actually from the tail, but from the musk-glands which are situated at the root of the tail. By docking a fox's tail the scent is not so readily led to the ground, and the animal is difficult for hounds to follow.

Every master of fox-hounds can tell you the history of some fox which, surpassing his fellows in fleetness and cunning, led hounds and huntsman many a pretty chase, baffled them and checkmated them, and finally left them with a mystery to solve—nothing but a mystery!

The beginning of wisdom is in profiting by previous experience, and undoubtedly the fox does this. Reynard knows that the scent he leaves behind is the true cause of his peril, and does all that he can to break or scatter that tell-tale line. He will run along a railway track, knowing that the glazed steel and the tarred sleepers do not retain the scent well; and more than once he has been known deliberately to lead the hounds under the wheels of an express train, which, of course, he could hear from afar, with the result that several of the hounds were killed, and the hunt so broken up that the fox escaped to safety.

Running water is a never-failing friend to the hunted fox, and well he knows the value of it.

A fox will of set purpose run among a flock of sheep so as to mix and scatter his scent with theirs, and he has even been seen to jump on the back of a sheep and ride a considerable distance, thereby breaking the guiding line.

But many a good fox who has fooled and baffled the hounds and given them a glorious run has won his freedom only at the cost of his constitutional fitness. Emerging at length from his sanctuary, after a rest of many hours, he is no longer the wonderful running-machine that he was when the hounds took up his scent, but is now a broken creature—lungs gone, heart gone, merely a physical wreck. And, again, many an exhausted fox, seeking shelter in a wet drain, lies there till, sick and chilled, and his vitality

* Earlier articles in this series, published in the May, June, July, August, September, and October parts of *Chambers's Journal*, dealt with the Badger, the Pine-Martens, the Water-Rat, the Hedgehog, the Brown Hare, and the Gray Rat respectively.

becoming low, he falls a victim to the fatal red mange, the scourge of the fox kind. In the mountains of the north, where the rugged nature of the country does not permit of fox-hunting, red mange is quite uncommon among the foxes, simply because they are never run to exhaustion.

II.

Just as foxes are clever and original in deceiving the hunter, so are they clever and original in their own hunting. Reynard possesses remarkable vocal powers, and can imitate exactly the bleat of a lamb, the squeal of a hare or a rabbit, and numerous other sounds belonging rightly to the creatures he is out to kill. One night, when driving home along a country lane in Dorsetshire, I heard what I took to be the bleating of a lost lamb coming down the hedge-row towards me. On making some commonplace remark concerning the sound to the farmer who was driving me, he replied, 'That isn't a lamb, sir; it's a fox. You can hear them bleating any night this time of year.' It was the time of the year when young lambs are about.

Many seasons later I again heard the bleating of a fox—this time in the hills near Burnsall village. I was spending the evening with a shepherd in his tiny cabin out on the moors, and as we both sat at the open door, smoking our pipes before he turned in, we heard the bleating of a lamb coming towards us down the wall-side. The cry was exact, save for an indescribable sinister ring about it, which at once raised my suspicions, bringing to mind the night in Dorsetshire some years previous. The shepherd reached for his gun; but Reynard evidently saw the movement, for there was brilliant moonlight, and we just caught a glimpse of him as he slipped, flattened out, over the wall-top.

Reynard clearly thinks that by mimicking the cry of a lamb he will spread unrest among the nursing ewes, and if any ewe has lost one of her lambs she may set off eagerly towards the sound, deserting her remaining charge, which is then at the mercy of the fox.

Rabbits are often called by a fox to within striking distance, Reynard lying concealed behind a tuft of grass or inside a bush, and imitating exactly the squeal of a rabbit in pain. I have myself called rabbits to within a few yards by this means—the old bucks or nursing mothers of the colony coming hopping up, stamping, and full of foolish, goggle-eyed importance, to see which member of the community it is that has fallen into difficulties.

The bushy tail of the fox has many uses, foremost among which is its value as a wrap or a travelling-blanket. In referring to the foxes of Manitoba, where the cold is intense, Seton says that he does not believe a fox which has lost its tail would survive the winter; but this certainly does not apply in the British Isles. As already

mentioned, vixen cubs reared in captivity are often docked before being liberated, and a tailless vixen generally lives to produce many litters. There is no doubt, however, that the tail is a considerable comfort to its possessor, for the fox, when resting, curls into a ball, its exposed nose and paws packed closely together; then it wraps its tail over them, and breathes through the long, close hair.

Thus curled, a fox is very difficult to distinguish against a background of leaves or bracken, and will lie perfectly motionless so long as it thinks itself unobserved by the passer-by—watching through the hair of its tail, which thus serves an additional useful purpose by hiding the bright eyes that might otherwise give the show away.

Foxes use their tails considerably when fighting, the combatants striking each other in the face, and thereby causing a momentary diversion which serves to cover a snap or a parry. I have heard it stated in all seriousness that a fox, before going out in search of a rival whom he intends to engage in combat, will deliberately sprawl in water, then roll in sand till his tail, and indeed the whole of his fur, is filled with grit, which so blinds his opponent that victory is easily gained!

Again, the tail of the fox is of value in assisting him to follow the lightning twists and turns of Brer Rabbit, acting as a rudder and a stabiliser; but nevertheless there are times when this generally useful piece of equipment is a severe drag. A hard-run fox that has been compelled to take to water finds his wet brush a sorry burden, and in the end the slight additional weight may prove his undoing.

I doubt very much whether the fox is so fast in a short sprint as the rabbit; twenty-eight miles per hour is probably the average maximum, but between the maximum speed of the fox and the speed it is capable of maintaining over a considerable distance there is but a narrow margin. Thus the prime fox, whose maximum speed is 30 m.p.h., will probably prove capable of maintaining 20 m.p.h. over a distance of four or five miles where the going is favourable, whereas a rabbit, which may attain 33 m.p.h., could not maintain 20 m.p.h. for more than five hundred yards.

III.

Gestation occupies fifty-one days. The young are born early in April, and are blind for about two weeks. Usually they appear at the den-mouth when about three weeks old, but they do not venture far from the area of trodden sand till about three months old, when, singly or together, they begin to accompany their mother on breathless mouse-hunting expeditions.

In fox-hunting country, where the home-den of the vixen and her cubs is never disturbed, foxes often choose the most exposed and open

place for their 'earths,' as the home-burrows are called; for instance, I have known one to be located in the centre of an open fallow field, sliok on the skyline, the mound of newly turned earth vastly visible against the sky. In mountainous districts, however, where the nature of the country forbids hunting, the utmost caution is exercised by the parent foxes in the location of their den. They choose some little-frequented and almost inaccessible spot as far from human habitation as possible, knowing full well that their little ones, if discovered, will be dug out and killed by keepers or shepherds.

The dog-fox, in spite of various doubts raised on the point, is a devoted father, though while the cubs are small he has little to do with their upbringing. His share at this time is to bring food to the vixen, leaving it at the den-mouth for her; and thus, by making sure that she is well fed, he can have no doubt that her precious cubs will not be neglected. Also, he acts as guardian of the den, making note of any strange figures that appear, and warning the vixen in case of danger. It is to be feared that in the days of spring-time plenty he often destroys more food than is needed, going out on long excursions of piracy, and earning a bad name for himself. Should the vixen meet her fate while the cubs are small, their father nobly takes charge of them, carrying them perhaps to some safer locality, and caring for them in the best way he knows.

Every infant fox is taught the lessons of life by its parents, and the cubs of a wise mother grow up wise foxes. As soon as they are old enough to play about the mouth of the den their lessons begin. First they are taught to use their noses; the parents, having brought food for them, hide it some little distance from the earth, and leave the cubs to locate it by their own keenness and cleverness. Thus the clever cub fares well, while the dull member of the family comes in only at the tail-end of the feast. A little later they are taught to pounce mice out of the grass, taught the folly of chasing the fleet-winged grouse that rise from the heather, and taught that, above all, stealth and cunning are the crowning virtues of the master of woodcraft.

One day their mother leads them to a new track on the hillside, and sniffing it, she bristles and growls, looks this way and that, then sneaks swiftly into the heather, keeping in the hollows, never showing herself against the skyline. Each cub sniffs the new track, bristles and growls because mother did so, and sneaks furtively after her, fearful of some unknown peril. And after that day the scent of that track brings fear to the heart of the fox-cub, and encountering it in his rambles, he sneaks off through the hollows, for it is the scent of the watchful shepherd!

Every nursery of fox-cubs has its playthings,

such as the wing of an old cock-grouse, dried by exposure to sun and sand, and durable as leather.

Until three or four months old fox-cubs give practically no scent at all; so little, indeed, that hounds will run over them—a very generous provision on the part of Dame Nature. At the time when they are old enough to play about the den-mouth, the vixen, evidently with the idea of widening their outlook a little, sometimes prepares for them a yard or a playground a little distance from the earth, and thither, on fine nights, or even during summer days if the place be sufficiently secluded, she takes them at regular intervals. Usually the yard is located in the midst of dense bracken, or some other suitable cover, and easily accessible from the den. The dam treads out a bed for herself at one side of the small open space, and there she lies watching her little ones while they roll and scuffle in front of her—keeping, always, to strictly defined limits.

The parents of the cubs are often very fearless and cunning in their efforts to draw away any intruder from the vicinity of the family.

A Highland keeper told me that one day, when crossing a moor, he was much mystified on seeing two foxes running apparently aimlessly round and round a boulder. He thought they were chasing each other for amusement, and forthwith proceeded to stalk them. Almost immediately, and without looking in his direction, the foxes made off, keeping together for a short distance, then separating. The keeper urged his dogs in pursuit, and was about to make his way to a point of observation, from which a chance shot might be obtained, when it occurred to him to look round the boulder where he had first seen the foxes, for clear it was that they had seen him before he saw them. Going to the place, what was his surprise to find a solitary little cub seated under the rock, so young that its eyes were hardly open! The man could not find it in his heart to kill the lonely little wean—apparently the sole charge of its parents, who, the man now realised, were busy, when he first saw them, scattering their own scent about the place so as to overwhelm that of the cub, finally running off together in order to leave an unmistakable line to lead away the intruder.

IV.

Early in the autumn, when the cubs have learnt to hunt and to take care of themselves, the family finally splits up, the fox and the vixen driving the cubs out of the home-range, this being a natural prevention of overstocking, which would result in many enemies or in scarcity of food. Each cub now sets off to seek his own fortune, and he may travel for days ere he finally settles on a range of his own. During this time of migration, while travelling restlessly from hill to hill, from forest to forest, the cub invariably carries something in his jaws. It may be an old sheep-

horn or the sole of a boot, or possibly it is the last thing he killed—a water-vole or even a frog. Exactly what his idea is one cannot say, unless it is that, feeling himself an emigrant, he is actuated by a desire to carry his worldly possessions with him. More probably, however, the ruling instinct is that of carrying a small store of food lest, in his wanderings, he should encounter a fruitless land and suffer hunger.

Many foxes have little secret caches or hiding-places, where they bury certain things which happen to take their fancy. All manner of strange oddments are buried here—little things the fox has picked up during a night's wanderings, carried for an hour or two, then hidden with his secret store, to be meditated over in leisure hours. An old barrel mole-trap containing a dead mole, a medicine-bottle which had held some strange-smelling concoction, a bit of a slipper, and an old dog-collar were found in one such cache, which was located in the decaying root of a tree in the centre of a lonely forest.

The fox is a hard-living animal, and, like all the canines, is not remarkable for longevity. He is old at ten years. Eight years is probably Reynard's allotted span of life, for once infirmity sets in, immediately his senses lose their keen edge, and he inevitably succumbs to one or other of his foes.

The fox is gifted with extraordinarily keen sight, and, like all predatory animals capable of speed, he uses it very considerably in his hunting. His nostrils, however, are as well trained as those of the best setter or pointer. In hunting, the general trend of his direction is against the wind, and his nostrils are aquiver at every step. Suddenly he stops, head aloft, ears acock, one paw upraised in an attitude of sculptured gracefulness—freezes into a statue, save for that never-ceasing quiver of the nostrils. He moves a step or two to left or right, tests the wind again, then slowly sinks to ground. In that dense clump of heather just ahead a blue hare is crouching. He cannot see it, but his nostrils have marked it down to within an inch. He leaps, pinning down the heather between his forepaws; then a thin-edged scream goes up, a pewit rises a-wing, another follows—but what matters the hubbub

now that Reynard has procured his supper? He lopes easily away, and the night sentries mark his going, screaming aloft.

When Reynard—and, of course, the same applies to other animals—hunts by scent, he must, at every stride, 'watch the wind.' His exquisite sense of smell would be of no value whatever to him unless it were worked in conjunction with an equally exquisite sense of wind-direction. Scent alone could not have told him just where that blue hare lay. The scent was of a potency and a property which meant 'two yards away,' but it was wind-direction, and wind-direction only, which marked its exact whereabouts.

Thus the nose of a fox is not only his scent-machine, but also his wind-vane. Both functions are performed by that small, moist, cold member which leads the way everywhere. If you desire to ascertain the direction of the wind, you moisten your finger and hold it up before you. The cold side is the wind side. Reynard's nose is moist by the natural course of events, and is so sensitive that it conveys to its owner the direction of currents of air so slight that they amount merely to faint movements of the atmosphere.

When a dog or a fox falls ill its nose becomes hot and dry. This is one of nature's remedies. A period of starvation is the finest medicine in the world, and with the drying of the animal's nose starvation is temporarily enforced, and, its hunting abilities gone, the sick creature is content to den up and sleep itself well. Thus at every turn we find nature's schemes worked out to attain a definite end.

It will be seen that the fox has many characteristics which are not unknown in man himself. We have our nurseries and our museums—so has he. His school is the great school of the woods, in which, during his cubhood days, the fox learns, lesson by lesson, the things which are to carry him through later life. If he learns earnestly, he lives; if not—well, there is no place in the Wild for the dull-witted and the foolish. The clever fox lives on the fat of the land; the fool is hungry and hunted till he falls a victim to the merciless weeding-out process that permits only the fittest to survive and breed their kind—the offspring of wise parents.

A BRACE OF TIGERS.

PART II.

IV.

A SLIGHT digression is necessary here to explain, for the benefit of those who are unacquainted with the *modus operandi* of tiger-shooting, how it is possible to drive a tiger to a single sportsman. When a tiger is aroused from his midday sleep by the shouts of the

beaters and the noise of 'tom-toms' (native drums), he naturally follows the line of least resistance, and makes off in the direction opposite to that from which the sounds emanate. He is not looking for trouble, and only wants to slink away to some place where he will not be disturbed, and can finish his siesta. He consequently walks or trots forward, looking

straight in front of him, and it does not occur to him to look upwards among the trees, from which he is not accustomed to anticipate danger. Any slight noise in front of him will cause him to turn in a direction which appears to be safer, and the sportsman takes advantage of this knowledge of his habits by placing men in trees as 'stops.' These, as soon as a tiger shows itself in front of them, cause him to turn elsewhere by coughing, or, if he appears to be likely to break through, by shouting. Usually a cough is quite sufficient to send the tiger to another part of the jungle, where he can escape from the din of the advancing beaters. He may come up against another 'stop,' and be eventually turned in the direction of the sportsman, who is sitting quietly waiting for him. There is, of course, no certainty about it; and it is especially necessary to choose suitable men for 'stops,' as one man may, by losing his head, ruin all chances of a shot. The selection of men for this purpose is generally left to the local *shikari*, whose *backshish* depends on the success of the beat, and he usually details for this duty reliable men who have been out after big game before.

In the present instance the *shikari* had selected eight or ten men, and on looking over the ground I indicated where I thought these should be placed, and left the matter in his hands while I superintended the tying of my *machan*, which had been brought to the spot by a couple of coolies. I found a suitable tree, and the *machan* was securely tied by ropes in a fork about twelve feet from the ground. By the time it was ready the *shikari* returned and reported the 'stops' all placed, and I sent him back by an indirect route to where the beaters were assembled, with orders to begin the beat.

I ascended to the *machan* by a light ladder that I had brought for the purpose, and after Mahomed Khan had cut away a few branches to give me as clear a view as possible in all directions, I told him to remove the ladder and take up his position in a tree about a hundred yards in rear. He carried my spare rifle, but had orders not to use it except in case of emergency, or on receipt of a direct order from me. Everything had, of course, been done as quietly as possible, and all orders were given *sotto voce*. I duly loaded my double-barrelled rifle, placed some more cartridges ready beside me, and sat as quietly as possible in the *machan*, awaiting the beginning of the beat. It was now nearly one o'clock, and the heat was intense, as there was not a breath of air.

Presently shouts and the sound of a drum were heard in the distance, and I knew that the beat had begun. A few peafowl appeared in the scrub jungle on the opposite bank of the stream; they stood looking for a few moments, and then, headed by a magnificent peacock, his tail trailing behind him, crossed the bed of the stream and

disappeared into the jungle on my left. A few minutes later some jungle-fowl ran across my front, and were lost sight of in the forest. I could hear the chattering of a few monkeys on my right front; but they never came into view, though I could see the branches of the trees swaying as they passed. I heard a distinct double cough from one of the 'stops' on my left, and feeling pretty certain that he had sighted a tiger, I strained my eyes to discover any movement in the jungle in front of me, but could see nothing. A few of the small, stingless, wax-producing 'dammer bees,' which probably had their home in some hollow tree in the neighbourhood, began to annoy me by settling on my face and hands, presumably attracted by the perspiration. I brushed them off, but they continually returned to the attack, and in spite of their small size—for they are smaller than a house-fly—caused me considerable annoyance.

v.

Suddenly I heard a cough from one of the 'stops' on my right, followed by a few words which I could not distinguish, and I felt sure that the tiger must have been moving in this direction. A minute later I saw, on the opposite bank, at a distance of about fifty yards, the dim outline of some large animal standing broadside on to me. It was so obscured by a bush that I could not distinguish which way it was facing, but from its size I felt convinced that it must be a tiger. I had not seen it come there, and it had appeared as if thrown on the screen of a kinema. I carefully aligned my rifle towards it, but would not fire until some movement occurred which would enable me to distinguish it more clearly. A few moments later it moved a couple of paces forward, and I fired, aiming carefully just behind the shoulder, which was now clear of the bush which had previously hidden it.

Almost simultaneously with the report of my rifle came a tremendous roar, and the tiger rushed out at full gallop straight in my direction. His head looked enormous as he came down the slight slope of the sandy bed of the stream, and when he was about twenty yards from me I fired the second barrel, aiming between the eyes. He turned a clean somersault, just like a shot rabbit, and fell in the stream a few yards from where I was sitting, splashing me from head to foot with the force of his impact on the water.

I quickly reloaded, and waited to see if he showed any signs of recovery. Although he was not quite dead, and gave an occasional gasp, I felt sure that he had received his quietus, and I did not want to spoil the skin unnecessarily. Up to this moment I had never felt the least excitement, but now I began to feel that the blood was congested in my forehead, and I was streaming with perspiration. The tiger gave forth a sound like an enormous sigh, which I felt sure was his dying effort. The beaters were evi-

dently getting quite near, and I had no thought that there was any chance of another shot, when I saw another tiger coming down the slope of the river-bed about sixty yards to my left front.

Although I was considerably surprised, my excitement disappeared in a moment. The tiger was trotting quickly just like a big cat, and I aimed at the shoulder and fired, when it changed to full gallop. I just managed to get in the second barrel before it got behind an overhanging branch, which hid its further movements. I felt sure that my first bullet had struck it, but was not so sure about the second. The beaters were now appearing among the bushes in front of me, and I did not want to run the risk of having any of them mauled, so I shouted to them not to advance any farther. It was not easy to descend from my *machân* with my rifle in the absence of the ladder, so I called out to Mahomed Khan, 'I have got one tiger and wounded another. Has one come out on your side?'

'No, *sahib*, it has not passed me.'

'Then I have got two! Bring the ladder quickly.'

In a couple of minutes Mahomed Khan appeared with the ladder, his face one huge grin with satisfaction, and I descended from my perch. We made sure that the first tiger was dead, and then proceeded to walk to the place where I expected to find the other. She (for it proved to be a tigress) lay on her side quite dead, about twenty yards beyond the stream. I called to the beaters to advance, and soon found myself in the centre of a salaaming crowd, who began hurling invective at our fallen foes. We then began to drag the first tiger, a fine male, from the water on to the dry bed of the stream, and here an amusing incident occurred. Some water must have got into his windpipe, and when the natives took hold of his legs and commenced to drag him shorewards, the air from his lungs, escaping, caused a slight noise like a gasp, with the result that there was a general stampede, and I was left alone, standing in the water by the side of the dead animal. I laughed so heartily that I could barely manage to keep my feet, and in a few moments the beaters, realising their mistake, returned and dragged the carcass on to dry ground.

.VI.

I now consulted with Mahomed Khan and the local *shikari* as to whether we should skin the animals on the spot or take them with us to Khitauli. The latter course was decided upon, as, if the skinning were effected on the spot, the operation could hardly be satisfactorily concluded before nightfall. Arrangements were accordingly made for the construction of a couple of litters from poles cut in the jungle, and while this work was in progress curiosity prompted me to walk to the spot where Mahomed Khan had said he saw a tiger in the morning, to ascertain

whether there was any sign of one having been there. He had evidently spoken the truth, for I found the track of a full-grown tiger exactly at the spot he had pointed out.

As soon as the litters were ready the bodies of the tigers were securely fastened on to them, and they were carried by relays of men towards Khitauli. After seeing matters well under way, I left the direction of affairs to Mahomed Khan and cantered on to my temporary quarters, thoroughly elated with my success. Two or three hours later a cheerful but perspiring procession arrived at the rest-house, the bodies of the tiger and the tigress were deposited under a large tree, and I proceeded to pay off all who had assisted me in the day's work, the *shikari* and the headmen receiving liberal *backshish*, and the beaters double pay.

During the evening Mahomed Khan, who had already covered more than twenty miles on foot, but whose energy seemed inexhaustible, arranged with the local *chamars* (skinners) to come at dawn next morning and skin the animals, and then, having engaged a couple of villagers to keep off jackals and prowling dogs, placed his *charpoy* (native bedstead) near the bodies of the tigers in order to see that the watchmen remained on the alert during the night. The smell of a dead tiger is appalling; how he endured it I cannot imagine, as I was conscious of it nearly all night, although I was in the bungalow some fifty yards away.

Over the skinning process I will draw a veil; but I may say that the whole of the flesh was consumed by natives of the *chamar* and other low castes. The fat was boiled down, six bottles being obtained; it is held in high esteem among the natives of India as a remedy for rheumatism. The skins were duly dressed with a preservative of which I had brought an ample supply with me, and pegged down in the compound, Mahomed Khan remaining on guard during the two following nights. On the third morning I noticed that some of the soft parts were beginning to show signs of decay, so I determined to send the skins at once to Jubbulpore, where there was a competent European taxidermist. No native of the better class will touch the skin of an animal, so I engaged one of the local *chamars* to take them, sending with him my grass-cutter to show the way and keep an eye on him. (I must explain, for the benefit of those who do not know much of the natives of India, that the whiskers and the claws of a tiger are considered to be powerful charms; and my object in sending one of my own men was to ensure their being delivered intact to a brother-officer, who was living in the same house with me at Jubbulpore.)

My leave had still a few days to run, and I wished to remain on the spot in case any opportunity occurred of increasing my bag. The man who was sent in charge of the skins

duly returned, bringing a note from my friend to the effect that when the parcel containing the skins was opened three claws were found to be missing. I at once questioned the men who had taken the package containing the skins, but both strenuously denied that it had been opened; it appeared that, as my brother-officer was absent on parade when they arrived, they had handed over the parcel to the wife of my servant, Jaisukh, for delivery to the *sahib* when he returned. Jaisukh had a small son, aged about five, the apple of his father's eye, and I at once came to the conclusion that his mother had taken the claws with the object of hanging them round the child's neck to avert the evil eye. I therefore summoned Jaisukh, and after informing him of my suspicions, said, 'A charm, to have the desired effect, must have been obtained honestly. If your wife has taken the claws with the idea of bringing your child good luck, they will be quite useless, and may have the opposite effect.'

Jaisukh agreed, and said, '*Sahib*, do not put me to shame, but leave me to deal with the matter when we return, and if my wife has really taken the claws, I will surely return them to you.'

'Very well, I shall leave it in your hands,' I said.

VII.

On arrival at Jubbulpore on the expiry of my leave I reminded Jaisukh of his promise, and next morning he informed me that he was quite unable to account for the disappearance of the claws, but that his wife had not taken them. I began to fear that I must reconcile myself to their loss, when Mahomed Khan appeared, and said, '*Huzur*, I believe Jaisukh has told the truth, and I suspect the man who brought the skins from Khitauli of stealing the claws.'

'How can we recover them?' I inquired.

'If your Honour will give me the money for the journey, I will go out to Khitauli and see if I can get them back.'

I handed him sufficient money to cover his expenses, and he departed. Three days later he returned, his face beaming with satisfaction, and placed before me a piece of old newspaper containing the missing claws. I inquired how he had recovered them, and his story was as follows.

'When I arrived at Khitauli, I at once went to the *chamars'* huts outside the village, and found the man who had carried in the skins. I told him that I had another job for him, and thus induced him to come to the Forest Officers' rest-house, and then accused him of stealing the claws. He denied it; but I locked him up in the cook-house, and left him there for a couple of hours to think over his sins. Then I returned, sharpening the big knife that MacLean Sahib gave me.' (I knew the knife well; it had a blade about eight inches long—he once cut a large thorn out of my foot with it.) 'When he saw the knife in my hand,

he asked me what I was going to do; so I said, "The colonel *sahib* has turned me out of the regiment for having stolen the claws, and I am quite innocent, so I am going to cut your throat, as without doubt you stole them." The man fell on his knees and begged for mercy. He confessed that he had opened the package during the temporary absence of the grass-cutter, and had extracted the claws, two of which he had sold to a fellow-villager. But he promised that if I would spare his life he would restore them. I therefore released him, and in a few hours' time he brought me the claws. I have thus executed the *sahib's* commands.'

I congratulated Mahomed Khan on his success, and the claws were duly restored to the skins, which were eventually set up by Rowland Ward, and now hang in the hall of my English home.

I thought that Mahomed Khan deserved some special recognition of his services in connection with my shooting expedition, and the subsequent recovery of the tigers' claws, so I obtained from Bombay a silver watch, with a suitable inscription, which I presented to him when I retired from the service a few months later. He shortly afterwards completed his time for pension, and returned to his native village to cultivate his bit of land. I have little doubt that when the village elders assemble about the well for their usual evening gossip, Mahomed Khan, who is blessed with a vivid imagination, recounts his exploits in love, war, and sport, and proudly exhibits my parting gift as a proof that he saved his colonel from the jaws of a tiger.

NOVEMBER LEAVES.

THE ghost leaves of November come drifting,
drifting down—

The sad brown leaves, the sodden leaves, November
leaves of town;

Each careless gust of autumn, each touch of
winter's cold,

Brings from the faithless branches dull showers of
tarnish'd gold.

(Ah! fickle trees of autumn, that shake your
shoulders free,

Disdainfully discarding your tattered finery—

Against pale skies of autumn your naked forms
uprear,

Delicate yet defiant, virginal yet austere.)

But lowly on the pavement the leaves of autumn lie,
Till winter, whistling on his pipe, comes arrogantly
by.

He sounds a mocking summons, he blows with icy
breath:

'Come, get you up, ye laggards, and dance your
Dance of Death!'

The ghost leaves of November rise wraith-like from
the ground,

And madly whirling in the air, go dancing round
and round;

While down the wind comes drifting, as they go
hurrying by,

A gust of phantom laughter, a memory-haunted sigh.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

IN November of this year the United States makes its choice of a new President to succeed Mr Wilson at the White House, Washington. The people of this country, not quite understanding or appreciating the American method and disposition, which for the most part are perhaps no more illogical and stupid than our own, have been amused at the proceedings at the two great conventions, first the Republican and then the Democratic, at which the rival candidates, Mr Harding and Mr Cox, were respectively nominated. These proceedings were official only so far as the two parties were concerned; they resulted in a decision as to candidates. Subsequently the various states choose their representatives for what is called an Electoral College, which nominally makes the choice of President. But in that these representatives are chosen on political lines and are pledged to vote according to instructions, their own election foreshadows the result of the presidential election proper; and, in truth, though the College is supposed to meet sometime between now and March, and to deliberate before formally casting its votes, this is a formality but imperfectly, if at all, observed. Once the states have voted, the name of the new President is known. Some states by their population have more representatives and more votes than others, and that is why they count more heavily in the final reckoning. This now is a great hour in the politics of the world, and it is of importance to consider what are the possibilities and probabilities of this American presidential election.

* * *

Despite certain doubts and various minor disparagements, it is the general expectation that this time the Republican candidate will be elected to the Presidency—that is to say, Senator Warren G. Harding of Ohio. There may be a slip, and there are strong influences running against Mr Harding; it has even been hinted that there are considerable forces of his own party that are not pleased with him and may do something to impede his election. If he succeeds in the contest, it will be because of his sound republicanism, and not so much for the strength of his politics and his political personality as they have been known. The chief fault that is

brought against him, so it seems, is that which arises largely from the circumstances of his selection by the great Republican convention at Chicago, which swung round to him as a sort of compromise when it found itself to be hopelessly, because equally, divided between two other more favoured candidates. The convention could not properly decide between Wood and Lowden. Happy could it have been with either had the other been away; but as they were both there, they divided the votes too equally, and that was fatal to the substantial majority that one of the candidates needed to have for adoption. Thus they had both sorrowfully to be abandoned; and then the Woodites and the Lowdenites compromised upon Senator Harding, who had been languishing in a kind of electoral wilderness. When he was chosen, the Democrats, the rival party, throughout the United States rejoiced—or it may well be that they affected to rejoice—for they said that their enemy had done a good thing for them in that he had chosen a poor candidate, and verily their own prospects of a victory in November were much improved by the circumstance. The newspapers said things that were not complimentary or pretty about the man from Ohio who was thus likely to be the governing hand in the United States for four years to come. One would have it that neither party had ever chosen a more 'respectable' candidate, or, since the days of James Buchanan, a candidate so little qualified to grapple with the nation's problems. It was said that he is a 'colourless and mediocre Ohio country politician,' whom his friends are fond of comparing with McKinley because he resembles the murdered President superficially. The most dignified newspaper in New York referred to Mr Harding as a very respectable politician of the second class, whose record at Washington, it said, was faint and colourless. But this is the American way; none of it must be taken very seriously. Insincere or rather shallow criticism of a boisterous kind is one of the least commendable habits of our cousins, but perhaps it is no worse than the custom in other countries, especially where monarchies stand, of adulation that is no less insincere and shallow. Of the two, indeed, the moralists and the independent philosophers would probably

urge that the American way by search and stimulation is the safer. For all that the papers say, Senator Harding is a great political force. He is a fine speaker, and often in past times has made a great impression upon the national conventions. Though he was born on a farm, and has been intimately concerned with the work of his newspaper in Ohio, he has always had a great attachment to politics, and has invariably been known to be scrupulously, and (as some Americans think) even absurdly, honest in his practice of them. In the all-important matter of the association of the United States with the war and with the peace, he was one of those who made up their minds that the Treaty of Versailles was not good for the United States, and that the best and only thing for his country to do for its peace of mind, its political freedom, its material prosperity, and its progress on that independent line it marked out for itself at the beginning, so far as it could continue it, was to back away to some considerable extent, and remain in only on some understanding of limited liability. Without being an extremist, he supported the reservations put forward by Senator Lodge, the discussion of which excited so much interest in this country, as well as in America, last winter.

* * *

He has always been an unswerving Republican. He it was who, in 1912, nominated Mr Taft for the Presidency, and when Mr Roosevelt went his own way and led a Progressive party, Senator Harding assailed him bitterly. Yet thereafter, during the war-time, he and Mr Roosevelt became friends again; and it was Mr Harding who proposed a legislative measure in favour of authorising his old opponent to raise two divisions of volunteers for service in the war in Europe—a proposition to which Mr Wilson did not assent. In the Senate he has worked hard on the Foreign Relations Committee, and has probably a better grasp of European affairs than most of his colleagues in that house of the American Parliament. He does not take his knowledge from the newspapers, or from what others tell him. He has been to Europe many times for the sole or main purpose of making the closest possible first-hand study of domestic and foreign politics, economics, social conditions, and all the rest in Britain, France, Germany, Italy, and other countries, and has come to definite conclusions of his own about the position and prospects of Europe and the relations that the United States should hold towards the old continent. And the result of his studies and of his deductions from the tremendous and terrible things that have happened in the world in recent years is that the world will not tend in time to become all of an international piece, as many believe and hope, but that nationalism will the more assert itself, at least so far as America is concerned. During the war the

United States was joined up to the general life of the world, called upon to bear its anxieties and sufferings, share with it in all its strife as never before, and as she had hoped she would never have to do. It was against the American principle, against the determination and the conviction that had animated the first Americans, and then in turn their descendants. That is a point which was not sufficiently taken into consideration when the United States was blamed so much for not entering into the war earlier than she did. But though now America can no longer preserve such a degree of isolation as she was wont to do, Senator Harding would have her regain all she can, with due regard to her own interests and the cardinal necessities of the civilisation and the progress of the world. 'We should cling everlastingly to American nationality,' he says, 'and we should suffer no abridgment of American constitutional liberty. For myself, I like the old-fashioned Americanism which arrogates to ourselves the keeping of the American conscience in all our foreign relations.' Yet he is a man for armies. Before 1914 he was a firm advocate of maintaining a considerable degree of military preparedness in his country, and now he is in favour of what he calls an 'ample' navy and a bigger army than America had before the war, and would like to see every young American undergo a period of military training, which, however, he considers should be voluntary and not compulsory, and should have the assistance of the Government in the shape of substantial grants towards the holding of annual training-camps. This can hardly be that mediocre politician at whom the New York newspapers jeered when the convention nominated him! In truth, so little mediocre is he that it was a question even in 1916 as to whether he should not then be nominated as the Republican candidate. He is essentially a senatorial selection. A group of senators who controlled the Republican convention were chiefly responsible for his being chosen, and it is considered that if he is elected the Senate will have scored a great victory in a continuous battle it is waging against the President in the White House, the Senate feeling that in these latter Wilsonian days it is being flouted, and that its authority is being usurped by a President with too much of a tendency towards autocracy. And, on the other hand, it has to be realised that if Mr Harding is elected—and, indeed, if Mr Cox, the Democrat, is elected instead, though perhaps not to the same extent—there must be a change in the political aspect of the relations between Britain and Europe generally on the one hand and the United States. America will be more self-assertive. Some difficult questions will probably be opened. For the moment our country seems entirely concerned with the problems of Germany and Russia, and the smaller—but perhaps not less difficult in some ways—problems of our relations

with our European Allies. Then we have difficulties in the East—Mesopotamia, India, and elsewhere. America seems to some for the present to be in a sense a negligible quantity. We appear to be concerned with her only as something to reflect and marvel upon, and as excuse for a smile, as when we contemplate her self-imposed trials upon the question of 'wet' or 'dry,' and wonder if she will make a success of her endeavours along the 'Pussyfoot' path. But it will soon be different. After all, America has an immensity of power. She had it before the war; to-day she is an almost immeasurably grand force in the moral and material domain. And she is about to display herself as she is. As between ourselves and the Americans in the near future there are vast questions looming, and they will cause difficulty. We cannot speak to these people as to the Germans, even if we desired—as we do not—or even as to our own most intimate Allies. We must recognise the power. There will be the question of the tolls of the Panamá Canal to arrange, and another question of the terms upon which British shipping shall enter American ports. So much, in brief, for the political view of this selection of Senator Harding as the Republican candidate for the Presidency of the United States.

* * *

Let us glance at the man on the simple human side; we shall probably need to think of him many times in the most serious way during the next four years, and it were well we should have some idea of the character of the raw human material of which this likely President is made. He is what we call a self-made man. In these days in the Senate he carries with him always a rule or measure that in former times he used when working in his newspaper-office. There is in his blood something of the Scot and something of the Dutchman too. His forefathers were Pennsylvanians, who, a hundred years ago, moved into that middle west in which there is such a concentration of American strength and American feeling of the more independent kind. Ohio may be less than a thousand miles in measurement from New York, but it is many thousands farther from Europe than the seaboard states in sentiment and determination. There in that middle west, in Ohio, the Hardings have remained ever since. The senator's father is a doctor—present tense, for, though seventy-six, he is in practice still. The boy was educated at the village school, later proceeding to a local college, where he completed a good education. But the funds in the family were small, and he had to do something himself to furnish the means for this educational equipment. He did a little teaching, worked on a farm, even performed some kind of navvy-work on the roads. But most particularly he found his way into the offices of the local newspaper called the *Star*, which was then a little weekly

sheet of two small pages. He liked the smell of printer's ink; that strange odour has an odd fascination for all such as are truly claimed of the Press or are about to be. It is not to them as the scent of roses or perfumes from the East, but there is a strange, subtle influence about it that stimulates the journalistic intention. The youthful Warren Harding was under its spell from the beginning, and to this day he is in a way keener as a newspaper man than anything else, active as he is as a politician. The *Star* was not a valuable property in those times, and, seeing the bent of his lad, the doctor determined to buy it for him after he had sufficiently mastered the handling of a newspaper. That was in 1884, when he was only nineteen years of age. It is his boast that he has held every position in a newspaper-office from printer's devil to managing editor. Under his control the paper made great advances; his pungent writings were eagerly read by the people of Marion and district; the new editor and proprietor came out into the local public life; he was closely identified with the Baptist church of which he was a member; he joined the Boards of companies; and so he rose upwards until he was a member of the Ohio Legislature, Lieutenant-Governor of the State, senator, and now, at fifty-five, strong candidate for the Presidency. Upon the American standard he is a handsome man. One makes this kind of qualification because his features are of a new type that America has so curiously bred, which seems to have come out of the North American soil, for it is of the Indian form. They are sharply cut, and Harding is clean-shaven. He is big and strong, makes a fine presence of a man, and he is one who knows his mind, and suggests at once that he is of the highly practical kind, which he is, and not a theorist or an idealist, as his predecessor so much has been. He is generous, frank, and sociable, and all who know him say that they like him much, and that nobody who really knows him can help doing so. That is not a recommendation for a Presidency, and there are things said about men who have no enemies; but then we see Mr Harding has enemies, that they are now at work, and so he is saved. The enemies to his candidature have been trying, as is customary for such enemies in America, to find out things about his past and to expose him, but they have drawn blank. A counter-campaign that was set up by his friends for the purpose of ascertaining little things that would assist in the struggle against the Democratic Cox resulted at first in the touching discovery of Miss Abigail Harding, Senator Harding's sister, who is a teacher of the English language in the high school in the neighbourhood of the family home, frying sausages and making the usual preparations for breakfast, while outside was the old doctor, with a huge sponge in his hand and a bucket

of water beside him, washing his little trap and talking friendly-like to his horse the while. To those who came to question him about his son he told stories of his determination and effort in his boyhood, and emphasised that he owed everything to his mother.

* * *

One must take a glance at the Democratic rival for the Presidency, Governor Cox. The election is not yet over, and all America may be wrong in its prognostications. As the Democrats said of the Republican candidate, so the Republicans say of the Democrat choice that it is one of the things that should make them smile. The probability is that the election will be more closely contested than was at first supposed, but still the chances are quite with Mr Harding. His opponent is in some respects a remarkable man, even though a fair proportion of Americans urge against him also that he is mediocre. Fifty years of age, he has been Governor of Ohio three times. In some respects there is a curious similarity between certain points of the careers of the two candidates. They are both of Ohio, and both have risen to eminence through the medium of the newspapers on which they personally worked. Few circumstances of American public life in these present days are more noticeable and significant than the high proportion of public men who are, or have been, journalists. The fact is recognised that the journalist—he who thinks and constructs, as well as merely writes—is by the very nature of his work and study better fitted, if a good journalist, for grappling with public affairs and achieving solutions to difficult public questions than almost any other class of person—indeed, better than any other. Thus we find a remarkable proportion of the ambassadors of the United States in foreign lands being drawn from the journalistic profession, and the example of America has been noticed, and has had a certain effect in other countries. James Middleton Cox was brought up on a farm, he was educated in the public schools, and as a boy, at evenings and during holiday-times, was a printer's devil. He, like Harding, was something of a teacher; he became a newspaper reporter on the staff of the *Cincinnati Enquirer*, and then private secretary to a member of Congress. Next he borrowed a sum of money with which he purchased the *Dayton Daily News*, and later he bought the *Springfield Daily News*. He found that his newspaper-work drew him irresistibly to politics, and so he stood for Congress twelve years ago, and was speedily swept into the great political whirlpool. He is a man who is liked, and has the reputation for having been an excellent

governor. His friends, no doubt, during the election period will make some use of the circumstance that he has recently bought the farm on which he was born; and it is his intention to turn it into a model farm-home, where he may pass the evening of his days when the hurly-burly of his political and public life is done.

* * *

Such are the two candidates for what is certainly the highest and most important public office of an elective character in the world. The man who is chosen has, in varying degree, an influence for a time upon the progress of the human race. That is not an exaggeration of an idea. Be it remembered that the power of the President of the United States is far greater than that of the President of the French Republic—which is indeed small. The American President can be something of a dictator in his way during his term of office, a dictator in what is in some respects the most powerful country in the world—that in the West towards which the tide of civilisation, wealth, power, and effort is steadily flowing from the stricken East. So it behoves each and all of us to consider the qualities and the dispositions, the thoughts and the determinations, of these men, and particularly the man upon whom the choice of the Electoral College is likely to fall, and to do it sympathetically, and not in the manner towards which there has been so much tendency in recent years, of high superiority, of an utter disregard for American methods and men. There is no more decisive indication of smallness of mind and complete ignorance of the essential and overwhelming facts of modern politics, circumstances, and values than that superciliousness and affected disregard by a small proportion of British people of even what is good in America, even what is best in her. Such people are self-condemned for envy or ignorance, or both. America is going to matter enormously to Great Britain in the next few years, and there will be no room for such stupidities. Let us give a fair welcome to the man who is elected President, recognising that it is inevitable that he must, by the very circumstances of his election, the most thoroughly sifting process, perhaps, that the world employs to-day, be a great man, even though his countrymen in their own way may insist on his 'mediocrity.' If a spirit of ambition after a season in the shades came back to earth and had its choice of situation of power and distinction in this strange world of to-day, what would it be? I can imagine it considering closely the Presidency of the Republic of the United States of America.

Y V O N N E.

PART III.

IX.

EARLY the next morning I went to see M. Lassenot, the notary, and gave him De Chaumonart's letter. I tried to learn from his countenance the contents, but I could not. He read and re-read it, and asked me many particulars of Pierre's death, and how long I should be in Paris, and said he would write to me. Why he should write to me or want to know my address I could not understand, nor could my uncle when I told him of it.

I was to know a few months later, when, to my utter astonishment, I learned that poor Pierre had left me a fortune of two hundred thousand francs.

I next went on to the Rue Dominique to see the baroness.

'Ah, my dear Henri,' she said, after she had kissed me again and again, 'I have been so ill and so lonely. If you or Julie or Yvonne had been here, I am sure I should never have got so depressed, but God has taken me by this path to show me what an idle, frivolous, useless life I have led;' and she went on to talk of her past imaginary sins and the vanities of the world, &c., till I gradually induced her to speak of more worldly matters, and finally about Julie's wedding. I could not have hit on a better subject.

'Ah, Henri, how can I do justice to that! All Paris was there. I got her dress from Devoyes', the lace at Dargalas'. Both Madame la Maréchale Soult and the Duchesse d'Abrantes (Madame Junot) came. You know what exquisite taste the latter has, and she said Julie's dress was a perfect dream.'

Thus quite forgetting in her enthusiasm all the vanities of the world, in the most naïve way she described the ceremony, the music, and finally the grand ball in the evening, and then came back to the dresses once more.

'But now,' she said, 'tell me about yourself. When did you last hear from my dear Yvonne? Why has she not written to me for such a time? Is she ill?'

Remembering my uncle's instructions, I merely told her that Yvonne was quite well, and I showed her the beautiful embroideries, and told her about the Holbein, which, when it had been cleaned, I begged her to accept.

'I will not accept it, *mon cher*,' she replied; 'I will simply take care of it for you. It shall hang up opposite the other.'

But she soon got fatigued. She had her old charm of manner, but none of the wit and vivacity that had brought her so many admirers and crowded her *salon*. Her chief pleasure was

for me to be near her; then she was happy. Just before my short leave came to an end I told her I intended to see Yvonne, and she gave me many loving messages for her.

'Tell her father,' she said, 'as soon as I am well and the war is over, I shall insist on the marriage taking place at once. You two young people will have to live in this house. It is too large for me. I shall make over to you enough money for the purpose, and take a smaller one near.'

Of course, I promised her to deliver the message. It was not that I wanted the money—with Yvonne beside me I cared little for what I got—but I knew the effect it would have on Martignac. My visit had undoubtedly done my aunt good, and what pleased my uncle Jean was that she never said a single word about going into a convent. This proved, he said, that the mind was getting into a healthier state.

X.

I started for Spain in better spirits than I had left it, though, of course, the chance of seeing Yvonne had a lot to do with that.

It was a beautiful November day when I pulled up at the 'Cheval Blanc' at Préville. I had written to Yvonne to say I was coming, so I knew where to find her. It was nearly four years since I had seen her. Ah! how can I describe her beauty, the perfect *ensemble* of her face and figure!

'You know, *mon chéri*,' she said, after my first transports had a little subsided, as we sat down on a low wall in a quiet lane that leads to the château, 'we shall, of course, be comparatively poor; but what does that matter? I shall be yours and you will be mine. I want to get right away from here. I feel that we Martignacs are only interlopers. I want to have a little cottage in Normandy, covered with roses and honeysuckle, far away from here. You won't mind that, will you?' she continued tenderly, looking up, with her hand resting on my epaulette. 'We can easily get one. Your aunt gave me a lovely pearl necklace when I was twenty-one. I am sorry, but I must sell that; and that beautiful ring you gave me when we were betrothed—that must go too. But we shall be happy—oh, so happy—you and I.'

I had to let her go on. The very sound of her voice was like the most beautiful music. I liked to gaze into the depths of her soft, bright eyes as she looked up at me.

Apart from the 60,000 francs I had received from De Courcy, after my two aunts had had their choice of the vestments and the embroideries, I had sold the remainder for 5000 francs, so

I had 65,000 altogether, and I had placed 40,000 francs in the bank and had the rest with me.

'Now listen to me, *ma chérie*,' I replied; 'I don't see why you should sell my ring, because,' I continued, producing a little box, 'I have brought you another.'

'Oh, how beautiful!' she said, as her eyes fell on the glistening gems. 'But, oh, Henri, what madness! Can't you see how we are placed?'

'You spoke about my being poor. If I were, it would make no difference to me, if you were willing to share my poverty; but I shall not be poor, because'—

'You won't be!' she exclaimed. 'Oh, Henri, I almost wish in one way you were, for I shall be. But, on the other hand, I am glad, oh, my darling, so glad, because in that case father, I am certain, will consent to our marriage. You must know,' she continued, 'that he and some other deputies have lost their money. He and they knew, before any one else, about a new canal to be built. He bought a lot of land with borrowed money. Then, owing to the Russian campaign, the building of the canal was postponed, and instead of victories we have had terrible disasters ever since. You know he went to see your aunt; but she was ill, and so he had no chance of help from her to pay the interest on the land he had bought. Now, M. Morot had always flattered me, and wanted to marry me, though I gave him no encouragement, and told him nothing would make me marry him, much as I respected him. Father had some poor, swampy land, with a small, old farmhouse that wants repairing. At the most it is not worth ten thousand francs, but it was near some land of M. Morot's, and father said he might have it for twenty thousand francs. M. Morot naturally laughed at the price, but said he would give it, and require no *dot*, if I would only marry him; and father consented. I stood firm. I told them both that they would have to drag me to the church. M. Morot, who is a gentleman, said at once, in that case, so far as he was concerned, the matter was ended. But father was furious, for he saw ruin staring him in the face. However, *le bon Dieu* came to my help. M. Morot, being under forty, has had to join the New Compagnie d'Honneur, which was raised from men of good families; so everything is in abeyance. Mother had some very fine rubies. They came, I believe, from distant relatives. I never knew she had them. These have been sold, but still father is in difficulties. Are you going to see him?'

'Yes, *ma chérie*, I am,' I answered, as I kissed her; 'and, what's more, I shall return with a paper that will make your bright eyes sparkle even more than they do now.'

XI.

Under the spell of the young girl's beauty I could think of only her, and I was quite sur-

prised when I found myself at the fine wrought-iron gates of my ancestral home. This brought me back to myself and the purpose of my mission. The man was a rogue, an arrant rogue, but still he was Yvonne's father. Yvonne was mine, and I was determined that she should be nobody else's. I meant to make that clear. Then, just as I had reached the château, an idea came into my head. If he was in such straits that he was practically willing to sell his daughter for twenty thousand francs, why should not I buy the wretched land? I had the money. That, I reckoned, would solve all difficulties.

Delighted with this idea, I rang the bell, and it was not long ere I was ushered into Martignac's presence. I was struck at once with his aged and worried appearance. I could see he was in two moods, and, being taken by surprise, hardly knew what line to adopt. There was defiance in his eye, but a certain warmth in his voice as he inquired about the health of *madame la baronne*, my aunt.

'I have just come from her, and she is getting on slowly, but she insists on my marriage with Yvonne;' and I gave him her message and told him the arrangements she intended to make for our happiness. He gazed at me in amazement.

'But what about the convent?'

'That's all finished. It was only the passing idea of an invalid. It appears,' I continued, 'that you have some swampy land with a tumble-down cottage that you wish to dispose of. Well, I'll give you twenty thousand francs for it, provided you settle it on Yvonne, and that you agree in black and white to our marriage.'

'Is this your aunt's idea?'

'No,' I replied, 'my own; and, what's more, it's my own money, and I have got it in my pocket.'

A look of intense relief came over his worried face. 'I will do it,' he said, shaking my hand warmly. 'I have been mistaken. We will forget the past. Yvonne is yours.'

I wrote out the paper. He signed, and I gave him the money.

'Now I am going to see Yvonne,' I said. At his request I promised to stop the night; and in another moment I hurried off in triumph.

I found Yvonne seated on a fallen tree, with the setting sun behind her. She knew my footsteps in a moment, and sprang up.

'Look, *ma chérie*!' I exclaimed, as I waved the paper before her and kissed her again and again.

'Oh, Henri, it seems too good to be true;' and tears of happiness came into her bright eyes as she read the agreement by the failing light.

There was, perhaps, a certain constraint with us all at first, but soon we were in the highest spirits.

Ah, that was a happy evening. Yvonne was really and truly mine now. All my anxieties were past. She was happy, and therefore I was.

To please me she sang, and never had she sung so divinely. No wonder the best professors in Paris were proud of their pupil.

It was past midnight ere I had finished writing to my uncle Jean, telling him of my good fortune. Early the next morning I took a sad adieu, and then, seeing all things *couleur de rose*, I set off for Spain.

If I had expected to repeat my success in the matter of loot, I was soon to find out that I could not do so, for the Allies with the coming year had begun the invasion of France. The British were driving us out of Spain; Prussians, Austrians, and Russians, like wolves, were closing in on the Emperor; and we received orders to retreat from Spain as fast as we could. I had fondly hoped that we might be placed under Soult—in that case I should have been near Yvonne; but one army of the Austrians was approaching Lyons, and we were sent in that direction.

With all his transcendent abilities, it was impossible for the Emperor to continue the unequal contest against all the Allies at the same time, and, as all the world knows, his capitulation was signed 30th March 1814.

It was but a few days after that event when I received a letter from Yvonne, who was in Marseilles, whither she and her mother had flown for refuge early in the year. After our defeat at Bayonne, Soult had retreated on Toulouse. The old château of my forefathers was in a direct line between those two places, and very bitter was the fighting around it. Martignac had foreseen this and sent his family away, with as many valuables as he could, but nothing would induce him to leave it. Twice it was taken by the British, and twice they were driven out; and it was in the beginning of their third assault that Martignac was killed by a shell that burst in the very room where Yvonne and I had passed such a happy evening. For Yvonne's sake I was sorry for his death, but apart from that I knew that the rogue had only got his deserts. On the other hand, I felt keenly the terrible damage that the château had sustained.

XII.

It was not long before I, like many a better man, received my *congé* from the Bourbons, and as soon as I could I hastened to Marseilles. Martignac's affairs were in such a terrible state that there was nothing for the family to do but to sell the property. Yvonne's only brother, a doctor, and Madame Martignac begged me to ask my aunt, who had now quite recovered her normal health, to buy it; and this she did for a third of its real value. So once more the old château came back to the descendants of its ancient owners.

A small army of workmen were soon employed in making good all the damage done. One wing was specially set aside for the baroness, who sold her splendid *hôtel* in Paris to a Russian

prince. He would have bought, too, all the *objets d'art* and pictures in it; but, while she sold the former, she would not part with the two Holbeins or her old Dutch masters, which she brought to the château. Fine as they were, from the sentimental point of view, so far as I was concerned, they hardly made up for some of the portraits of my ancestors that were lost in the Revolution.

But before the house was dismantled in Paris, our wedding took place in the autumn. To the horror of my wife, on the Emperor's return from Elba I had to serve again; but as my regiment was one of those destined under Marshal Oudinot to watch the Austrians, I saw no real fighting, and my military career was ended.

With a king upon the throne again, and the country bent on peace, in that secluded spot I led very much the quiet, happy, and, I hope I may say, useful life of my ancestors. There was plenty to do replanting trees and renovating the estate—which, however, was wonderfully improved a few years afterwards, without my having much to do with it, by the making of the canal that had proved the ruin of Martignac. This canal simply doubled the value of all the properties it went through.

Now, it had always been the custom of my worthy ancestors that a fête should be given on their own fête-days and on those of their ladies. My aunt Hortense particularly insisted that all the old customs should be kept up. With us her slightest wish was law, for neither Yvonne nor I ever forgot what we owed to her; so a *fête champêtre* was held not only on my fête-day in June, but also on that of the baroness in September, which, fortunately, came just about when the merry vintage-time was over. On these two occasions the tables were spread under the trees, where the whole district, high and low, rich and poor, assembled. They ate and drank to their hearts' content, and finished the day dancing on the sward till the lengthening shadows stopped their revels.

Equal pleasure was derived on Yvonne's fête-day in December. Rows of tables were placed in the great hall, but so large was it that, even with hundreds of candles, there was not too much light. Then, when the meal was over and the tables were taken away, the fiddlers in the gallery began, and my aunt, with the highest noble present as her partner, set the ball rolling with a minuet. In spite of unlimited wine, the *paysans* and *paysannes* were always a little shy at first, till Yvonne, perchance with my steward, and I with some pretty *laitière*, had joined in a country-dance; and then all went as merry as a marriage-bell till the clock struck ten, which was quite late enough, considering the distance some had to go and the state some were in. Of all these festivals it was the winter one on Yvonne's day that gave us, perhaps, the greatest pleasure, and certainly the most amusement.

XIII.

It was five years after we were married. Our guests had gone; the candles had been extinguished, leaving a horrible odour that permeated the whole château. It was an awful night; the wind was howling in the chimneys and the rain was swishing against the panes. I had gone upstairs and thrown myself on a chair before the blazing logs, and not without a smile, being so comfortable myself, I thought of those (some in stately coaches, some in gigs, while some rode or walked) who had left us, after they had all partaken freely of the *coup de l'étrier*, consisting of a very fine punch, the secret of which many had tried to find out.

According to her wont, Yvonne had gone to kiss the children as they slept, and to see if my aunt desired anything. Seldom had I seen her look more beautiful as she entered the room. As a birthday present I had commissioned Gérard to paint her portrait. Like many another celebrated painter, he had known the baroness in Paris, and, indeed, he had done her portrait about the same time that he had painted the well-known picture of the Emperor in his robes. Being in the district, he came to see the baroness, and he was so pleased with his quarters that I had no difficulty in getting him to stay on to paint Yvonne's portrait. And a splendid picture it was, worthy, indeed, of its original. This had been placed in the hall that very day, and she was wearing the same beautiful dress that she had been painted in, so that all could see how true it was.

'What are you smiling at, *mon cher*?' she said merrily, detaching a splendid necklace of diamonds from her throat, and placing it in a box which was to be hidden in one of the secret recesses in the oak panelling of the room.

'I was thinking, for one thing, how beautiful you look,' I replied.

'Oh no; you were smiling at something besides that.'

'Well, I was thinking, as I heard the storm without, how some of our good friends are getting home, and whether Jean Berlot is going to repeat his adventure by falling into the river to-night.'

'Yes,' she laughed, 'you find that an endless source of amusement, but it's a very cruel of you.'

'And I was thinking what a success the picture was, and wondering next year what present I could give you on your birthday. Now, do you remember, *ma chérie*,' I continued, with a smile, 'how you said once that you would like a little cottage in Normandy, with pretty roses and honeysuckle and earwigs and all that sort of thing? Well, you shall have one if you like, and'—

With parted lips she stood motionless for a moment, her bright eyes twinkling with merriment. '*Oh, grand Dieu, quelle folle idée!*' she exclaimed, and the room rang with her merry laughter.

'I don't see anything droll in it.'

'Don't you? Why, it would take ten days to get there! What would aunt say? Oh, *ma foi!*' and she went off into peals of laughter again. 'No, *mon cher*,' she said with decision, placing her hands on my cheeks and stooping down and kissing me, 'I am not going to have a cottage in Normandy, nor, indeed, anywhere. I have got you, and I don't want anything else in this world; and so far as my poor finite brains can tell me—though, of course, you need not tell M. le Pasteur—I cannot imagine anything better in the next.'

THE END.

THE EFFECT OF SLEEP UPON PLANTS.

By A. T. JOHNSON.

ONE of the most interesting chapters in the romance of plant-life is that which tells us how plants go to sleep. Most of us have noticed how the trefoils fold their leaves at evening like a butterfly's wings, how the common nasturtium dips its round discs of green to a vertical poise, and how the rays of the lupine's leaves droop at dusk until they look like green shuttlecocks turned upside-down. These and innumerable other examples, movements which are more noticeable in dry, cold weather than when it is warm and damp, are what one may term voluntary efforts on the part of plants to check a too rapid radiation of heat, which would be liable to occur were the flat surface of the leaves, instead of the edges, exposed to the chilly night-air.

But most plants undergo a sleep which is of a more prolonged and thorough kind. This is that which we are accustomed to call their winter's rest, a period during which vegetation is entirely suspended. This winter repose differs essentially from the foregoing, since it involves, in its most complete form, an actual cessation of all vital activity, a kind of stupor forced upon the plant or the tree by a low temperature. And it is a matter of common observation that this period of rest, especially if it be extended, as by a long spell of frost, has a remarkably stimulating effect upon hardy vegetation, resulting in a more luxurious production of foliage and flower. Indeed, there are plants, such as many alpine, which, if they are not subjected to the stern but kindly influence of frost, remain in a semi-active

state all winter, only to awake to meet the spring too weary to produce a blossom.

It was from a recognition of these facts that observant gardeners adopted the practice known as 'retardation,' a practice which has been and still is the primary factor in the production of beautiful spring flowers at the dead season of the year. It was noticed that plants could not only be put to sleep by frost, but that they were rendered more prolific by the process, for some roots being subjected to the temperature of a refrigerator behaved precisely as if they had endured a long spell of wintry weather. Thus lily-of-the-valley plants, having been prevented from blooming at their natural period in spring by being plunged into cold-storage, are brought out and placed in heat in the summer, when they immediately burst into a wealth of bloom, hastening to meet what they believe to be the spring.

A curious but commonplace example of the invigorating effect of frost upon vegetation is afforded by the rhubarb. The roots of this plant which are selected for forcing are dug up in early autumn. They are not put in a refrigerator, but merely left on the open ground and exposed to frost for a week or so, when they are planted in boxes and brought indoors to a moderate heat. The result, however, is precisely the same as if they had been subjected to cold-storage retardation. The exposure of the roots produces what is known as a 'check,' which is to say, the plant, having been submitted to conditions of temperature so much lower than that to which it is usually accustomed in autumn, is thrust into suspended activity, so that when it suddenly wakes up to the warmth of the forcing-house it feels that the winter is over, that spring has come, and the effort it makes to respond to the effect of this trickery materialises in the familiar pink stems of forced rhubarb. The same treatment will produce a like effect with many other plants whose roots are hardy enough to stand the ordeal.

There are plants, however, which cannot be retarded by cold. These are the spring-flowering bulbs, the gay daffodils, hyacinths, and tulips. Many efforts have been made with the object of 'keeping back' these early bloomers, but they have always scorned the chilling influence of the refrigerator and obstinately refused to depart from their natal custom. Then it was discovered—quite by accident—that if the opposite treatment, that of heating, is bestowed upon these bulbs, they will flower not only earlier, but more generously. It happened in Holland, where bulbs are placed for storage not in cold but in warmed rooms. One day a large consignment of hyacinths was forgotten, and subjected to a temperature which was then considered so dangerous that it was feared the whole lot were ruined. But the bulbs were tested, and, to the surprise of every one, they flowered much sooner

and developed finer blossoms than any of the others. The outcome of the incident was a new method of treating bulbs by heat, and 'super-heated bulbs' soon became, as they are to-day, a feature of the trade lists.

This ripening of bulbs by heat and drought, which ensures their getting a complete rest instead of merely a 'dog's sleep,' is exemplified in some other plants which, having been brought into our gardens from lands where it is nearly always summer, bloom at midwinter. Though they may endure our frost, it has no message for them, nor can it induce them to go into quiescence. The lovely *Iris stylosa* from Algeria flowers at Christmas, and is closely followed by that other little southerner, the violet-scented *Iris reticulata*. Yet, though these come to maturity and brave the rigours of our gray skies when all around them the native plant-world is asleep, they do not flourish without their period of rest. This they enjoy in the fullness of summer, and unless they are planted in a soil which at that season is dusty and baked with the rays of the sun at his height, their rest will be no more than a sleepless vigil for their native conditions, so that when their blossoming period comes round they will be too languid to produce a flower. But here again the thoughtful gardener can induce the violet-scented iris to lapse into that period of inactivity so essential to good blooming, even when soil conditions do not afford sufficient heat to send the plants to sleep. This he does by digging up the bulbs as soon as the growing season is over, when they are dried and put away in paper bags in a warm place for their summer slumber.

The beautiful azaleas, lilacs, and other flowering shrubs which are such an attractive feature in plant-houses in spring are also stimulated by the tonic of a winter sleep. Thus, instead of bringing them indoors in autumn, the gardener puts them against a chilly north wall, where they are submitted to as low a temperature as can be risked without injury for several months. This ensures their getting a thorough rest. Indeed, they are forced into a deeper torpor than they would experience in the ordinary way, and afterwards express their appreciation of the rest by breaking almost spontaneously into flower as soon as they are submitted to more genial conditions.

Having discovered that the date of a plant's blooming is largely dependent upon a period of quiescence, and having succeeded in suspending its vital energies and conserving them by artificial freezing, or the application of heat, experimentalists have gone a step further. They have, in their desire to induce a plant to bloom many months before its appointed time, before those submitted to the ordinary processes of retardation and subsequent forcing are likely to bloom, obtained their ends with some success by the use of anæsthetics. Thus lilac-bushes which were thrown into a deep sleep for twenty-four hours

by the use of chloroform or ether behaved, on awakening from their stupor, very much as if they had been at rest for many months. They bloomed at Christmas instead of in the spring, and showed extraordinary vigour and prolificacy. But interesting as such experiments may be to

scientific horticulture, and instructive as they are in indicating that interdependence which exists in the world of plants between rest and activity, it is doubtful, and perhaps happily so, whether they will ever become a part of practical floriculture.

THE BUSH HAS ITS SECRETS.

By J. M. STUART-YOUNG.

I.

IN the tropical noon solstice we sat on the deck and talked. We were three. For a long time the *Bonny* had been making its way toward the low-lying swamp that marks the entrance of the river. We were all three passengers. Two of us were Europeans; the other was a Lagos negro of undeniable education and refinement.

We had watched the smudgy line of the shore, over a ribbon of glittering silver, until the interminable stumps of mangrove-trees had at last opened out and revealed the delta-reaches beyond.

The sun fell with pitiless intensity upon the water. It seemed to rise from that heaving surface of oily smoothness in a haze of vaporous heat that both hurt the eyes and tired the brain.

Major Ord Brixton was talking. He is a well-known soldier in the 'Waffs,' and a keen collector of West African curios. Perhaps he is proudest of the little series of cotton-wood figures that he secured from Boola City when it was raided by our Government, in punishment of the crimes committed by the king of two decades ago.

He was telling us now, this quiet, middle-aged Englishman, of the life-size effigy of the High Priest of the Boola Secret Society, which said figure is carved from soft wood, and deeply infused with the life-blood of countless victims. Brixton durst never bring it again to West Africa, although the Government afterwards questioned the legality of his claim to its possession. He keeps it in a little private museum, known and valued at its true worth by international enthusiasts, in the purlieus of Hampstead, London.

Our coloured interlocutor was Kali Afuma, the most popular native lawyer in Lagos, a man who was trained at the Inner Temple, and who is wont to visit Europe once in every three years. He nodded his confirmation while Brixton detailed to me the outer aspects of his famous Ju-ju.

'It is most curiously carved,' said my fellow-traveller, 'and, although it must be over a hundred years old, it is in excellent preservation. The hands are elongated, held bent outwards

slightly from the wrists, and curved upwards in such a way that the heart—and other vital organs—of victims could be deposited therein during the ceremony of dedication. The soft cotton-wood is so soaked with blood, congealed to the consistency of copal varnish, that you could almost believe the lower limbs to be made of mahogany. On both forearms are long coils of copper-wire. Afuma is going to tell us soon the native significance of this insulation. But first let me briefly describe how the figure came into my possession. Have a drink! There goes the steward! Let me call for three iced lime-waters.'

We others cordially assented, and the steward soon brought us the refreshing liquid, which we imbibed through straws, while Brixton related how he entered Boola with his troops early in the present century. It was clear that he was not romancing as, in his unimpassioned voice and with his quiet, restrained gestures, he told us of the horrors of that campaign.

He prefaced his narrative by remarking that he had recently seen service both in France and in Mesopotamia, and that he had become hardened to death in all its violent aspects. But it was very clear that his subaltern experiences in the tropics had bitten deepest into his consciousness. His eyes showed his bitter revolt against the revelations of crime in Boola that had stained his first joyous anticipations of the charm that clings to a soldier's life.

I glanced from time to time, with intuitive reading of his nature, at the sun-tanned skin, the clear, straight eyes, the firm mouth, the thin, fine nostrils. I could well imagine that he would be full of buoyant youth as his troops marched towards the West African city. He was then at a period when 'to-day' is everything and 'to-morrow' is of no possible importance, until provision has been made for the present hour.

II.

'The first white man to go down was my sergeant. We were trailing along a bush-path, and had been held up twice, but with only small casualties. It was the ambiguity of the fight that was so terrible. We knew that vague forms of men dogged us in the elephant-grass on either side of the road. Sometimes we

caught glimpses of them running along, bent double. Then would come a sortie—a wild onslaught of leaping, yelling, incoherent figures that seemed, in the blaze of sunlight, like a crazy nightmare. We had to use the Gatling once, and it mowed them down by dozens.

'But my sergeant, good old Robson, went out at my side under the fourth attack—an attack that was direct and venomous. It came from five immense savages armed with cutlasses. I have never forgotten that death—I can see it now, even although I have encountered equally terrible events in Europe and Asia. . . . Robson and I were talking of our hope of reaching a clearing, where we could make a stand, and maybe use our Gatling in enfilade. We had left our men some distance behind. Then, suddenly, I saw five naked figures surround us. Robson threw up his arms as if to protect me. There was a confused rush of blows, and then the negroes disappeared. It was all over in a few seconds, even while I held my sword half-drawn from its scabbard.'

Brixton paused to suck up the iced water. He looked wistfully along the swampy banks of the river. We had crossed the bar, and were now ploughing our way toward the widest stream that lies above the snake-like windings of the delta.

'Poor old Robson! Do you know, he stood and looked at me, swaying slightly, with half his head lopped away; and then he fell—not beside me, but *on* me! I was greatly moved—it was my first white loss, and he was a splendid soldier, keen on discipline, and always cheery and bright. . . . And I had to wait in the awful solitude, with Robson at my feet, till the platoon came up. We carried the body for the rest of the way, and buried it in a shallow grave at the first clearing we came to. But I shall never forget that walk—my feet were worn and wet, and it was dear old Robson's blood that filled my boots. . . .

'The attack eased off for that day; it was as though the natives were satisfied, after having killed one of our leaders. We were only four white men in the whole platoon, and right glad we were to rest in the clearing that night, with the sense that we had the long grass a fairly reasonable distance from our flanks. Warfare in West Africa is nerve-trying, just because of its horrible ingenuity, and the native's snake-like skill in keeping cover.

'There was a tumult of angry and wild yells all through the darkness, and we knew these must come from the city. We were nearing our goal. . . . I'll not burden you with descriptions of the slaughter outside the walls during the morning hours of the next day. We lost fifty of our splendid Hausa soldiers, and we must have accounted for literally hundreds of our enemies. It was at the entrance to the town that I saw for the first time my great

Ju-ju. It was surrounded by the witch-doctors, who were making the most awful din. The figure stood at the gate of the town, right in the middle of the road. The scene was a shambles—there were headless trunks by the dozen piled around it, and the Ju-ju's outstretched hands were filled with human entrails.'

III.

'The tumult of war-like yells was checked abruptly by a gesture from a form that I knew must belong to the principal witch-doctor. This grotesque figure danced its way towards us, the body swathed in dried grasses, the limbs tinkling with scores of talismans: shells, pieces of metal, teeth of animals, and bits of dried leather. I had murder in my heart. I meant to avenge poor old Robson's death whatever the cost! You cannot believe the rage and disgust, the incredible loathing and hatred, that nerved my arm and fired my brain. Remember I was only twenty-five at that time.'

Ord Brixton paused, sighed, shook his head impetuously, and then shrugged his broad shoulders.

'I—yes, I *would*!—I would do the same thing to-day to such a loathsome specimen of debased and degraded humanity. I could see his snake eyes, bemused with bestial religious ecstasy, as he pranced toward me. My sword was drawn—and I took his head clean off! I swung my arm from left to right once—just once—and I was scarcely aware of the concussion. All I knew was that his weird figure collapsed before me, and that his inane head rolled to the side of the road.

'My God! I wish I could make you hear the prolonged and poignant wail of fear and despair that came from the crowds around. It was not anger; it was sheer animal *fear*, and it sounded as though the assembled negroes had lost their last hope on earth. . . . For behind me was a solid phalanx of Hausa soldiers, and my companion officers were in complete command of the Gatling.

'The population stood aside; and I was still so keyed-up with loathing and horror that I made straight for the immense Ju-ju figure in the gateway of the city. There was a great commotion all around, and I saw that the soldiery had opened rank, and that they now lined the road right up to the city wall. The Gatling was in readiness, and suddenly an immense silence (after this rapid series of movements) dropped over the place like a veil. I found myself standing, among a heap of black corpses, looking straight into the face of that hideous Ju-ju! Its expression was diabolical beyond the descriptive power of mere words.

'I used my sword as a rake, and I pulled all the hearts and other horrible sacrifices from those hideously outstretched hands. It was

then that I noticed the copper-wire that encircled the forearms. I had heard dim stories about the power attributed to this metal by the natives of Boola. What impelled me I cannot say; but I used the point of my sword to get a purchase on the ends of the wires, and I began to unwind the coils, deliberately, steadily.

'I saw then that the other witch-doctors, a dozen or more of them, had approached me over the heap of bodies, and I paused in my work to turn swiftly on them.

'I suppose I looked as mad as I felt. Those weird figures appeared less tangible to me than the nightmare dreams of a man sick with malaria. They gibbered and muttered and threatened. But I spat at them! And I was abruptly conscious that I was snarling and raging like a mad dog! They retreated before me, and I returned to my task of uncoiling the wire.

'Then I knew that my fellow-Englishmen were behind me. I heard one of them say, "Oh, he was splendid—he took the town by that action—but he must be utterly demented. What on earth is he after *now*? Those pieces of wire can be of no possible value or significance."

Again Brixton paused to laugh at the reminiscence, a laugh that sounded mirthless and forlorn in the noonday heat.

'I had finished removing the wires by this time, and I put them in my pocket as nonchalantly as if they were a piece of string just removed from a parcel of clothing. I had leisure then to examine the face of the great Ju-ju. D'you know, you fellows—and, of course, it may be sheer fancy on my part—it seemed to me that (as though in response to some invocation that we could neither see nor hear with the ordinary senses) the dark leer on the carved face changed to one of sombre brooding, solemn sadness, infinite regret. That look is there *to-day*, in my little museum at Hampstead. Psychologists have asserted that this immense piece of woodcraft lost its subtle evil power when I unwound those coils of wire, and that from henceforth—even when, for the mere sake of *vraisemblance*, I put on *other* pieces of similar wire—the wood could convey only a message of regret and sorrowful remembrance.'

IV.

Kali Afuma had listened to the narrative of my friend with inscrutable face. But he nodded from time to time, and his introspective gaze showed that he was greatly interested, if not altogether convinced, by the Englishman's arguments.

'I have finished my story,' said Brixton. 'We lost no more lives—the town was utterly subdued, beaten by the weapon of superstition. We shot all the witch-doctors the same sunset.

I remember how morbidly anxious I was for a wash and a change—especially keen on cleaning my shoes and my socks. I have never enjoyed a bath so much in my life as I did that hurried toilet, when we took possession of the king's compound. As you will remember, the aged king Prama-Prama was sent to England, and thence to the Bermudas, where he died ten years later. Since the conquest of the city, Boola has become one of the most progressive of our West Coast possessions, and there are to-day both colleges and hospitals and churches there.'

I looked at my soldier-companion as one might peer at a man who has been at the bottom of a pit, to the obscure depths of which the sun may never penetrate. I remembered the cynical aphorism of Anatole France in which that great thinker demands whether human life has any value. 'We interest ourselves,' he declared coldly, 'in lives that do not concern us one whit. It is just as though we were foolish enough to believe that life has an intrinsic value.'

These thoughts were irksome. I had never killed a man, and dared not even ask myself whether I could afterwards justify the act were fortuitous circumstances to compel me to any such deed of slaughter. I turned to Afuma for relief of my embarrassment.

'Will you explain the wires on the Ju-ju's arms?' I asked him.

The face of Kali Afuma remained impassive. He had the reputation of being more in touch with native tradition and usage than any other educated negro of the colony. But his legal training had made him impersonal and judicious.

'You Englishmen,' he said, 'are so far emotional that you become hysterical when you confront horrors of the kind so eloquently described by Major Ord Brixton. We negroes are different. We are brought up—or should I not use the past tense and say *were* brought up, inasmuch as the younger generation is more European in its culture, and scorns native religion!—we were brought up in a tradition of crime and bloodshed, so long as that bloodshed was justified by religious protection. We looked to our priestcraft as you Englishmen look to your king, your state, your constitution. Without the British Constitution your society would be in a state of chaos. Without our priestcraft, a generation or two generations ago, we negroes would have had to submit to the indignity of slavery from surrounding tribes. The strongest and most formidable peoples were those who possessed the most powerful and forbidding of Ju-jus. Major Ord Brixton, in first killing the high-priest of the Boola Secret Society, and then despoiling the Ju-ju of the tribe, robbed Boola, from king to scullion, of its strength. Had I been present myself it is probable I

should have expected the valiant officer to be shattered by a thunderbolt for such an affront to our witchcraft. That he survived was proof, damning, startling, soul-shaking, to all those Boola natives that their cause was irrevocably lost.'

I was watching Afuma's face. Anything approaching the change that had come over his features I have never seen before. His eyes were gleaming; his wide nostrils quivered; his thick lips shook—he looked ten years younger; and his very voice was more resonant and far clearer. It was evident that, despite his European training and his deep knowledge of British jurisprudence, he still believed in witchcraft and the powers of the supernatural world.

Was he living again, in mental retrospect, his childhood and youth at Leko—a town not many miles removed from Boola—where his plastic will had been resigned to every little detail of his tribal witchcraft? Who could say?

He had ceased to speak, but in a low voice, as though he were addressing some vision, he said, 'Ask me no more—the wires on the wrists had received the most dreadful conceivable form of insulation, a spiritual or a demoniacal insulation, that was known only to the Boola people. The removal of these talismans from the arms of the Ju-ju, coupled with the death of the high-priest of the image, meant the absolute end of King Prama-Prama's hopes.'

And then, in a whisper, he said, in his own tongue, 'Inyena—inyena!'

I knew enough of his language to guess at the meaning of the cry: 'The Unknown! The Unknown!'

Ord Brixton laid down his tumbler, and spoke in a commonplace voice, as he turned to me. 'There goes eight bells! Time we had a wash in readiness for lunch. Come along, old bird; for I have quite an appetite on me after all this pow-wow.'

THE MONTH: SCIENCE AND ARTS.

LOCK-JAW IN THE WAR.

'TETANUS [lock-jaw] is one of the most dreadful diseases which have been produced in nature to torment mankind. No one who has seen a severe case can ever forget it.' Thus begins the introduction to a pamphlet on *The Prevention of Tetanus during the Great War by the Use of Antitetanic Serum*, written by Major-General Sir David Bruce, K.C.B., F.R.S., Chairman of the War Office Committee for the Study of Tetanus, 1914–1918. The results given in the pamphlet are confined to 1458 cases which occurred among the wounded in our home hospitals, out of roughly 1,242,000 men sent home for treatment. A diagram is given showing the number of cases of tetanus throughout the war. For September 1914 this figure was 9 per 1000 wounded men, with a fall to 7·3 in October. In the middle of the latter month systematic preventive inoculations of antitetanic serum were begun, with the result that the number of cases fell to 2·3 per 1000—a figure which was exceeded for only two months, and that merely to a slight extent, during the remainder of the war. Similar evidence is quoted as being given by Bazy in the *Comptes Rendus de l'Académie des Sciences*. He states that preventive injections to all wounded at the moment of entry resulted in 4·18 cases per 1000, whereas when injections were given only to cases thought to be suspicious the figure was 12·79 per 1000. This authority also cites the case of 200 wounded, 100 of whom were given injections, with the result that there was only one case of tetanus; while among the remainder, who received no

injections, 18 cases occurred. Sir David shows, too, that the longer the period of incubation the lower the death-rate, and that the use of the antitetanic serum greatly lengthens this period. The chances of recovery are also considerably increased by the fact that the administration of the serum renders the disease milder in character. Dealing with the number of deaths, Sir David puts the pre-serum death-rate at 85 per cent., while out of 879 cases treated in England who were known to be protected by the serum only 203 died, or 23 per cent.

THE 'SHOCK-SHIFTER' HUB.

Few more remarkable inventions have been brought out in recent years than the 'shock-shifter' hub for motor road vehicles. This device consists of an annular space between the axle and the hub nearly filled with steel balls. Naturally, if the space were packed with balls as tightly as it would hold, there would be no play between the axle and the wheel, and the device would become an ordinary ball bearing. A few balls being left out makes all the difference, as this allows a certain amount of give and take. As the wheel revolves the balls turn, and, aided by centrifugal force, they tend to arrange themselves symmetrically round the hub, with the axle in the middle. When the wheel passes over a lump in the road the jar is taken up in squeezing the balls out of place, the tendency being to force them round from the bottom towards the top, while the axle drops slightly below the centre. To enable this action to take place, the connection between the wheel and the hub allows of sufficient vertical movement. Owing

to the war the development of this invention was suspended for several years, and recently the patent was extended for a term of seven years by judicial decision. The case for the inventor was supported by Colonel Crompton, C.B., president of the Commercial Vehicle Users' Association, who stated that the device overcame the ruinous disadvantages of road shock, and that by its use solid rubber tires were made as serviceable as very good pneumatic tires. General Searle, managing director of the Daimler Company, speaking of his twelve months' test of it, said that the 'shock-shifter' device gave every satisfaction; while Major Sharp, of the Transport Service, testified to having run with every comfort thousands of miles, on rough roads at high speeds, in a heavy touring-car fitted with solid rubber tires and this invention. The inventor claims that the device reduces both friction and vibration, with a consequent saving in petrol and lubricating oil. It is suggested also that damage to the roads by heavy motor-vehicles will be much reduced by the advent of the 'shock-shifter' hub.

AN AERIAL 'LORRY.'

Those best able to judge are of opinion that until the transport of *goods* by air can be made to pay, commercial aircraft will enjoy only a very limited field of usefulness. At present the high freights for aerial transport limit the goods carried to express mail matter and light, valuable parcels for which the senders are prepared to pay high rates to ensure speedy and safe delivery. Commercial aircraft can only be placed on a sound basis by rendering aerial transport practical and profitable at a *moderate speed*, high velocities being achieved only at an enormously disproportionate cost. With the usual form of wing heavy loads cannot be carried at a moderate speed, owing to low lifting-power. At high speeds it is done at the cost of great resistance, which obviously entails high engine-power, and consequently high freights. After years of research-work, costing many thousands of pounds, a new type of aeroplane-wing, known as the 'Alula,' has been evolved, and tried out on an experimental machine. The most advantageous speed for the transport of goods, having regard to prevailing weather conditions, is, according to the inventors, from sixty to seventy-five miles an hour, and they contend that the wings now in common use would have to be of unwieldy dimensions to lift any load worth considering at seventy-five miles an hour. It is admitted, however, that what are known as 'high-lift' wings are capable of sustaining considerable loads at comparatively low speeds, but they have a high resistance, involving an amount of engine-power which is prohibitive for the profitable transport of goods. The crux of the matter is high lifting-power coupled with low resistance. Based on the experience gained

with the experimental machine, fitted with 'Alula' wings, designs have been prepared for what the inventors have named the 'Pelican' four-ton lorry. This machine is a monoplane having both the wings and the body constructed of mahogany planking on the principle adopted in modern flying-boat hulls. The wings do not fold, the intention being to do without sheds. Only two men are carried as crew—a pilot right forward and a mechanic in charge of the engine-room aft. The engines are twin 'Lions,' and the machine is designed to fly and climb even if one engine breaks down. Some idea of the size of the machine will be gathered from the following dimensions and weights: span, 146 feet; length, 84 feet; height, 22 feet; diameter of body or fuselage, 14 feet; weight when empty, 13,440 lb.; weight with four tons of cargo and fuel for a trip from London to Paris, 24,100 lb. The cruising-speed is seventy-two miles an hour, and the landing-speed fifty-five miles an hour. The engines together develop 920 horse-power, but only about half is used under normal cruising conditions. With both engines the climbing-speed is 410 feet a minute, and 40 feet with one engine. The cargo space measures 1700 cubic feet. Reckoning a working life of three years as a basis for depreciation, the annual cost of running is calculated at £21,400, which, for three hundred and twelve single journeys a year, with four tons of cargo, works out at 1s. 5d. a ton-mile. Cargo is carried in the front end of the fuselage, the nose of which is hinged, and swings open to give access to the 'hold,' in which a container may be placed.

POWER FROM VEGETABLE REFUSE.

Apart from the enormous tracts of land in Egypt irrigated by the operation of the Nile dams, water is pumped from the river to large numbers of small farms along the banks. Gas-engines are mainly used to work these pumps, the gas being generated in suction-producers from anthracite. During the war this fuel became so scarce and costly that the pumping-plants were in danger of having to shut down, with the consequent loss of valuable crops. Realising the danger, the Egyptian Government caused investigations to be made under the supervision of its former Inspector-General of Mines, Mr John Wells, with a view to utilising waste vegetable matter as an alternative source of gas for the pumping-engines. So successful were these efforts that by the end of 1918 no fewer than three hundred and sixty producers were making gas from vegetable refuse. The experience gained with these plants has resulted in the design of standard producers for the generation of power-gas in countries where coal and oil are costly and vegetable matter is abundant and cheap. These producers, which were recently described in *The Times Engineering Supplement*, are far more bulky than those used with anthra-

cite, while it has been found advantageous to make them rectangular in form instead of circular. In many respects they closely resemble the domestic slow-combustion stove, a large volume of fuel being carried above the flue, whence it gradually works down. It is important that air should not be allowed to enter with the fuel. The latter is, therefore, introduced through a separate receptacle, this being filled and closed at the top, while the outlet at the bottom rests on the flat top of the producer. When full, the receptacle is slid round until this outlet coincides with a hole in the top of the producer, previously closed by a plate attached to the bottom of the receptacle, which therefore moves round with it. The grate at the bottom of the producer is in the form of a ladder, this design being found the best for the large amount of ash to be dealt with, the grate being easily cleared through poke-holes when the plant is in operation. A water-seal prevents the entry of air at the bottom. Each producer is built up of standard cast-iron plates, measuring 2 feet by 1 foot, which are bolted together at their edges. Various sizes of producers can be made from these plates, the requisite number being despatched against orders with the necessary fittings. Before the gas can be used in an engine, it is passed upwards through water dripping from a series of baffle-plates in chambers known as scrubbers. Here most of the tarry matter is extracted, the remainder being removed by a rotary extractor and a dry scrubber. The cleaned gas is nearly as rich as that from anthracite, and it gives equally good results in the engines. In Egypt cotton-stalks are largely used as fuel, these being cut in a machine similar to a chaff-cutter into 2-inch lengths, whereby their bulk is reduced to less than a fifth of the original volume.

A VISIBLE SPARKING-PLUG.

Almost every motorist knows that although a sparking-plug may give a 'fat' spark when taken out of the cylinder, it by no means follows that equally good results will be obtained under compression in the combustion-chamber. Several devices have been invented for showing whether or not sparking is taking place in the cylinder. Among these is the 'Periscope View Plug,' with which one can actually see the sparks. The essence of the invention is a tubular, high-tension electrode passing right up through the plug and connected with the wire from the magneto. At the top and above this connection is a silica lens, through which the sparks can be observed between the 'earthed' electrode and the bottom of the tube. The lens is carried in a cap, which can be easily removed for cleaning. Not only can the sparking be seen, but also the flame from the explosion, the colour of which forms a good indication of the correctness of the mixture. The lens never comes in contact with

the flame, as the inert gas in the tube cushions the explosion. It therefore keeps clean in the dirtiest of engines. No inconsiderable advantage of the device is that the lens can be quickly removed for injecting petrol before starting.

A NEW LIQUID FUEL.

The getting of coal at the working-faces in the pits and the various handlings it receives on its way to the consumer produce large quantities of dust, which, although having the same thermal value as coal in lumps, is extremely difficult to use. Many attempts have been made to burn coal-dust by blowing it, in the form of jets, into boiler-furnaces along with compressed air. The jets burn with a roaring flame, producing considerable heat; and this system has been adopted to a limited extent. Coal-dust is also made up into briquettes, after being mixed with tar or some other 'binder.' In spite of these demands for it, however, coal-dust is more or less of a waste product, and can be bought at a comparatively low price. With a view to utilising it in a more effective manner, Mr G. C. Calvert has invented and patented a process of mixing it with fuel-oil in such a way that the mixture can be used in liquid-fuel burners without their being altered, and even in oil-engines of the Diesel type. 'Colloil,' as the new fuel is called, produces a minimum of ash, and the full heat value of the coal-dust constituent is utilised. In order to mix in the coal-dust and produce homogeneity in the fuel, the mixture is agitated in the storage tanks by compressed air, by gas, or by mechanical means. (In the case of plant which is at present being run on oil-fuel, the existing storage tanks would serve for this purpose quite well.) Coke-dust can be treated in a similar manner. Gas or tar oils, charcoal from peat, sawdust, rice or coffee husks, may form other components in addition to the coal-dust, or as substitutes therefor. The liquid carrier may be oil, alcohol, water, or a mixture thereof. If more convenient for transit, the substance may be prepared in concentrated paste form, consisting of five parts of coal to one of oil, and the balance of the oil (four parts) can be added by simple stirring at the place where the fuel is to be used. Vast quantities of coke-dust are available in the coke-oven districts at almost nominal prices. In India and South America powdered rice and coffee husks can be used, either with or without previous carbonisation to charcoal. In Norway and Sweden large supplies of sawdust and wood waste are available, which it has not hitherto paid to distil for wood-alcohol and other products, but which could now be treated remuneratively, as the powdered charcoal produced could be readily used in the manufacture of the new liquid fuel; the brown lignite found in South Africa and Germany can also be employed to form colloil. Water has been mentioned as an alternative carrier to oil. This

is used in a 50-per-cent. mixture, and is filtered away before burning. During a ten-hour test with four tons of colloil burnt under a large marine boiler, water was evaporated into steam at a cost of 10s. 6d. a ton, against 14s. 6d. for fuel-oil, and no difficulty was experienced in handling and burning the colloil by means of the pumps and burners designed for ordinary oil-fuel.

THE WORLD'S LARGEST WIRELESS-STATION.

When completed, what is to be known as the New York Radio Central Station, on Long Island, will be easily the largest wireless-station in existence. With the power-house as a centre, six aerials will be arranged in the form of a gigantic star, each extending more than a mile from the middle point. Each aerial will be supported by twelve steel towers 400 feet in height, the actual wires being suspended from 150-foot cross-bars. Five aerials are to be used for regular service, the sixth being held in reserve. By employing what are termed multiple-tuned aerials only one-sixth of the power required at other stations will be needed to give an equal range. Two 200-kilowatt alternators of an especially effective type are to be installed for transmitting from each aerial, and these can be used in combination for signalling, if desired, giving a total power of 2000 kilowatts (approximately 3000 horsepower). A new type of receiving-aerial to be adopted will allow of the uninterrupted receipt of messages under all weather conditions. According to Mr Edward J. Nally, president of the Radio Corporation of America, as recently quoted in the *Scientific American*, 'we break away from a precedent once again in locating our receiving-units only eighteen miles from the multiplex transmitting equipment, instead of following the former practice of establishing one transmitter and one receiver in one locality, and restricting the service of the circuit to one overseas destination.' In many cases only one-half of each aerial will be used for transmission to certain points, so that messages may be sent to ten stations in different parts of the world simultaneously, thus doubling the facilities originally planned. Wireless-telephony has already proved practicable over distances up to 2500 miles, and it is expected that the new station will enable a direct wireless-telephone service to be established with foreign countries. The range of the transmitting and receiving apparatus will embrace France, Germany, and other European countries, as well as Buenos Aires and various other stations in South America. Although the station is to be located on Long Island, it is to be controlled from the company's offices in the financial centre of New York, where messages will be received and despatched direct by a series of operators' keys and relays which will control the transmitting and receiving apparatus already described.

A NOVEL RESEARCH-STATION.

Probably the evil most dreaded by a stock-raiser is an outbreak of foot-and-mouth disease among the animals under his care. An epidemic of this highly contagious and infectious febrile disorder recently occurred in Norfolk, in which the disease was carried over a distance of fifty miles, and spread dismay throughout a wide area of rich stock-raising country, nearly ten thousand head of cattle, sheep, and pigs having to be sacrificed. The origin of the outbreak was a mystery, but some of the officials of the Board of Agriculture and Fisheries were suspicious that the contagion came from America, the channel of communication being the hay and straw used in the packing of goods imported from that country. A large proportion of this packing-material ultimately reaches British farmers as manure, and is regarded with grave suspicion as a probable germ-carrier; but in view of the trading complications that would ensue, the Government is not prepared to prohibit its entry into this country, until the necessity for such a step is clearly demonstrated. With a view to ascertaining whether the necessity has arisen, and, if possible, to solve other problems in connection with this disease, the Ministry of Agriculture has entered upon a campaign of exhaustive research, and because of the highly contagious character of the complaint, has arranged for all the work of investigation being carried on at sea. The necessary vessels have been supplied by the Admiralty, and when they are equipped with the laboratories needed, and with suitable accommodation for the British and Continental scientific experts chosen to form the investigating party, the ships will proceed to some point the location of which will, so far as is possible, be kept secret, and there the investigators will begin their work. It is sincerely to be hoped that their researches will throw light upon a problem which has almost completely baffled veterinary science for more than a generation, and has cost the country enormous sums of money paid as compensation for animals slaughtered to prevent the spread of the disease.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to 'The Editor, Chambers's Journal, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

HOW THE PRINCESS HORATIA CAME TO HER KINGDOM.

By LETTICE MILNE RAE.

PART I.

I.

'AS you say, count, I am a woman now,' observed the Princess Horatia, resting her elbows upon the table and her determined little chin upon her hands, while she surveyed her companion with bright eyes.

Count Wenceslaus darted a keen glance across the table at the lovely face opposite him, but made no reply. There was more to follow this remark, he felt sure.

It was exactly eighteen years ago this very day that he had first made the acquaintance of the Princess Horatia. Her face then had been very round and red, and not at all lovely to his eyes—though her attendants had loyally assured him that she was the most beautiful baby ever seen. He had been thinking of that occasion a good deal to-day; so much had happened since. Then he had been Lord High Chancellor of the kingdom of Promethea. Now he was an exile in a strange, though hospitable, land, and guardian of the Princess Horatia, whom he had carried to safety when the lawless soldiery of Duke Conrad of Rosencrantz had taken possession of the palace at Ghetalia on behalf of their master.

It cannot be denied that Duke Conrad's claim was (or, rather, had been) legal and righteous. Twelve months earlier he had been the acknowledged heir and successor of King Alexis, who, at the age of sixty-six, was a widower and childless—an easy-going, peaceable man, and a great lover of the chase. The fascinations of the Countess Horatia Fiorenzoli, however, during a brief visit of King Alexis to her brother's shooting-lodge, had made everything 'gang agley.' Within three months the Countess Horatia was Queen of Promethea. But her reign was of short duration. Scarcely a twelve-month later the king was again a widower, though no longer childless. The Princess Horatia had made her appearance.

Duke Conrad of Rosencrantz had from the first refused to recognise his cousin's marriage with the Fiorenzoli. The countess had never made any pretension to royal blood. And as this fact did not weigh at all with King Alexis,

he could never understand why it should affect others. A certain proportion of his subjects, however, agreed with Duke Conrad, and supported his claim, when, about eighteen months later, King Alexis followed his bride, leaving his infant daughter to be fended for as best might.

Duke Conrad's declaration that he would maintain his right to the throne by force of arms made a strong appeal to the imaginations of the turbulent Prometheans. A warrior king was much more to their minds than a helpless baby girl, who would become the pivot of warring factions and would-be regents; and accordingly they transferred their allegiance.

But Count Wenceslaus remained true to the daughter of Alexis, whom he regarded as the rightful queen, and had borne her in his own arms from the palace by a private doorway when the soldiery, aided by the mob, had burst into the royal apartments.

As Promethea was no longer 'healthy' for the young princess, or for the man who had so gallantly defended her rights, Count Wenceslaus and his lady had brought the child to England—the paradise of exiles and dethroned monarchs.

II.

To-day being the Princess Horatia's eighteenth birthday, the count had taken it upon himself to remind her that she was no longer an infant in the eyes of the law, and that it was time she should think of selecting a husband—for even a throneless queen must have a consort.

On this matter the Princess Horatia had views of her own. They began to take clearer shape when Count Wenceslaus suggested the second son of the Emperor Hildebrand as a suitable suitor, and assumed definite opposition when he presently announced that it had been arranged that Prince Ajax should pay her a visit in strict incognito to sue for her hand. She was a woman now, as she informed the count, and no longer the Queen of Promethea; and as England had become the land of her adoption, she intended to follow English customs, and not be given away as if she were the daughter of a Turk.

Count Wenceslaus bowed meekly beneath

this forcible expression of her intention, but begged her to keep an open mind until she had at least seen Prince Ajax, who was reputed entirely worthy of his renowned namesake, and professed himself full of ardour to make the acquaintance of the most gracious and highly desirable Princess Horatia.

But the highly desirable Princess Horatia was by no means so anxious to pursue acquaintance with Prince Ajax as he, in all sincerity, appeared to be with her after passing a week in her society.

In the first place, he was fat and pink—and her taste inclined towards men who were lean and bronzed. He was swollen with martial ardour and the pomp of war, while she had a preference for sportsmen, and thought cricket more admirable than sword-play. Moreover, she soon discerned that his dearest ambition was not so much the hand and the heart of the Princess Horatia, as the kingdom of Promethea, which, he suggested not too subtly, should be regained by force of arms.

Now, the Princess Horatia was not devoid of ambition herself, and in the secret recesses of her heart she also cherished a hope—a faint, romantic hope—that one day she might be restored to the throne of her fathers. But that this wish should be gratified by the rattling of Prince Ajax's sabre was utterly repellent to her. Rather would she be a throneless queen all her days than accept her crown as his spoil of war.

When, therefore, he pressed his suit and would not be gainsaid, she begged for delay. The prince was royally magnanimous. He would wait, he declared, and repeat his offer a year later, when, in all probability, he might present himself as the conqueror of Promethea. The emperor and his myrmidons were already at work burrowing subterraneously, and fanning the combustible elements that were smouldering in turbulent Promethea, until at the propitious moment a well-set fuse would ignite the inflammable material carefully collected by the imperial forethought, and Prince Ajax would then lead forth his army in the name of the rightful Queen Horatia, and fighting his way victoriously to the capital, would drive out the usurping king and take possession.

She listened in silence to his boast, then waved him farewell with a smile upon her lips and a guileful design in her heart.

This design she presently made known to Count Wenceslaus. It was nothing short of a project to visit Promethea in the guise of an English tourist, to make acquaintance with her kingdom and discover for herself, if possible, what her chances might be against the reigning monarch without recourse to arms or to Prince Ajax.

King Conrad, who had seized the crown from her infant brow, had been gathered to his fathers more than a year ago, and his son reigned in his stead. Of him Princess Horatia was able to

learn but little. According to Count Wenceslaus he was all that was detestable, as his father had been before him; and certainly the portrait the count had always drawn of the late king presented the son in no favourable light to the imagination of the princess.

The suggestion that she should even set foot in his ill-gotten kingdom filled the faithful guardian with dismay. It had become a hot-bed of anarchy and lawlessness under the wrongful sovereignty of the Rosencrantz, he asserted. But as his hatred of the usurpers of the throne of Promethea was the strongest and most unrelenting trait in the good man's character, his objections were soon successfully combated by his wilful young ward, and she proceeded to unfold her plans. They were simplicity itself: merely that, while the count and his lady were enjoying their usual course of baths at Buxton, she, the princess, accompanied by 'Pinkie,' as she familiarly dubbed her former governess, Miss Pinkerton, whose services she still retained as *dame de compagnie*, should take the trans-Europe express straight to Ghetalia, the Promethean capital, and from there make the usual tour of the beautiful little kingdom as directed by the famous 'Cook.'

The mere mention of this world-renowned personage, who smoothed the path of travellers with courtier-like discretion, had the effect of restoring the count's disturbed confidence, and he set about making the necessary arrangements for the journey of the princess to her native land.

III.

Now, if the Princess Horatia had adhered to her declaration that she would follow the route approved by Cook, her visit to Promethea might have had a very different ending. But after spending a fortnight in Ghetalia visiting churches and picture-galleries, and gazing with fascinated eyes upon the palace looking down upon the capital from its royal height, she declared that she could see the like in any other country in Europe, that she had come to probe the heart of Promethea, and not do sight-seeing in a diminutive quasi-Paris or Brussels. Even Count Wenceslaus's carefully arranged tour to places of interest or beauty at various points of the little kingdom did not satisfy her. She might as well visit Buxton or Brighton, Trouville or Aix; such places were not typical of the real Promethea. She must strike off the beaten track, she proclaimed, and come in touch with the true spirit of the country. To do this she intended to make an expedition to Hesione, the remote and inaccessible mountain fortress that had, across the centuries, been the cradle of her race, and the stronghold of the ancient kingdom of Promethea.

Miss Pinkerton's white cheeks grew whiter at this proposal. She had no liking for heroic adventures; the Brightons and the Buxtons of

Promethea were much more to her mind than mountain fortresses, whatever their historic association or romantic interest. But the will of the Princess Horatia was not easy to thwart, and poor Miss Pinkerton had to taste the bitterness of those that 'tread another's stairs,' and make ready for the distasteful expedition.

To arrive at dead of night at a dilapidated and cut-throat-looking inn on the crest of a precipitous height, that appeared all the more sinister under the ghostly light of the moon, was not at all to her fastidious mind; while to pass the hours that remained till daylight in a rude box-bed, half-smothered between two ill-smelling *duvets*, and closed in by rough homespun curtains coloured with a crude native dye of pungent odour, was still less so. Not even the unaffected delight of the princess at having at last escaped from the commonplace amenities of civilised life could cheer 'Pinkie's' drooping spirits or calm her apprehensions.

It was no doubt her nervous anxiety for the welfare of her charge, combined with her own exceeding dislike of her comfortless surroundings, that made her so far depart from her usually unimpeachably decorous behaviour next morning.

IV.

They had breakfasted—if a bowl of goat's milk and a hunk of dark-looking, sour-tasting home-made bread with sourer cheese could be honoured by the name given to that good English repast dear to Miss Pinkerton's heart—in their sleeping-apartment, and the princess was bent on seeing something of the primitive little hill-town before they pursued their mad career up to Hesione. The conscientious duenna duly followed in the footsteps of her charge, though her apprehensions were by no means allayed by the uncouth and brigand-like appearance of the inhabitants, who, it seemed to her, eyed them with hostile intent.

So uneasy was she in her mind that the sight of a man's figure a little distance off, clad in the approved and unmistakable dress of an Englishman travelling abroad, and wearing a field-glass case slung upon his shoulder, made her so far forget her English manners and traditions as to give him chase.

He had taken up his position on a ledge of rock that formed a small, natural overhanging terrace on the hillside, and was intent upon surveying through his glasses the splendid panoramic view of the valley.

'Excuse me, sir,' panted Miss Pinkerton on reaching his side, 'but it's such a relief to see an Englishman in this outlandish place that I simply must speak to you.'

He lowered his glasses, turned a pair of amused brown eyes upon her, and raised his hat.

'I want to ask you,' she continued breathlessly, 'if you think this is a safe place for two English ladies to be alone.'

'Not particularly comfortable, I'm afraid,' was the non-committal reply. 'Making a long stay!'

'Oh no, not here; but I'm sure these people up here are not to be trusted. They may be murderers or robbers—one hears such dreadful tales of things happening'—

'The question is, are they true?' he remarked, and laughed in the nonchalant fashion of the English. His laughter somewhat restored Miss Pinkerton's failing courage.

'How like an Englishman!' she exclaimed, with a faint but relieved smile. 'Leaning to justice, but always refusing to look facts in the face!'

'But what facts do I overlook?' he asked, a gleam of amusement still lighting his dark eyes and playing over his pleasant, sun-tanned face.

But Miss Pinkerton's attention was now turned upon the approaching figure of the Princess Horatia.

'Do please tell the—um—my companion what you think,' she urged in a confidential undertone. 'She inclines to be imprudent and venturesome.'

His gay, smiling eyes fell now upon the equally gay and smiling face of that young lady as she joined her duenna, who at once informed her, 'This gentleman is not at all sure that we are wise in coming here.'

But no sooner had she made the remark than she began to be very doubtful as to the wisdom of having thus picked up acquaintance with an entire stranger—Englishman though he might be, and pleasing. The princess was of royal blood. Miss Pinkerton was deeply sensible of the gulf which must lie between even the ex-Queen of Promethea and an ordinary English gentleman totally ignorant of the barrier which divided him from one who must appear to his eye to be an ordinary English girl. She would have tried there and then to retrieve her mistake had he not taken up the conversation.

'That depends on what you're out for,' said he in reply to Miss Pinkerton's admonition. 'If it's English comfort or the best hotels of Promethea, then I think you have been very unwise in your choice. But'—

'If we want the very opposite,' put in the princess.

'Then you've struck it, I should say.'

'No, not quite. I'm going to Hesione,' she laughed, with a triumphant glance at Miss Pinkerton, whose spirits drooped lower than ever.

'Hesione!' repeated the stranger, with the faintest lift of his well-marked eyebrows. He seemed about to say more, but refrained.

'You think it a very dangerous place for two ladies?' questioned Miss Pinkerton with a despairing appeal for affirmation.

'It's not a place frequented by ladies, I believe,' he ventured cautiously. 'In fact, it's not much frequented by any one.'

'So I know,' chirruped the princess delightedly. 'That's exactly why I'm going there. It's the heart of Promethea!'

The stranger looked at her keenly as he fingered the strap of his field-glass case. 'The fact is,' he said presently, 'I'm bound for there myself. If there's anything I can do'—He glanced suggestively at Miss Pinkerton, who now deeply regretted the indiscretion of ever having addressed him, or permitted him to address the princess, who, metaphorically, was throwing herself upon his neck in the exuberance of her spirits.

'Are you really?' she exclaimed. 'How are you going?'

'Mules.'

'How glorious!' laughed the princess, clasping her hands in an ecstasy of glee. 'I don't want to be rude, Pinkie dear,' she added, seeing the deepening horror and disapproval on her companion's face, 'but a donkey's the very thing for you.'

'Sure-footed,' put in the stranger encouragingly, 'and the best mode of reaching Hesione. It's some road!'

There was a mischievous sparkle in his dark eyes that attracted the Princess Horatia. He was evidently a sportsman. 'When do you start?' she asked him.

'My mule is ordered for noon, but when it may appear is a different matter. One hour is as good as another, I find, in these parts.'

'Then we shall order ours for noon too,' decided the princess.

'Good! I'll fix it up for you, if you like,' offered the stranger obligingly. 'I have a slight acquaintance with the Promethean dialect.'

'Do!' responded the princess with enthusiasm, although she was not altogether ignorant of the Promethean dialect herself. Count Wenceslaus, being a patriot, had seen to it that the rightful queen should know something of her subjects' tongue, but she did not wish to disclose the fact to this amiable young Englishman.

V.

Miss Pinkerton's spirits dropped to zero when she saw the turn of events to which her unfortunate indiscretion had led—the Princess Horatia actually travelling to Hesione in company with a strange young man, to whom she was now presenting her card, which bore the name she had adopted for her travels.

'*Miss L'Estrange*,' read he, glancing from the card to the bearer of the pseudonym with undisguised interest. 'Of French origin? Came over with the Conqueror, I suppose?'

'No; we were later than that,' replied the princess, with a smile.

'I'm sorry I haven't a card with me,' he returned. 'But mine is quite a commonplace name. It's John King.'

Miss Pinkerton groaned in spirit. It was a commonplace name—plebeian, indeed! What would Count Wenceslaus say to such an acquaintance for his august ward?

The Princess Horatia was untroubled by any such fears. John King appeared to be all that was pleasing to her in a man, even as Prince Ajax was all that was odious.

The mere thought of Prince Ajax, swollen with imperial arrogance and the lust of war, sharply recalled to her mind the real reason why she was here in Promethea—namely, to outwit the machinations of the emperor and his myrmidons, as well as to test the loyalty of the Prometheans to the usurping king. But in neither of these quests had she been able to accomplish much or anything. Of the king she had learned little. He was a young man, and lately come to the throne. He did not trouble his subjects, and his subjects apparently did not trouble him. He performed the duties required of him, and, for the rest, enjoyed life as he chose. He had been absent from the capital during the Princess Horatia's visit to Ghetalia, on a yachting cruise on the Ægean Sea. The date of his return was unknown to any she had questioned on the matter; nor had her probings as to the depth of their loyalty met with more than a smile or a gesture which might have betokened entire satisfaction or sheer apathy—the Princess Horatia was at a loss to divine which.

One thing she did perceive, and that was, be their feelings towards their ruler lukewarm or otherwise, their awe of the emperor was unmistakable. But here, again, she was somewhat uncertain whether it was the awe of true reverence, or that which is produced by the proximity of a bully. Sometimes she felt as if it were a measure of both—that the country was divided into factions, some in favour of the bully, others against him, but ready to lie down beneath his bullying if delivered with impressively imperial pomp. The Prometheans, like the Romans of old, had an innate respect for brawn and muscle, combined with a passion for pageantry. Now, the Emperor Hildebrand was nothing if not spectacular.

Was the present King of Promethea also a royal mountebank? the princess wondered. As she had never set eyes upon him either in the flesh or even in pictured form, she had had no means of judging. According to an ancient law of Promethea, it was forbidden to portray the form or features of the sovereign in any manner whatsoever. The figure of Prometheus with his fire-brand—from whom the Prometheans claimed descent—took the place of the king's effigy on all the stamps and the coinage of the kingdom, as well as figuring on articles of popular use and fancy where the royal portrait might have been expected.

(Continued on page 787.)

THE MARK OF JERUSALEM.

By DAVID MACRITCHIE.

ONE doesn't generally think of the author of *Vanity Fair* in connection with descriptions of life and scenery in the Levant, although it is a matter of common knowledge that Mr Michael Angelo Titmarsh published, in 1846, his *Notes of a Journey from Cornhill to Grand Cairo*, undertaken in the late summer of 1844. These *Notes*, however, have acquired a fresh interest, owing to recent developments in European politics, undreamt of by Thackeray. For example, he tells his readers of an American fellow-traveller who had been appointed U.S. Consul-General for Syria. This worthy was a good deal of a crank, who expected the Millennium to begin soon after his arrival in the Holy Land, and he had brought with him a dove as a symbol of that great event. Without loss of time, on arriving at Jerusalem, this unique consul 'sent and demanded an interview with the Pasha; explained to him his interpretation of the Apocalypse, in which he has discovered that the Five Powers and America are about to intervene in Syrian affairs, and the infallible return of the Jews to Palestine.' The news, observes Thackeray, 'must have astonished the Lieutenant of the Sublime Porte.' The consul was some seventy or eighty years out in his reckoning, but his anticipations were not so foolish as Thackeray assumed them to be—so far as regards the intervention of American and European Powers in Syrian affairs, and the return of Jews to Palestine. But he showed himself the poorest kind of a prophet when he asserted that the Millennium was at hand in 1844.

This, however, has little to do with the Mark of Jerusalem, an emblem which Mr Titmarsh thus refers to: 'Some worthies there are who drive a good trade by tattooing pilgrims with the five crosses, the arms of Jerusalem, under which the name of the city is punctured in Hebrew, with the auspicious year of the *Hadjj's* visit. Several of our fellow-travellers submitted to this queer operation, and will carry to their grave this relic of their journey. Some of them had engaged a servant, a man, at Beyrout, who had served as a lad on board an English ship in the Mediterranean. Above his tattooage of the five crosses, the fellow had a picture of two hearts united, and the pathetic motto, "Betsy, my dear." He had parted with Betsy, my dear, five years before at Malta. He had known a little English there, but had forgotten it. Betsy, my dear, was forgotten too. Only her name remained engraved with a vain simulacrum of constancy on the faithless rogue's skin, on which was now printed another token of equally effectual devotion. The beads [which were then offered for sale as relics] and the tattooing seem essential

ceremonies attendant on the Christian pilgrim's visit; for many hundreds of years, doubtless, the palmers have carried off with them these simple reminiscences of the sacred city. That symbol has been engraved upon the arms of how many princes, knights, and crusaders!' The soundness of this deduction is manifest, yet it does not seem to have occurred to other popular writers of the nineteenth century. Scott, for example, makes no reference to this practice, so far as I can remember.

Two hundred and thirty years before Thackeray, another British pilgrim had recorded the same custom. This was the Scottish traveller Lithgow, a native of Lanark, who visited Jerusalem in 1612, in the company of ten other Franks. 'The last day of our staying there,' he writes, 'we went all of us Friars and Pilgrimes in againe to the Holy Grave, where we remained all night. Early on the morrow there came a fellow to us, one Elias Areacheros, a Christian inhabitant at Bethleem, and purveyor for the Friars, who did engrave on our severall Armes upon Christ's Sepulcher the name of Jesus, and the Holy Crosse; being our owne option, and desire: and here is the Modell thereof.' Lithgow's 'Modell' shows a rectangular cross, with limbs of equal length, except that the lowest is slightly prolonged into the H of the letters IHS placed beneath. Below these letters is the word IERUSALEM, in Roman characters, not in Hebrew, as in Thackeray's time. The ends of the three upper limbs terminate in a crutch, something like that of the *cross potent* or of the *cross moline*. Within the four angles of the cross are four little crosses, akin to the Maltese—these four, together with the large cross, constituting Thackeray's 'five crosses, the arms of Jerusalem.' Lithgow also prints 'The Armes of Jerusalem' beneath his 'Modell.' The correct heraldic designation seems to have been 'The Arms of the Holy Sepulchre.'

Lithgow was not content with the conventional emblem alone. 'But I decyphered,' he adds, 'and subjoynd below mine, the four incorporate Crowns of King James, with this Inscription, in the lower circle of the Crowne, *Vivat Jacobus Rex*: returning to the fellow two Piasters for his reward.' Lithgow carefully portrays 'King James his foure Crownes' underneath his sketch or 'Modell' of the Jerusalem arms. It is something of a coincidence that in each of these recorded instances of 1612 and 1844 a secular addition to the emblem appears. In the earlier case the motive was loyal and patriotic; but 'Betsy, my dear,' and the two united hearts merely represented the ashes of a flame long extinguished.

Little did Lithgow know, however, when he indulged in this loyal outburst at Jerusalem, that he was laying up serious trouble for himself in the near future. This he painfully realised when, on his homeward journey, he was arrested at Malaga on suspicion of being a spy, and was cast into the dungeons of the Inquisition, there to undergo the most fiendish tortures. The discovery of the loyal emblems tattooed on his arm only furnished his persecutors with a fresh form of cruelty. For Lithgow tells us that 'the Encarnador [or Tormentor] informing the Governor that I had the marke of Jerusalem on my right arme, joyned with the name and Crowne of King James, and done upon the Holy Grave, the Corregidor came out of his adjoining stance and gave direction to teare asunder the name and Crowne (as hee sayd) of that Hereticke King and arch-enemy to the Holy Catholicke Church.' By the process of 'cutting the Crowne, sinews, and flesh to the bare bones,' by means of tightened cords, the servants of the Inquisition apparently succeeded in obliterating the design—although their victim would carry to his grave the traces of their cruelty.

Had Lithgow not made this superfluous addition to 'the mark of Jerusalem,' it is clear that that emblem would have constituted an appeal that the Inquisitors could not disregard, since it asserted that the pilgrim had made the *hadj* to

the Holy Sepulchre. Yet even here some reservation must be made. There were many fraudulent pilgrims wandering about Europe during the Middle Ages and in later times, who could not be accepted at their own valuation. There were, for example, the *coquillards*, who professed to have visited the shrines of St James and St Michael, in testimony whereof they wore in their hats the scallop-shell, or *coquille de Saint Jacques*. But this hardly amounted to proof of their having made the pilgrimage. It would be so easy to assume the scallop-shell, or to have the five crosses tattooed on one's arm, without ever visiting the shrines at Compostella or Jerusalem. Such a practice is not unknown in Switzerland to-day, where tourists sometimes have their alpenstocks branded with the names of summits that they *meant* to ascend; only, they found it so much more restful to remain at the base.

Legitimate or fraudulent, this ancient symbol must have been tattooed upon the arms of innumerable pilgrims, not only princes, knights, and crusaders, as Thackeray suggests, but men of lesser note. Many other references must exist besides the two I am able to quote. The practice of tattooing was at one time widespread in Europe, and it seems extremely probable that 'the mark of Jerusalem' was first impressed by a people to whom that practice was familiar.

RECOLLECTIONS OF A NAVAL SECRETARY.

V.—CAPE AND WEST AFRICA, 1882-85.

By C. E. GIFFORD, C.B., R.N.

I.

AS recorded in earlier instalments of these Recollections, I joined the Royal Navy as assistant-clerk in March 1861, and served my first five years in the *Marlborough* and the *Victoria*, three-deckers, flagships of the Commanders-in-Chief in the Mediterranean, to whose offices I was attached.

After a commission in the Commander-in-Chief's office at Devonport, I went to Halifax, in the office of the Commander-in-Chief on the North American and West Indian station.

War between Germany and France brought us home for service in the Channel Fleet.

After three years' service in China and Japan, and further commissions at Devonport and in the Channel Fleet, I was invited by Admiral Sir Nowell Salmon, V.C., K.C.B., to accompany him as secretary to the Cape of Good Hope. We sailed from Devonport in February 1882, in H.M.S. *Thalia*, with a new crew for the *Boadicea*, to be recommissioned as the Cape flagship.

The *Thalia* was not calculated to accommodate the crew of a ship of the *Boadicea* class for so

long a sea trip, and there were doubts expressed as to whether our provisions would hold out.

While steaming slowly across the 'doldrums'—the calm belt on each side of the equator—we fell in with the clipper *Cutty Sark*, flying a signal of distress. We closed her, and her captain came on board us. She was bound from San Francisco to New York, and had been so long becalmed on the line that the crew were reduced almost to the lowest extremity for food. The admiral invited the captain to breakfast, whilst a supply of beef, biscuit, &c. was being put into his boat; but he could not face our luxuries of bacon and sausages, having tasted nothing but coffee and biscuit for a long time. He left us confident that he had now enough food to take the ship to the nearest port—Pernambuco. The way in which the half-famished crew, especially the apprentices on the mizzen, handled the sails was the admiration of our crew. A more beautiful model could scarcely be seen.

We crossed the line, with the usual ceremonies, on the 10th March, and reached Simon's Bay on the 10th April, having, since All-Fools' Day, been very doubtful whether either our coal or our food would last. The 'sweet little cherub,'

however, stood our friend; the south-easter, which blows constantly in these seas in the early months of the year—the height of summer, that is, for we are in the southern hemisphere—died away, and we slipped round Cape Point without having been obliged to burn mess tables and stools as fuel, or to grill the admiral's dove for breakfast, both possible contingencies.

The Cape and West Coast of Africa station at this time extended from the river Gambia on the west, round the Cape of Good Hope to Delagoa Bay on the east, some five thousand miles of coast-line. The headquarters in Simon's Bay, with its old Dutch-built admiralty house and pleasant cottage on the beach for the secretary, were very attractive. Fortunately residence there for a considerable part of the year was the rule of the station, so that we had the happiness of home-life combined with the benefits of foreign service.

Each year we left the Cape immediately after Christmas, called at St Helena and Ascension, crossed thence to the Gambia settlement, worked our way round the coast, visiting Sierra Leone, Liberia, the Gold Coast, Lagos, the Oil Rivers, Fernando Po, the Congo, and Portuguese Angola, returning to Simon's Bay in April. Then, in the winter or spring months, we visited the eastern ports of Cape Colony—Mossel Bay, Port Elizabeth, East London, Durban in Natal, and occasionally Delagoa Bay.

II.

The period 1881 to 1885 was one of great interest and activity in Africa. The game of land-grab was being vigorously played by the European nations, the doctrine of Hinterland was being preached, and new atlases were constantly needed to keep pace with the changes.

The vast Congo Free State had already been formed by the king of the Belgians as a memorial to his son and as a philanthropic measure (*œuvre civilisatrice*). Lieutenant de Brazza, of the French Navy, was busily engaged in annexing, to the north of the Congo, the territory now known as the French Congo; the French were also planting their flag in Dahomey. Germany annexed Togoland, Cameroons, and the territory on the Atlantic seaboard lying between Portuguese Angola and the Cape, which was named German South-West Africa. Britain was extending her borders in the Niger district, which developed into North and South Nigeria; and Cecil Rhodes, then absorbed in making Bechuanaland a British Protectorate, doubtless had his eyes on the magnificent vacant lot farther north which now forms Rhodesia, though we did not suspect him of it.

The rules of grab were pretty much the same when played with land as with cards: he who got his hand in first was the winner.

Mr Hewett, British Consul at Fernando Po, assisted by the officers of the West Coast naval

squadron, was active in making treaties with the native chiefs in the Oil Rivers, just at the time that Germany annexed Cameroons. In connection with the latter I have a story to tell, which may be taken as a sequel to the account of this annexation given by Major-General Sir Ivor Maxse in his interesting life of Colonel Seymour Vandeleur. I was walking with Sir Nowell Salmon one Sunday afternoon in Cameroons, when we met the king of Bell Town, a well-dressed negro. He had evidently seen the admiral's flag flying in the *Alecto*, and was on the look-out. Coming up to us, he said in fluent English, 'Admiral, I want to sell my country to the white man. I write one letter to Lord Clarendon, one letter to Lord Granville, and I get no answer. So I write to Queen Victoria and say I want to sell my country. Suppose I not get answer very soon, I ask the Germans; perhaps they like to buy it.'

Well, shortly after this, and apparently before the king had received an answer to his letter to Queen Victoria, Dr Nachtigall, the German explorer, who had been given by his Government considerable powers of annexation, arrived at Cameroons in the gunboat *Moewe*; the king of Bell Town went on board, a bargain was struck on the spot, and the purchase-money paid. The German flag was hoisted, and Bell retired into the bush with the proceeds of the deal.

Kings were at this date as plentiful as huckleberries on the West Coast of Africa; they were in reality the chief traders. On Cameroons River, and in near proximity to each other, were five towns—Joss, Bell, Acqua, and Dido on the left bank, Hickory on the right, each owing allegiance to its own 'king.' The Germans had negotiated for the purchase of the district with Bell only, and refused to recognise any other claimants, saying they must get their fair share from Bell. As they could not succeed in this, Joss and Hickory burned Bell Town for selling them, whilst Dido gave Acqua four dozen for supposed connivance with Bell. Dido murdered a British subject, but escaped all punishment.

Later a German admiral, who had been sent out to the colony, was held prisoner for four days by natives; whilst a German consul died of fever—a somewhat disastrous opening to the German occupation of the great and rich province of Cameroons. This occupation, it will be remembered, ended in the early part of the recent war, Cameroons being captured by Franco-British forces.

Ambas Bay lies opposite Fernando Po, in the angle formed by the great southward bend which the coast here makes. A glance at a map will show that it is a veritable 'corner of the earth,' and that here rises almost from the bay to a height of nearly fourteen thousand feet the Grand Cameroons Mountain. I never hear in our Church's morning service the verse of the Venite, 'In His hands are all the corners of the

earth, and the strength of the hills is His also,' without being taken back in my mind to that scorching Sunday morning when the crew of the *Boadicea*, lying in Ambas Bay, almost under the shadow of the mountain, sang this verse at their morning service. This magnificent mountain, and a strip of territory extending as far as Lake Chad, have, under the peace arrangements, been assigned to Great Britain.

I had an amusing experience during a walk with the admiral in Cameroons. A woman carrying a baby held it out to me, and as a joke I offered her a fourpenny-bit for it. To my astonishment, she promptly accepted the coin and walked away, leaving me with the baby in my arms, to bear as best I could the loud laugh at my expense from a crowd of men and women. No doubt I might have stuck to my bargain had I so wished, but being the proud father of two white babies, I had no real desire for a black one, and eventually I found a local Miriam who, for another small coin, agreed to take the baby back to its mother.

III.

After our return to the Cape, a German cruiser anchored in Simon's Bay. In the course of conversation with Admiral Salmon, her captain, who was paying his official visit on arrival, mentioned that he had annexed all the coast of Damaraland and Namaqualand lying between Cape Frio and the Orange River—that is to say, some seven hundred miles of territory separating Portuguese Angola from Cape Colony. 'What about Plum Pudding Island, Roast Beef, Ichaboe, and the other guano islands, for which my friend Captain Spence is paying rent to the Cape Government?' said the admiral. 'Oh, I suppose all islands within three miles of the coast go with it,' replied the captain. 'But the diplomatists can easily settle that.' I observe even in pre-war atlases the letters (Br.) against the names of these rocks—for they are little more—showing that they remained ours.

It is to be regretted that this enormous territory—some 330,000 square miles—thus acquired by Germany, but now attached to the Union of South Africa, should consist largely of barren desert. The lack of water on this part of the coast is no doubt mainly due to the absence of trees, and, to complete the vicious circle, one might add that the absence of trees is due to the lack of water. An Admiralty chart of this coast has a notation: 'First tree visible since passing the Orange River.'

I remember seeing in a German illustrated newspaper a picture of Angra Pequena in their newly acquired province, showing a navigable river with ships alongside wharves. Unfortunately the sketch was purely imaginary, and the settlement consisted in reality of two or three buildings. One of them was a kind of tower, in which at the time of our visit a prisoner was waiting till a judge should come from the

Cape to try his case. While the *Boadicea* was at Angra Pequena, previous to its occupation by Germany, we asked the only English resident what we could do for him. 'Let every boat which lands from the *Boadicea* bring me a beaker or two of drinking-water, and I shall be very grateful,' said he.

Farther north, at Elephant Bay, there is practically no rain from year's end to year's end. It was one of the ports of call of our West Coast squadron, and, for want of a more lively amusement, the crews were accustomed to bivouac for a day or two on a high hill near the coast. In the adjoining bay (where, I was told, were both trees and water!) a Portuguese settler had built a lime-kiln. The bluejackets, having carried up the hill a load of lime, and water from a 'fountain' near the beach, would fill up their time by marking out, in great whitewashed stones, the name of their ship. When we were some miles out at sea we could distinctly read the name *Avon*. The ship had left the station several years before, but no rain had come to obliterate the work of her crew, and on visiting the hill we found the whitewash on the letters still quite fresh, the letter 'O' being twenty yards wide.

The so-called 'fountain' was really a small spring forming a water-hole, and was visited every night by droves of wild zebra, which we could hear galloping across the plain.

Cape Colony had at this time established Government nurseries for trees of all sorts, which they supplied free of charge to any one who would plant them. Reafforestation was becoming very necessary, since, owing to the lack of coal, all the trees had been cut down for firewood. I remember driving across an arid plain near Port Elizabeth, where our host, Mr Campbell, told us that as a boy he had shot duck in the marshes; these had entirely dried up owing to the destruction of the trees.

On our return to Simon's Bay from one of our West Coast cruises, we, as we supposed harmlessly, brought with us a sprouting coco-nut and a bag of pea-nuts—and narrowly escaped a very heavy fine. It seems that travellers from Australia had brought in a spray of the Port Jackson Willow—a mimosa—which had blight on it. The blight spread, and eventually destroyed all the orange-trees in the Eastern Province. The Cape Parliament accordingly passed a law inflicting severe penalties on any one importing plants of any description. We burned our palm, already moribund, and ate our pea-nuts without loss of time!

IV.

The fighting in Zululand, which ended in the capture of Cetewayo and his confinement at De Renske's farm near Cape Town, was over before our arrival. Our only dealing with that troublesome chief was the provision of a passage for him and his many wives in a man-of-war from

Simon's Bay to Zululand. He had recently returned from England, where terms had been arranged with him, under which a part of his former dominions was to be restored to him.

He arrived at Simon's Bay in a very bad temper, accompanied by his English interpreter, Mr John Dunn, and it was not until he had drunk two or three glasses of champagne that he vouchsafed any reply to the admiral's remarks. Another glass led him to propose to write to Queen Victoria. Accordingly he dictated to Mr Dunn a letter, which that gentleman translated, and I wrote as follows :

'ADMIRALTY HOUSE, SIMON'S BAY,
January 4th, 1883.

'I am writing to you, Queen Victoria, to thank you for releasing me from the cruel bondage I was recently kept in, and to say that I am this day leaving the shores of South Africa for my native land. I thank you for your kindness, and hope that I will be able to sleep safely in my country. Keep my feet off the ground, as a mother would do her infant. I do not want to get into trouble any more. Do not think that Cetewayo will ever neglect you, and if you ever again hear idle reports of me, ask me to come to you and explain all myself. I am the child of the White House; keep me and watch over me always. I conclude by thanking you for your kindness to me, and, when I leave this place, trust to prosper in your name. As long as I am alive I will always want to hear of you.

(Signed) CETEWAYO.'

The 'Child of the White House,' I may add, must have weighed some twenty stone at least, so that Queen Victoria's task in 'keeping his feet off the ground' was to be no light one.

Cetewayo was, so Mr Dunn said, very proud of being able to write his name in English, and in his best style he laboriously printed 'CETEWAYO' at the foot of the letter, Mr Dunn giving him occasional hints that he was running uphill, instead of sticking to the lines which he had ruled for him.

After this picturesque expression of his gratitude to the Queen, it was sad that the forecasts of those who, knowing the character of Cetewayo, declared that the truth was not in him should receive immediate confirmation. No sooner had he set foot on the shore of his native land than he despatched scouts in all directions with lying messages to his people concerning the arrangement come to with the British authorities, and followed this up by breaking all the promises which he had made.

v.

So far I have attempted to give some general idea of the Cape station in the 'eighties; I propose now to give a short description of our visits to the West Coast of Africa settlements and the Oil Rivers.

On our first tour of the station we visited the Congo, a grand river, some six or seven miles wide at its mouth, and enormously deep. On approaching it we met, out in the open sea, little green islands, which had been torn off the banks by the rapid current, and carried out. Unfortunately the sheltered anchorage in Banana Creek was so fever-stricken that Her Majesty's ships were not allowed to lie there at night, and we accordingly anchored off the unsociable Sharks' Point.

We also visited Mossamedes, a somewhat dreary-looking town in Portuguese Angola. On some rocks to the south of the town a weary Frenchman had carved in deep letters: '*Mes chagrins m'ont conduit ici.*'

Our northernmost point, the Gambia River, had a bad reputation as a nest of fever. So bad was it that Her Majesty's ships were forbidden to make any prolonged stay there, except in the early months of the year.

We visited it in February 1884, and were pleasantly surprised to find that the climate was perfect; the days were fine and hot, and at night a thick blanket was a comfort.

Sierra Leone, beautiful as we found it, was also very unhealthy at that time. On one of our visits we learned that all the chief officials were absent on sick leave, and that a young barrister was acting-governor. He told me that people did not know how to live in Sierra Leone, and that if one took proper care, plenty of exercise, and suitable food, it was not a bad climate. Alas! on our next visit we learned that he had died of fever.

The ships of the West Coast squadron were allowed, in addition to their ordinary fighting complement, a certain number of Kroomen. These are a fine race of negroes from the neighbourhood of Cape Palmas, and are the working-bees of the West Coast. They could be employed on any ship's work in the tropical sun, which would be fatal to the health of the white members of the crew.

There was in Sierra Leone a large colony of Kroomen, from which the naval agent selected the numbers needed for shipment, and on our first visit there we completed to the number of forty allowed to a ship of the *Boadicea* class.

Their native names being unpronounceable and quite unspellable, it is the practice to give them English names. The happy thought occurred to Mr Rigby, assistant-paymaster, to give our new-comers Pickwickian *aliases*, and for the next three years Mr Pickwick, Sam Weller, Tracy Tupman, and their friends answered their names at the musters of the ship's company. This was a great improvement on the plan adopted in the previous commission, when very frivolous nicknames had been given the Kroomen. On a brass plate erected in Simon's Town church to the memory of those

officers and men who had died during the commission (the list is headed by the name of my old messmate Commander Francis Romilly, who fell at Majuba) there may, no doubt, still be seen the names 'Flying Jib,' 'Prince of Wales,' 'Bottle of Beer,' and others equally ill-chosen.

VI.

From Sierra Leone we went on to Monrovia, the capital of Liberia, the negro republic built up by the United States of America as a philanthropic experiment for the benefit of West Africans returning to their native country.

The admiral was received on landing by three officers, negroes of course, who were dressed in full naval uniform with epaulettes and cocked hats, but who told us they served equally in the navy and the army. They escorted us to the White House, where we found the newly elected president of the republic, Mr Johnson, the first native-born occupant of that post. He was surrounded by the Government officials, all of them as black as himself. We were regaled with champagne and sponge-cake, followed, after a short interval, by a glass of port.

So far as we could judge from our talk with the officials, the experiment in self-government was not proving very satisfactory. The state was bankrupt; Monrovia, the capital, showed signs of decay and neglect—so much so that weeds were growing luxuriantly in the main street; and the officials said that nothing could be done for want of money. The people appeared to be well educated, and they showed regard for their benefactors by speaking English, the official language of the state, with a strong American accent. Nor were some of them deficient in the keen American sense of business. One of the smartly dressed officers, who escorted us to our steam-barge, anxious not to lose the chance of

doing a deal, invited us to buy some coffee from him. We accepted his invitation, and found his coffee excellent.

An old resident in West Africa, speaking of Liberia, summed up the situation in this way: 'They are trying to make asses into horses, whereas they are only fit to be mules.' It must, however, be admitted that Monrovia was infinitely superior to the native towns in the adjoining districts under negro rule.

From Monrovia we coasted along to Cape Coast Castle and Accra.

Landing in a surf-boat at Accra was a new experience for me. These boats—built after the fashion of whale-boats—are wonderfully well handled by their native crews. A dozen sturdy blacks sit round on the gunwale, and work their paddles most vigorously to a monotonous chant of 'Flagship, he come again, he come again, he come again; flagship he come again,' repeated all the way from the ship to the beach. The coxswain, keeping the boat's bows on to the huge rollers, watches for a lull, and takes instant advantage of it to turn the boat round towards the shore; whereupon the crew 'dig out' madly for the landing, until the coming of more rollers necessitates another complete turn to face them again.

(To any one who would like to read a scientific description of the handling of a boat in the surf, I would say read Admiral Fitzgerald's book on the subject.)

We lunched at Christiansborg Castle, two miles from Accra, with the governor-in-chief of the Gold Coast, Sir Samuel Rowe. This old Dutch fort was then the residence of Gold Coast officials. It is close to the sea, and the never-ending roar of the surf is so depressing that the quarters in the front are at a discount.

(Continued on page 797.)

THE MINERAL WEALTH OF COLOMBIA.

By REGINALD B. SPAN.

GOLD-MINING has always been a fascinating subject, and the life of the prospector for gold and other precious minerals is full of romance and adventure, as well as hardship and toil, which is particularly attractive to the hardy, adventurous Anglo-Saxon.

The great gold-rushes of the world have generally been led by the British, Scotsmen being particularly prominent as discoverers of new auriferous regions. It is a noticeable fact that the reliable, canny Scot makes the best mining engineer and mine manager; and on the gold-fields of Africa, Australia, and America you will find Scotsmen holding the most prominent positions.

The recent important discovery of gold in Western Australia reminds us that there are still

vast mineral treasures in the bosom of Mother Earth awaiting the adventurous seeker. For years the goldfields of Western Australia had been in a more or less lifeless condition, when suddenly the prospector's pick opened up a lode some twenty-five feet wide, running two ounces (and more) to the ton, on the Hampton Plains, which hitherto had proved so barren. In a week the shares of the Hampton Properties Company rose from 3d. to £2, 10s., whilst a 'rush' set in from all parts of Australia to the new El Dorado. The daily papers, as well as the financial press, were at once full of this new gold discovery, with its consequent wild speculating on the Stock Exchange in shares of companies interested in the district.

The whole thing is a gamble—the gold-reefs

of West Australia (unlike those of the Transvaal) are proverbially uncertain and erratic, as the writer pointed out in a letter to the *Financial Times* at the time.

Enormously rich lodes have frequently been known to 'peter out' at comparatively small depth in West Australia. These discoveries cannot be relied upon from one week to another.

For the gold-seeker, perhaps the most promising country in the world is Colombia, in South America—which is too little known to the British—with vast auriferous regions still untouched. Of late years a few British companies have started work there on concessions obtained from the Government of Colombia, and dredges are now in full operation on the rich deposits of gold and platinum which line the river-beds and valleys in the districts of Cauca, Antioquia, Choco, &c. The richness of these gravels is stated to be enormous. In some river-beds there is far more platinum than gold, and when one considers the present value of platinum, about £28 an ounce, it is easy to judge how very profitable these operations may prove.

The oldest mining district in Colombia is Antioquia, where the quartz and placer deposits have been worked since the days of the Spaniards, but show no sign of diminution. The French expert and mining engineer, M. Demangeon, in his work *L'Industrie Aurifère en Colombie* (Paris, 1907), states: 'The massif of Antioquia alone is perhaps the richest gold-deposit in the world, and only awaits labour, properly organised, and capital, to show its immense value. The great mountains in this auriferous region are full of ravines, where one may see the outcroppings of lodes in all directions, most of which are gold-bearing, but at present, to a great extent, inaccessible for lack of roads or means of transport. There are rich alluvial-deposits in the Cauca, Porce, and Nechi rivers, and the many *quebradas* which flow down the mountain ravines, where a good deal of gold has been obtained by the natives; but the auriferous sands appear inexhaustible, and with proper machinery very profitable yields could be obtained.' Mr Robert White, the well-known Scottish engineer, in referring to these deposits, observed: 'I do not know any rivers in any country outside of Colombia where such favourable conditions exist for the extraction of gold.'

All the same, it is as well to point out that Colombia is not a poor man's country. It is a difficult country to prospect, and capital is absolutely necessary. Mr I. A. Manning, the American Consul, in his *Daily Consular Reports*, October 31, 1912, writes: 'This is not a poor man's country. Scientific prospecting only will pay in Colombia. The placer and quartz deposits both require up-to-date machinery to prove profitable, and then they will pay handsomely.'

In no country in the world are the mining laws so liberal as in Colombia, and every facility is given to the prospector to explore and take up mining property. No annual work (generally known as assessment-work in America and Australia) is necessary to hold property, and therefore there is no fear of one's claim being 'jumped' by others, as is so often the case in other countries if the assessment-work is not done in the required time.

(The writer had a valuable gold-claim jumped at Cripple Creek, Colorado, U.S.A., as he was taken ill, and was unable to have the necessary assessment-work done in the stipulated time.)

A prospector in Colombia who has not the means or ability to develop his mining property takes up as much land as the law entitles him to, and then waits until he can find some capitalist or syndicate to buy him out. Sometimes he parts with his claims at a very high figure. A man with sufficient means to 'keep him going' in the way of supplies and food—which can only be obtained at high prices in the mining regions—and a good constitution to stand the extremes of heat and cold met with on plains and mountains, could do very well as a prospector in Colombia, and might make a fortune in a comparatively short time. Public attention in this country and America is being directed to the vast possibilities and wealth of Colombia, and more and more companies are forming now, and will be formed in the near future, to exploit the rich deposits of gold and platinum which were so lavishly distributed in the rivers and the mountains by the hidden forces of Nature.

The rivers of the Pacific coast are all auriferous, some being extremely rich; but there is one great drawback, and that is the climate, which is very warm and damp near the sea-level, on the plains, and in the deeper valleys amongst the mountains, where malaria claims many victims amongst those who do not take the necessary precautions.

Colombia has now taken first place amongst the countries of the world as a producer of platinum—that most rare and valuable of minerals, so indispensable in important industries. Until a few years ago Russia was the principal producer of platinum; but the deposits there, worked for so long a period, are rapidly approaching depletion, whilst in Colombia fresh discoveries of the metal are constantly being made, the last extensive deposit found being in the Opogodo River (a tributary of the San Juan), which is soon to be dredged by the British Platinum and Gold Corporation, the machinery being now erected on the property.

Platinum was first discovered in Colombia as long ago as 1737, by Antonio de Ulloa, a Spanish scientist. To-day it is chiefly found in the San Juan River and its tributaries, such as the Tamana, Iro, Opogodo, and Jujiado, where it far outvalues the gold. In the other district

where it is found—namely, the Barbacoas, extending from the frontier of Ecuador to the Micay River—the gold-deposit predominates over the platinum. (Platinum is always found with gold—never alone.)

The British companies now operating in Colombia are extracting gold and platinum at the same time, with the same machinery. One of these companies has discovered profitable petroleum-wells on its property, as well as precious minerals.

The gold and platinum fields of the Choco district are reached by steamer up the San Juan River, the nearest seaport being Buenaventura, about fifty miles south of the San Juan River mouth. Concerning this region Mr R. B. White writes: 'The western chain of the Andes, the source of the San Juan and its affluents, is extremely auriferous. The formation of the valleys of the Atrato, of the San Juan, and some other rivers of the Pacific coast dates from a later epoch than the high lands, and we can conclude that these rivers, the Atrato, the San Juan, and their affluents, hold and confine enormous quantities of gold in their beds. . . . I have examined the gravels of the San Juan and Tamana in many places, and have always found them sufficiently rich to pay for washing, even by the most primitive methods. In the better parts of these two rivers I have proved that the gravel contains over an ounce of gold to the ton, but it is natural that in these gravels the gold does not remain long on the surface. My observations, and the results obtained by natives, warrant me in saying that the layer resting on bed-rock will produce, on the average, *ten ounces of gold per square yard.*'

The principal deposits, where British syndicates are now working, are about a hundred miles from the coast, and transport is effected by river steamers up the San Juan and its tributaries, which connect with ocean steamers at the mouth of the river.

The climate is a severe tropical one, but a European can perform his regular duties there, provided the usual precautions are taken. The great thing is to be careful in the matter of food and drink. Take doses of quinine every day, avoid exposure to wet and extreme heat, and keep the mosquitoes at bay by a good mosquito-net—the best that can be obtained, as mosquitoes cause more disease than anything else. The rains are very heavy, and the climate a damp one, so good waterproof clothing and waterproof sheeting is essential.

Railways are few and far between in Colombia, and travelling is chiefly done by river steamers along the numerous palm-fringed waterways of that beautiful country. Prospectors go from one goldfield to another by boat. Journeying in this fashion is generally rather slow.

A trip up the Magdalena River by steamer from Barranquilla to La Doranda—a distance of

600 miles—takes ten days. There are numerous halts and delays on such a journey, and, on account of constantly changing shoals and sand-banks in the river's course, boats can travel by day only.

Unfortunately the richest gold-mines are in the remote interior, away from the rivers, so they are difficult of access, being without means of transportation; consequently few of them have been worked by modern machinery. A native writer has said that 'in Colombia one walks on gold, lives without effort on the indigenous products of the soil, and is never anxious about a place in which to sleep.' On the higher lands, away from the rivers, sleeping out would no doubt be very pleasant, as the climate is warm and not damp, and there are no mosquitoes or malaria; but black bears abound in many of the cordilleras, just as tigers inhabit the jungles of the lower valleys, and panthers the forests on mountain-sides, so one would need to exercise some caution as to one's sleeping-berth.

The greater part of Colombia is still an unbroken wilderness, with vast mineral wealth and exceedingly rich and varied undeveloped resources. There are few countries in the world more picturesque and beautiful, and its commercial possibilities are almost incalculable. Besides gold and platinum, Colombia produces silver in abundance, diamonds in small quantities, emeralds from the celebrated emerald-mines of Muzo, and rich iron ore from the plains of Bogotá. Near Rio Hache, on the coast, are seemingly inexhaustible coalfields; and asphaltum, sulphur, magnesia, and alum are found in many parts of the country.

The north coast of Colombia was part of the old Spanish Main, with which Spanish treasure-ships, pirates, and romance are indissolubly associated. In the adjoining state of Venezuela was the original and far-famed El Dorado, the scene of so many legends of fabulous wealth and romantic deeds. In El Dorado ('The Golden') gold, diamonds, and precious stones were said to be as plentiful as the sands and pebbles of the sea-shore; and the streets of Manoa, the gorgeous capital of this wonderful country, were reported to be paved with solid gold.

Many adventurers sailed up the Orinoco in search of El Dorado, the chief of them being Sir Walter Raleigh, who in 1595 brought his frigate up the great waterway of the tropics as far as Caroni. Whether El Dorado existed or not, it is certain that Spanish adventurers brought back fabulous wealth from the mountains and inland recesses of Colombia and Venezuela, and their treasure-galleons were laden to the brim with gold and silver and precious stones.

These two countries were, and are, a veritable storehouse of precious minerals, surpassing in wealth any other country in the world—but riches, alas! so difficult to reach and extract. There is, we are told, a region in Venezuela where gold

lies on the surface in nuggets and gold dust, and the rocks glitter with the precious metal—millions of pounds worth—but it is a place of death, guarded by a deadly malaria and myriads of mosquitoes of unusual size and ferocity.

Only three men lived to tell the tale of what that golden valley contained, and they died on reaching civilisation from the effects of malaria and the terrible hardships they had been through. Others, at various times, have gone in search of this place, but none of them ever returned. The way to it lies over vast swamps, through dense

jungle, and over precipitous mountains, where one has to face every kind of hardship and danger, infinitely worse than the terrible snow-bound trail to the Klondike in the early days of that famous goldfield, or the scorching, waterless deserts of West Australia. Nature has a way of safeguarding her treasures, and it is only the strongest and bravest and most determined who can wrest her secrets from her, and become possessed of the precious metals and gems which lie concealed in her wildest and most formidable solitudes.

A STRAIGHT FLUSH.

By JOHNSTON SMITH.

I.

CAPTAIN TIMOTHY REILLY of the tramp steamer *Orion* rang his engines down to 'dead slow,' and then 'stand by.' Leaning over the bridge-dodger, he eyed the pilot cutter wallowing to windward in the swell. Just ahead, with the long Pacific rollers booming at their base, sheered the dark purple cliff walls of Sydney Heads.

A boat dropped smartly from the cutter's davits, and working briskly down in her lee, pulled alongside the *Orion*. Waiting for the exact moment when a roller lifted the cockleshell high up towards the tramp's rusty side, the pilot sprang for the Jacob's ladder and clambered monkey-like aboard.

The engine-telegraph clanged again, and the *Orion*, rolling and creaking, moved slowly ahead into the harbour.

'Back again, captain?' began the pilot conversationally, as he swung her over to take the outer passage.

'Aye, aye,' agreed the skipper cheerfully. 'It's back again I am, like the "southerly buster" after a heat-spell.'

For a young man Captain Tim Reilly had done well by the sea, and if not yet the owner of the old *Orion*, he already held the controlling interest in her. A good seaman, he was a better business man; but even so, adventurer, in the old sense of those merchant-seamen in Queen Elizabeth's time, would be nearer the mark. And if he could not go forth to plunder the Spanish Dons in the Indies, he had to display the greater ingenuity in his ventures on that account. Unlike most of his countrymen, he never nursed a grievance, preferring, to his great popularity, to seek the joke that ever lies hidden—even in tragedy. He made a jest, too, of his old tramp, and, to make her the more truly Irish, had the sign of the great constellation painted on her bows in emerald-green, and if the Board of Trade had permitted, he would have had the name itself

spelled in the Hibernian manner, *O'Rion* or even *O'Ryan*.

And now, if Captain Reilly had required an added incentive to get rich quick, he had discovered it in the bright eyes of Flossie Mortimer. Always welcomed heartily by old 'Malay' Mortimer and his daughter when he reported himself each trip at the old house on the slopes of Neutral Bay, he had made up his mind that the fair and charming Flossie would be even more charming as Mrs Reilly. The only fly in the ointment was Josiah Shine, a highly respected officer in the Sydney Customs. Mr Shine also desired to win Miss Mortimer for his own, and Captain Reilly did not make the mistake of underrating the solid weight of the opposition. Mr Shine's reputation had been built up on his unerring and uncanny instinct for the detection of smuggling, and what he did not know of the tricks and devices for introducing opium and other contraband into the Commonwealth without the formality of paying duty was not worth knowing. Likewise, Josiah Shine was a presentable enough fellow, with a shore job as steady as Captain Reilly's was hazardous and uncertain.

Now, partly by the accident of a sporting bet taken and offered in the bar of the Australia Hotel, and partly out of sheer love of a joke, Captain Reilly had seized the opportunity, ably assisted and abetted by his Chinese boy, Wong Ping, to turn a dishonest penny (and incidentally to put a spoke in Shine's wheel) by a bit of opium-smuggling.

Success meant not only an exceptionally nice little profit—and Captain Reilly was a keen judge of the improper percentage due to him—but a personal score over Shine, such as might seem good in Flossie Mortimer's forget-me-not blue eyes.

II.

But, as in all matters of high enterprise, if the prospective reward was great, so also was the risk, and now, as the *Orion* rattled her wheezy way up the harbour, it is not wholly

surprising that her skipper showed signs of pre-occupation. True, he had not left the laying of his plans to chance; indeed, the problem had been tackled, with Wong Ping's help, some days before, and, to be almost reassured, Captain Reilly had but to walk to the end of his bridge, whence he could see the faithful Wong Ping diligently at work sluicing the deck with a stream of water supplied from a length of hose-pipe lying snake-like along the starboard scupper.

At the sight Captain Reilly's natural optimism returned like the back-swing of a pendulum, and he rejoined the pilot, who was by now engaged in watching with close professional interest the irresponsible traffic of the ferries plying in and out of Circular Quay. In particular, he was concerned with the vagaries of a Mosman Bay ferry-boat, which was intent upon going across the *Orion's* bows at any cost, or, in the alternative, piling herself upon the rocky spit of Pinchgut Island.

'Call themselves skippers?' asked the pilot vindictively. 'Why, the whole boiling of 'em's no better than or'nary tram-drivers.'

Captain Reilly laughed. 'It's a darned sight too careful you are, old man,' said he amusedly, 'and carefulness never leads any man anywhere.'

The old pilot rang the telegraph for 'half-speed,' and glanced shrewdly at the *Orion's* master.

'Any'ow, even if they are only tramway-men, they ain't going to punch *my* ticket, captain. But if you fancy making an 'obby of carelessness, why'—

'I'm to go ahead and be damned,' said Captain Reilly. 'Well, to tell you the straight truth, old man, that same trick would be suiting me better, and no mistake. I was always the bhoys for takin' me fair share of risks, and, bedad! there's a sight more fun in the game played that way, wid the long odds laid against you and all'—

'Ah!' remarked the old pilot sagely, as he slewed her slowly round to make the Darling Harbour entrance, 'you're young enough, anyhow, to stand the racket.'

Captain Reilly had a fleeting reminder of the odds against him then, before he could win through with the opium deal—and Flossie, and he sighed involuntarily.

'Sure, it's me that's hoping so, old man,' admitted he fervently. 'Tis a wearing life the seafaring, anyhow, and it's true I've taken a skinkful of risk this trip'—

'I've noticed,' said the pilot acutely, 'you've been kind of trying to haul off a lee-shore, captain, ever since I come aboard; but there—I don't want to know nothing about it—but only'—

'Yes?' said Captain Reilly.

'If so be as you're trying to do something new and original in the smuggling line—and

something seems to 'int to me it's more'n likely'—

'Yes?' repeated Captain Reilly, with native caution.

'Then,' said the old pilot, with marked enjoyment, 'I'm real sorry for you, sonny—real sorry—for you're right plumb up against it.'

'Yes?'

'If there's one cove in the Noo South Wales Customs as knows the whole bag o' tricks in that trade, his name is Shine—Mister Josiah Shine; and, by the Lord Harry! I can see the very identical bloke waiting for you, as sure as ever was, on the jetty there'—

Captain Reilly swept a quick glance to the quay and swore softly.

'See him?' asked the pilot, solicitously and with a throaty chuckle. 'Why, you ain't got a Buckley's chance.'

'See him?' echoed Captain Reilly boldly. 'You trust me, I'll see him right enough, the dirty blackguard. I've got a straight flush that will be after seeing me through this, the way he won't be liking it'—

The pilot rang the engines down to 'stand by,' and then again to 'slow astern,' ere he nodded sagely. 'Aye, aye,' said he with conviction, 'but I can call to mind many a sure straight flush in my time that's ended up as a first-class imitation of a wash-out.'

Captain Reilly shook with laughter as he clapped the old man on the back. 'And isn't that just what I'm after telling you?' said he confidently. 'Sure, it's the same thing, only different when you're at the wrong end of it, and, the way I'm reckoning on it, it's your friend Shine that will be getting lost in the wash.'

III.

'Good-morning, Captain Reilly,' said Mr Shine, a trifle stiffly, as he stepped aboard the *Orion* the moment she was berthed.

'It'll be Mister Shine that's speaking,' returned Captain Reilly with heartiness. 'Tell me now, does it go well with old "Malay" and Miss Flossie? I dare say, now, you've seen them both but lately?'

The Customs man raised his eyebrows in somewhat pained surprise. 'I believe,' said he coldly, 'both Miss Mortimer and her father are quite well.'

'First-rate,' said Captain Reilly jovially. 'It's glad I am to hear it. I'm for stepping up the hill myself to-night, if so be that I can get free in time. I'll be seeing you there, perhaps?'

Mr Shine frowned. 'Business first, Captain Reilly,' said he distantly. 'I've got my responsibilities to the State, and they're pretty considerable. This opium-smuggling traffic, for one thing, is showing signs of coming back again, and—it's up to me to stop it.' As he spoke he looked Captain Reilly squarely in the

eyes, and the skipper read there the officer's intention to go over the old *Orion* with a pocket tooth-comb.

'Indeed, now, you surprise me,' replied the skipper, with a frankly interested show of concern. 'I would be thinking, now, that the man that would try to put one across you, Mr Shine, is asking for trouble. But it's keeping you off your work I am, standing here talking. I will be leaving you to it, old man, only that, if so be that you find anything on the ship, I will not be running away without a word or two of explanation about it.'

And with a laugh on his part, and a pale smile from Shine, both men went about their duties.

A couple of hands were dragging a hose across the deck and passing it over the jetty as Captain Reilly passed aft. 'Hullo!' demanded he brusquely. 'What's this for?'

'Flesh water, capitan,' explained Wong Ping lucidly. 'Water tanks allee empty.'

'Can do,' acknowledged Captain Reilly casually, and passed on to where Mr Fraser, the mate, was superintending the removal of No. 2 hatch. To him the skipper had a word or two to say ere he sent for the engineer, and, with him for company, withdrew to the chart-house for a spell.

Old Macintosh, the chief, had a sub-acid but strangely provocative brand of conversation that always acted upon the skipper as a tonic. And so, for the better part of an hour, whilst outside, the donkey-engine shook and rattled, and the derricks swung inboard and out again with the *Orion's* cargo, Captain Reilly invited the Scottish engineer's views on a variety of topics from the thermal values of steam-coals to the theories of Haeckel; and in due time came Mr Shine in person, a trifle disgruntled in fact, but the more suspicious in that his suspicions had led to the discovery of nothing dutiable aboard the tramp.

IV.

At his knock Captain Reilly stepped outside the cabin, and together they crossed to the rail to take a look at the busy scene on the jetty below. The skipper's keen eye swept over its salient features in a glance, and if, to his expert eye, there was anything amiss, it was no doubt on that account that he turned quickly to engage Shine in a ready flow of animated talk.

But Mr Shine was no fool, and listening to the skipper's sudden stream of loquacity, he took care to keep an eye lifting over the wharf below. His was a slow, methodical brain that worked unhurriedly, probing and examining one thing at a time, and if he had failed, so far, to discover what he had expected to find on the *Orion*, he was in no way satisfied or even disturbed at the result.

Of a sudden he seemed to stiffen like a terrier

at a rat-hole. 'My oath!' cried he involuntarily, 'if that ain't a rum thing'—

'What is that, now?' asked Captain Reilly, alert in a moment.

'Why,' exclaimed the Customs man, pointing to the wharf, 'if you ain't got a *couple* of hose-pipes laid on to that there jetty!'

Captain Reilly leant with sudden interest across the rail, and in so doing clumsily fouled the siren-lanyard. A sharp 'toot' ripped the air. Mr Shine jumped.

'Faith! and I believe it's right you are, Shine,' admitted the captain, with slightly overdone unconcern; 'but, anyway, 'tis only the one of them that's pumping'—

But Mr Shine had already disappeared. The captain took another anxious look at the wharf. Just thirty seconds after that warning hoot from the siren, the white-painted bow of a launch poked from out the gloom beneath the jetty-piles and crept surreptitiously under the *Orion's* stern. Once clear of the mooring-hawsers and propeller, the motor-launch started her engine, and in a minute or two she was plugging down-harbour. Captain Reilly watched her until she had swept round the promontory, and only then turned to follow Shine.

Clattering down the short ladder to the deck, he went straight to where a quietly triumphant Wong Ping was busy with polishing-rags on the brasswork of a salt-water cock. The uncoupled end of a hose was lying in a pool of water at his feet. Rags, brushes, a polishing-tin or two, and a brace of empty wooden boxes lay strewn around. The Chinaman turned as his skipper appeared.

'Is it all clear of the stuff you are now, Wong Ping?'

The lid of one almond eye flickered gently. 'All li, tuan,' he whispered. 'Tanks all filled one time, capitan.'

'And the opium?'

The Chinaman picked up a tin of 'Brasso' from the deck, placed it in the mouth of the hose-pipe, which he coupled up to the cock, and grinned delightedly. 'All tins gone, capitan, muchee quick. Customs man no can savee; makee much bobbery one time.'

Captain Reilly burst out laughing. 'Angry—is he?—the little scut! Where is he gone to now?'

Wong Ping jerked a thumb jettwards.

The skipper went to the side and looked over. 'Right!' said Captain Reilly. 'Now listen here. The launch is clear away with the stuff by now, and it's a game I would have with this Customs wallah, savee? I'm for going down on to the jetty to see what he's after. Unless I'm mistaken, he knows we've put a new trick on him, for he's ferreting round that hose like a rat at a pump. Give me a minute or two, and then turn on the water again, and we'll let him see how it's done.'

'Can do,' said Wong Ping brightly; and, with a happy glint in his eye, Captain Reilly hurried off to join Mr Shine on the jetty.

v.

The Customs man had, with the true instinct of the sleuth, traced the shore-end of the suspected hose to a stand-pipe for fresh water. In this manner steamers were, indeed, accustomed to replenish their supplies of water on arrival; but Mr Shine quickly discovered, without surprise, that the end of the pipe, instead of being connected up to the cock, dropped down a hole in the planking of the wharf. Confirmed at once in his suspicions that this hose was being used to convey something from, instead of to, the ship, he peered down into the gloom to the harbour waters beneath. Amidst the recently disturbed flotsam and jetsam of driftwood and oily scum his sharp eyes detected an incriminating pole fitted with a large landing-net. Of the obviously necessary accomplices in a boat or otherwise there was, however, no sign. Mr Shine began to realise, to his chagrin, that he had discovered the nest just too late—the birds had flown. Disappointed and angry, he rose to his feet, to find Captain Reilly grinning at his discomfiture.

'Anything wrong?' asked the skipper politely.

Mr Shine bit his lip. 'Just this, Captain Reilly,' said he with suppressed fury: 'but for that accidental "toot" of yours with your siren and one bit of missing evidence, I'd have had you laughing on the other side of your face by now, and'—

The Customs man broke off abruptly to stare at the hose, which was in process of a queer transformation. Something appeared to be passing through it from the ship. There was just a slight swelling as when a snake swallows a rabbit. With a quick spring Mr Shine flung himself upon the heaven-sent missing link in his evidence, and with the pipe throbbing beneath him under the pressure of a fresh head of water, he yelled orders.

'Quick, there,' he shouted; 'fetch up the end of that hose and lay her along the wharf.'

A stevedore or two stopped work to see the fun, but it was Captain Reilly who commenced hauling up the slack of the hose.

'Faith!' cried he innocently, 'what is it now?'

'Easy!' shouted Mr Shine harshly; 'lay her clear of that hole. I can feel the blessed tin under my hands here. Oh, it's opium right enough, and one tin of it's all the evidence I want to prove how they've pumped the rest of it ashore. Easy now!'

'Aye, aye,' cried Captain Reilly innocently, as the end of the hose, spouting cold water, came above the planking. 'Easy it is.'

'Keep her there,' called Shine triumphantly, and released his own hold on the throbbing pipe.

At that precise moment Captain Reilly appeared to slip clumsily on a wet board, and losing his balance, turned, by an unlucky chance, the full force of the stream of spouting water upon the unfortunate Shine. For one brief instant the Customs man gamely stood his ground, clinging with all his wit and strength to the evidence shot into his eager hands, and then he rolled over and subsided like a water-logged sponge. With belated concern Captain Reilly jumped to help the Customs officer to his feet, but Mr Shine declined any assistance, and, with cold sea-water pouring from his clothes, arose unsteadily and shook a small tin cylinder in Captain Reilly's face.

'Got you, you swindling skunk!' he began, when a shout of laughter from amongst the crowd of stevedores broke in upon his triumphant words.

He paused, gazed at his prize with almost comic dismay, and then, with a gesture which might under happier circumstances have been almost magnificent, hurled from him an empty tin of brass-polish.

Captain Reilly, seated on a bollard, holding his aching sides, paused between gusts of helpless laughter to throw a happy wink at the appreciative audience of stevedores and crew.

'Oh, my hat!' he groaned. 'A fair old wash-out, and no error!'

THE OLD COACHING INN.

SINISTER gable square to the winds,
Shuttered window like sightless eye;
There it stands where the high-road bends
Up the hill to the arching sky;
Broad the strath as it rolls below
From Craigellachie to Carrou:
What have ye looked on, staring eye?
What have ye known, gray walls and dour?

Crows on the smokeless chimneys perch,
Brisk at the wainscot gnaw the rats;
Compassed by hedges of dusty yew,
Rank grow the weeds in the garden plats;
Red with rust are the bolts on the doors—
Never the lock will turn again;
Rang there a step on the wide-flagged path?
Came there a rap on the window-pane?

Under the starry northern night
Chanced there the gallop of horses fleet,
Moving shadows against the blind,
Rattle of bars and tread of feet,
Lightning of sword-blades behind the door,
Women's cries from the head of the stair?
Was there a swish of skirts and cloak?
Was there a glint of eyes and hair?

Every echo is dulled again,
Dim are the eyes that were bright of old;
Turned is the page in the pictured book,
Secret guarded and tale untold.
Still the clouds on the sleety wind
Chase the rainbow across the moor. . . .
What have ye looked on, staring eye?
What have ye known, gray walls and dour?

CHRISTINE G. M. ORR.

Chambers's Journal

SEVENTH SERIES

FIJI: ITS HISTORY, DEVELOPMENT, AND INDUSTRIES.

By Sir BICKHAM ESCOTT, K.C.M.G. (late Governor of Fiji and High Commissioner for the Western Pacific).

I.

JUST 277 years ago Abel Janszoon Tasman, the great Dutch navigator and explorer, sailing with a favouring south-westerly wind from the island of Tasmania (to which he had given, in honour of the Governor-General of Batavia, the name 'Van Diemen's Land'), sighted, in the bright sunshine of a tropical morning, the Fiji Islands. In his log the group is called 'Prince William's Land,' but there is no record of Tasman having attempted to make a settlement on any of the islands, and, after taking on board supplies of water and tropical fruits, he returned to Java, whence he had set out to discover the 'Great South Land.' To all intents and purposes the Fiji Islands remained unknown for a further period of 131 years—that is, until Captain Cook, in his voyage of discovery in the Pacific, touched, in 1774, at Vatoa, which lies at the extreme south of the Fiji group, and christened it 'Turtle Island.' Fifteen years later Captain Bligh, H.M.S. *Bounty*, after the mutiny of his crew, which ended in his being sent adrift, with some of his officers, in a ship's galley, passed by the Yasawa group to the north-west of Viti Levu, the largest of the Fiji Islands, on his adventurous voyage to Timor, in the Dutch East Indies.

Early in the nineteenth century Botany Bay convicts contrived to escape to Fiji, and were the first white settlers in the islands. Their evil practices and mode of life were reprobated even by the natives, cannibals although they were, and it was not until 1835, when Wesleyan missionaries first landed in Fiji, that contact with Europeans exercised a beneficial influence on the native population. This is not the place to detail the magnificent work among the Fijians of the Methodist Mission, but it was due largely to the influence of their missionaries and of Mr Pritchard, the British Consul of Fiji and Tonga, that, in 1859, the principal chief, Cakobau (pronounced Thakombau), who had been given by English settlers, and had assumed thereafter, the title of King of Fiji, offered to cede to Queen Victoria the whole of the Fiji Islands, which exceed two hundred in number and have a total

area of the size of Wales. The offer was declined three years later by the Duke of Newcastle, then Secretary of State for the Colonies, on the advice of a Colonel Smythe, who had been sent to Fiji to investigate, and report on, the condition and prospects of the islands. Twelve years later, when Cakobau's Government was reduced to great financial straits, the offer of cession was renewed, and its acceptance was agreed to on the joint recommendation of Commander Goodenough, R.N., who was in command of Her Majesty's ships on the Western Pacific Station, and of Mr Layard, who had succeeded Mr Pritchard as Her Majesty's Consul in Fiji. The change of front adopted by Her Majesty's Government was due partly to the rapid growth in the European population consequent on the introduction, during the American Civil War, of the cotton industry; partly to representations made by powerful bodies in Australia, with which Fiji's trade was principally conducted; and partly to the fear, probably well grounded, that, in view of Germany's activities in the Pacific and the establishment, with the support of the German Government, of German trading-stations controlled by Messrs Godeffroy of Hamburg, the group might become a German colony if the second offer was refused.

The terms of cession were arranged by Sir Hercules Robinson, the Governor of New South Wales, who in 1896 was raised to the peerage as Baron Rosmead, and the document signed by Cakobau runs as follows: 'We, King of Fiji, together with other high chiefs of Fiji, hereby give our country, Fiji, unreservedly to Her Britannic Majesty, Queen of Great Britain and Ireland. And we trust and repose fully in her that she will rule Fiji justly and affectionately, that we may continue to live in peace and prosperity.' At the closing ceremony on the 10th October 1874, when the deed of cession was signed by Cakobau, twelve principal chiefs, and Sir Hercules Robinson, Cakobau, through his former Prime Minister, Mr Thurston, who fourteen years later became governor of the colony, gave up his war-club to be presented to Queen Victoria, and in doing so spoke as follows: 'With this emblem of the past I send

my love to Her Majesty, fully confiding in her and in her children, who, succeeding her, shall become Kings of Fiji, to exercise a watchful control over the welfare of my children and people.'

II.

Sir Arthur Gordon, afterwards Lord Stanmore, became the first governor of Fiji, and undertook the difficult task of creating a stable administration and of evolving financial order out of chaos. The debts of the colony, amounting to £115,000, which were incurred during Cakobau's reign, were redeemed by the Imperial Government, but the sum was treated as an advance to be refunded by annual instalments, the last of which was paid early in 1919. In the forty-six years that have passed since Fiji became a possession of the Crown the administration and the agricultural development of the colony have proceeded hand-in-hand. Governed at first as a pure Crown colony, Fiji obtained in 1904 an elective element in its Legislative Council, which now consists of the governor, as president, and twenty-one members, of whom eleven are nominated officials, seven are elected by a somewhat limited franchise, two are native Fijians of the highest rank, and one is a native of India.

The introduction of new industries and of better methods of cultivation has changed entirely the financial position of the colony, and has improved, out of all knowledge, the social condition of the population. The financial transactions of 1876—two years after cession—showed a revenue of £40,524 and an expenditure of £66,636. In 1916 the revenue was £335,064, and exceeded the expenditure by £34,347. In 1875 only 96 tons of sugar, of the value of £3417, were exported. In 1916 the quantity exported was 120,528 tons, valued at £1,729,658. The vast strides made in the sugar industry are attributable almost entirely to the enterprise shown by the Colonial Sugar-Refining Company, whose headquarters are at Sydney, New South Wales. Fruit, consisting principally of bananas, the export of which in 1875 was worth only £97, was exported in 1916 to the value of £205,122; whilst the export of copra—that is, the dried kernel of the coco-nut—the principal export of the Fiji Islands in pre-cession days, of which 3871 tons, valued at £40,058, were exported in 1875, rose in 1916 to 15,368 tons, of the declared value of £359,372. The cultivation of the Pará rubber-tree has now been established in the colony as a new industry, and 38 tons, valued at £11,803, were exported in 1917. To the preceding principal industries should be added many minor industries already in existence, which admit of great development, such as the cultivation of sea-island cotton of a high grade; rice, grown extensively by Indians; tea; limes equal in quality to those produced

in Montserrat and Dominica in the West Indies; maize; tobacco; coffee not inferior to the famous Blue Mountain coffee of Jamaica; and cacao which rivals that of Grenada and Trinidad. Cattle-rearing and the raising of horses, pigs, and sheep, if undertaken in suitable localities, should prove to be profitable occupations. But for all industries, great and small, and for the further development of the rich islands in the Fiji group, it is essential that an adequate supply of labour should be provided and maintained.

III.

It is unfortunate that one of the most important conditions of the cession of Fiji secured by Sir Hercules Robinson—namely, the transfer of land from the natives to the Crown—was abandoned under the government of Sir Arthur Gordon, and that in many, if not the majority of, cases the natives obtained, individually or communally, land to which in the pre-cession days they could not have established a claim. The result has been that the natives of the colony, who numbered in 1918 about ninety thousand, have shown a not unnatural disinclination to work steadily for hire on European estates, and have been content, as a general rule, to remain on their own lands, which they cultivate only so far as is required for their personal needs. That the Fijian is capable of hard and sustained toil has been proved by the exceptionally good work of the hundred men who composed the Fiji Labour Detachment that was employed on stevedore duties from 1917 onwards, first at Calais, then at Marseilles, and lastly at Taranto. But for agricultural work, especially on sugar estates, the Fijian has shown, so far, neither aptitude nor liking, and the future of the sugar industry in the colony depends on the continuation, in some form or another, of the arrangements whereby labourers have been imported from India, or on some other source of labour-supply being tapped. During the last forty years emigration from India to Fiji has been allowed by the Indian Government, under conditions which were laid down by that Government, and were similar to the conditions prescribed for the other sugar-producing colonies—namely, Mauritius, British Guiana, Jamaica, and Trinidad. The labourers, who were drawn from the classes in India that live always on the verge of starvation, have prospered in Fiji to a very marked extent, and one of their number, who has attained to a position of affluence since the completion of his term of indenture, is now a nominated member of the Legislative Council of the colony. The Indian population of Fiji, which numbers sixty thousand, is the principal factor in the prosperity of the colony, and it is earnestly to be hoped that the commissioners who were sent recently to India to place the position before the Government will be successful in inducing it to reconsider its

decision to allow no further emigration. To no reasonable conditions that may be imposed by the Indian Government will any objections be raised, and, at a time when there is a world's shortage of sugar, it would be unfortunate if the sugar companies now operating in Fiji were compelled to close down any of their admirably equipped factories through want of sufficient labour to keep existing sugar estates under cultivation.

Fiji, with an area of 7083 square miles, has a population of 163,000, of whom, as has been stated, 90,000 are native Fijians and 60,000 are natives of India. It is estimated that 55,570 acres of land are under cane cultivation, from the produce of which 120,528 tons of sugar were exported, as noted above, in 1916. The Hawaii Islands, which lie half-way between Vancouver and the Fiji group, are smaller than Fiji by some 500 square miles. They were annexed by the United States of America in 1898, and from that date their development has been rapid. The population is, approximately, 240,000; and whilst the Hawaiians themselves number only 23,770, the Japanese amount to 97,000. It is to the latter's labour that the extraordinary

success of the sugar industry is mainly due. In the financial year ended 30th June 1916 the quantity of sugar exported from Hawaii was 640,000 tons, or nearly six times as much as that exported from Fiji in its best year. In a direct line Japan is not more than one thousand miles farther from Fiji than from Honolulu, the capital of Hawaii, and the question naturally arises whether, if the Indian Government continues to prohibit the emigration of its surplus population, arrangements cannot be made to obtain from Japan the labourers who are essential for the maintenance at its present level of the sugar industry in Fiji.

The area of land that can be brought under cane cultivation in Fiji is not so large, probably, as the extent of land so cultivated in Hawaii, but it is large enough to admit of the addition to its workers of, certainly, fifty thousand labourers; and if such an addition were assured, the capital required for their employment and for the extension of the sugar industry would be forthcoming. Fiji would then enter on a new era of prosperity which would result in the colony becoming in time one of the richest possessions of the Empire.

HOW THE PRINCESS HORATIA CAME TO HER KINGDOM.

PART II.

VI.

WITH all this in her mind, it is not surprising that the Princess Horatia turned the conversation upon the present ruler of Prometheus during the ride to the ancient royal fortress.

The road to Hesione, if road it can be called, is a steep and narrow track that scales the face of the mountain-gorge in a manner that might well dismay the traveller who does not love the bright eyes of danger. On one side it is bounded by the mountain-crag rising sheer and rocky to a giddy height; on the other it falls away into an abyss of almost unplumbable depth. And yet, withal, the track may be traversed with perfect safety by those who know something of its hazards and how to avoid them. This (the party was presently advised) could best be done by going in single file. Thus Miss Pinkerton, with blanched cheeks and an expression of resignation to sure and certain death, was led off by the muleteer who acted as guide, and was followed by the princess, whose mule's bridle John King insisted upon holding himself; while his mule, loaded with the baggage of the party, brought up the rear, led by an irresponsible and sturdy urchin, who might have posed as an infant Bacchus.

The princess led up to the subject which filled her mind by discoursing appropriately upon the old fortress of Hesione. The great

Prometheus himself, tradition alleged, had erected the original building on the site, and named it in honour of his bride, in the days before he incurred the wrath of Jove and suffered expiation on the rock. From the ancient rulers of Promethea she skilfully turned to the present monarch, and discovered that John King had been more fortunate than herself, insomuch as he had actually seen him.

'What is he like? Can you describe him?' she asked with feverish interest.

John King shrugged his shoulders. 'He's much like other men,' he replied dispassionately. 'Got eyes, nose, and mouth same as I have!'

An exclamation of provocation escaped the princess. 'Can't you give me any more definite description than that? I'm very much interested in him.'

'Are you? Why?' asked John King, turning serene brown eyes upon her. 'Do you think he's an interesting character?'

'That's what I don't know yet and want to discover. If I could know what he was like exteriorly I might be able to form an opinion. Does he always parade about in a uniform, for instance?'

'I've seen him in one,' admitted John King. 'What does that signify?'

'That he apes the Emperor!'

John King laughed. 'Wouldn't that be *l'èse majesté*?'

'No; imitation is the sincerest form of flattery!'

'But kings generally wear a uniform of some sort, don't they?'

'Oh yes, on occasions! I don't mean that the actual wearing of a uniform is objectionable. It's what it stands for—in the case of the Emperor, anyhow—bullying and bossing. The last King of Promethea, I know for a fact, wore a uniform as seldom as possible. I've always heard it said he much preferred a shooting-jacket. But, then, he was a sportsman.' The voice of the Princess Horatia rose in a note of pride and enthusiasm, and John King again turned his eyes upon her. They had in them a look of surprise and perplexity.

'Do you mean the late King Conrad?' he asked doubtfully.

'Oh no, no! I forgot he was the last—old wretch! I mean King Alexis, the father of the young queen from whom Conrad seized the crown. If that wasn't bullying and bossing, what is?'

A smile played over the pleasant face of John King. 'So you haven't a very good opinion of him?'

'No—have you? Do you think it was a fair thing to do to deprive the rightful queen of her heritage just because she was an infant and couldn't fight for it?'

'But the rights and wrongs of it were mixed up with the royal marriage law, were they not?'

'You mean about King Alexis marrying the Countess Fiorenzoli?'

'Well, I wasn't taking much interest in Promethean affairs at the time, but I have since understood that was the cause of dispute.'

'But why should he not have married the woman he loved?' demanded the princess hotly. 'She belonged to the nobility, and was very beautiful and accomplished?'

'So I understand. But what about the law?'

'There never was a royal marriage law in Promethea,' asserted the princess sharply.

'There was evidently something stronger,' replied John King.

'There was.'

In John King's mind that 'something' was Promethean public opinion; in the Princess Horatia's it was *la grande passion*.

'I think King Alexis was entirely right,' she proclaimed boldly.

'So do I,' said John King quietly.

VII.

The air of conviction with which he spoke, and the glance he turned upon his companion, were, strange to say, decidedly disconcerting to the Princess Horatia. She had not expected such an answer. And as he walked very near to the mule's side on the perilously narrow path, his eyes for the instant had looked very closely into hers. They were most expressive eyes, and

she had seen in them a glint that forced her suddenly to look hard ahead between the mule's erect ears.

She was, after all, of royal blood. Could she permit such a glance to fall upon her from the eyes of an English commoner? But then, to be sure, he did not know it, else he would never have presumed. Of that she felt confident. Yet he was so pleasant, this John King—so thoughtful of her comfort and safety. She sighed to think there was a gulf between them. He was, in short, a gentleman, which Prince Ajax, in spite of his imperial blood, was not.

It was preposterous, of course, to compare a man she had known for only a few hours with a son of the Emperor Hildebrand. But the Princess Horatia was apt to be preposterous, as both Count Wenceslaus and Miss Pinkerton knew only too well. And so she set herself to weigh the pros and cons of John King as he walked by her side conversing amiably, while she scrutinised him with carefully guarded but keenly observant eyes.

He was lean and bronzed; that was pleasing to her. (She had vetoed the fat and pink variety from any place in her estimation after seeing Prince Ajax.) And, then, he was a sportsman with the 'air of modest stillness and humility' than which 'nothing so becomes a man.' Altogether to the eyes of the Princess Horatia he seemed so much more desirable than any royal swashbuckler that she determined to forget the gulf between them.

He was so 'serviceable' too. The princess greatly admired this trait. To her mind it was a royal virtue. To rule and to serve were not to be dissociated, but went ever hand-in-hand. Prince Ajax had scorned such a notion. They had quarrelled rather hotly on the point, she remembered. Man as man, he had asserted, whether of royal blood or no, was designed to rule and to be served—by women, of course. But John King evidently thought otherwise, for when Miss Pinkerton's mule presently came to a stop at a spot where a shallow cavern in the rocky cliff suggested a halting-place, and Miss Pinkerton faintly proposed tea, it was he who promptly detached their tea-basket from the baggage-mule's pack and set the kettle agoing. He also it was who unstrapped their rugs and cushions and seated them comfortably in the little cave, waited upon them all the time, and finally took the major share of the packing up.

By the time they came in sight of the ancient royal fortress, poised like an enchanted palace upon the rocky pinnacle of the mountain-top, and silhouetted against the gorgeous sunset sky, the heart of the Princess Horatia was fluttering like a bird's in the fowler's net.

It was not so much the sight of Hesione, strange to say—beautiful, soul-stirring, and romantic as it was—that caused this leaping in

her pulses; it was John King—the glance of his eyes, the sound of his voice, the spirit within him, which seemed so strangely akin to her own, though she was the rightful Queen of Promethea.

These tender feelings came upon her perhaps most strongly when she watched his graceful figure pass before her towards the gateway of the fortress, to which, he had proposed, he should hasten forward and make demand for her entrance and Miss Pinkerton's. The monks, who for many centuries now had acted as custodians of the ancient royal stronghold, were, it was known, extremely chary of admitting a woman within its time-honoured walls. But the golden key, he had assured her, would probably put matters right.

Thus, when, after a short colloquy with the guardians of the place, he led her mule over the rough cobbles of the great grim gateway, with a monk standing obsequiously at either side with modestly downcast mien, a wave of exultation possessed her soul. Was she not entering the goal of her heart's desire, the cradle of her ancient race, and entering it right royally too, led by a champion bold and true, albeit he was only John King?

Small wonder that her heart felt tender towards this devoted servitor, and that her lips uttered his commonplace name caressingly as she stretched herself, happily tired, upon the hard pallet bed of the austere monastic cell allotted to her within the famous walls of Hesione!

VIII.

The fair and sparkling morning that dawned did nothing to divert the tender sensibility of the Princess Horatia for her travelling companion, but rather strengthened it. John King continued to render his pleasant service, escorting her throughout the ancient fortress from dungeon to rampart, and drawing skilfully from the garnered knowledge of the monks the lore concerning the legendary handiwork of Prometheus, so that the princess felt entirely justified in her bold design in thus visiting the renowned stronghold of her royal line. But what made it all the more satisfying to her soul was the fact that John King did not attempt to disguise the increasing warmth of his devotion towards herself. It waxed even as the sun in the turquoise heaven, nor waned as it sank in splendour on the western sky.

This, as can be imagined, was highly pleasing to the womanly vanity of the young princess, and it is impossible to say what might have been her answer to his bold suit which he pressed that very afternoon had not a wholly unexpected incident occurred to change the tenor of their friendship.

Towards sunset they had, at his suggestion, wandered down a narrow, precipitous, and half-subterranean flight of steps, which, as he had

already discovered, led down to a wondrous little cavern hewn out of the face of the rock in the form of a balcony, or *loggia*, whence could be seen the full expanse of the mountain-track winding down to the valley.

Miss Pinkerton, uninvited and unable to follow, watched their descent with dismayed eyes. What could be more engendering of an undesirable intimacy than such an expedition—with a hand to be stretched forth at every turn, not to speak of the possible necessity of carrying the princess bodily from a perilous position? Miss Pinkerton remembered the stiles in the fair green fields of her native land, and the time-honoured use that men and maidens had been wont to make of them in the days of their youth and folly, and metaphorically wrung her hands in despair, being thoroughly distrustful of the discretion of the Princess Horatia.

Her fears were by no means groundless, for John King was not slow to seize the golden opportunity. It was while they stood together in the flaming sunset, gazing down upon the glorious prospect displayed before them, that he openly avowed his love and laid his heart at the feet of Miss L'Estrange.

This he did with such ardour and sincerity that it might well have got the better of the worldly wisdom of the Princess Horatia, and her hope of asserting her rights as Queen of Promethea, had she not, at the self-same moment, heard another voice sounding unpleasantly upon her ear, and that the voice of no less a person than Prince Ajax.

There was no mistaking the strident, unreasonable, and violent expletives that were rapped out in angry abuse of all things Promethean in general, and in particular of the steep and crooked steps down which he had blindly stumbled, to be projected violently into the midst of the little cavern and almost into the arms of the dismayed Princess Horatia.

At any other moment in her life's history there was nothing she would have enjoyed more than this sight of Prince Ajax's discomfiture. His face, always full and florid, was strongly reminiscent of a baited turkey-cock's, while his green huntsman's hat, recalling a Wagnerian hero with its ridiculous peacock-plume, inclined over one eye in a rakish and unprincely manner. But seeing he had so clumsily precipitated himself into the most tender and romantic episode of her whole career, it could not be expected that even the Princess Horatia could fully appreciate either the dramatic or the ludicrous aspect of his entrance.

Indeed, the horrified tone in which she uttered his name might well have betokened, even to one less obtuse than Prince Ajax, a grave solicitude for his welfare.

When he had sufficiently recovered to adjust his hat, or, rather, to doff it on recognising his liege-lady, click his heels together, and bend

over her hand, he accordingly expressed his thanks for her most gracious and ever-to-be-cherished concern, but assured her that, owing to a beneficent Providence that always interposed favourably on his behalf, he was unharmed. He further went on to expatiate upon the extraordinary and divinely-to-be-interpreted omen of good fortune that the rightful Queen of Promethea should, on this her evidently private visit to her heritage, thus meet with the devoted and undaunted upholder of her cause within the very cave of the great founder of her royal race and kingdom, to which he was even now come disguised, as she must perceive, as a Promethean huntsman, to promote secret negotiations on behalf of her righteous and lawful claim, and in accordance with his imperial father's firm wish and purpose to see her restored to the throne of her fathers, for which cause he was ready to draw his undimmed sword, nor sheath it until he had driven forth the miscreant usurping holder of her crown.

Brevity of expression was not one of Prince Ajax's strong points, and though the princess made desperate efforts to cut him short, or at least turn the impetus of his talk into other channels that she might be able to preserve some shred of her incognito, he continued his blatant boast of restoring the kingdom to his all-but-betrothed bride by the might of his own prowess, until her whole life, lineage, and aspirations were laid bare before her humble admirer, John King.

Never had the Princess Horatia found herself in such a quandary. She scarcely knew whether to laugh or to cry. The situation was worthy of a burlesque. Yet, with John King standing a pace behind her, and silently viewing it all with his keenly humorous eyes that had so lately bent upon her with the Question of all Questions in their deep, ardent gaze, it seemed more like a matter for tears.

And meanwhile the Great Question was unanswered. It never could be answered now.

Henceforth she was no longer Miss L'Estrange to whom he had so honestly declared his love, but the Princess Horatia of Promethea, the daughter of a line of kings, while he was only a simple gentleman with a commonplace name.

Yet it was this same simple gentleman of the commonplace name who now took command of the awkward situation. Stepping forward, courtier-like, as if to the manner born, and making use significantly of his new-found knowledge, he inquired, 'Does your Highness wish to return?'

Offering his hand with an ease and grace worthy of an Elizabethan gallant, he led her, in spite of Prince Ajax's gobblings (which, as it were, he waved aside), through the low aperture of the cavern to the crooked stairway, where a compatriot of the prince's, in a like disguise to his royal master's, did his best to click his heels together and flatten himself against the rocky wall. Farther up the steps they had a fleeting vision of a pair of sandalled feet and fluttering woollen skirts which, the Princess Horatia shrewdly suspected, belonged to the reverend Father Superior of Hesione. He was standing musingly upon the ramparts surveying the sunset when they emerged at the stairhead, and turned a benign welcoming gaze upon them; but his expression was not altogether as composed as it was calculated to be.

'Does your Highness wish to retire?' said John King. 'Or'—

'Yes, yes, I shall go in at once,' replied the princess, breathless and agitated, and not daring as yet to return the honest gaze of her erstwhile suitor. 'I'm rather tired. I sha'n't come out again. Good-night, Mr King, and thank you. Thank you very, very much for—for all you've done. I'm'— But further speech failed her. She held out her hand, and John King stooped and kissed it.

'Good-night, your Highness!'

(Continued on page 807.)

'FARMER GEORGE.'

SOME UNPUBLISHED ANECDOTES.

By GERTRUDE BACON.

AMONG the few family treasures that I, as a younger member of a younger branch, have inherited is an ancient soft-leather-backed MS. book, its yellowing pages covered thickly with an old man's shaky but flowing writing, inscribed in ink that is too good to fade. On its title-page it bears the date 1847, and the inscription: 'Reminiscences of the late John Bacon, R.A., and other Persons of his Time; so far as an old and treacherous Memory may be relied on.'

The writer was my great-grandfather, John Bacon, junior, himself a sculptor of no small fame, many of whose works stand beside those of his more illustrious father in Westminster Abbey and St Paul's. He was over seventy years of age when he penned these patient pages that now lie before me, and he wrote of the days of his own and his father's youth in the latter half of the eighteenth century when George the Third was king.

And Farmer George himself bulks largely in

the old man's intensely interesting, if rambling, story; as indeed he should, for it was largely to his favour that John Bacon, R.A., owed his rapid rise to fame and fortune as a sculptor. Reared in bitter poverty, though of gentle birth, it was by his sheer innate genius that he rose early to renown, and in 1769, when only twenty-eight, received from the hands of the great Sir Joshua himself the first gold medal for sculpture that the newly founded Royal Academy had awarded. A year later he was elected A.R.A., later R.A.; but the turning-point of his career came when Christ Church College, Oxford, desiring a bust of his august Majesty, the young and rising artist was fortunate enough to secure the commission to execute it.

Then indeed came his chance. Clad in plain and sober clothes, armed with his best modelling-tools—we have them in the family yet—and with a silver syringe (which did away with the ungraceful necessity of squirting the water on his model from his mouth!), Bacon repaired to the palace to execute his task. Authorities agree that he was a man of most perfect tact and manners, especially in his dealings with the exalted. Royalty was pleased, and smiled. Where royalty smiled in those days the rest of the world proved mighty agreeable. More copies of the royal bust were commissioned. Orders poured in on all sides from the great and the wealthy; and the young artist was soon established in Newman Street as a fashionable sculptor, with more work to his skilful hands than he could well accomplish, and a growing fortune, which at his death in 1799 amounted to £60,000.

Naturally, therefore, George the Third finds place of honour among the crowd of illustrious personages who figure in these unpublished 'Reminiscences,' and it is to him alone that the following extracts refer. Written as they are in the quaint and stilted language of the formal early Victorian age, they have a delicate old-world savour of a time that seems very, very far away; and as I turn the discoloured pages I seem to hear the soft and deliberate accents (for so they have been described to me) of an intensely courtly old gentleman of strong evangelical bent, and I see again his well-known portrait with its handsome features, blue eyes, and abundant silver hair, high-shouldered coat and enormous white stock of eighty years ago.

This is how the old man wrote, for his children, of his father's great patron: 'My father was one of those who opposed the silly and disrespectful notion, too prevalent among a certain class, that this monarch was not to be regarded as possessing superior intellectual qualities. That thoughtless, superficial opinion arose, I suppose, from the loquacity in which he often indulged, and particularly from his instantaneous change from one subject to another. If this be a sign of lightness among the com-

monality, I contend it was not so in a king who, as his numerous subjects come near him, must find an appropriate word for each (as, of course, the king must speak first); and as his wonderful memory retained something concerning every man's family or doings, he necessarily flew from one thing to another. Hence some very acute and discerning men were not aware of the superior character of his mind. I may instance Lord Erskine, with whom I was conversing on this very subject. He said, "I, like many others, had taken up the notion that the king is a man of inferior capacity, but after being Chancellor, the first time I was closeted with him I discovered my mistake. The king is a d—d clever fellow. He has as much sense in his little finger as is contained in the heads of all his Cabinet put together." . . . My father's testimony rested on the general tenor of the king's conversation, which was never trifling or commonplace. I recall his mentioning that the king once asked him what works he was employed on, and my father named a bust of General Guise, whose life had then just been published. The king said, "You have read his life, of course?" My father replied that he had not yet done so. "Then," said the king, "how can you give him the right expression? How can you mark his character?"

As flattering proof of King George's well-known royal memory, the memoirs cite how, having on one occasion inquired of the sculptor the number and names of his children, he never afterwards failed to ask after them all separately by name, never making a mistake, though the little Bacons were a numerous progeny. 'This reminds me,' the narrative continues, 'of Mr Langton, who was among the first projectors of the Bridgewater Canal, and who was introduced to the king in order to give him some account of the proceedings. The king was, as usual, very inquisitive respecting depth and width, and the method of overcoming certain difficulties. Mr Langton replied as well as he was able, but suggested he would be better able to satisfy his Majesty a twelvemonth hence, when the work had progressed. It was, however, three or four years later before his next interview with the king, by which time he had himself forgotten more than half the circumstances of which he was at once reminded by his interrogator. "How did you surmount the difficulties you met with at this place and that place? Did you find it needful to do so and so? You said your locks were to be so many feet wide—did you find that enough?" with many such questions not a little puzzling to Mr L., who told us that the king had remembered all he had told him four years before, while he himself had forgotten these early difficulties of his undertaking.'

The king's quickness in discerning faces in a crowd is instanced in a story of how he and Queen Charlotte once visited Whitbread's

Brewery, and the original Whitbread, founder of the firm, desirous of commemorating so flattering an event, ordered of Bacon two marble busts of his illustrious visitors to ornament his premises. (Are they there now, I wonder?) The trouble was that Bacon's previous bust of the king was too youthful to represent his present age, and Whitbread, who was politically out of favour, did not see how to approach the king for another sitting, while Bacon himself declined to do so. The astute brewer proposed to the sculptor that he should go to Cheltenham, where the king was then staying, and study his countenance as best he was able. 'To this my father also objected, not only because it would appear like thrusting himself into the presence of the king, but because he said he knew his royal patron would not look favourably on his leaving his work in London and luxuriating among the fashionable at such a place as Cheltenham. "But," said Whitbread, "you can get a look at him when he is surrounded by the crowds that follow him, and then he will not see you." To this my father at length agreed, and was very careful never to get sufficiently near to catch the king's eye, or when the crowd was not very dense. He returned to London triumphing in having accomplished his purpose without having been recognised. Some weeks afterwards he had occasion to be at Buckingham Palace, when the king, on seeing him, said, "How are you, Bacon? How do you like Cheltenham, Bacon?"'

Of a royal visit to Weymouth my great-grandfather tells a story on the authority of a friend of his, Edmund Henning, banker in that town. 'The king was riding out one morning on horseback, attended as usual, when he met a venerable-looking old man walking with a staff. The king stopped him, asked his age, and whence he had come; and the old man told him. "How far you have walked!" said the king; "it is seventeen miles from this place. And how much farther are you going?" "I be going to Weymouth." "Are you aware that that is seven miles farther yet, and that will make a long walk for a man of your age? Tell me what you are going there for." "Why, I be told that the king is there, and they do say that he be a very good sort of man; and I have thought I should like to see him before I die." "Well," said the king, "I can show you his picture. Will not that do as well?" and he put a guinea into his hand. "I be very thankful, sir," said the old man; "but I must go on and try if I can catch sight of the king himself, or I sha'n't be content." "Well," said the king, "look at the guinea in your hand, and then look at me;" on which he took off his hat and turned his face in profile, adding, "The guinea is only my picture; but now you see the king himself, so you may save yourself the labour of walking on to Weymouth." On

which the old man fell on his knees and blessed the king for his great kindness and condescension, and turned towards home again full of joy and gratitude.' Good old Farmer George!

In truth, this very simple-hearted and human monarch liked well enough to play the *Deus ex machina* to his subjects, and to feel himself a father to his people. In his position he could interfere, indeed, to an extent that might well have been resented in anybody else. This same Mr Henning of Weymouth, a great friend of the Bacons, was highly esteemed by the king, who often paid visits to him and his wife, or, if they were out, his young children, in the simplest and friendliest way possible, gave him presents, and on one occasion saved his hay-crop by opportunely sending him thirty or forty soldiers to help to get it in. The following are Mr Henning's own words, which the narrator here copies into his 'Reminiscences': 'On account of the king's illness the royal family did not visit Weymouth for more than two years, during which time it pleased God to deprive me of my dear and amiable wife, on account of which I was for more than a year in a low state of mind. When the royal family came again to Weymouth the king sent a special messenger to my house to request, or perhaps I ought to say to command, me to come to the Lodge, as he wished to see me, and which, of course, I obeyed. But a little before I arrived at the Lodge I met his Majesty and his attendants going for a ride. He received me very graciously, and we had not ridden but a little way when his Majesty said to his attendants, "I wish you to keep behind as I want to speak to Mr Henning." He then addressed himself to me, and said, "I am now going to mention a subject that is very painful to me, but more so to you; that is the great loss you have sustained. I can assure you that the queen and all of us sympathise with you most sincerely, and we hear that you give way too much to grief. Now you ought not to do so, seeing it is what God has been pleased to appoint. I wish to give you a little advice, and that is, look around you and see if you can find another worthy, good woman, and marry again. But remember one thing—never expect to meet with such another as your late wife; if you do, take my word for it you will be disappointed."'

Part of the reason for the very real and continued interest that King George took in the sculptor is undoubtedly to be found in the decided bent they both had for religious discussion. It is certain that much edifying argument took place during the hours the king sat for his bust, greatly, no doubt, to the satisfaction of both. This little *penchant* of the king's occasionally led him into trouble, as witness the following tale, related on the authority of a Mr Leach, one of the royal attendants. 'In the grounds attached to Windsor Castle was a

gardener, whom the king, while taking his private walks, would occasionally stop and converse with, as he discovered him to be a reader of his Bible, and one who had religion at his heart. He was, however, frequently so imprudent as to detain the king longer than he ought to have done, not having the good sense to perceive that the king submitted to be detained, not from respect to him or pleasure in listening to him, but purely out of deference to the *subject* he was conversing on. Mr Leach told us that, from his sitting-room at the back of the castle, he observed the king walking onwards till he got sight of this gardener, when on a sudden the king turned back and walked away. The man was simpleton enough to walk after him, which, the king perceiving, mended his pace; the man in consequence quickened *his* pace, till the king found it necessary to run. The man then ran also; but Mr Leach said he had the pleasure to see that the king was too nimble for the man, and reached the steps which led up to his library before the gardener could overtake him, opened the door, and banged it against his pursuer!

The picture of his panting Majesty, pursued by the implacable gardener, is a pleasing one. Some of the king's servants, however, knew better how to get round him. "There was an old porter at Buckingham House. When the king went to reside principally at Windsor Castle he took this man with him. Three or four weeks afterwards the king came across the man, and said, "Well, John, how do you like Windsor?" The man replied, "I will confess to your Majesty that I do not like it at all!" "Not like Windsor!—not like Windsor! How is that, John?" "Please, your Majesty, Windsor starves me." "Starves you!—starves you! Anybody starved in my house?" "No, please your Majesty, there is enough and to spare as it regards the body; but Windsor starves my soul." "Starves your soul!" said the king; "starves your soul! How can that be?" The man replied, "I know your Majesty requires an honest answer, and therefore I mention that, as your Majesty allows your servants to worship God on the Sabbath day wherever we prefer to go, I had the privilege of attending the ministry of Mr ——" (mentioning some eminent Dissenting minister); "but at Windsor I cannot find out any such preacher." "Oh," said the king, "if that is the case, no man shall starve his soul for me. You shall go back to Buckingham House," and he allowed him instantly to return."

There is another delightfully simple story on the authority of this same Mr Leach. "On one Sunday afternoon the chimney of the room where the king and queen were sitting paid no respect to royalty, and began to smoke. The queen said, "We must send for Leach." "No, my dear," said the king, "let us put up with the inconvenience. Mr Leach will not like to be

engaged in superintending such an affair on Sunday." This, continues the 'Reminiscences,' 'was a concession to what the king knew Mr Leach's religious principles would forbid him to be employed about!'

Space forbids the multiplying of these extracts, though room must be found for the following. 'Another anecdote of his Majesty ought to be recorded, which I take for granted to have been a fact, as it was related to me by the celebrated musician, Mr Charles Wesley, the brother of that wonderful musical genius, Mr Samuel Wesley. We were speaking of the king's general preference for Handel's music, and he informed me of a remarkable prediction of Handel himself respecting the fact. Handel was at Hampton Court when it was the residence of the Prince and Princess of Wales, father and mother of George the Third, who was then only about two years old. Handel was made to entertain a large company of nobility and others who, as is too common, were indulging in conversation while Handel was playing on the harpsichord. But the young prince, who had been playing on the carpet, crept under the harpsichord and sat listening with much delight; which Handel, discovering, said to a nobleman, "My lord, do you see this little prince? Mark my words, my lord; this little prince will patronise my music when I am dead and gone."'

My great-grandfather's own words make fitting conclusion. 'Having related so many matters regarding this good king, the remark may be allowed, what a fine thing to be a king, as it appears that the smallest affair, the most commonplace action, shall be of sufficient importance to be recorded; so that the finger of an illustrious prince seems like the philosopher's stone, turning everything it touches to gold. But for this circumstance, I should be accounted weak and silly for putting value upon an old silk bag and rose, such as in olden times was worn instead of a tail to the wigs of gentlemen in full dress. On one occasion (but I regret I cannot call to mind on what occasion it was) my father had an obligation laid on him to go to Court, and, very much against his own inclination, to go full dressed, with blue satin waistcoat edged with gold lace, ruffles, stone-set knee-buckles, a sword by his side, and powdered wig, having the rose and bag before referred to. How so subordinate a person as my father happened to be near the king I cannot explain; but so it was that, on withdrawing, the king said, "Bacon, your rosette is untied!" On which my father, of course, thanked his Majesty, and was about attempting to tie it himself, when the king said, "Here, I'll tie it for you," which he condescended to do. This rosette is consequently placed among my much-treasured memorials.'

Alas that this priceless relic cannot now be traced!

KYTSON THE MERCHANT.

A BUSINESS MAN OF TUDOR TIMES.

By ARTHUR L. HAYWARD.

I.

THERE can be few satisfactions equal to that of founding a family. To start from little or nothing; to cherish ambitions of wealth, power, and position; to see these ambitions realised and their ends perpetuated, must be one of the truest gratifications possible to any man. How much greater must this have been when wealth was harder to win, when power was restricted to a few, and position was a question of birth! To found a house was a rarer event four hundred years ago than it is now, when easy money has brought with it power, and has dispensed with the necessity of birth in attaining position.

The sneering remark that we are a race of shopkeepers is just. We are and always have been a nation of middle-class folk. Four centuries of shopkeepers have made the greatest Empire of the world, and have seen the decay of every nation which has depended upon prestige and noble tradition as its sole supports. The tradesmen and merchants of Tudor London did more to build the British Empire than all the statesmen, soldiers, and sailors who have so gallantly given of their best to uphold it.

Though it took centuries for the work of these early pioneers to bear fruit in all corners of the earth, England herself benefited by their labours immediately. As these merchant princes made their fortunes they moved out into the English shires, bought estates which the dissolution of the monasteries had left in the king's hands, or acquired property which the old lords of the land were growing unable to maintain with the death of feudalism; and the wealth and business ways of the new-comers soon brought prosperity to the country-side.

Typical of these merchant princes was Sir Thomas Kytson, mercer and merchant adventurer, sheriff of London, and builder of Hengrave Hall, near Bury St Edmunds. As the record of one of the many rising merchants who, as Froude says, 'were able to root themselves in the land by the side of the Norman nobility, first to rival and then slowly to displace them,' what is known of his career may be read with interest.

Our democratic spirit has always treasured the ideal of the poor lad who tramps to London and in fullness of time becomes Lord Mayor. Such careers were as rare in olden days as they are now, though we always like to think that such things might be. Dick Whittington, the embodiment of this encouraging legend, was, as a matter of historical fact, never a penniless boy, but came from a well-to-do family of Gloucestershire, and started his London life with moderate means.

The prosperous London merchants were nearly all drawn from the middle classes, and in most cases came from the country, whither they eventually returned as wealthy landowners to build comfortable mansions and found county families.

II.

The subject of this sketch was a man of this type. The Kytson family held property at Warton, near the Westmorland border of Lancashire, and had been settled there for centuries. Though well-to-do, they were not wealthy, and the keen wits and insatiable ambition of young Thomas Kytson must soon have made him impatient of dull life in a corner of the country, remote in these days, but far more so in the opening years of the sixteenth century. So it happened that about 1503, when he was eighteen years of age, he came to London, and was duly apprenticed to one Richard Glasyer, a wealthy mercer. At the end of his time he was admitted into the Mercers Company, being then twenty-two years old, and embarked in business on his own account.

The mercers of Tudor times were wholesale traders in silks, velvets, cloth of gold, and other finery. The increase of wealth and the habits of pomp and luxury which were beginning to find favour amongst all classes made their business one of the most profitable in the land. In conjunction with the merchant adventurers they attended the staples or cloth fairs on the Continent, and had their branch houses in Antwerp, Middelburg, and Flanders, whence their agents travelled through the Low Countries, and went far afield in search of goods to be imported into England. The finest of materials passed through their warehouses ere they were cried for sale by the prentice-lads of Cheapside.

Young Kytson threw himself into this trade with eagerness, and in ten years' time had already laid the foundations of a considerable fortune. As the son of a country squire with some influence in his own shire, and by virtue of his increasing wealth, at the age of thirty-one he was possessed of sufficient interest to obtain an appointment in the royal household, where, in 1516, he became one of the Knights of the Body, sworn to attend in the king's chamber. In this way he came into personal contact with Henry, and began a number of financial dealings which ran into very large figures. There are records of royal transactions amounting to many thousands of pounds, and a glance at the portrait of Thomas Kytson dispels all doubt as to whether the profit of these transactions showed in the merchant's ledgers or in the royal accounts.

Holbein depicts Kytson with a hard, shrewd face, thin lips closed together firmly, and calculating eyes, which make one sympathise with the wail of a nameless debtor who needed some £800 'to save me harmless against master Kitsun, mercer of London.' A certain widow, Katherine Blount, likewise had little cause to love the hard-headed business man who threatened to turn her out of her home unless she paid a sum equal to £1200 of our money. 'Kytson will have his money at Candlemass or enter into the land,' she complains to Thomas Cromwell.

III.

But business was business in Tudor days as in our own times, and at the age of thirty-seven Kytson was a flourishing merchant and a figure in the City. He had a house with a chapel attached to it in Milk Street, the furniture of which was valued at well over £2000 of our money; a garden under the shadow of London Wall in Coleman Street; another house and chapel at Stoke Newington; and had already begun the splendid mansion in Suffolk which was to perpetuate his name.

In 1521 Thomas Kytson resolved to settle in the country. His business interests required that he should not be so far from London as his native Warton, so he bought from the Duke of Buckingham the manors of Hengrave, in Suffolk, and Colton Bassett, in Nottinghamshire, for a sum exceeding £30,000 of our money. The transaction was barely completed when the Duke of Buckingham was attainted, and Henry VIII. made a bold attempt to seize the properties already sold. But he found his master in Kytson, who fought the case stubbornly, and did not rest content until he had obtained an Act of Parliament confirming him in his manors. This Act, which is dated 1524, gives some inkling of the position he held in the City, for it describes him as 'citizen and mercer of London, otherwise called *Kytson the Merchant*.' Indeed, in his correspondence on the matter Kytson mentions the fame and unpopularity he had earned by his harshness in exacting a loan for the king.

The building of Hengrave Hall was begun as soon as the property was definitely secured. Contracts were given out, and for thirteen years the great work continued. The carving and extra-skilled labour were performed by artisans from London, but the fabric was entrusted to local workmen, the particulars of whose services are all recorded in still-existing account-books. The mason's contract was given to one Ihon Eastawe, of whom it is stated: 'The said Ihon must make a house at Hengrave of all manor of masons work, bricklaying, and all other things concerning the masondrie and bricklaying . . . according to a frame which the said Ihon has seen.' This frame was evidently a complete model of the proposed

mansion duly passed by Thomas Kytson. For this work Ihon was paid £2400. The plasterer contracted to do his work, including ceilings, for £1500. The entire cost of Hengrave Hall, when completed, ran into a sum exceeding £40,000 of our money.

The plaster and stone were mostly brought from Northamptonshire, coming by water to Brandon, and thence by road. A quantity of stone, however, much of the lead, and other materials were obtained at the dissolution of the lesser monasteries, when the destruction of the houses of God furnished this London merchant with cheap material for the erection of his private mansion. In 1538 the work was completed, and over the doorway was inscribed its builder's name:

Opus hoc fieri fecit Tome Kytson.
Ano Dni MCCCC tricesimo octavo.

No expense was spared in furnishing it with a grandeur worthy of its size. In the 'great chamber' alone were eight huge pieces of arras, one hundred and sixty yards in length, depicting hunting scenes and imagery-work. The house was, indeed, a self-contained community, producing everything necessary to run it, there even being a room devoted to the manufacture of candles.

Meanwhile Kytson's prosperity and importance in the business world were daily increasing. He was twice Warden of his Livery Company, and soon became Master. He had a branch house in Antwerp and a warehouse in London full of cloth of gold, satin, tapestry, velvets, furs, fustians, &c., to the value of over £14,000 of modern money. His travellers were scouring Europe, and constantly passing to and fro between London and Flanders. In connection with this, one comes across an incident suggestive of recent times. One of his servants chanced to be coming over from Holland with a large quantity of copper. England was at that time at war with Scotland, and the worthy Dutch authorities were, as ever, desperately anxious to offend neither party, but to maintain a strict neutrality. So Kytson's servant was arrested on the charge of trying to smuggle munitions of war into England, and only after endless formalities, and the swearing of solemn oaths that the copper was not for the making of ordnance, was he allowed to proceed.

IV.

The last day of May 1533 was a day such as London has rarely seen. Ann Boleyn was to be crowned, and the city had determined to do her honour. Cornhill and Gracechurch Street were blazing in scarlet and crimson; Cheapside was draped in cloth of gold, tissue, and velvet. The streets from Temple Bar to the Tower were freshly gravelled, and were lined with the gayest of holiday-making throngs. Every window was filled with the smiling faces of the citizens' wives

and daughters, chattering eagerly, and straining their necks every now and again to watch a gorgeous apparessed figure on a great black Flemish horse, who rode up and down the line of procession to see that all was in order. This was Thomas Kytson, one of the sheriffs of London, who had reached the height of his civic dignity, for he resolutely refused to become eligible for the mayoralty.

Presently there is a thunder of guns from the Tower, Kytson dashes off to take his place in the procession, and then, amidst the clash of bells from every City steeple, and cheers from every citizen's throat, the dazzling column makes its way through the streets. French knights and English knights, mitred abbots and crimson-gowned barons, earls and marquesses in all their glory, pass on. Here come the Lord Chancellor, the Venetian Ambassador, the two Archbishops, the Lord Mayor with the city mace, Garter King at Arms; and then, amidst all her bridal glory, Ann Boleyn, the new Queen of England—'fortune's plaything'—in a white chariot with a golden canopy tinkling with tiny silver bells. Close by her side, with unmoved face, possibly seeing far into the future with those piercing eyes of his, rides Thomas Kytson—plain Thomas Kytson but little longer, for that same afternoon saw him dubbed a Knight of the Sword.

As sheriff Sir Thomas Kytson presided over the inquisition taken at the Guildhall in connection with the great trial of Lord Montagu and the Marquis of Exeter for sympathy with the papal cause. Shortly afterwards he was on the jury for the trial of Sir Geoffrey Pole, Sir Edward Neville, and others implicated in the same affair. He also accompanied Bishop Lee of Coventry and Lichfield to the Charterhouse, where he received the oath of allegiance from the monks, so soon to be dispossessed. On the conclusion of peace with Scotland we find him attending the Windsor Herald as he rides through the City to proclaim peace from St Magnus, London Bridge; Leadenhall Street; the Standard, Chepe; and the Conduit in Fleet Street. These few glimpses are all we get of the busy civic life of this prosperous London merchant.

v.

Another great purchase of land took place in the spring of 1540. A number of manors adjacent to Hengrave were on the market, and Sir Thomas Kytson bought them for something over £43,000. He had by this time spent more than £125,000 on his country estate, and yet at the age of fifty-five was, so far, without an heir. His first wife had given him a daughter, since married to a Suffolk squire; his second wife, Margaret Donnington, the daughter of one of his neighbours at Stoke Newington, had borne him a girl, and was about to become a mother once more. Would the new-comer be a son, or was there to be no child of his own name to inherit

his vast wealth and follow his footsteps in the newly built mansion and estate?

It must have been some such thought as this which made the sharp business man put off making a will and setting his affairs in order. Whatever the reason, however, no will was made, and his last huge purchase was not completed when death stepped in with dramatic suddenness.

It was the evening of the 11th September 1540, and Sir Thomas Kytson lay stricken mortally sick in his great bedchamber at Hengrave. One can picture the room with its tapestried walls, the thick Eastern rugs, and the luxury and comfort the great mercer's travellers had been able to procure him from every market in the world. In a huge canopy bed lay the master, all his grandeur and pomp slipping away farther and farther with every breath he drew. There had been no time to put anything in order, no preparations had been made, and the whole household was numbed by the catastrophe which had overtaken its head.

The chapel bell had just struck eight when one of the watchers by the bedside, Henry Payne by name, leaned over the dying man and asked whether he had left any will. Kytson shook his head and murmured, 'No.' Some time before he had been heard to say that his wife was to have his property. Was that still his wish? asked Payne. 'Ay, marry, shall she,' was the reply. With these four words the greatest estate in England was disposed of! Four hours later Sir Thomas Kytson was dead.

His body received a funeral befitting so great a man. Over £3000 was spent on his obsequies, and a visitor to Hengrave might well expect to find him lying in a tomb worthy of the splendid estate he had created. But his widow was young and pretty; moreover, she was the wealthiest heiress in England. In a short while she became the wife of Sir Richard Long; and on his death, a few years later, she married the second Earl of Bath, who was astute enough to make it an article in his marriage-settlement that he and his wife should reside at Hengrave Hall, 'forasmuch as it . . . was commodious, profitable, necessary and delectable for the health, wealth, and pleasure of the Earl.' When her time came, the countess was laid to rest with her three husbands in Hengrave Church. The effigy of herself in a gown of crimson ermine, with a close black coif encircled by a coronet, lies with that of the Earl of Bath beneath a splendid canopy on an altar tomb of marble and coloured freestone. On the step of this, as though a mere intruder or a poor relation, lies Sir Thomas Kytson, the founder and builder of all the magnificence around.

'Here lyethe Sir Thomas Kytson, Knight,' reads the simple inscription, 'who departed this lyfe ye XIth of September Anno Domini MDXL etatis LV.'

VI.

The crown to all his ambitious schemes and ceaseless labours was denied to Sir Thomas. A month after his death the widow gave birth to a son, who was christened after his father.

Thomas Kytson the younger came into the property on the death of his mother, when he had just come of age, and he settled down as a county magnate. Considering the political and religious troubles of the times, he led a peaceful life, the greatest event in which, perhaps, was the visit of Queen Elizabeth on her triumphal journey to Norfolk. 'Before her Highness passed into Norfolk there was, in Suffolk, such sumptuous feasting and bankets, as seldom in any part of the world hath been seen before. . . . Sir Thomas Kytson and divers others of worship kept great houses, and sundry, either at the Queen's coming or return, solemnly feasted her Highness, yea and defrayed the whole charges for a day or twayne; presented gifts; made

such triumphes and devices, as indeed was most noble to beholde, and very thankfully accepted. . . . On her return she went to Sir Thomas Kytson's, where, in very deede, the fare and banquet did so exceede a number of other places, that it is worthy the mention. A show representing the fayries, as well as might be, was there seene; in the which show a rich jewel was presented to the Queen's Highness.' At the close of these festivities the queen very graciously conferred the honour of knighthood on her loyal entertainer.

With Sir Thomas Kytson the younger the male line died out. Though he was twice married, he had no son to succeed him; and on his death Hengrave, with all its grandeur, passed, through one of his daughters, to the D'Arcies, and thence to a Sussex family, the Gages, who held it until modern times. Three miles or so from Bury St Edmunds it still stands as magnificent as ever, a lasting monument to the commercial genius of that long-forgotten Tudor gentleman, Kytson the Merchant.

RECOLLECTIONS OF A NAVAL SECRETARY.

CAPE AND WEST AFRICA—continued.

VII.

OUR first visit to the Oil Rivers, as the mouths of the Niger are called, was paid in March 1883, when we arrived in the *Boadicea* off the Brass River. Here we found H.M.S. *Flirt* at anchor, with Consul Hewett on board. Commander Hammick, of the *Flirt*, was an old West Coast ranger, having an intimate acquaintance with the rivers and their chiefs. We spent five very interesting days with him. A gun-vessel is scarcely calculated to accommodate at one time an admiral with his staff and a consul; but Hammick was more than equal to the occasion. Where he slept was a mystery to us. His cabin was given up to the admiral and the consul, while our cots occupied all the space on the tiny poop, from which, by the way, we were driven almost every night by the warnings of a coming tornado.

Each of the Oil Rivers has its so-called king, who is in reality the principal native oil-trader. The kings have their great war-canoes armed, as we saw them, with Whitworth guns, which they were always ready to use against one another.

The annual visit of the admiral was often taken advantage of by the consul, who possesses great power in the Rivers, to summon the kings and chiefs to a 'palaver,' and there settle disputes, without having recourse to the canoes and Whitworth guns.

We had a 'palaver' on board the *Flirt*. The 'boys'—that is, the slaves—of a chief named Spiff had maltreated the English doctor, and had been fined by the consul a hundred puncheons of oil.

Spiff refused to pay the fine, and the coming of the admiral in a ship of war gave the consul the backing of authority which he needed. After a long 'palaver,' Spiff agreed to 'leave the puncheons' before the end of the month.

At Bonny I was glad to meet Captain Bowler, chairman of the local Court of Equity, and an important man. Some twenty years before, as captain of the foretop, he had been a petty-officer in the *Marlborough*, my first ship.

We attended afternoon service in Bishop Crowther's church—the bishop and his clergy being all Sierra Leone negroes. We must have presented a ludicrous appearance, the admiral, the flag-lieutenant, and myself being carried across a swamp on the shoulders of three sturdy negroes supplied by Captain Bowler.

The service in the church was very interesting. The building was packed with women and young girls, all of them having their dark skins painted or stained with patterns in indigo. They all wore some head-covering, and a light shawl over their naked shoulders, as a concession to episcopal etiquette! It was amusing to see them donning their shawls as they came within sight of the church.

The service generally was in the native tongue, but English hymns were sung fairly well. The sermon was preached by the arch-deacon, a son of the bishop, in English, and translated, sentence by sentence, into the vernacular by a young clergyman.

On leaving the Mission Station we walked through the native town of Bonny, a collection of small huts. In a very forlorn square stood the

ju-ju house, a squalid, tumble-down shed, in which were a dozen or more hideous wooden images; also, fastened on bamboos planted upright in the ground, there were several rows of skulls, the heads of chiefs killed by the Bonny men in their wars.

Ju-ju and fetish appear to be the same thing, a mode of working on the ignorant superstition of the natives, occasionally usefully employed, but generally degrading. We passed a fowl-roost in the veranda of one of the huts with an empty gin-bottle hanging in front of it. The bottle was somebody's *ju-ju*, and served as a protection against thieves. No native would dare steal the fowls for fear of the harm the *ju-ju* might do to him! Might we not at times be grateful in England for some such protection?

VIII.

The trade of the Oil Rivers was mainly, as the name implies, in oil; in some places we also saw large quantities of ebony. To the everlasting discredit of Europeans, they had established a system of barter most degrading to the natives. A puncheon of oil would be paid for chiefly in Hamburg gin, a fiery spirit costing about one shilling and eightpence per gallon. Part of the payment was made in Manchester goods of weird patterns, specially designed for the West Coast; firearms, costing six shillings and upwards, and as likely as not to burst; gunpowder; umbrellas at one shilling and two shillings; elegant smoking-caps of cheap velvet, gold-braided, at four shillings and sixpence; old cavalry-swords at three shillings and sixpence; and so on. But the bulk of the payment was in gin!

All the chiefs of Bonny came on board the *Flirt* to pay their respects to the admiral: Oko Jumbo (the king), Wariboo, Dublin Green, Sam Hart, Squiss Banigo, and Long Tom—each in a splendid canoe, paddled by about thirty 'boys,' the youngest in the bows, the oldest aft. The chiefs looked a very ordinary set of negroes, but they had risen to be great men in their own country. Oko Jumbo offered a bullock for the ship's company. 'Send ashore and shoot any one you like,' he said. 'They are all mine.'

After a short 'palaver' the chiefs wandered about the ship, Wariboo—who was a great warrior owning war-canoes—asking for a box of polish, to see whether his 'boys' could make his Whitworth guns as bright as the *Flirt's* armament. They all left the ship together, and it was very striking to see the six great canoes—every 'boy' 'digging out' with his paddle for all he was worth, keeping perfect time to an accompaniment of tom-toms.

The admiral also had a visit from the ex-King George of Bonny, an æsthetic negro in well-cut clothes, with a velvet coat. He had been sent by his father, the late king, to England, 'to learn book,' so that he might be able to hold his own in 'palaver' with the white man. He cer-

tainly talked and wrote 'book,' his letters being florid compositions. He was said to have addressed a harangue to the chiefs to the effect that 'in every ever-changing scene of change-ful Bonny' he had been their friend. Unfortunately, at his first 'palaver' his 'book' had failed him, and he had been on the losing side. Want of success in such circumstances is unforgivable in Bonny, and the chiefs stopped his 'comey' (native customs dues), leaving him powerless and in debt, but still the perfect gentleman. On my being introduced to King George, he asked, 'Gifford or Jifford?' 'Gifford,' I answered. 'Oh, I thought you might be related to my friend Lord Gifford'!

IX.

Our next visit was to Opobo, the country of King Ja-Ja. He and Oko Jumbo were the two most powerful chiefs in the Oil Rivers, and had waged bitter war against each other. Ja-Ja did not come on board to pay his respects to the admiral so promptly as was expected of him; so the flag-lieutenant (Ian Grant) and I left for the shore to hurry him up. On the way we met a splendid canoe, in which, seated in a large Madeira chair, under a canopy of matting, we saw a black man wearing a tall white beaver hat, which would have been a joy to a Parisian *cocher*, a black-velvet coat and waistcoat bound with very wide silk braid, an enormous gold watch-chain, and a gaudy waist-cloth, beneath which were bare legs and feet.

We felt sure of our man, and hailed him: 'Are you the king?' 'Yes,' came the answer. 'Then you had better hurry on board. The admiral is waiting for you.' The canoe made all haste towards the ship, and we followed.

At this time Ja-Ja feared that his rule in Opobo was coming to an end, and, anxious to enlist the admiral on his side, he pressed him, in the openest manner, to accept a valuable gold repeater-watch. 'You keep my watch,' said he, 'memory for me. I keep yours, memory for you.' Now, the admiral's watch was a hack, lent him for the cruise by a Cape Town watch-maker; so the bribe was hardly veiled. I need not say the exchange did not take place, to Ja-Ja's great astonishment.

Next he invited us all to dinner, it being then about eleven o'clock. 'I go on shore and kill a cow. Dinner at three.' Some of us went, curious to see a native king at home. His 'Europe House' stood in the middle of a large oval compound, the boundary of which was formed of the huts of his many wives—forty or fifty, I think. Amongst them, I regret to say, was a German woman, but she had the grace not to stand at the door of her hut, as the native ladies did.

Dinner was served in a large central room, an old ship's fitting for tumblers and wine-glasses hanging over the whole length of the table.

The 'cow' appeared, in square fids, supplemented by palm-oil chop, baked yams, and Bass's beer. We made our meal off the two last named.

Twice during the dinner the king, who had been rolling the yams into pellets and dipping them into the palm-oil chop preparatory to eating them, washed his face and hands, a basin, soap, and towel having been placed on a spare chair alongside him.

Several of his young daughters came to the doors to have a look at us. Their black skin was entirely covered with bright-red colouring matter, to soften it, we were told. They had, however, no other covering!

X.

Back on board, we made our way to the Old Calabar River and Duke Town, which lies about forty miles from the sea, and is, therefore, above the mangrove-swamps that make the mouths of the Niger so unhealthy. The European 'factories' (that is, stores) at Duke Town were better than any we had seen, and there was a large and clean native town.

The chief authority here (always excepting the British Consul and the Court of Equity, composed of the heads of the European trading houses) was King Duke Eyumba IX. He had been crowned a year or two before our visit by Consul Hewett. The ceremony took place on board a British gun-vessel, and was accompanied by much toasting in ship's rum, a drink specially prized by the West Coast negro. The consul crowned him as Duke Eyumba VIII. A few hours later the king and his chiefs were seen coming off again, and the consul and the captain of the gun-vessel, having strong suspicions that more rum was the object of their visit, were ready at the gangway to meet them and prevent their coming on board.

'Consul,' the king shouted from his canoe, 'you make a mistake. My father Duke Eyumba VIII. I Eyumba IX. I come on board and you crown me again.' But Mr Hewett was fully equal to the occasion. 'All right,' he answered, 'Eyumba IX. it is;' and the disappointed king was constrained to shove off and go ashore.

On our arrival Eyumba IX. came on board the *Flirt* in a six-oared gig, sitting under a resplendent umbrella some ten feet in width, with broad stripes of the brightest colours. His costume consisted of a purple silk dressing-gown with sleeves and collar turned back with imperial yellow (a combination of European and Chinese royal colours!), a dazzling waist-cloth, and, to crown all, a very tall footman's hat with broad curly brims bound in gold, and two rows of gold lace on the hat itself.

He was accompanied by one of his courtiers, Archibong II. by name, who was dressed in a black frock-coat, a Lincoln & Bennett tall hat, a jersey, and a waist-cloth—legs and feet being

bare. A third chief, who gave his name as John Bokko Cobham, Esquire, did not affect a coat, but contented himself with a new jersey with bright-green silk facings. The king and Cobham Esquire were attended by mace-bearers, boys carrying handsome drum-major's wands of office! John Bokko Cobham's canoe was specially fine; he sat under a large umbrella with a deep scarlet fringe; in the boat were a dozen 'music men.' Most of them pounded tom-toms or played a kind of cymbal, while one with two pieces of bamboo beat a sort of drum made of hollowed wood, so big that it just fitted the bottom of the canoe. The general effect was painful to European ears, but apparently very pleasant to J. B. C., Esquire.

XI.

We were particularly desirous of learning what we could about the Old Calabar custom of 'Egbo,' of which Admiral Sir Frederick Richards wrote as follows: 'Egbo is a species of freemasonry comprised of several grades, with great privileges attached to membership. English traders purchase "Egbo" and become members, for the purpose of being able to recover debts from the natives for goods advanced for the purchase of palm-oil; it consists of nine grades, said to be of the total value of £1350, the higher grades not purchasable by Europeans. It is the only law of the people of Old Calabar, and may be regarded as a code founded on heathen superstition, invented by the governing minority for the purpose of keeping in subjection the governed masses, who are principally domestic slaves.'

As a special honour to the admiral, the king had 'ordered Egbo out,' and we were to see him.

In order to maintain the 'Egbo' mystery, the penalty of death was incurred by any unauthorised person looking at an 'Egbo' runner as he passed through the town. This ceremony took place at uncertain intervals, and without any warning, whenever a member wished to have a debt collected. Mr Hewett, however, obtained a concession that 'Egbo' should not be 'blown' without due notice being given in the town, so that the people might have time to get into their houses and shut the doors. (There are no windows through which local Peeping Toms might obtain a glimpse of the mystery.)

Accordingly on our landing there was not a soul visible, and we walked to the palace through perfectly silent streets. We were admitted to a large yard leading to an inner court, where we were met by Archibong II., who had discarded his frock-coat (shirt or underclothing he had none), but stuck to his hat. He was to escort us to the king.

The king received the admiral in his throne-room—an apartment about twenty-five feet in length, the walls covered with mirrors in deep gilt frames. Six large chandeliers with lustres, and about twenty lamps, hung from the ceiling;

a large photograph of His Majesty Duke Eyumba IX., and of the heir to the throne; a gorgeous sofa, with specimens of the needle-work of his wives; and two really handsome chairs of state, very solid, gilt all over, the backs being composed of the arms of England, completed the decoration of the room. The handsome seats of the state chairs were covered with cheap railway rugs!

Inviting the admiral to sit on one of the chairs, the king occupied the other, and refreshments were produced. We had been warned by the merchant who supplied the royal cellar to beware of the king's champagne and port, for which he paid nine shillings a dozen. They were duly produced, in a hamper; but, mindful of the warning, we asked to have some of the wine of the country, the fresh milk of the coco-nut, called *mimbo* in Old Calabar.

With very slight encouragement from Captain Hammick, the king sent his principal wife for his coronation robe, which must have come from the neighbourhood of Drury Lane. It was of purple velvet, reaching nearly to the ground, covered with stars and glittering ornaments; a crown of purple velvet, with bands of enormous imitation rubies and other precious stones set in tinsel brightly gilt, completed his costume. He proudly donned these splendours, and we found it very hard to keep countenance at the sight of this absurd little creature, with an expression of extreme satisfaction on his coal-black face, sitting on a gorgeous chair of state, holding his sceptre across his body, and sticking out his bare black legs a foot in front of him.

Next we were shown over the 'Europe House,' in one room of which we were amused to find, lying on a bed, the third volume of Gibbon's *Decline and Fall of the Roman Empire*, *The Complete Elocutionist*, and a Wesleyan Missionary magazine. Lest one should think that this was the class of literature read by the king's household, I may say that when we told our consul, he suggested that the books had been stolen from the Mission Station during a recent fire, which had burned down the greater part of it.

'Egbo' now came down the street—a sort of wild man of the woods, using a branch as a walking-stick, dressed apparently in chain armour, a very large, flat scarlet hat on his head, a big bunch of coloured feathers concealing his features, a thick bristly ruff round his neck and shoulders, and a similar ruff round his ankles. Tied to his waist was a large hand-bell, which clanged at every movement of his body. A group of men accompanied him, beating tom-toms.

The method of debt-collecting was apparently to lodge one of these men (a sort of Oil River bailiff) in the house of the debtor, and to impose a fine of a pig or a goat for every day that the debt was left unpaid.

XII.

Old Calabar appeared to be far more highly civilised than the other rivers which we visited. Yet even in Old Calabar many barbarous customs remained. The birth of twins, for instance, was regarded as so disgraceful as to call for the murder of mother and infants. One of the twins was supposed to be the child of the Devil, and, as it was not known which, both were killed; so was the mother, lest, on her giving birth to more children, the seed of the Devil should bear fruit. Here again good European influence came in; the missionaries provided a refuge for the twins, whilst the natives were persuaded to spare the lives of the mothers.

It must be remembered that the state of affairs which we witnessed was a great improvement on that which had existed some years previously. In Hertslet's *Treaties* can be read an account of a series of extraordinary efforts made by our consuls and naval officers to suppress crime amongst the natives. For instance, Commander Wratislaw, of H.M.S. *Ranger*, obtained from 'King Eyo Honesty III., Tom Eyo, and King Cameroons' a written engagement that they would 'abolish without delay the practice of punishing the innocent in room of the guilty, and would use their influence in abolishing the practice in the whole region of Old Calabar.'

Another treaty tells how the Governor of Fernando Po persuaded King Eyo to 'abandon the practice of sacrificing human beings, either upon anniversaries or as an offering to the gods, or upon the death of kings, chiefs or their relations, or upon any pretext whatever.'

The work thus begun was carried on steadily; European influence slowly remedied abuses, introduced law and order, and finally swept away the little native states, with their warring kings and cruel customs.

All these Oil River towns were eventually placed under British rule, and now form a part of Southern Nigeria.

(To be continued.)

WINTER BOUGHS.

AH! why should we pine
For the leaf's decline,
When the bare boughs fringed with frost
Are a splendour of silver, line on line,
Latticed and laced and crossed?

Summer at will
May be dreamed of still
With her wonder of blossom and wing,
Whenever the sun goes over the hill
With his crimson cloak a-swing.

For, see, in the west
Where the rose is guest
And the gold blooms linger yet,
A flame-red bird with a purple crest
Lies bound in the beech-tree's net!

WILL H. OGILVIE.

Chambers's Journal

SEVENTH SERIES

INSTINCT.

By DOUGLAS NEWTON, Author of *War, Green Ladies, &c.*

PART I.

I.

COLLINS stood on the fo'c'sle-head of a West Indies packet-boat, and he was astounded at himself.

He stood limply staring at the slapping seas that pushed up the throat of The Water from the tossing at the Bramble, and he asked himself why he, a furniture clerk with a steady job and settled habits, had abruptly shipped as a common seaman. He had not even given notice to his firm in town. He stood frightened at the mad thing he had done, and a rough voice snarled, 'You over there—you staring at the ruddy moon—get to that winch, hang yer! Jump ter it!'

He remembered what he was, and what he was supposed to do. He jumped violently to the wrong thing. He was cursed for a landsman, and a kindly deck-hand put him right. (They were all busy with a wet and muddy chain that came in over the side and vanished across the deck into a small hole.) The deck-hand called, 'That lashin', matey,' and Collins tried three things before he got the right one.

'Wot sort o' seaman be you?' asked the deck-hand.

'I'm a furniture clerk,' stammered Collins—'on a holiday.'

'Ooliday!' gasped the deck-hand, straightening himself and spitting with unerring accuracy into a scupper. 'If this is yer idea o' a 'oliday, crieke, 'ow I sh'd 'ate yer work!'

II.

In this way did a strange phase in the life of John Collins open. It opened with a madness he could never explain. He had no right to go to sea; he hated the sea. He had no right to go to sea as a seaman; he hated manual work only slightly less than he hated work that was uncomfortable and made one wet. He had absolutely no right to ship aboard this packet at all, for he happened to be under contract to his furniture firm, and could not leave without a month's notice. Yet here he was, at sea as a seaman, defying the laws of employer and employee.

No. 521.—VOL. X.

Why he had done it he never did understand. He had come to Southampton for his fortnight's holiday. He had been told of the old-world charm of the town and the towns about, and the prettiness of the surrounding country. He had also been told that a man with expert knowledge and his eyes open could pick up some very decent bargains in old furniture. John Collins had combined a desire for old-world charm and scenery and a hankering for bargains, for which reason he had placed £30 in notes in his right hip-pocket.

And, being in Southampton, he had gone to see the docks. He was not very much interested in docks. He was less interested in ships—they were merely symbols of much sea-sickness to him. The sea and seafaring men had no glamour for him. But he went down to the docks. Perhaps because it was the thing to do in Southampton, perhaps because something drove him there.

He was doubtful about the impulse at first, rather more sure about it on his second visit. He felt he simply had to go down and look at that old-fashioned steamer with a curving prow—which a stevedore told him was a sign of a 'clipper-built,' whatever that meant. He went down because he felt he must go down. And as he stood looking at it, wondering why he had come, he heard some one say that it sailed for the West Indies in a day or so, that it was an old ship used on the inter-island trade only, and that it had come home to refit.

Frankly all this meant nothing to Collins. He wasn't thrilled. There was not the slightest excitement for him in the destination of the ship, or in the things the dockers brought to its derricks in their continuous barrow lines. The ship herself cast no spell over him as she lay at the wharf rocking gently as the second tide thrust against her, steam rising with hissing laziness from her old winches. She was just a ship to him.

As he stood looking at her, and at the men who came and went on the long gang-planks, he heard a man say, 'She'll sail short. Can't get no more deck-hands nohow.'

That meant nothing to him.

[All Rights Reserved.]

NOVEMBER 20, 1920.

He went away from her, wondering why he had gone to see her; went to his lodgings in Bugle Street, got out his bike, and set off to Winchester. He forgot all about the docks and this West Indies packet, *The Itchen*. But next morning he was down by her side again, looking at her.

He felt he had had to come; but now that he was beside her, he did not know why he had come. He stood there, a tall, ordinary figure of what one called a 'young man' to distinguish him from a youth. He had a pleasant, sallow face, of the kind that can be met by hundreds on London Bridge at the times when clerks swarm. You would like him vaguely if you had to talk to him, and you would never remember him, just as you would find no reason for picking him out from his fellows.

He was an obvious clerk, earning an obviously small, if fair, wage, content with his lot, determined to go on steadily with his steady job as long as he could hold it. Also, from his air of slight restiveness and an absence of comfortable complacency, one could tell that he was not married, but engaged to be married.

That was the one note of individuality in him, as it frequently is the one chance of individuality in the lives of so many of his kind. The even tenor of his days had been disturbed by the fact that he loved and wanted to marry a girl as pleasant and ordinary as himself—a girl very soft, pretty, and desirable in her own quiet way. She was the reason for that £30 in his pocket, and his craving for bargains in old furniture. He wanted those bargains to make money. His regular income (with annual rises) was the sort married people could live upon, but unmarried people could not wed on.

If they had been already married it would have done. But marrying meant a good deal of money. There was a house to rent and furniture to buy, and half-a-dozen legal and other things to do, each of them demanding spot cash. John Collins did not have that spot cash, or not quite enough of it. He was anxious to make a tight little extra sum to cover his wedding.

III.

But on that last morning when he came down to the docks to look at *The Itchen* he had forgotten all these practical facts. He had come on that strange impulse that forced him to go to her. It was the strange impulse that caused him to act in that mad way in the end.

There was no other word for it. Without reason or logic, without for a moment considering what it meant to himself or Winnie, he had behaved—like a madman.

And yet it had happened in such a casual and ordinary way.

A worried man had come off *The Itchen*. He began to stride towards the dock gates, when,

seeing Collins, he swerved aside. He cried, 'Say, you a seaman?'

'Me?' answered Collins in surprise. 'Good Lord, no!'

'Thought you was,' said the man. 'Seen you 'anging about a good deal. Thought you might be looking fer a ship. But I'm not in luck.'

He went striding off to the dock gates. Collins waited by the ship. He remembered having heard a man say that *The Itchen* was short-handed, and he guessed that this fellow's trouble was that he could not find hands to work her. But he felt no excitement about the matter. He did not feel any emotion at the thought that he had a chance to go to sea, to sail to the sun-glowing West Indies. He simply did not think about this at all, but stood idly gazing at the ship without any great interest.

He was there when the man returned, gloom settled on his face. He had been unsuccessful in his search for seamen. When he drew alongside Collins he stopped for sympathy, and said, 'This *is* my unlucky day,' as he scowled at the ship.

'Deck-hands scarce?' said Collins, speaking as one who merely said something for the sake of politeness.

'Not a ghost of a deck-hand in the port. And we sail on the afternoon tide—short-handed, hang it!'

Then Collins, to his own astonishment, said, 'All right, I'll come along with you.'

Directly he had said this Collins was staggered at his own remark. He felt that he had got himself into a mess. He felt that he must explain to the man that it wasn't he who had said that. He wanted to say that something outside himself had made that idiotic promise. And he found himself saying, 'I haven't been to sea before, ever, but I guess I could pick up the tricks pretty quickly. What do you say?'

The man had said very little. He had jumped at him. He had said that all that could be got over, and very promptly set about 'getting over' it. Collins, bewildered, anxious to explain, anxious to get out of this dilemma into which he had been so inexplicably plunged, but incapable—because of some force that kept him tongue-tied—of explaining or getting out of it, went through the process of 'signing on' in a sort of inarticulate protesting dream.

Something seemed to have run right away with him, and in such a manner as to make him go through with this insane and calamitous business in an entirely rational fashion. He behaved with the utmost common-sense in the committing of this disastrous act. He went to his lodging, fetched his suit-case, paid his landlady, and returned to the ship. He even, with this strange, thorough calmness against which he strove to rebel, wrote a picture-postcard to Winnie, and another to his 'boss' in the furni-

ture-office. He was so far in control of his actions that he chose for Winnie a view of the old Norman walls of Southampton because they were pretty, and a card bearing a view of St Michael's Church for his 'boss,' because that would lend an air of gravity to the important communication—this though both cards must come upon their recipients with the effect of a thunder-bolt.

He went aboard with the same calmness against which his soul seemed to struggle with a fruitless amazement. The fo'c'sle, with its darkness, its odours, and its cramped accommodation, seemed to him beastly. But this force, this spell, that had hold of him carried him into it as though to the manner born, and he selected a bunk in such a way as to suggest to the men that he had been at sailing all his life.

It was only when the ship had actually sailed that the malevolent force which had caused him to destroy all his prospects deserted him, and he became the insignificant furniture clerk once more, bewildered by the happenings around him, and beside himself with anxiety and fear at what he had done.

IV.

The voyage does not matter. It was one of entire misery for John Collins. He was sick. He loathed the hard work; he hated getting wet, and he was often wet; the conditions of life seemed to him really frightful. Physically it was a terrible voyage; he was close on breaking down under the strain and the bad conditions by the time it came to an end.

But bad as the physical side of it was, the mental side was awful. During the whole of the journey John Collins was obsessed by the thing he had done, and the things it meant to him.

It meant the shattering of his prospects. He had lost his job once and for all with the furniture firm. The position he had built up so carefully through years of steady work was swept away at one stroke. He would have to begin again—begin again at the beginning, and work up from a small position with a small salary. That would mean years before he reached the level from which he had been so ruthlessly torn.

And that, in turn, meant the end with Winnie. He couldn't possibly afford to marry Winnie for years and years now, even if Winnie overlooked this senseless act of his. He did not think she would overlook it. She was too practical and sensible; she would not be willing to run the risk of linking her well-being with a man who threw everything away from him, as he had, without the slightest excuse.

Even if she overlooked the strange act, he couldn't expect her to wait years and years for him; it was too much to ask a girl in her position to do so. She wouldn't wait, and he would lose her. He sat lonely for hours on the

fo'c'sle-head, quite oblivious to the soft glory of the amazing tropical nights into which *The Itchen* had steamed, because of this agony of loss in his heart.

Why had he been so mad? Why, when things had been so near, had he chucked everything away by this insane impulse? He found no explanation, no reason—save a ghastly one. He could only have done this thing because he was mad. Somewhere in him there lurked a strain of madness, he felt, that he had not known of—a strain welling up in his blood from some obscure generation. It had captured and controlled him at that devilish moment. He had shipped aboard *The Itchen* because he was mad.

He searched through his memories of his family to find who it was that had bequeathed him this ghastly strain. He could find nobody. Father, grandfathers, great-grandfathers; mother, grandmothers, great-grandmothers, they had all been ordinary, steady-going people. His immediate forebears had been clerks, as he was. None of them had ever travelled even. There was no explanation.

Yet madness was the only thing to explain his position. Why else this reasonless journey over a sea he hated? Why else that strong impulse to do what he did not want to do at all? If he could only see something behind it all he might have felt better. He saw nothing behind it—only madness.

V.

They called at West Indian ports. But John Collins took no pleasure in their novelty or colour. He simply did his work stolidly, his mind darkened by the obsession of his disastrous action.

Then, after a month of stolid monotony, John Collins again did a mad thing. *The Itchen* was in the Leewards—calling at Dominica, as a matter of fact. John Collins was lounging disconsolately on the quay, turning over and over again the old melancholy thoughts. It was a night of heavy, oppressive heat, but he did not notice that. He was asking again why he had ruined his life in this way.

Close to him was a sailing-boat preparing to get under way. A nigger on the quay was talking to one of its crew. He heard the sailor utter the name 'Sainte Marie.'

Sainte Marie meant nothing at all to him. But he went over to the quay beside the boat, and called down, 'Are you going to Sainte Marie?'

The half-caste in the boat flashed bright teeth up at him.

'No, sar; we's goin' Martinique. We call at Sainte Marie as we's go—that's what we do, sar.'

'You are sailing for Sainte Marie to-night?' asked John Collins, again with the inner powerless protest against his own action he had felt on the dockside at Southampton.

'We's sail at once, sar, but for Martinique. We's 'call only at Sainte Marie to-morrow afternoon. Lovely place, Sainte Marie, sar. Would you like to come?'

John Collins looked down at the boat.

'Yes, I'm coming,' he said, although he knew he did not want to go to Sainte Marie at all. He turned to the nigger on the quay. 'Look here, row me over to my ship, wait under the fo'c'sle and catch my bag over ship side when I throw it down, then take me ashore again. Be quiet about it now.'

In this way Collins, adding madness to madness, set off for an island he had never heard of, and never had any intention of visiting.

As he sat huddled in a cramped sailing-boat that combined a powerful and unpleasant smell with its other discomforts, he felt the limp despair that had come to him in the first moments after *The Itchen* had left Southampton. Why had he done this? What reason was there behind it? Was he just mad?

He huddled in the clumsy boat all night and the following morning, nursing his distress. Towards midday something happened to take his mind off his troubles. Looking up, he found that the seamen had collected at the forepart of the boat, and were staring ahead and making the air frantic with excited jabbering and gestures.

He went forward, and saw an astonishing sight. Like a great fan against the sky, and from the sea up, there lifted an enormous pall of smoke.

It was a vision to strike fear. As he stared at the silent and brooding pall Collins noticed that the day had changed. The air was sultry and malevolent. The world had become dull and lowering, and full of storm and dust. He could look at the sun, and about it was a band of muffled light, as though he saw it through a screen. The world in this yellow light seemed full of evil and terrible forces—and he seemed alone on a breathless sea.

He had seen nothing like this before, and he did not understand it. He asked of the nearest sailor, 'What's that over there? Burning ship?'

Several voices answered him.

'Sainte Marie. It's Sainte Marie.'

'I mean that smoke—that cloud.'

'Sainte Marie,' they cried again, and there was terror in their voices. 'That is Sainte Marie. . . . Mont Diable has gone up.'

It took John Collins some time to understand what Mont Diable 'going up' meant. It was minutes before he realised he was looking at a volcano in eruption. And then he could not quite understand all it meant. It was all so impersonal, that vast fan of smoke hanging silently over the distant sea. Only when he found his hands and his clothes covered with a curious brown-black dust did he grasp some-

thing of the immense meaning of the thing that had come upon Sainte Marie.

As the boat went towards the cloud of smoke he listened to the sailors talking. He gathered that this eruption could only have started an hour ago. At that time the look-out man had seen a great burst of smoke leap up in the sky, a sort of explosion, and after it the vast cloud had begun to grow over the spot where the island stood. Now and then the sailors would break into excited cries. Great blood-red slashes of colour curled and licked upward in the heart of the pall. Mont Diable was still going up.

As they sailed nearer, Collins saw the island brooding under its cerement of smoke. It was hard to distinguish details because of the smoke. It appeared to him a broad, hummocky island, out of which a hammer-nose of a mountain seemed to thrust. The pall of smoke was hanging about this mountain.

They came closer, and he could see, at a distance, tufts of isolated smoke going up from little bits of woods and from the cleared, brown surface of the hummocky hills. He saw flames running under these tufts of smoke, like sparks in wool, or like fire in heather and furze when a common is ablaze. He could not understand these isolated and outlying fires, but he was told that they had been started by dropping fire. Flying sparks and white-hot stones were plunging down on to the country all about the burning mountain, and woods and dry grass slopes took fire at once.

He noticed then that there was a rain of large black pieces all about the sailing-boat. The deck was gritty with cinders. He noticed, too, that fear was beginning to take hold of the boatmen. They were talking wildly of what they should do. They were throwing glances at him, the only white man on board. He caught their talk. They seemed torn between a desire to make land, which meant taking people and their belongings off in the boat and thus gaining much money, and their fear of something terrible happening to them.

They glanced at Collins, and he heard himself say, tersely and with the accents of command, 'We'll go ashore.'

Presently he saw the town, on the spit of the island under the hill. It was horrible. He saw fires there, wavering among the houses—fires that slacked off and burst out afresh. He saw ships at quays burning down to the water's edge. He saw frenzied crowds of people streaming along the shore on the beach, sometimes dashing into the water. Boats were coming away from the land—all sorts of boats, from smart launches to uncouth dinghies. All were crammed with people; frantic men, women, and children had still, it seemed, to struggle for life, though they were making off over the water from death. He saw a

packed whaler sway drunkenly under its burden of humanity, heave, and spill its entire cargo into the sea.

The air was thick and suffocating with smoke and gases as they moved closer in. The seamen now had to dash buckets of water every now and then over flames that sprang from woodwork and rigging as falling cinders ignited them. The men were frightened.

Collins said again in that voice of command, 'Go right in.'

He thought there ought to be a lava-stream. He had read accounts of such. He asked about it,

and it was pointed out. It was disappointing. All he could see of it was a swathe of dull smoke and gases winding down the mountain-side.

When the boat touched the beach, well away from the town and the mountain with their fire and destruction, Collins landed at once. He left the boat without looking back, caring not at all whether it went away without him or not. He plunged straight towards the town. He felt horribly frightened—but he wanted to see everything.

(Continued on page 821.)

ONE HUNDRED YEARS AGO.

By F. N. BURN.

THESE recollections are written by me in Dalle, a suburb of Rangoon, in the month of March 1919. Just one hundred years ago, in March 1819, my father, the late General George Burn of the Madras Army, joined the service of the Honourable East India Company. His commissions in the various grades from ensign to major-general are before me as I write. He was born on 25th March 1803, and as his first appointment as ensign is dated 6th March 1819, he had not attained the age of sixteen years when he became an officer.

I was born in 1843 at Bangalore, where my mother was staying during my father's absence in the first Chinese war. Soon after his return from foreign service he obtained three years' furlough to England, and the whole family proceeded there in the sailing-vessel *Nile*, Captain Nisbet, round the Cape. My earliest recollections as a child are of the sea. My sister, who was three years older, has told me that we rescued the crew of a vessel on our homeward voyage, their ship having been destroyed by fire. Of this event, however, I have no personal remembrance. I have only a hazy recollection of a vast expanse of water, and of going on deck to look at it and to enjoy the cool sea-breeze. I was too young during my father's furlough in England to remember very much of him. I was always fond of reading, though I understood very little of what the books were about. I read the *Pilgrim's Progress* before I was four years of age. *The Fairchild Family*, *Little Henry and his Bear*, *Masterman Ready*, *Robinson Crusoe*, are the titles of a few of the books with which I soon became fairly familiar.

My father retired after forty-two years' service in India, and I then saw a little of him for a few months until I came to the East myself in 1862. In 1876 I returned to England for a six-months' holiday, and it was then I learnt most of what I know regarding him. He was born in Hanover Square, London, where his parents resided. His father was employed in the

India House, so had no difficulty in getting one of his four sons into the Indian Service. My father was educated at St Paul's School, where, he used to say, the teaching was good, but the punishments were often brutal and cruel. Young people of the present time have little idea of the treatment meted out to school children in the early years of the nineteenth century. Those who survived it often turned out good and humane men, but the reverse must sometimes have been the case. No examinations were held of those who obtained cadetships. They were called up before a Board of Directors, asked a few simple questions, and told to be in readiness to proceed within so many weeks to the particular presidency to which they had been appointed. They seem to have been of all ages from fifteen to twenty-five.

My father's destination was Madras, and one of the cadets who came out at the same time was married, he told me—the only instance he ever saw or heard of such an early union throughout his whole Indian service. During the Napoleonic wars there was a tradition that one rather diminutive cadet who presented himself was interrogated by a director: 'Well, my little man, do you think you would be able to run a Frenchman through the body with your sword?' 'I don't know, sir, for I never tried,' was the immediate reply; 'but I would let a Frenchman run me through the body before I would run away.' Needless to say he passed with honours, and he afterwards became one of the most distinguished servants of the East India Company.

On arrival in Madras my father was posted to the 14th Madras Infantry, a regiment which had seen considerable service in the later wars of the eighteenth century, and won the distinguished motto of 'Faithful and True,' which it bore on its colours and appointments. He was an ensign for only one day, receiving his promotion to a lieutenantancy on the following day. The ink filling up all his commissions must have

been good, for it had faded very slightly after a hundred years in the case of the oldest one—half of this period having been spent in a tropical climate, where neither paper nor ink is supposed to last so long as in the temperate zones. My father's regiment was ordered on service at Kittow in 1824, at Kolapore in 1827, in Goomsow in 1836, and finally in the first Chinese war in 1841–42. He told me he learnt his drill with sepoy, and with the old heavy flint matchlock. At Goomsow, where we had an army of nearly 7000 men, besides artillery, he fired several rounds from a sepoy's musket at the embrasure of a fort we were besieging, and his shoulder was sore from the effects for several days afterwards. This was where he obtained his first prize-money, 600 rupees, half of which, he said, he remitted to his father in London to assist in the expense of educating his brothers.

We often begin campaigns with muddling, and we actually started our first Chinese war with only our European troops armed with percussion muskets, although the invention had taken place more than thirty years earlier. The Madras Infantry, which formed the bulk of our army, were still armed with the old flintlocks. This very nearly led to a disaster and the slaughter of a company of the 37th Madras Infantry, which, having missed the road, found itself, with night coming on, in the middle of a paddy-field, and gradually being surrounded by some thousands of Chinese and Tatar troops. The weather also changed, and a tempestuous storm of rain followed on a very hot day. The sepoy, were, however, well disciplined and ably commanded; they trusted fully in their officers, and obeyed every order given. The storm appeared to increase in violence, and as darkness had set in, and the effecting a safe retreat with his wounded seemed impracticable, Lieutenant Hadfield (in command) formed square, and resolved to keep the Chinese at bay with the bayonet as best he could. The firelocks were mostly useless in the heavy rain, though some of the sepoy had loaded under cover of their clothing and handed their muskets to their officers. A forward man amongst the enemy would be picked off sufficiently often to deter them from closing. This went on for two hours, when two companies of Royal Marines, armed with percussion muskets, arrived, and delivered the sepoy from their seemingly hopeless position. A single volley poured into the crowded ranks of the Chinese at the distance of a few paces soon swept them away, and at the same time proved the value of the percussion muskets to the whole army.

When the 37th Madras Infantry returned to their own presidency after the war was over, they were formed into the 37th Grenadiers in recognition of their discipline and good behaviour. No notice, however, seems to have been taken

of the blunder the authorities made in sending any troops to a war armed with flint muskets fully thirty years after the invention of percussion-caps. We had successfully muddled through. My father used to say that the Chinese war was the only one Britain had ever waged which more than paid its cost in money.

I remember as a boy in the 'fifties of the last century that when a court-martial was held on an officer in any part of India, a short *résumé* of it, with finding and sentence, always appeared in the budget of Indian intelligence, which used to be published on arrival of the mails. This went on until the mutiny of 1857, somewhat on the same principle as giving short details of cases against the civil population of the country which still appear in every home newspaper. There were sometimes six or seven of these courts-martial in a single issue of the paper called the *Homeward Mail*; usually two or three. The majority of the cases were for being drunk on duty, and conduct 'to the prejudice of good order and military discipline.' The remarks of the Commander-in-Chief, approving or disagreeing with the finding or punishment, were always appended. Some of those I have read in earlier days, when Sir Charles Napier was Commander-in-Chief, were often amusing and instructive. He was a man who said what he thought, and often in very unofficial language. One I remember concluded somewhat as follows: 'Officers and gentlemen have every right in their spare time to ride to the devil if they so choose. But they have no right to do so in crowded places where there is a danger of their sending other people there *when they may have no wish to go*.' Napier was a fine old soldier, but he could not hit it off with Lord Dalhousie, who was another autocrat in his way, and who as Governor-General was, of course, supreme. When the 66th Bengal Native Infantry mutinied, Napier disbanded them and enlisted 1000 Gurkhas in their place. This he had no right to do without reference to Calcutta. In 1857, though there were instances, notably at Lucknow, of a few sepoy of particular regiments remaining faithful to the British, the 66th Gurkhas, enrolled by Napier in the 'forties, was the one solitary instance of a whole regiment of the Bengal regular army, of seventy-two regiments of native infantry, doing so. Had Napier's advice been followed by Lord Dalhousie, in all probability there would have been no mutiny in 1857, for he wanted to maintain at least 10,000 Gurkhas in the Bengal Army. Since the Nepal war of 1816 the Gurkhas have always been amongst our bravest and most loyal soldiers, and their enlistment in larger numbers would have shown those who had hitherto composed the Bengal Army that we were not, as they thought, wholly dependent on them for filling the ranks of our sepoy regiments.

HOW THE PRINCESS HORATIA CAME TO HER KINGDOM.

PART III.

IX.

THE spirits of the Princess Horatia, which inclined to be low next morning, were greatly revived by the receipt of a small folded missive. She found it lying beside the jug of steaming coffee that the lay-brother left at the door of her cell at an early hour. It was addressed in strong, neat characters to 'Her Highness the Princess Horatia,' and was sealed at the back with a small red seal which bore the faint impression of a signet. But the princess did not stay to examine the seal, so eager was she to break it. The writing, she knew, was not the scrawl of Prince Ajax, and her heart fluttered pleasantly.

'Do I greatly dare,' it ran, 'to ask if you will come out to the ramparts? His Imperial Highness will not be stirring for some time yet.—JOHN.'

She gazed at it for a moment with shining eyes. It was her first love-letter. At least, it was the nearest thing to a love-letter that she had ever received. She liked the intimacy of the signature. Then, with the contrariness of the human heart—perhaps more especially a woman's heart—she began to wonder if she ought to like it. She even thought she should be very much displeased. Was not John King being over bold in thus addressing the rightful Queen of Promethea? Did he not understand that a gulf yawned between them? Nevertheless, on finishing her coffee, she put on her hat, and, without acquainting Miss Pinkerton, sped out to the ramparts.

The morning air was fresh and sparkling as wine, and there was John King awaiting her at the bottom of a steep flight of steps that led up to the topmost height of fair Hesione. He came forward to greet her with his usual pleasant smile. Yet it was, somehow, different. The pleasantness was the same, but it had in it something more, something she knew that was for herself alone. She held out her hand to him, and he bent over it and kissed it.

'Let us ascend to-day!' he said, looking into her eyes with his dark, smiling orbs. 'We were interrupted yesterday down in the depths, so to-day we shall climb to the heights.'

Accordingly at his suggestion she meekly tripped up the steep stone steps, amazed at her own behaviour. Why should she obey the behests of John King? She must remember her position and remind him of his, since he seemed to forget it. So she decided as she mounted to the battlemented terrace that rose at a giddy height as if poised in blue ether, with

the world lying far below. Reaching the top, she gasped a little, with the steepness of the climb, the sharpness of the air, and the sheer loveliness of the scene—and, also, the agitation of the moment. For John King, after standing by her side, gazing into the heavenly space of blue, and down upon the rocky crags and lower towers and turrets of Hesione, sharing her delight in silent sympathy, gently laid his hand upon her arm.

'Princess,' he said, to draw her attention from heavenly sights to a more pressing earthly matter, 'I am waiting your answer to my question of yesterday.'

Her arm fell away from his touch, and she drew back a pace with slight hauteur. 'Everything is changed to-day from yesterday,' she murmured.

'Why? Because Prince Ajax has arrived at Hesione in disguise?'

The tone of his voice and the glint in his dark eyes brought a smile to her lips.

'He's a buffoon,' she observed, 'but he was not playing a part. Nor am I—not now. You may find it difficult to believe, but he really is the second son of the Emperor Hildebrand, and I—am the rightful Queen of Promethea—the daughter of King Alexis. I was very anxious to see my kingdom, so I came as Miss L'Estrange, an English tourist. And it is true, as the prince said, that I hope one day to get back my kingdom—though not, I trust, by his help,' she added vehemently. 'And so'— She lifted her eyes pleadingly to his, as if to implore him to understand her position without further words.

'And so you think me outrageously presumptuous that I should still ask you to marry me?' he said quietly, taking both her hands in his.

'You must not,' she murmured, turning her head aside to avoid his gaze, though she did not withdraw her hands. 'I am Miss L'Estrange no longer.'

'Yet I still dare to love you. You—just you,' he said earnestly. 'Can you not dare to return the love of plain John King?'

'Don't ask me,' she pleaded. 'I may not—I—'

'I did not expect such an answer from the daughter of King Alexis and Queen Horatia. Remember there is no royal marriage law in Promethea. I have your own word for that,' he added triumphantly, with a smile playing over his bronzed face.

She gasped at his boldness, and her breath came and went sharply as he still held her hands captive. She could not speak.

x.

'I think we were both agreed that King Alexis was entirely right, were we not?'

She was silent. Her eyes wandered over the rocky walls of the ancient fortress. It was fair to see and girt about with romance—the handiwork of a god. She was the daughter of its race of kings. What should be her choice? The kingdom of Promethea, the troubled, 'insubstantial pageant' of a throne, herself the centre of storms and tempests and the quarry of swashbuckling hunters; or the quiet kingdom of a good man's heart and the sweetness of the crown of love?

She could not have told how long she stood in hesitation, with John King holding her hands in his strong clasp and eagerly awaiting her answer, nor yet how long she might have stood upon the fearful brink 'to be or not to be,' had not Prince Ajax appeared from the doorway of the citadel and at once descried the two figures who stood poised against the turquoise sky on the topmost height of Hesione.

He stood below, crimson of visage, and stared up at them as if he doubted the sight of his eyes.

'John,' whispered the princess, releasing her hands and placing them upon his shoulders, 'I am my father's true daughter. I surrender all to my love.'

'My princess,' said John King in triumph, folding her in his arms in the full vision of the gaping Prince Ajax and the aghast Miss Pinkerton, who had just stepped forth from the doorway.

'Do let us go and announce our betrothal to him,' cried the princess, with a laugh of pure happiness. And down the steep flight of steps she sped, with John King following fast upon her heels.

Hand-in-hand they advanced upon the still gaping prince, who had now been joined by his fellow-huntsman and several of the monks, headed by the Father Superior; while poor Miss Pinkerton leaned against the stout wall of the citadel, unable to support this shocking result of the princess's foolhardy expedition and her own indiscreet behaviour.

'Sir,' began John King, in a voice that was full of dignity and pride, 'Her Highness the Princess Horatia desires me to inform your Imperial Highness that she has pledged her troth to His Majesty the King of Promethea, who requests that you will hold the matter in confidence until such time as he can inform his Ministers and subjects of his intended alliance, which will restore with peace and honour the throne of Promethea to the rightful queen.'

The hand of the princess fell from his clasp and her eyes widened, half in amazement, half in dismay, as her lover proceeded to make a similar announcement in the Promethean tongue to the reverend guardians of Hesione. They, lifting their hands to heaven, repeated in unison a benediction upon their king and his royal bride, the Princess Horatia.

'John,' murmured the bewildered princess when the monks had withdrawn, bearing Prince Ajax and his companion with them, while Miss Pinkerton discreetly vanished, 'what does it mean? Who are you? Am I in a dream?'

'My dear,' said her lover serenely, 'it means exactly what I have told Prince Ajax and the good fathers. I happen to be the wrongful King of Promethea, and I am going to restore the rightful queen to the throne of her father in the happiest possible manner for myself and everybody else.'

'But it seems to have happened so ridiculously like the plot of a comic opera—I can't believe in it. How did you come to be at Hesione just when Prince Ajax arrived in his absurd disguise?'

'It's all very easy to explain, my dear—though I am not responsible for the absurdity of his Imperial Highness's disguise. Prince Ajax, or the Emperor, it seems, has for some time been trying to upset the loyalty of our subjects, as well as that of the fathers of Hesione. He finally confided to the Father Superior his design of coming in disguise to further his machinations. The good father, who is my friend and a loyal Promethean, acquainted me of the fact, and suggested that I should pay a private visit to the fortress and confront him. I took his advice. On the way—Well, you know the rest.'

'So we were both masquerading, and you never confessed that you were not John King until I had humbled myself to agree to a *mésalliance*. Wretch, to take advantage of my innocence and *penchant* for romance!'

'Forgive my deception! I thought at first the *mésalliance* was going to be on my side, and wondered how the Prometheans would take it,' he added with a gay laugh. 'We are both playing the parts of sensible beings now, so are quits. But I protest against the charge of masquerading. I didn't don a uniform—I've got several, but don't ape the Emperor—or assume any disguise. I merely wore my usual travelling-suit. You took me for an Englishman (I do happen to have a London tailor), so I gave you my name in the English form. In the Promethean tongue I am called *Evano Rex*.'

THE END.

HABITS AND CHARACTERS OF BRITISH WILD ANIMALS.*

VIII.—THE RABBIT.

By H. MORTIMER BATTEN.

I.

AS a rule, young rabbits are born in a shallow burrow known as the 'stop' or the 'stab,' often not more than a yard in depth, and so small that one would hardly think an adult rabbit could squeeze into it. Generally this hole is out in the centre of an open field, facing south for warmth. It is the rabbit's first step towards hiding her young, though her ideas in this direction are still so undeveloped that she often digs her stop within view of the whole colony, the fierce old bucks of which are as great a source of danger to her children as is the weasel or the stoat. The nest consists largely of down the mother has stripped from her own breast, intermingled with soft dry grass or moss scratched from the rocks, so that nothing warmer and softer could be imagined.

Nature devotes a good deal of energy to keeping the rabbit population within reasonable limits, and it is just as well that it is so; otherwise Bunny would overrun the whole universe. Often this thinning-out process begins before the babes have seen the light of day. Perhaps the mother is young and inexperienced in nest-making, and instead of digging the burrow half-way up the sloping bank, she digs it at the bottom, and the day after her infants are born there occurs a heavy thunder-storm. Water collects in the little hollow, and begins to trickle into the burrow. It may finally fill the chamber within, drowning the whole family; or it may merely damp the bedding. In the latter case three of the young ones, perhaps, contract paralysis, a fourth dies, while the remaining two, being sturdier than the rest, take no harm. When the mother comes again to feed them, she rakes out the dead one, and evidently carries it off so as not to advertise the whereabouts of her home, for I have never seen the missing member of the family lying near the nest.

In a few days all the young have their eyes open, and are old enough to begin to think about a vegetable diet. The first favourable night, therefore, the mother leads them out of the nursery-burrow into the moonlight, shepherding them and pushing them along, while, dazzled and bewildered, they try to get beneath her. Slow is the progress that they make; but presently, topping a ridge, they see scores of

other rabbits squatting about on the moonlit plateau, some quietly feeding, while others sit up with ears erect, doing sentry-go.

The mother-rabbit now becomes very goggle-eyed and important, stamping her hind-legs as she herds the sprawling little ones across the open. Several rabbits sit up and look at her, then, seeming to take it as a matter of course, go on with their feeding. One long-legged old gentleman (more like a hare than a rabbit), through whose ears there are many shot-holes, hops up with a look of inquiry, circles inquisitively round once or twice, then scratches his neck with an air of indifference. His very manner seems to indicate that this old fighting buck is the king of the colony, and that one will hear more about him later on.

The mother-rabbit takes her family to the home-warren, whither most young rabbits go as soon as their nest-days are over, and here their worldly training begins. By no means are they the only young rabbits occupying the burrow, for on sunny days scores of the same age are to be seen sitting about the warren-entrances, enjoying the warmth, or shivering in the wind, between intervals of nibbling the closely cropped grass.

As the days pass they find more and more of their own food, thus becoming less and less dependent on their mother, and she, sad to relate, is very rapidly losing interest in them. Old Long-Legs, the king of the colony, now begins to make himself felt. When he has nothing else to do, or the time seems favourable—whenever, indeed, he happens to think of it—he amuses himself by chasing the youngsters through the burrows, kicking them and nipping them, and making himself an unholy terror in their lives. At first their mother sticks up for them in a half-hearted way, for they are still quite small. But very shortly she seems actually to forget which are her children among the many that throng the burrows; and so Long-Legs bites their ears, kicks them head over heels, chases them, and makes them squeal for mercy, till finally they run and hide at the sight of him.

II.

Each night the young rabbits venture a little farther afield, becoming more and more interested in the movements of their elders. At dusk, an old doe sits up and begins to hop out along one of the clearly defined runways that lead from the burrows. Slowly and cautiously she goes, placing her feet just where she placed them last night and the night before, while

* The articles in this series, in much fuller form, together with chapters descriptive of the remaining larger British mammals, are embodied in a handsome octavo volume, *Habits and Characters of British Wild Animals*, by H. Mortimer Batten, with life-like illustrations by Warwick Reynolds (W. & R. Chambers, Ltd., 21s. net, 1920).

behind her comes first one rabbit and then another. A second old doe (a buck never leads) sets out along a second runway, leading in the opposite direction; then the move becomes a general one, almost every adult rabbit sallying forth on its nightly foray. For a minute or two the whole earth is brown with them, and one would never believe a single warren could contain so many residents. Rapidly, almost mysteriously, they melt away. In the dimness you just see a leading doe, perched like a silhouette on the break in the wall, as she pauses for a final survey ere she leads her train into the next field. She disappears, and a second black speck takes her place; then a third and a fourth are seen, like bobbing clockwork toys, till finally the gathering darkness blurs out the gap.

Not long do the rabbits stick to their runways, one branching off here and another there, so that by the time the moon is up they are scattered all over the country-side—old Long-Legs being two miles away, nibbling a cottager's cabbages at the very threshold of the village. At the home-burrow, squatting about the plateau, there remain only a sprinkling of youngsters and a few nursing mothers keeping guard.

The youngsters join in at the tail-end of the procession ere very long. The first night out the wall across the meadow appears to them as an insurmountable obstacle, so they nibble the grass on this side of it; the night following they try the leap and succeed, browsing on the other side; ere a week is up they are nibbling the grass nearly a mile away—keeping a weather-eye open for Long-Legs, who is apt to pounce furiously upon them at any time.

All along nature's weeding-out process, designed to keep their numbers in check, is going on. There comes a rainy spell, during which several of the young rabbits contract liver complaints through eating too much wet grass, and die. In the wood near there lives a wild cat of the tame variety. She actually shares a room under a rock with several adult rabbits, and each night she steals forth along a rabbit-runway, as though she were one of the colony; yet ten minutes later she is crouching behind a wall, a sinister vision of bristling fur and gleaming eyes, waiting for the first unwary youngster that comes her way!

Then one night a whole battalion that set off northwards fails to return, and at dawn, before the respectable world is astir, a ramshackle motor-car takes a sackload of netted rabbits to a neighbouring station.

In spite of these drainages, however, the home-warren becomes more and more thickly stocked, every mother taking her young there as soon as they are old enough. And now we see the value of old Long-Legs, who in the past has been a bully and a tyrant, apparently neither useful nor ornamental. The family whose career we have so far followed are now strong and independent; but Long-Legs is still the terror of

their lives, driving them out whenever he sees them, as if intent on inflicting some bodily injury. Glad to be rid of him, they turn at length to the great wood at the mountain-foot to the west, and here, among the loose rocks, thickly overgrown with bracken and briar, they make homes for themselves, free to do what they choose.

This wood is really the overflow reservoir for the home-burrow. Each year scores of young rabbits have been taken to the burrow, remaining there till old enough to take care of themselves; and then, bullied and harried by some old buck, they have gladly moved to the shelter of the wood, which, as the season proceeds, becomes thronged with the surplus stock of young rabbits. Were it not for this the home-burrow would become overcrowded, and disease, nature's never-failing remedy, would fall upon the colony.

III.

Almost all animals of gregarious habits have ways of signalling danger to one another. One of the first things young rabbits learn to do is to signal danger by thumping the ground with their strong hind-legs, and it is to be feared that, in their inexperience and ignorance, they misuse the alarm when they are small, thumping away at the very slightest pretext, and apparently carrying on a Morse system of telegraphy with each other in this way. Old rabbits, however, never thump unless they suspect serious danger, and the more suspicious they are the more vigorously they thump.

Then rabbits have another and a far more important way of signalling danger to each other, which they do unintentionally and without sound. There are times when the thump system would merely attract the attention of their foes—when it is better that every rabbit should steal swiftly away, as silently as possible, as they often do.

Of what value is the rabbit's white tail? One would think it merely makes him conspicuous when otherwise he might escape unseen; and this, indeed, is the case. His white tail is of no value to him personally—in fact, he would be better without it; but it is endlessly valuable to his friends, in the same way as *their* white tails are endlessly valuable to *him*.

The whole colony is at its feeding-grounds, and suddenly danger appears over the ridge. The rabbits are as yet unseen, but the faintest sound would betray their presence; so the cony nearest the danger rises and bolts swiftly and silently, and every rabbit he passes sees a bobbing white danger-signal, which means there is not a moment to be lost. And each rabbit as he beholds it rises and glides away, unintentionally giving the alarm to those nearest to him, so that in a few seconds it has spread north and south and down the forest-side, and the man stealing through the shadows with his gun wonders why there is not a rabbit abroad to-night, for by the time he reaches the foot of the wood the alarm has flashed ahead of him over two or three fields!

Rabbits appear to exist simply as a natural food for other things, and there is no end to their foes. Guns, nets, snares, traps, dogs, weasels, cats, and foxes are but a few of their everyday enemies, for tens of thousands of rabbits meet their fate annually by flood-water or by disease. Those killed by man, the veritable cartloads which go to our cities each week during autumn and winter, in fact the whole year round, are but a dribble compared with the gigantic drain on their numbers effected by the ordinary course of nature; yet everywhere the rabbit thrives and multiplies, often to so great an extent that the most stringent measures have to be taken in order to keep its numbers in check.

In the mountains of the north the rabbits for ages past have made their burrows in the sandy banks of the mountain-burns; and the very fact that these banks are of sandy formation, which so exactly suits the rabbit's burrowing habits, proves that the streams are subject to sudden torrent from the heights, the silting and sifting process of endless floods having washed away the earth and left only the insoluble sand. Each year, when these burrows are full of young rabbits, the flood-waters come down and exterminate whole colonies—the victims merely huddling in batches at the ends of their holes, making no attempt to escape ere their retreat is cut off. In fact, the abundance or scarcity of rabbits in the autumn in these regions is governed entirely by the number of spring and early summer spates. If there have been no floods, then August finds the glens and the woods alive with rabbits; but if, on the other hand, floods have been frequent, there is hardly a rabbit to be found in the country when August comes along.

IV.

Of all ways man employs of taking rabbits, probably more fall by the snare than in any other way, for its use is world-wide and universal.

Netting is the only humane method of catching rabbits, as in shooting a certain percentage get away, however deadly a shot one may be, to perish miserably; while in ferreting numbers of rabbits are injured by the ferret—if not by his teeth, then by his claws—and have to be abandoned in their burrows. I consider snaring more humane than ferreting; but the cruelty begins when old and rotten snares are used, and the rabbit gets away with the tightly drawn noose about his neck.

What fate is then in store for him? Better far that he had met the weasel on his own ground, or perished by the flood-waters when he was small. There is no getting rid of this hateful thing about his neck, and he does not know what ails him. For days the wretched creature lingers between some sheltering cranny and a patch of greensward, wearily dragging himself back and forth, unable to eat or to take an active part in the world of sunlight about; and

in the end blindness overcomes him, if not death in some merciful form.

Sometimes, after days of torture, a rabbit gets rid of the cruel noose, and finally recovers his strength; but he is now a blind rabbit. Every colony of any size has its blind rabbits, just as long ago every herd of buffaloes on the prairie had its blind members. And just as the blind buffalo, his other senses becoming quickened, was often the first to give warning of danger to the rest of the herd, so blind rabbits, feeding with the rest of the colony, are frequently more alert and keen than any of their brothers and sisters.

I have seen a rabbit, totally blinded by the broken snare or by shot, get up and bolt like an arrow on the first approach of danger, dipping underground at the exact spot without hesitation or fault. His foes are many, however, and, thus greatly handicapped, it is merely a matter of time ere he falls to one or other of them. Once off his own runway, once turned aside from the path he knows so well, and he stumbles, falls, and is lost, finally crouching in the open without further attempt to save himself.

On their runways rabbits always place their feet in exactly the same places, so that the track, instead of being evenly worn, like a human pathway, consists of a string of worn patches, from one to the other of which they hop. The rabbit-catcher knows this, and places his snare in such a way that it will catch the rabbit mid-leap; but a pathway of this kind is of value in that the patches become trodden hard and free of crackling leaves and twigs, so that the owners can run along it without creating undue noise.

The rabbit is swifter than the hare when on its own ground and over a short distance, the superiority of the hare lying in its staying-powers and in its marvellous maintenance of a high average speed.

It is generally thought that the natural home of the rabbit is its burrow, that this creature belongs to the earth, and comes up only for food; but this is not so. Like most wild creatures, rabbits love the sunlight and the air as much as we do, and seek the ground only as a place of sanctuary from their foes or from storms. A far greater number of rabbits live and have their homes above ground than dwell in burrows, their open-air houses consisting of little seats in the grass, wisely chosen to suit the weather; and here they crouch as you pass by, never stirring unless you threaten actually to tread on them.

V.

Rabbits are polygamous—or, rather, they are wholly licentious as regards their marriage customs. 'Faint heart never won fair lady' is the code of the rabbit metropolis, and he who, by strength of hind-leg and readiness of tooth, is best able to hold his own against his fellows, is, to put it bluntly, the father of the most children.

A doe wild rabbit probably begins to breed

when three months old. Some naturalists put the age at six months; but since a rabbit is full-grown at three months, and it is no uncommon thing to find does that are not full-grown already heavy with young, three months would seem to be a conservative estimate.

The number produced per litter varies with the time of the year. An early spring or a late autumn litter may number only three or four, late spring and summer litters being from five to ten. The young are born blind and deaf; they begin to hear at the end of ten days, and their eyes to open about the eleventh day. These data are the result of observation among the rabbits of the Pennine heights. The young are independent of their mother when about three weeks old during a season of plenty, and almost as soon as they are self-supporting she begins to bethink herself of yet another family. Indeed, it would seem that the female pairs again within twenty-four hours of producing her young; and having these facts to work upon, it does not require much imagination for one to arrive at an understanding as to how the rabbit survives.

Though closely allied in many ways, the rabbit and the hare are totally different from one another in character and temperament. 'Rabbit-hearted' is an expression commonly used not only by white races, but also by red and brown people, and except in the case of a mother defending her young, this creature has no heart whatever. When pursued, it trusts to a short burst of speed taking it to the sanctuary of its burrow, and if foiled in any way and unable to find immediate shelter, it at once loses heart. I have known a rabbit, on finding its burrow closed, to begin immediately to run in foolish circles, screaming piteously, though its pursuer was nothing more fleet and formidable than a small boy, into whose hands the creature ultimately fell!

One has every respect for the hare, but neither the character nor the mentality of the brown rabbit is calculated to excite our admiration. It will return and nest time and again in the hollows of a swamp that is periodically flooded, and where death by drowning inevitably awaits its young; it has no morals to speak of, and no pluck whatever. True that it figures as an important item on the nation's bill of fare; but even here the rabbit does not pay its way, and only because it is to the poor man what the pheasant is to his employer is the existence of the creature justified.

Rabbits are not supposed to be particularly hardy animals, as they are said to be susceptible to damp, yet they seem capable of surviving under any conditions whatever. In the heights of the Scottish hills, where they live for seven months of the year amidst the driving wet of the cloud-wraiths, they flourish exceedingly. On every wind-swept island bordering the coast,

though some are so bleak and rugged that practically nothing grows in the shallow soil, the rabbits fatten and multiply till periodical disease wipes them out. Among coast cliffs they are entirely at home. Here, on a dizzy shelf, the young are born; they grow up to share their burrows with the puffin and the shearwater; they become a crag-fast race of their own, thriving and multiplying till some, perforce, wander inland.

VI.

Rabbits do considerable damage on the grazing-lands which they frequent—not only by what they eat and by so defiling the land that sheep will not graze after them, but by bringing about an entire change in the flora of their habitat. Where rabbits flourish the grass soon dies, and its place is taken by thistles, nettles, and other weeds which are very difficult to displace. The areas of useless sand-grass found in some localities are probably due to rabbits, the more useful growths that once clothed these areas having been killed off, so that the coarser, hardier growths finally took possession. On sandy hillsides the rabbits do considerable damage by casting up vast mounds of unfertile earth, and thus burying the fertile surface.

Farmers do not generally realise the full extent of the damage done by rabbits on their property. It is customary to let the shooting, if in the farmer's own hands, and the rent received for it is supposed to compensate for the damage done. On the many rabbit-shoots I myself have rented, however, it would, on almost every occasion, have been possible, had one cared to work, to pay the rent by selling the rabbits killed at sevenpence per head. Those rabbits cost the farmer more than sevenpence each to rear, and by letting the shooting he was by no means assured that the work of extermination would be thoroughly done. I do not mean to infer that farmers would be well advised to increase the rent of their rabbit-shooting; on the contrary, from the tenant's point of view, it is seldom worth what is paid for it, and the best arrangement is for the farmer to come to an agreement with the tenant that, after a certain date, measures will be taken systematically to reduce the rabbit population—preferably by the employment of a professional rabbit-catcher. The man who is simply out for sport does not kill down the rabbits as they should be killed, and by February at the latest traps and snares should have been brought to bear, and should be kept in operation till they no longer yield results. The doe-rabbit killed in February could profitably be bought, at ten times her market-price, by the farmer in whose land she was killed, and this is a point he should bear in mind ere he decides to dispense with the rabbit-catcher's services.

So few wild rabbits die by the kindly hand of Time that it is difficult to arrive at their natural length of life. In an enclosed park in the West Riding a rabbit, distinguishable from his fellows by a white ruff about his neck, was seen by the family at breakfast almost every morning for nine consecutive years. He was born about the same time as the eldest son of the house, and, curiously enough, he died, judging from his disappearance, on the same night as the child's grandpa died! His name went down with the family traditions.

This rabbit lived a hedged-in and protected life in the precincts of a city, and under such

conditions he might, indeed, have lived to see his fifteenth year. How long a wild rabbit lives depends upon the speed at which it lives. Safe from its foes, passing its days in peaceful security, it would probably live many years longer than if it were eternally but unsuccessfully chivied by stoats and lurchers. Since normally wild rabbits live less strenuous lives than hares, they live proportionately longer. I should set down the average life of the normal wild rabbit at eight years; senile decay generally sets in rapidly at the end of the ninth year, and few of them live to reach eleven.

NEW OIL FROM OLD.

By FREDERICK A. TALBOT, Author of *Inventions and Discoveries*, &c.

AT this moment the country is suffering from a shortage of oil to keep the wheels of industry running smoothly. Mineral oil as a native product is virtually unknown in these islands, although a certain quantity is derived from shales; but the domestic supply would be totally inadequate to keep our workshops in full swing. The average individual scarcely realises the vital rôle which mineral oil plays in our complex industrial and commercial life. If we were suddenly to be deprived of this commodity, every piece of mechanism would be brought to a dead-stop. We should be unable to grind our corn, unless we reverted to the methods practised by our woad-bedecked forefathers. We should be unable to move the flour from point to point, because our trains and various road vehicles, as well as power-driven vessels, would be condemned to immobility. We should be deprived of the conveniences afforded by artificial light, heat, and power; our workshops would be forced into idleness.

To modern civilisation oil is as indispensable as is bread. It is a moot point whether the lay mind has ever conceived what an oilless Britain would mean. Yet we have been prone to waste this commodity in the most reckless manner. The mechanic at his machine wipes his hands upon a lump of cotton-waste. When the cleanser becomes too saturated to be of any further use, it is consigned to the flames. In the process of destruction both the rag and its greasy contents are lost. Separate the one from the other, and the two articles become available for a further spell of usefulness. Oil drips from a machine, and is absorbed by a layer of sawdust on the floor. When the absorbent reaches the stage at which it cannot possibly soak up another drop of oil, it is swept up and thrown into the furnace. A simple remedy, but how wasteful! The oil is lost beyond recovery.

Formerly it did not matter. Oil was cheap.

In 1913 oils and greases, or substances from which they are produced, were coming into this country from all parts of the world in steadily flowing streams to the value of £22,000,000. It was so easy to draw from the inexhaustible reservoir offered by Mother Earth, so simple to prepare for specific purposes; it could be despatched over thousands of miles at an insignificant charge, and could be placed upon the market at a very low figure. So, oil being available in plenty and cheap, why trouble to recover the greasy contents of the waste or the sawdust?

But to-day the streams of oil have shrunk; and we cannot produce sufficient ourselves to satisfy our requirements. The stringency is such that we have not enough oil to go round. Moreover, in accordance with the inexorable law of supply and demand, the price of this formerly abundant and cheap commodity has soared, until now it has reached a startlingly high figure.

Fortunately for us, at least one inventor was wiser in his generation than his countrymen, and during the prodigal days of peace, despite the unattractive outlook, gave his ingenuity and fertility of thought full rein to perfect a simple and inexpensive means of recovering a significant volume of oil from waste materials at negligible expense. Although the days of plenty militated against his making revolutionary headway with his invention, nevertheless he did succeed in enlisting the practical encouragement of certain prominent firms, who expressed their faith in his process by installing the requisite plants, which sufficed to demonstrate the capabilities of the system. Consequently, when the exigencies of war conclusively demonstrated that we must proceed warily in our consumption of oil, and pointed the advisability of reclaiming waste as far as practicable, to make available new supplies go further, a proved, simple, and inexpensive process for achieving the desired end was found ready to hand. So industry

was spared the weary waiting incidental to the commencement of a new movement at a critical moment, and was saved the interval of suspense between laboratory experiment and proved commercial application.

The process in question has been described as a simple means of offering new oil for old, or (should it not be?) producing new oil from old. It compels attention because it completely dispenses with any necessity to resort to chemical processes, which at one time were considered the only feasible solution of the problem, and which, in addition to being somewhat circuitous, are liable to prove expensive, inasmuch as the indispensable ingredients to-day are relatively costly, more particularly the solvent.

The system may be most aptly described as the effective application of dry heat combined with centrifugal force. The necessary plant comprises a cyclinder or drum, inside which is placed a perforated steel cage, which in turn receives a basket contrived from wire or perforated sheet-steel. This basket is removable, to facilitate charging and emptying. The cage in which it is placed is so mounted as to be free to revolve, the necessary rotary motion being imparted by a jet of steam playing upon the blades of a small turbine directly connected to the cage.

The waste—oil-soaked cotton rags, cotton-waste, mechanics' gloves, or whatever it may be—is dumped into the basket, and the latter is then inserted in the cage. The drum is now closed and the steam turned on. The jet of steam playing upon the turbine-blades causes the latter to revolve, carrying the cage and its contents round with it, speed being increased until a peripheral velocity of approximately six thousand to seven thousand feet a minute is reached.

After the steam has performed its initial function of driving the turbine, it is not permitted to escape, but rises through a central dome to pass into the heart of the contents of the cage within. It permeates the whole of the material, thus heating it up, and in so doing renders the oil more fluid. Passing through the material, the steam escapes through the perforations in the cage, and thence into the outer air. The oil and the grease thus liquefied become separated from the solid material as represented by the rag or waste, and upon release, under the centrifugal action set up, are forced through the meshes of the basket and the perforations of the cage, to fall within the annular space between the cage and the outer drum. The oily ingredients, being of the same temperature as the steam, are rendered exceedingly fluid, with the result that they run readily. The oil, falling to the bottom of the drum beyond the zone of centrifugal action, is now permitted to escape from the separator into the settling-tanks. Here any solid impurities which

may be present gravitate to the bottom in a sediment as the oil cools, to be subsequently drawn off. If desired, filtering of the oil may be carried out simultaneously, the hot oil being conducted from the separator to vessels provided for this purpose.

It will be seen that the process is continuous, it only being necessary to stop the machine at intervals to withdraw the basket and empty the contents, from which nearly all the oil has been extracted, and to insert a fresh charge. The fact that the whole of the retrievable oil has been extracted from the contents of the basket is apparent from the cessation of the flow from the drain-pipe into the settling or purification tank. The actual time occupied in the separating process naturally varies according to the heaviness and the character of the oil or the grease.

The apparatus itself is noticeable from its compactness, simplicity of operation, the small space required to accommodate it, and its high efficiency. All that is required is a supply of steam, which in the case of a factory driven throughout by electric energy generated by a gas or an oil engine may be economically raised specially for the purpose by a small portable boiler. The steam does not even require to be raised to a high pressure to complete its work. The plant is completely self-contained; while, moreover, it requires no form of mechanical drive involving the installation of overhead or underground gear, belting and pulleys, or other complex devices. The fact that it occupies very little space enables the plant to be installed in any odd corner which is not otherwise being used. As a matter of fact, the plant may be mounted upon a base plate, and in such a manner as to facilitate its removal if required. The efficiency is high, because the quantity of oil recovered is in excess of 90 per cent. of that contained in the waste. Then, again, it must be remembered that full advantage is taken of the steam. The consumption thereof is very low, owing to its economical application. The initial pressure of the steam suffices to drive the turbine; while, virtually as waste steam, it is allowed to fulfil a further useful purpose—namely, the permeation of the material under treatment, thus facilitating and expediting the separation and the recovery of the oil and the grease under the centrifugal force imparted to the container by the turbine. Consequently full use is made of the steam itself.

The settling-tank comprises a sheet-steel vessel fitted with a suitable inlet to receive the oil from the separator. The contents of the tank are heated by a closed steam coil. This raises the temperature of the oil to such a degree as to permit the ready separation of water and solid impurities associated therewith. The pure oil rises to the surface of the tank, and is immediately led off to another vessel to cool; while the solid matter settles to form a sludge,

and can be drawn off, together with the water, through a cock in the base of the settling-tank. One novel feature is the adjustable copper float which slides on a brass pipe and is ingeniously connected by a suitable union to the draw-off sludge cock. The outlet for the pure oil is connected with this moving float, and in such a manner as to be always at the level of the contents. As the level of the oil in the settling-tank falls the float naturally descends, until at last it comes into contact with the denser sludge, when further movement is instantly arrested, and no more oil is allowed to pass from the surface into the second vessel. But all the time the settling-tank is receiving oil from the separator the float is working, and so maintains a continuous steady delivery of pure oil to the second vessel.

The material from which the oil has been extracted, upon removal from the basket, is submitted to a washing process which extracts all dirt and other foreign matter. Upon emergence from the washer the material is placed in a drying-cabinet. When withdrawn from the cabinet it is ready for use once more, being as clean as when first served out to the workmen.

The oil-reclamation process being purely mechanical throughout, the material suffers no physical deterioration from submission to the treatment. The fibres of the waste or rag are left quite unimpaired. Moreover, the oils natural to the textile, and those introduced during its manufacture, are left untouched. Consequently the waste shows only the signs of ordinary wear and tear, and may be passed through the reclamation-plant again and again, until absolutely worn out and rendered unfit for further service. If a small percentage of new waste be added to each issue of old waste, and the two blended together, the treatment may be continued indefinitely, and in this instance the loss of waste becomes scarcely noticeable.

The system possesses the additional advantage of being inexpensive in first cost. Naturally the capital expenditure involved varies according to the desired capacity of the installation, but for the sum of one hundred and fifty pounds it is possible to secure a machine adapted to the requirements of even a large factory. Further, the value of the materials recovered—waste and oil—is such as to enable the plant to pay for itself within a very short time.

The economical factor of this system has been proved very convincingly time after time. Indeed, in many quarters it is regarded somewhat as a money-maker, from the fact that it has indicated to the firms practising the process a source of revenue which they have hitherto persistently disregarded, in the feeling that it was not worth while to exploit the waste.

Machinery plays a more or less prominent part in every industry, and its care and attention necessarily entail the utilisation of a certain

quantity of rags, waste, or cloths. The consumption of this material is far more significant than one might be disposed to imagine from cursory reflection. Thus one large establishment specialising in the chemical industry installed a small plant comprising two of the turbine centrifugal separators, a washing-machine, and a drying-cabinet. The grease-laden waste is passed in at one end, is submitted to treatment in the separators, is subsequently washed, and finally dried in the heated cabinet. Upon emergence from the opposite end of the plant it is ready for reissue. The total cost of the plant was two hundred and ten pounds, the preparation of the building for its reception entailing a further outlay of one hundred and ninety pounds—four hundred pounds all told. Cloths are employed as the wiping material, the cost of each being slightly in excess of twopence. During the course of a single year three hundred and fifty thousand cloths were passed through the plant, and were induced to yield, in all, one hundred and twenty-five casks of oil, aggregating five thousand gallons. At tenpence per gallon this represented a total of two hundred and eight pounds six shillings and eightpence. The ability to use the cloths over and over again enabled the firm to effect a direct saving upon expenditure for cotton-waste during the twelve months of two hundred and eighteen pounds eight shillings—one hundred and eighty-two hundredweights at twenty-four shillings per hundredweight. Against this figure, however, had to be set the outlay for fifteen thousand new cloths to make good the losses incurred through ordinary wear and tear, which at two shillings and a penny farthing a dozen aggregated one hundred and thirty-one pounds ten shillings and twopence halfpenny. But even then a saving under this heading of eighty-six pounds seventeen shillings and ninepence halfpenny was secured. The gross saving recorded during the year was no less than four hundred and twenty-six pounds fourteen shillings and eightpence, the net return, after allowing for wages, repairs, cost of steam, capital outlay on the new cloths, and 5 per cent. depreciation upon the first cost of the plant, being no less than one hundred and two pounds twelve shillings and fivepence halfpenny. This plant was installed upon the basis of defraying cost out of savings effected, which was achieved within approximately four years!

The foregoing is by no means an isolated instance. Many similar cases might be cited, showing equally striking results. The oil return as a result of the treatment fluctuates widely. Thus it is found to range from one gallon per hundredweight of waste treated in a motor-garage to twenty-two and a quarter gallons from a similar quantity of this material used to tend the blast-furnace equipment of a colliery. No matter how apparently small the reclamation

may seem, the process is remunerative, because it not only yields a certain proportion of oil, but enables the waste, the cost of which represents a significant item in these times, to be used again.

In order to determine the precise advantages and economic value of the system, one of our railway companies carried out an interesting comparative test. The original practice was to submit the soiled sponge-cloths to the ordinary washing process. They were sent to a laundry for the purpose. The cost under this heading was seven shillings and sixpence halfpenny per week. The cotton-waste was replaced by new material in the usual manner, the yearly bill for this commodity being one hundred and thirty-seven pounds. The company then installed a small plant such as I have described at a cost of one hundred and twenty-five pounds eighteen shillings and sixpence. During the twelve months seven hundred and sixteen gallons of oil were reclaimed; but the most notable saving was in connection with the cotton-waste, the outlay on which was reduced from one hundred and thirty-seven pounds to one hundred and two pounds eighteen shillings—thirty-four pounds two shillings less. At the end of the year, after allowing all charges for the operation of the plant and 5 per cent. depreciation, a saving of thirty-one pounds nineteen shillings and tenpence over the previous system was secured—sufficient to enable the plant to pay for itself within four years.

But the ability to wring the oil from the cotton-waste used for wiping machinery does not represent the limits of the system. Indeed, it can be employed for wresting the oil from any material. One large works making extensive resort to automatic machinery employed sawdust, distributed over the floor, as the medium for absorbing oil dripping from the machines. When the sawdust had become thoroughly saturated and soiled, or at specific intervals, it was swept up and thrown into the furnaces. It was suggested that this sawdust, instead of being unceremoniously burned, should be passed through the reclamation-plant. The only modification required was the substitution for the ordinary metal basket of a canvas bag to hold the sawdust. The result was a complete success. The steam, after performing its initial function of driving the turbine, permeated the powdered mass and liquefied the oil, which then became freed by the centrifugal force exerted, and was thus recovered. The sawdust, upon withdrawal from the bag, was found to be quite clean, and suitable for another spell of duty, and consequently was redistributed over the floor, to be re-collected and re-treated again in due course. This cycle is repeated indefinitely, it only being necessary to add a small proportion of new sawdust to the bulk after each treatment to repair the various losses inevitably incurred.

In fashioning metal-work with the lathes a vast quantity of oil becomes associated with the turnings or swarf. The general method is to allow the oil to drain off, but if it is heavy and adhesive the quantity recovered in this way is very small. So it was decided to ascertain the possibilities of the centrifugal system in this connection. The turnings are dumped into the canvas bag and placed in the separator. The hot steam causes the oil to release itself from the metal, to be thrown off and recovered. In this instance practically the whole of the oil is reclaimed, leaving the turnings clean and dry. Preliminary draining is superfluous, because the swarf can be bagged and introduced into the machine without any delay. Of course, the oil recovered can be re-utilised as a lubricant in the working of the metal by the various machines. One firm which decided to introduce the system has recorded a startling success. At the present moment by treating all its swarf in this manner it is recovering over one thousand two hundred gallons of cutting-oil every week, which quantity represents about 90 per cent. of that originally served to the machines.

Such results as have been narrated are sufficiently impressive to establish the economy of the process, and so it is not surprising to learn that to-day our factories, no matter what their range of activity, are availing themselves of this simple and inexpensive means to reduce their oil and waste or cloth bill. Even the printing trade has discovered the possibilities attending the application of the idea to its peculiar requirements. The rags, cloths, and waste used in the cleaning of type and rollers, which become soiled with ink and turpentine, are submitted to the process. Both the ink and the cleansing medium—turpentine—are recovered for further duty, as well as the rags themselves.

'PRAMS.'

EVERY day, when the weather's fine,
The prams go by in an endless line:
Prams of brown, and prams of blue,
Family prams, and prams brand new;
And pushing the prams along the street
Are trudging mothers on weary feet—
While in every pram, it is quaint to know,
Is a man or woman in embryo.
A few more years, and each will be
A doctor, or clerk, or a wise M.P.—
Perhaps a professor in cap and gown—
Perhaps a Lord Mayor of London town!
(And if they are baby girls—why, then,
They are the future mothers of men!)
O babies, whatever in time you are—
Whether you foot it or keep your car—
Remember that once you rode the street,
Pushed by a mother with weary feet,
And whatever heights you may reach some day,
She gave you the first push on your way!

B. NOEL SAXELBY.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

SOME attempted to scare their intellectual betters with the desolate vision of a winter fireside—maybe fireless—short of the comfort and the tranquillising influence, the balm, of a fair company of new books. A want of paper, the preciousness of labour, and a new reactionary but yet refreshing parsimony of persons were to form an anti-literary combination that might drive the booksellers to ruin and the people to the papers only, with a preference for those of largest circulation. But yet among those of sense and a certain quality of mind—the standard not needing to be superlative—reading is not so much a pastime or a simple custom as an affair of the instincts; while this fireside reading on winter nights has been discovered to be the only effective means of preserving a certain purity of heart and elevation of thought, with determination to persevere upon a disappointing way, amid the much surrounding grossness of the time. There were days when people were stimulated to good reading by examples in high places; they have gone. Ministers and politicians are not to be suspected of a tendency to bookishness in any form while they are so marvellously practical—and cunning withal—in the furtherance of their most material measures. Mr Gladstone sought solace and delight continually in out-of-Commons hours by happy excursions in beloved fields of Homer, but not for some years past have such habits been customary among Premiers; nor have they been encouraged. A new and unliterary spirit reigns among leaders of the people. There is the true story of a permanent official at a most important department at Whitehall who, upon a new man of no appreciable erudition taking over the Ministerial control a few years ago—and he was and is a Minister of eminence—wrote to a friend in horror and dismay, saying: 'At last we have here a fellow who can neither read nor write!' But neither the illiteracy of Governments nor the conspiracies of economic circumstances may diminish the ardour of a man of good mind for the reading and contemplation of a book that lays a presumption to him that it is good and entertaining. Indeed, it would be no surprise to know that the law of contrary here makes

incidence, as at some other desirable points in our present disordered existence, and that the scarcity of books, for such as it may be, or the talk of it for what it is, has encouraged the way of reading and increased both its extent and its seriousness among those who are of that way—made it more serious certainly, for light novels are fewer and books of fact (or what purport to be so) more numerous.

* * *

The fashion of the time among writers and readers is for revelation. If there were printed but a thousandth part that is of consequence of all that was said and done by those in high places during the last six years, what revelations then! We are assisted to a few of them, and some are of high quality. Indeed, one has the idea firmly that the new Repington book, with its intimate and detailed view of so much that was happening behind all the most important political, social, and other scenes, for value and interest joins the historic company in which are established the diaries of Pepys and Evelyn, the Creevey Papers, and such like. And to this it may be added that there is a certain semi-official feel in the reading, and if it is likened to Pepys and Evelyn, it is, as we say, 'more so' than they are, and more important. Colonel Repington has the true manner of the diarist who sees and knows nearly everything, and is engaged in a constant and skilful quest of the little that remains, with a fine idea of his own consequence, which is good in every way. Take his diary at random and see how, in fulfilling duty or relieving conscience by recording his daily experience, he catches at our curiosity and sets a spark to imagination. Thus—it is a Sunday in January of the last year of the war: 'Finished my article on the need of the army for men, explaining the whole situation clearly to the public, and laying the blame for our critical situation upon the procrastination and cowardice of the War Cabinet. It will create a sensation when it appears. Played a little bridge at Lady Paget's with Lady Mar, Lady Florence Willoughby, Mrs Maguire, Lord Charles Montagu, and a few more. I told them of my resignation, and they all applauded it. Dined with the M'Kennas, Mrs George Keppel, Lady Granard, Sir Lionel Earle, and several others,

who all seemed delighted with my decision, and said the nicest things. I then went on at 10.30 P.M. to see M. Cambon, the French Ambassador. De la Panouse was with us during our talk. I explained the position of affairs, and requested M. Cambon to explain the real position to M. Clemenceau. Cambon undertook to write a letter to M. Clemenceau, and guaranteed that it would be delivered to the French Premier personally—perhaps by Cambon's brother—and I offered to go to Paris if Clemenceau wished to see me. Cambon inclines to the view that the Germans will not attack in the West, but agrees with me that we must be prepared for it. Here, then, is not only a little of war fact and history and much suggestion, but such a dainty demonstration of psychological fluttering as the admissions of all the most famous diarists exhibit. But apart from this class of revelation, there are given to us now other fresh volumes of life and men and women, their capers and caprices, their more secret ambitions, their funny little intrigues as they forget the sun and the stars and are possessed of an instinct that all they think and say and do are things of some importance. Those who do much reading of new books, such as for whom the publishers' announcements are as the best of news, may agree that never were personal confession, revelation, or biographical study made more attractively than now. A good reason is that in recent times people have been living rather more than they should, and now, with such experience, desire to know more than ever of life. The subject attracts them.

* * *

Some old problems created neither by wars, by wages, nor by politicians are given to the minds of prospective readers as such books as these come fresh from writers' minds. They are problems that arise from conscience a little troubled on fine points of ethics and duty. How should this new literary stuff be treated by us, the individual reader? How thoroughly, or to what extent a little less than thoroughly? What system of reading should there be? To what principles should there be adherence? These are ancient questions; they vary naturally with readers and persons, suggesting they should also vary with the books. Upon such a train of thought one approaches a conclusion that all systems should be denounced, and moods or judgments of the moment be left in full authority, as is mostly done with those who made the books. But a majority of regular readers of books, perhaps, attach themselves to the idea of some sort of system, among other reasons, so that to the best of their capacity they may conscientiously accomplish their duty, reading as much of what is good for them as it is felt they should and can within the fair compass of a lifetime. This is perhaps not in all ways a commendable view, but it is remarkable how it interests the general community of readers who, at the close of a season, have a sense of

increasing futility, helplessness, despite their most extensive reading. Untouched volumes glare from their covers reproachfully from year to year. A man ashamed at fifty declares that ere another sun of spring shall shine the *French Revolution* of Thomas Carlyle (who, having been, as we may say, under much suspicion for pro-Germanism, and for that considered improper and not to be read during the war—as Wagner was not to be played—when minds were so much contracted, is now permitted to return), and with it some new reading of value and consequence, like the new life of Disraeli, already touched with that fearful plague of procrastination, shall be added to the company of the read and thought upon. Such book skeletons are reared up in the mental cupboards of most readers; they have been disturbers since the responsibilities of reading were first realised, and each neglected year has made them more harassing, until now they often cause a real unhappiness. The root-cause is failure to admit limitations, due to hypersensitiveness upon intellectual duty. You may have heard of the case of the country gentleman, a considerable reader and lover of books, obtained from subscription libraries in parcels of six, who, coming to London and for the first time visiting the reading-room of the British Museum, was overwhelmed with the vast immensity of literature preserved and visible in that great rotunda, and having heard that even this was nothing to what was hidden behind, was so overcome with the minuteness of his own extreme effort against this seeming infinity that he determined never again to read anything but the newspapers and such simple stories as he had on shelves at home. Something of this feeling comes at times into the minds of many of those who are regular and persistent readers of books; but they are wise, perhaps, to thrust it aside unthought upon, or to be philosophic, realising that it is rather a morbid fancy, and is, indeed, associated with such others as are concerned with suggestions upon the futility of life itself, having regard to the problems of the universe and wondering upon eternity. Best it is to make no resolutions, dismiss such niceties of conscience in these reading matters, dismiss rules and systems, and let only moods and pleasures have their way, for what reading comes not from them is wasted effort surely. There would be a gain in the end. This is well enough, some will say; but such questions as that of skipping are not to be so dismissed, and the post-war conditions of fewer books, with probably the standard of literary and informative value appreciably raised, brings new points to them. Thus, for a case, there are in the two volumes of the Repington afore-mentioned 1168 closely printed pages, and if these—leaving aside the consideration of pleasure and curiosity—are to be read with thoroughness, there are very many nights and Sundays to be applied to them,

and diaries are hard for skipping, since pages and paragraphs are usually unconnected with each other. If with some it is to be Repington in thoroughness, as they would like, then Mrs Asquith with her splendid candour and truly charming egoism, the love-stories of Disraeli, a fascinating set of Victorian vignettes by Lord Frederic Hamilton, and several others must be slipped, with more worry for the conscience, and a new fancy possibly that in a far future of human evolution the power of speedy absorption by the mind, assisted by a new and intense capacity of eye, may rid our distant posterity of such quandaries as these.

* * *

But still it is for the present a question for each person—each person for himself, and often should be of every book. Some are born to skip; a glance of three seconds upon a page might be enough for them; their sight, by a trained instinct, would catch upon such sentences as they felt were of consequence to their special cases. This is again sometimes a matter of long and careful training; it is like the capacity of the good journalist of long experience who at a single glance upon a large sheet of newspaper discovers there what is of importance to him, and in this way may deal with a score of papers, and not unthoroughly, in less than half-an-hour—have ‘read’ them better, indeed, than another might when devoting several hours to one. For in this quick glance there is a fine acuteness, and it is such acuteness and concentration upon selected passages that are at the same time an excuse, and even a certain commendation, for the skipping, because an expert at this procedure may often know and remember much more of the inside of a book than one who plods a laborious way along every printed line. Clearly then, if our skipper knows his business, the better the book the less there is of skipping. Conscience is well enough, but who that tries to act with it has not a certain envy of another who, bringing down to his chair at evening three or four new volumes, with a satisfied air and a slapping of the final covers goes off to bed with the lot accomplished—as he would say—and truly well prepared to tell stories from them all, or explain the authors’ attitudes and directions? And those who like to live with the characters of a novel for a lengthened period, feeling that such society and companionship is a pleasure sweetly drawn (how the characters of the Barchester community of Anthony Trollope did seem to fasten on us, and insinuate themselves into our very lives!), may yet admit, even with a hesitation, the advantages of a novel a night, so that an evening thus may be of itself complete, like another at a theatre, leaving the freedom of open choice for its successor. What, again, is true is that few books in general, and extremely few new novels, are worth more than a single spell of the time of any one who makes fair use of life

and capacity; while, as to the novels, some supposed to be the cleverest are desperately difficult to skip. There is a vogue in these days for Mr Joseph Conrad, whose art is held by his admirers to be higher and more splendid than that of most of our native writers whose tongue he uses, having chosen it and lived and worked in England for so long. Excellent and very conscientious work it is indeed, but this is no reading for the skippers. Mr Conrad insists upon the most minute attention to every statement that he makes, and not just that, but a close memory for all he says; indeed, a friend complains that, much as she admires and likes this Mr Joseph Conrad, she finds the need of learning his opening chapters irksome.

* * *

A little meditation makes it appear that to learn to read well and efficiently, in a manner such as to satisfy completely an individual demand, to still the murmurings of a captious conscience, is an accomplishment for long experience, for a keen judgment. But some of the wise men say that at middle age and afterwards the zest for reading diminishes. It may have been that way in calmer times, but many would distrust the suggestion now. In a note Samuel Butler set the proposition: ‘People between the ages of twenty and thirty read a good deal. After thirty their reading drops off, and by forty is confined to each person’s special subject, newspapers, and magazines.’ If this were really so, it would require a new examination of the skipping problem and the reading systems that have been propounded. Upon ‘the art of reading’ some suggestive books and a mass of articles have been produced. Sir Arthur Quiller-Couch has lately issued a volume bearing on this subject, the result of lectures delivered; but he treats it widely, and not, as some would say, practically. That may be a manner in which he would not care to treat it. But one wonders if his title, *The Art of Reading*, were the best, thinking now of one of the most delightful treatises on book-reading having that title—*L’Art de lire*—a book of rare flavour and yet ‘practical,’ written by the eminent French critic, Émile Faguet, who died some four or five years ago. No man who loves his books, none troubled upon such doubts as have been stirred just now, should omit the pleasure of a reading—a slow one, if but for compliment’s sake—of this gentle discourse. It opens in the preface by reminding us that Voltaire said that people read very little, and, as to those who wish to learn something, the majority read very badly; while Sainte-Beuve observed that the critic is just one who knows how to read, and teaches others how to read. Then, when Émile Faguet begins himself in the first chapter, he abashes the community of skippers, and those who have defended and abetted them, first with the title ‘*Lire lentement*,’ and then his admonishing

opening lines, saying (translated): 'To learn to read one must first of all read very slowly, and afterwards read very slowly, and always, up to the last book that has the honour of being read by you, it will be necessary to read very slowly. It is necessary to read a book as slowly to enjoy it as to learn from it or to criticise it. Flaubert said: "Ah, those men of the seventeenth century! How they knew Latin! How slowly they read!"' And then we are taken along delightful dissertations, rich in suggestion, wise in advice, upon books of ideas, obscure writers, bad writers, poets, sentimental books, critical books, re-reading, and other phases of the vast affair. Perhaps no other critic has written so nicely and effectively, in almost a popular vein, and yet with dignity and strength, as Émile Faguet in the case of this little brochure. We come at the end of it to some generous reflections in an epilogue where he says: 'The art of reading is the art of thinking with a little assistance. Consequently it has the same general rules as the art of thinking. One should think slowly; one should read slowly; one should think with circumspection without hurrying in the thought, raising objections ceaselessly; one should read with circumspection, raising constantly one's objections against the author; yet at the beginning one should abandon one's self to the train of his thought, and only after the lapse of a little time turn round to consider it.' . . . Émile Faguet makes some appealing suggestions in nearly every line; there is no little book that a worthy reader would care so little to race through as this. In such a presence we should forget we ever heard of this vulgar skipping.

* * *

For exculpation of ourselves there are, after all, writers and critics, good and wise, who are not so austere as Émile Faguet was—yet right, we know, in his austerity. Not long ago Mr Walter de la Mare, a good and favoured poet, gave his mind to the subject in a manner very practical and at length. He examined the situation as it has just presented itself, with thoroughness and in the cold and unsentimental manner of a house-painter or a plumber. The questions of taking notes, of whether we should bother ourselves with the author's preface, of whether we should read the end of the book before the beginning or while engaged upon its middle, are duly examined, sure conclusions and good advice resulting. Speed and skipping are twin points, and Mr de la Mare suggests: 'Whatever the pace may be, a second immediate reading of the same book or passage may curiously sharpen any vestige of the faculty we may happily possess of the second sight. We may thus, and thus only, win the smile from our author that accompanies the grasp of his hand. Much (as always) depends not only upon whether we wish to remember what we read, but upon *how* we

wish to remember it. Personally, rather than remember all that I have read I would much prefer to read again all that I can remember, though a sound method of reading might have substantially augmented the latter. . . . To skip or not to skip is an equally simple question. Just as, perhaps, a poet should be forbidden to indulge in *vers libre* until, for mere discipline's sake, he has written, say, 500 Limericks, or 154 (unpublished) Petrarchan sonnets, so should the skipper earn the privilege of skipping. It requires years of practice to skip with precision. Moreover, though an author may be telling us something which countless other authors have told us before, he is telling it in his own peculiar way. From each individual book, then, we should learn in what manner and degree we should indulge ourselves in this indolent kind of blind-man's buff.' And so, having taken counsel with friends and the authorities, we find with but partial satisfaction that these questions are for ourselves, with our inclinations and our necessities guiding us. Are we greedy—even with a vulgar greed, as some would say—of the new books that come to print this fireside season, then we must forget we ever met good Émile Faguet. There are a score or more of little reading-tricks—the handling of books, the making of each volume in some way personal to one's self—that would make good argument and mutual gain among a company of earnest readers. The book when it comes new from the shop is a raw and impersonal thing. The potentialities are there, of course, but it is at this appearance an affair entirely of an author and some printers, and much like a thousand others. But yet it comes to us with a certain appeal as of one who would not be so little identified, one who seeks a master and a friend. For ourselves the new book arriving by messenger from the shop in Piccadilly is like the little puppy-dog we bought some time before. There is some pathos in this lonesome coming; it needs a master, strong but kind, and these twain will become attached. The little dog develops an individuality, and a pride with it, and a pretty arrogance with the pride. So it is with our new book, or ought to be. We may read it, and may mark it, and make notes upon it, and treat it according to our judgment and our fancy. Then it becomes our book indeed, our very own and not like others, a precious and friendly possession, the companion for the fireside. Take care of the manner in which you mark your books; these markings would reveal to strangers prying curiously upon them your inner thoughts and feelings, something of your soul. One of the most satisfying institutions established by an old reader who makes few notes on fly-leaves and none elsewhere (keeping a note-book for some special quotations of striking value as it seems to him) is, when the last line has been read and there is a pause for a little thought, to

write at the end the place and date of reading, and any other circumstance about it—as of companionship, or nature of work or study at the time—that may be germane to a later consideration. The interest of a contemplation of this conjunction in after-years is hard to indicate to

those who have no experience of the kind. Specially it makes a strangely enlightening study of one's own variable, mood-tossed self to reflect at a re-reading in older age on changes in judgment and affection that arise from time and circumstance.

INSTINCT.

PART II.

VI.

HE had been wandering about the stricken town for hours, running a multitude of risks that he never realised, when it suddenly occurred to Collins, 'They ought to know about this at home.'

The thought stuck in his mind. At first he put it away by telling himself that somebody would send the news along; but the thing came back to him again and again, reinforced by the thought that there was nobody there to send the news—no newspaper reporters or people of that sort.

He was helping one of the few white settlers in the work of rescue, when this idea came to him in a way he could not resist. As both straightened themselves after finishing one job, Collins asked, 'Is there a place I could send a telegram?'

The other looked at him as though he were mad, and said, 'Good gad, does it look like it?' and then, as an afterthought, 'But I don't know—the cable-station at the other end of the island might be all right. It should be outside the danger-zone.'

In an hour Collins was in the cable-station. He did not quite know why he had gone there, but he had got there. He had started out to follow the road the settler had indicated. Just outside the stricken town he had found a horse in the shafts of a gig, the horse left tied to a rail by a water-side house, and badly scared. Collins had never driven a horse before, but he drove that one, and by some miracle reached the cable-office.

In the cable-office he found a three-fourths white telegraphist. The quadroon was limp with fear and wanted to run, but his body was held there by that three-fourths strain in him that forbade him to leave his post. But that seemed the limits of his grit. The one thing he did not appear capable of doing was working his instrument. He said to Collins, 'I've sent out the alarm. Nothing more can be done.'

'I want to send a cable,' said Collins evenly.

'I've sent the alarm,' the telegraphist cried, dancing in repressed fear. 'I can't do anything more—nothing more need be done.'

'You've got to do it. I want to cable to—to *The Morning Record*, London.' It was the first paper that came into his head. It was the one he read every day in London.

'I can't possibly send it.'

'It's got to go off.' Collins's even voice was implacable. Before it the clerk changed his line of resistance.

'Have you got a pass?' he asked, hoping that would defeat this stubborn fellow.

'What's that?' asked Collins.

'A pass—permission to send over the wire.'

'I'll pay,' said Collins. He put his hand in his hip-pocket and pulled out his wad of notes. The man fell back sullenly, defeated by the sight of this money.

'Will it be a long message?' he snarled.

'I don't know,' said Collins. He didn't know how much a word the message would be, so he said, 'Go on until this runs out.'

'I can't send a long message,' wailed the man. 'My nerves'—

'It's got to be done,' said Collins. He took the cable-forms the telegraphist had been fiddling with, and began to write with the utmost simplicity.

VII.

Collins didn't know the first thing about sending distance cables, and the telegraphist had to pull him up several times and irritably point out mistakes. But as the message grew things went smoother. When he had settled down to work, the telegraphist found his nerve. It was what he had needed—something to steady him—and he became more sympathetic and helpful to Collins.

Collins wrote down very plainly the things he had seen, using the abbreviations he would use if wiring a message for his furniture firm in England. He knew so little about writing that he did not spoil his message with purple passages. He just told baldly of the way the town of Sainte Marie had been overwhelmed; the way the houses were burning; the way people were flying allwhither; the way he had seen the bodies of men and women caught as they ran the gauntlet of fire in the streets; how they had fallen scorched to death by the abrupt upsurting of flame from frail, wooden, palm-thatched houses. He told of the wild lost children suddenly bereft of mothers; of mad and wandering women looking for children torn away from them in the panic. He told of the struggle to get to sea, and the overturning of overfull boats. He told in a sentence or two

of the fog of smoke and gas and the ever-falling rain of fire. He told of half-naked people flying into the country-side of the island, and of a settler's terse cry, 'They're flying straight into famine.' He gave facts and figures he had picked up from these white settlers as they had struggled in their rescue-work.

It was a message admirable and strong in its laconicism. The telegraphist took it from him slip by slip, and sent it clicking over the cable into the great void of a world as yet unconscious of the disaster. It was not a very long message, though it took Collins a long time to write. When he had finished, and signed it, the man handed him back eight pounds, which seemed to Collins to stamp the telegraphist as a robber, until he counted the words and worked out the cost—and gained his first insight into the dimaying price of those few words he had read so casually over his breakfast at home.

When he had finished, he wondered what he would do next. But at once the inner impulse came to him again to return to the burning town. As he made this known he found that the telegraphist had ceased to be hostile, and had become his friend. The telegraphist both venerated the press and needed his company. The telegraphist overwhelmed him with advice.

'I've a motor-cycle,' he said. 'You can run into Sainte Marie on that very quickly. Hide it outside the town so that no one can steal it. You can see the town and come back here. You'll want a place to sleep—well, sleep here. Also, you'll want to wire again, and your paper will cable you instructions here. You come back.'

So Collins, who understood a motor-cycle, began those journeys to and from the town which lasted for a fortnight. On the next day he did receive a wire from *The Morning Record*, and in it he got a hint of the scoop he had secured, though not of the tremendous splash he had made in newspaperdom. The editor of *The Record*, like the live-wire he was, had jumped on to the thing at once. He cabled: 'Magnificent man. Send all can. File R.T.P. Draw on us all expenses.' The telegraphist told him that R.T.P. meant Receiver to Pay, and showed him a cable he had had giving Collins the freedom of the cables to the extent of two thousand words a day, if necessary. Collins thereupon sat down and wrote another message.

VIII.

That is the story of Collins's first and astonishing 'scoop,' and the story of the strange impulse or instinct that lay behind it—that instinct which had impelled him to go to Sainte Marie against all reason. Instinct or impulse is the only thing that explains the way Collins smashed up his ordinary life to ship to the West Indies, where he did not want to go, and then to undertake that sailing-boat journey so as to arrive

at Sainte Marie at the psychological moment. There's no reason in his action; there is, so far as I know, no other way of explaining it. He had the instinct to get to a certain spot at a certain critical moment—that's all there is to it.

And that's all there is to John Collins, the great special correspondent of *The Morning Record*. He is, actually, an utter 'wash-out' as a special correspondent for most days in the year; and then that instinct gets to work, and there is a miracle, and *The Record* 'scoops' once more, big and fine.

For the remainder of John Collins's story is made up of that sort of thing. Collins stayed on in Sainte Marie writing cables about the sufferings of the people, the rescue-camps, and the need for funds, until his editor wired curtly: 'Cut it out. Come home.' Thereupon Collins took a boat to Jamaica, and at Jamaica was met by a lively little man from Cook's Agency. The man told him that an amazingly large sum had been placed to his credit in the banking department of his firm, and he took Collins's innocence in hand, saw that he went to a first-class hotel instead of a third-rater, fitted him out with decent clothes, and smothered his ideas about a second-cabin trip home in a brisk command for a saloon berth.

Collins arrived in London full of fear for his future, and anxiety concerning his reception by Winnie. He decided he had better go to *The Record* Office first. He would probably get that editor to see that the messages he had sent were worth a few pounds—if only for the time they had taken; and with a few pounds in his pocket he might face Winnie with greater courage.

His experience at *The Record* Office startled him. The editor welcomed him as though he were a king. And he didn't even wait for Collins to bring up the subject of payment. He called his accountant in, named a sum in hundreds that took Collins's breath away, asked, 'Do you think that's fair, Mr Collins?' and in a moment was handing over a cheque as though such sums grew on currant-bushes.

And on top of that he further pounded Collins into bewilderment by saying, 'And, look here, you come to us permanently, of course. Three years' agreement, at, say'—and he named a figure which exceeded Collins's rosiest ideal of a monthly salary. And then, as he hesitated, this pleasant and violent man let him see that he was merely mentioning a weekly salary. For he read into John Collins's silence the instinct for bargaining, and he multiplied the astonishing sum by four and added twenty pounds, and said he would say that figure a month; and Collins, almost bursting with joy, agreed to be a special correspondent at that figure a month, and went off to Winnie in bewilderment and rapture.

They decided not to marry for three months—

one never knew how things would turn out; and for ten weeks it seemed as though they had been wise, and to the editor as though he had been quite otherwise. For during those ten weeks Collins proved hopeless. In the ordinary routine of office-work he was the dullest of failures. He 'fell down' on every 'story' that was assigned to him. He didn't know the first things about nosing out news and following up scents. In routine jobs—weddings, political meetings, and the rest—to which the news editor in despair sent him, he wrote so woodenly and with such lack of perception that he was worse than the worst cub reporter. By the end of those ten weeks the editor was seriously thinking of paying off the contract and getting rid of Collins. He was an incubus.

IX.

And then, at the end of the ten weeks, the news editor came one day to the office to find that Collins had apparently got rid of himself. The news editor wanted to send him to a cattle-show, and Collins was nowhere to be found. He hadn't come to the office at all since sent out on a job the day before. The news editor, forgetting how hopeless the fellow was, gave way to temper. He was short-handed, and for this fool to act like this was to throw the whole working of *The Record* out of gear. He raged all day, promising the most curdling tortures when the fellow did come in.

Collins did not come in. But just about the time when the machines were being prepared for the final 'Town' edition of *The Record*, a stream of 'flimsies' began to pour into the news-room. These telegraphic-slips contained a bald, strong message telling of a terrible mining disaster *then happening* somewhere in the north of England. The message was obviously being sent by somebody who had been on the spot *before* the awful thing had happened. That was the fact. Collins had been in that mining-town two hours before the first moment of the disaster; his signature was on the messages.

He had 'scooped' once more—'scooped' as brilliantly and dazzlingly as he had over the Sainte Marie volcano disaster. *The Record* was the only morning paper to print the news. A special edition of *The Record* had a full story from its special correspondent, John Collins, while even the evening papers had to be content with short, 'flash' paragraphs sent by local men.

Collins had gone to that northern town, as he had shipped to the West Indies, for no reason at all. He could not explain himself. The impulse, the instinct, had come to him quite suddenly; he had gone to the station, bought a ticket for a town he knew nothing of, and hurried there by train.

He could not explain himself at all. And now he did not try; nor did anybody try. It became an accepted fact in *The Record* Office. John Collins, his editor saw, was a man who, in ordinary routine-work, was dull and useless to him; but he had an instinct—a brilliant instinct—for being on the spot at critical moments. The editor did not attempt to reason it out, but acknowledged the fact, and kept Collins as his special correspondent.

And John Collins remains his *great* special correspondent to this day. A man you never hear of at all until, startlingly, *The Morning Record* comes out ahead of any other paper with a great piece of news; as it did in the Sainte Marie and the mine disasters; as it did, later, in the story of the Balkan Revolution, the sinking of the Cape liner off the Spanish coast, the big and ugly strike in Ontario, and so on.

In each of these cases Collins had arrived on the spot before, or immediately on top of, the happening. His instinct, his curious inner sense, had carried him there against reason. You can, if you like, put it all down to some sixth sense that gives his commonplace soul some strange, psychic warning of coming events; but, on the whole, you had better leave it, as John Collins, and Mrs Winnie Collins, and the editor of *The Record* do, to his instinct.

THE END.

RECOLLECTIONS OF A NAVAL SECRETARY.

VI.—ASCENSION.

By C. E. GIFFORD, C.B., R.N.

I.

INCLUDED in the command of the admiral on the Cape station was Ascension, an island of volcanic formation, lying some eight degrees south of the equator.

The island, which had been occupied by the British in 1815, was regarded pretty much in the light of a ship, and was officially described as 'Tender to *Flora*.' This '*Flora*' was not the Goddess of Flowers, but the stationary ship at

Simon's Bay; and 'tender' must be read in the naval sense—that is, a vessel attached to a parent ship, and not as suggesting any affection for *Flora* on the part of the residents in the island!

In the *Challenger* report Darwin compares Ascension to a large ship kept in first-rate order.

In the middle of the island, which is about twenty-two miles in circumference, is the Green Mountain, 2800 feet high, the only spot in the island having a sign of vegetation. From it can

be seen the outlines of twenty or more volcanic cones, little craters long extinct. From the foot of this hill to the shore not a shrub, not a blade of grass, is visible. Some of the houses in the so-called garrison on the beach have a few flower-boxes in their verandas, but nothing grows in the surrounding soil, if, indeed, the scorias of volcanoes can be considered to constitute soil. In some of the valleys, however, there are patches of purslane, and the castor-oil plant is found in many places.

Of this isolated spot a captain of the Royal Navy was in command, with about a hundred officers and men under him. Those married officers whose wives could be accommodated on the island were appointed for three years, other officers for two. It is on record that a bachelor once asked to be reappointed for a third year; but he was an enthusiast, who wanted to complete a work on the fauna and flora of the island.

Communication with the outer world was almost limited to the arrival from St Helena, at intervals of thirty-five and twenty-one days alternately, of the homeward-bound Cape mail steamer. Thirty-five days' news to read and twenty-one days before another word came, and no electric telegraph to disturb one—can anything more peaceful be imagined? And yet in Ascension there was war at times. A story, known there as 'The Judgment of Solomon in the Island of Ascension,' tells of the wives of two officers of equal rank both laying claim to a front-seat in the little church. The matter came eventually to the captain for decision. After hearing what they had to advance, 'Ladies,' said he, 'your husbands' commissions dating from the same day, I am not able to award precedence to either; therefore the only fair way of settling the matter is for the elder lady to take the front-seat.' The coveted pew is said to have remained unoccupied during the stay of the two ladies on the island.

II.

Ascension furnishes a very interesting illustration of what can be done by man to assist nature in rendering habitable a volcanic island. The first necessity is, of course, fresh water, and untiring efforts have been made to save every drop formed on the central hill by the condensation of the moisture brought by the damp south-east trade-wind. A dew-pond collects some of it, and constant watch is kept for a 'drip,' no matter how small, in the upper six hundred feet of the hill, which is often enshrouded in wet fog. The water is led in pipes to tanks, the lowest named 'God be thanked,' and so on to the garrison.

The Green Mountain fully justifies its name. There are interesting reports at the Admiralty, dating as far back as 1847, of the efforts made to introduce verdure into the island. A Kew gardener is said to have spent some years there, carefully studying the possibility of encouraging

the growth of trees, shrubs, vegetables, grasses, &c.; and the Bermuda cedar, stone pines, and fuzes were specially recommended.

As we saw it, between 1882 and 1885, the Green Mountain presented a striking contrast to the lower parts of the island. The farm-bailiff lived there permanently, and there were a few houses, occupied in turn by the residents of the garrison, with gardens and shade-trees—Bermuda cedars, a few palms, eucalyptus, bananas, Pride of India, hibiscus, and a very brilliant bed of nasturtiums met the view. We found quantities of tomatoes (the little yellow *pomme d'oro*) growing wild on the slopes.

The farm was of considerable extent, producing fruit and vegetables, including turnips and sweet-potatoes. There was also pasturage for cattle on the slopes.

Paths had been cut round the ridge, and here gorse, blackberries, wild ginger, mimosa, and other shrubs abounded. Captain Barnard reported in 1862 that a thousand Australian wattles had been planted, and that a thousand more were ready to go in.

The farm-bailiff in 1883 said that he thought sheep would do well, and the admiral sent up a flock of five hundred from the Cape of Good Hope, but the result was not altogether satisfactory.

III.

The farm suffered from a series of pests. Land-crabs swarmed, and a reward was offered for their destruction, which gave occupation and pocket-money to some of the men. Rats multiplied amazingly, and trappers were constantly at work killing them. Cats were introduced to keep down the rats; but, alas! the cats increased so rapidly that a price was soon put upon their heads. When I shot one the keeper said, 'Six-pence in my pocket!' Rabbits were plentiful, and furnished both sport and food; but in *Whitaker's Almanack* for 1913 it was stated that steps were being taken to exterminate them. Several pairs of rooks were sent out from England to destroy the wireworm which ruined the turnips. For two or three seasons they did not breed; then came a succession of reports from the farm-bailiff: 'The rooks are nesting'; 'The birds are sitting'; 'The young birds are on the wing'; and then, sad to relate, the whole colony flew out to sea and were heard of no more. The nearest point of the African continent is about nine hundred miles distant, but this is not a greater distance than is covered every year by the flocks of short-winged quail that migrate from the Azores; so the rooks may have settled on the shore of the Gulf of Guinea.

To take the place of the rooks, mina-birds were imported from Mauritius, and they and little avadavats, seed-carriers, were multiplying at such a pace when we visited the island that in subsequent years the authorities may well have had to introduce hawks to destroy them.

Then, too, bitter complaints came of the destruction to shrubs and crops caused by a herd of wild donkeys, and they were condemned to be shot. The farm also suffered from the early morning visits of many wild goats, which returned after their meal to the precipitous cliffs on the southern side of the island. They furnished sport to the early riser in the mountain houses, and were accordingly not unwelcome visitors; but I read that they, too, have become such a pest that they are being exterminated. In fact, the only really popular introductions appear to have been guinea-fowl and the red-legged partridge. I shot one of the latter flying out of an india-rubber tree!

A very interesting visitor to the island is the 'wide-awake,' a tern or sea-swallow. These come in their thousands every eight months, occupying a valley known as 'Wide-Awake Fair.' Here the female lays one egg on the ground, and hatches it; and as soon as the young birds are strong on the wing, the whole colony disappears for another eight months. They are said to make their way to the Sargasso Sea, that expanse of floating weed in mid-Atlantic, and to feed on marine insects. During their stay in Ascension their eggs form a pleasant change in the monotonous diet of the residents.

Another periodical visitor is the turtle. The females come to lay their eggs on the sand, and from one to two hundred are 'turned' yearly, and confined in ponds until their turn comes to be eaten or to be sent to England. They run up to six hundred pounds and more in weight.

It was in the days of Sir Joshua Jebb, the prison reformer, that inquiries were made as to the diet of naval prisoners. Ascension had a small prison, where offenders against discipline were at times confined for short periods. In the diet-sheet of this prison appeared on two days a week 'turtle-soup.' Sir Nowell Salmon, Commander-in-Chief of the station, knowing Ascension, passed this; but exception was taken by the home authorities to the extravagance of feeding naval prisoners on a delicacy suggestive of Guildhall banquets. A serious report from the medical officer of the island, in which he stated that in the trying climate of Ascension prisoners sentenced to hard labour needed a generous diet, in order that they might not

suffer in health, with a covering remark by the captain that turtle-soup was a drug in the island market and cost practically nothing, was accepted as a sufficient explanation; the prisoner was not deprived of his turtle-soup, which, by the way, he by no means appreciated.

IV.

Ascension was the depot for supplies of all kinds for the West Coast squadron.

Our endeavours to provide fresh meat for them on their periodical visits, and for the crew of the island, were not always successful. I have mentioned the flock of sheep, which we had hoped would produce a goodly number of lambs yearly, but did not. Our arrival in the *Boadicea*, with a large crew, was welcomed by the paymaster of the island as an occasion which he had long been awaiting for killing an enormous ox which had been sent out from England. It was three times as large as the island, unassisted by ships' crews, could consume, and was eating its head off, being stall-fed on English hay, and he calculated the beef had already cost about two shillings and fourpence a pound—a great sum for those pre-war, preparation days!

I was greatly honoured by having placed at my disposal the services of Jimmy Chivers, the veteran mule of the island, said to be its oldest inhabitant. He carried me to the Green Mountain, amongst other places, and only once did his aged limbs give way, when we came to earth (or, rather, cinders) together.

Before taking leave of Ascension I must mention that one cannot quit the island when the 'double rollers' are prevalent. These enormous waves come without any warning, and break on the shore with great violence, and this whilst ships lie quietly at anchor in calm water outside the rollers.

Since putting together these notes I have again read Lady Gill's charming book *Six Months in Ascension*. This is an account of the visit of the Astronomer of the Cape Town Observatory, Sir David Gill, and herself to the island to observe the transit of Mars. To any one interested in Ascension I would say, read Lady Gill's narrative.

THE END.

FINDING'S NOT STEALING.

By E. R. PUNSHON.

I.

'MY dear,' protested Mr Napper Hill—for already the car had been at the door a quarter of an hour, and how was he, a poor dull man, to know that Mrs Napper Hill loved it to be there so that the neighbours might have

every chance for indulging their natural admiration and envy?—'my dear, I thought you said you were ready. We shall be late if you aren't quick.'

Mrs Napper Hill, a little afraid that she had overdone it, and that they might indeed miss their train, told her husband indignantly that it

was all his fault for standing there like a dummy and not helping her. Then she snapped a final warning at the maid, gave her two or three more hurried last instructions, and bustled out of the house to the waiting car.

'And I do hope,' she added in a tone more expressive of despair than of hope, 'that Annie won't forget what I've told her.'

And in the house Annie closed the front-door, and made behind it a face little indicative of affection for her departing mistress. 'Thank goodness,' she thought, 'they won't be back till Monday, and I'll have a bit of peace till then. Profiteers—that's what they are.'

She did not quite know what a profiteer was, but she used the word as a current and handy term of abuse, just as people in a different sphere of life employ 'Bolshevik' as a convenient word for expressing reproach and dislike; and then, as she was turning to go back into the kitchen, she gave a sudden, loud exclamation.

For there, shining on the mat at the foot of the stairs, lay Mrs Napper Hill's new diamond pendant.

'Lor'!' exclaimed Annie loudly, as she stooped to pick it up.

Then she laughed as she thought of Mrs Napper Hill's dismay when she discovered her loss, and of all the lectures about carelessness that that good lady had given her in the past, and of how clearly she had pointed out that it was entirely Annie's own fault when Annie lost her purse a few months ago.

'She'll be fair dropped on,' said Annie, chuckling, 'when she knows.'

Still smiling, highly pleased, Annie went into the dining-room and put the pendant to her throat to see how it looked there on her reflection in the mantelpiece mirror. It looked very nice indeed, she thought, and the glittering, shining jewel seemed to her the most beautiful thing she had ever seen in her life.

'Wish it were mine,' she murmured, touching it with loving fingers. 'Isn't it just pretty?' she cooed while she tried it first in one place and then in another on her dress, and at last turned away with a little, half-unconscious sigh. 'The missis won't know where she's dropped it,' she thought. 'I had best send her a telegram.'

She had been instructed to do this in case of any important happening, and had been duly provided with telegraph-forms ready to fill up. Annie had already got them out and was looking for pen and ink, when a sudden thought flashed into her mind, so that all at once she went very pale as she drew in her breath with a sharp gasp.

Mrs Napper Hill would not know where she had lost the pendant. She would almost certainly not discover her loss till she reached her destination, and then she would most likely imagine she had dropped the jewel in the train or at the railway-station, or perhaps in the car

on the way to the station. It would not be likely to occur to her that she had dropped it in the hall before her start.

'If I keep it,' Annie said to herself—and it was like some one else whispering in her ear—'no one will know.'

Very pale, and trembling a little, she looked nervously around as though to see who had spoken or who could hear. In the palm of her open hand lay the sparkling thing, winking temptation at her. Instinctively her hand closed to hide it, but she could still feel it in her clasp, and it was as though whispers of longing and desire travelled up her arm to fill her mind and overcome her will.

'It wouldn't be stealing,' she muttered—'only keeping.'

This seemed to her a distinction of the utmost importance and significance, and yet all the time she knew very well that there was not the least real difference. Hitherto she had always been a very honest girl, for so far no temptation like this had ever come her way, and deliberately to seek opportunities to rob her employers had never even occurred to her.

Nor, indeed, was it now the money value of the jewel that tempted her, but only what seemed to her its overpowering beauty. She felt she could not bear to part with a thing so altogether lovely.

She opened her hand again, very cautiously, and there it still was, even more beautiful than she had thought, shining tranquilly in her palm as though appealing to her never to let it go. And why should she? It might be hers if she liked. Practically it was hers already. Mrs Napper Hill had lost it; she had found it; that was all.

Annie discovered that she was very cold, and it surprised her greatly to find that she was trembling in a very curious manner. Her accustomed chair by the kitchen-range was near, and she sat down; and somehow it appeared to her that by doing this with the pendant still in her hand she had in some subtle way taken possession of it, and that henceforth it was hers.

'Very well,' she thought, 'I'll keep it.'

Her mind worked with an unusual rapidity and clearness. She saw that it would be easy to pack it up in a little cardboard box she had, and send it through the post to her sister, asking her to keep the box for her without opening it. Then presently she would give Mrs Napper Hill notice and take another place; and after a time, cautiously, she would be able to wear the pendant, sometimes, on special occasions. She could say it was a present from a soldier. No one would suspect—know.

Quickly she began to put her plan into execution; and when she had the pendant securely packed in its little box she pinned on her hat, and hurried out to the post-office round the corner. She would wait a month or two, she thought to herself as she sped along, and then

she would give notice, or provoke Mrs Napper Hill, by means of what is technically known as a 'back-answer,' to give her notice; and then, after she had found a new place at a safe distance and waited a little longer, she would be able to begin wearing the pendant. Already she felt herself thrill with anticipation of that supreme moment when all the world should see it, shining in all its glory on her neck, beautiful beyond conception.

'My!' she said to herself, drawing in her breath between her teeth; and it was much that she expressed in that one word. 'My!' she said again, and then for a third time, 'My!'

And as in a vision she saw herself moving through a great crowd with the pendant shining at her throat like the summer sun at high noon.

II.

When she came to the post-office Annie found that it was shut—for lately it had been closed every day from one till a quarter past two—and there still wanted a few minutes to the opening-time.

A little vexed, and feeling that she was not tidy enough to go on to the post-office in the main street, she returned to the house. She could easily come back in ten minutes or so, when the office would be open again. She let herself in by the front-door with the key Mrs Napper Hill had given her. As she did so she heard a slight noise in the dining-room, and thinking the cat was there, pushed open the door, and saw within, to her extreme amazement, a pale, thin young man who had just forced open the sideboard and extracted therefrom a quantity of the silver that was Mrs Napper Hill's chief glory and delight in life.

Annie was so astonished that for the moment she could only stand and stare; and then it came into her mind that this pale, thin young man was one who had called recently once or twice to try to sell her some cheap jewellery, and, failing in that effort, had nevertheless engaged her in friendly conversation, which had been, at least, an agreeable break in her task of blackleading the kitchen-range, though during it he had asked so many questions that finally she had called him Mr Impudence and Mr Curious, and had sent him about his business. But what on earth he was doing here now she quite failed at first to understand, though she did take in that he was making a pretty mess of the room she had so carefully tidied that very morning—and wearing his hat, too, he was, just as though he were in his own house.

'What are you a-doing of, if you please?' she demanded indignantly.

He had turned as she opened the door, and he was looking at her with an expression in his eyes such as she had never seen before. It puzzled her very much, and she saw that he was breathing hard, like a man short of breath, and

that the muscles of his mouth were twitching in the oddest manner possible.

'What have you come back for?' he muttered. 'I saw you go; I watched you. It's your day out. What did you come back for?' With a sudden and violent gesture he pushed towards her the silver he had just laid on the table, so that some of it fell on the floor. 'There,' he exclaimed; 'now then.'

'Mind what you are doing,' she cried angrily, for the cream-jug he had just pushed from the table to the floor was a favourite of Mrs Napper Hill's, and there would be a frightful row if she found it damaged on her return.

'Look 'ere,' said the pale, thin young man quickly; 'you 'elp me, and we'll go shares. See? You needn't do anything. See? Not a thing. But I'll give you half; honest, I will. See?'

'What? What? What's that?' she muttered.

He made a gesture of extreme anger and impatience.

'It'll be safe enough; no one will know a thing,' he urged. 'I'll give you half; straight, I will. No one will suspect. Why should they? This silver's worth a bit, and there's jewellery upstairs, and some loose cash besides. Shares, me and you. As easy as anything. You go out as usual for your day off, and when you come back you find what's happened, and you go right to the police. See? Halves it'll be, you and me—and worth it.'

'Think I'm a thief?' she demanded indignantly.

Her resentment was extreme. The cheek of the fellow! Watching her go out, and then coming sneaking in, without so much as a 'by your leave,' and marching into the dining-room and upsetting it all, when she had only done it out that very morning! And then expecting her to help! And standing there with his hat on, as large as life!

'Think I'm a thief, do you?' she repeated. 'I'll show you.'

She shook at him her hand in which she still held the cardboard box that she had packed the diamond pendant in, and turned with a vague idea of summoning help. She was not conscious of the least fear, for, indeed, her heavy and slow-moving mind had not even yet taken in the full significance of the thing. Her chief feeling was one of hot indignation at the man's cheek and impudence in first watching her go out, and then coming creeping in like this. She had simply never heard of such a thing. But now, the moment that she moved, he was upon her with a sudden leap, and catching hold of her arms, he tried to thrust into her mouth an antimacassar he had snatched up from the back of a chair.

Yet this was scarcely a prudent thing for him to do, for Annie was an exceedingly strong girl, and plucky enough, and now extremely angry, and he was certainly not possessed of any excep-

tional physical strength or skill. So, when his first attack failed—for she wrenched her arms free at once—it was on almost equal terms that they fought there in the doorway of the dining-room and in the hall, and with a swinging slap on the cheek she sent him staggering backwards.

'Would you, though?' he snarled, and flew back at her at once; for, coward though he was, the thought was in his mind that this was only a woman and he could soon master her.

He lashed out a vicious blow at her with his clenched fist, and it was by pure good fortune that she managed to avoid it. Often enough she had engaged in rough horse-play with one young man or another, and had generally found her strength not markedly inferior to theirs; but this was different—oddly different. She divined in him an intention to do her harm; and this blow he had dealt her, though she had managed to avoid its full force, had sent her reeling, nearly falling. He came at her again with his fist raised ready to deliver another blow, and some instinct born of the rage and fear she felt made her dodge under his lifted arm and wreath one hand fiercely in his thick, disordered curls. His hat had fallen off, and she had dropped her cardboard box, and as they scuffled there in the hall she was screaming at the top of her voice, while still maintaining her grip on his florid curls. Cursing wildly, he tried again to strike her, but she was pressing too near his body for his blows to be effective, so he adopted new tactics and kicked her ankle viciously. She fell, but in falling somehow so twisted herself about him that he fell with her. They rolled over together on the floor, crushing utterly his hat and her cardboard box, he still cursing vigorously, and she uttering scream after scream, with her hand still wreathed in his hair.

'Let me go. I'll murder you, I will—if I swing for it,' he panted, and somehow or another found himself free, though at the expense of a handful of hair left, roots and all, in Annie's grasp.

She was on her feet, too, by now, and ready to rush at him again; but he had no more stomach for the fray, and flew to the front-door and out, with her hand upon his heels. She struck at him as he tore down the steps, but only with her open hand and without effect.

He turned on her furiously. 'Leave me alone—why can't you?' he cried, and hit back at her, but wildly, doing her no harm; and when he fled down the street she was still close behind him, still uttering scream after scream.

With one wild final curse he bolted round the corner and straight into the arms of a very large policeman who—the hour and the man for once coinciding—chanced to be standing there.

III.

'Now, what's all this?' said the very large policeman, enfolding the pale, thin young man

in an ample embrace in which he became at once completely lost, as a drop is lost in the ocean.

'Stop thief!' said Annie, turning the corner. 'Stop thief!'

'Right, miss,' said the policeman; 'so he is.'

'It's a fair—cop,' panted the thin young man from his place in the policeman's arms.

'It is so,' answered the policeman, who seemed of an amiable character, and to like to agree when possible; 'but what have you been up to?'

'Stop—thief!' repeated Annie; and then, realising that that request was no longer necessary, she added, 'You just step this way and you'll see what he's been a-doing of.'

She led the way back to the house, where the disordered hall and dining-room and the silver ready for removal showed quite plainly what had been the intentions of the pale, thin young man, who had now the air of being much more thin and pale even than before.

'Watched me out, he did,' said Annie indignantly; 'but I came back, and there he was as large as life—and me only tidied the room this morning as never was. And wearing his hat, too, same as he might be at home. But when he grabbed me I grabbed him, and that's his hair I pulled out, the great coward.'

'I ain't no coward,' snivelled the pale young man, roused by the injustice of this reproach, for he felt he had fought like a hero. 'And you 'urt me more nor I 'urt you,' he added, painfully conscious of an aching gap in his florid curls.

'Asked me to take half and let him go,' said Annie, continuing with increasing indignation; 'so I says, "Think I'm a thief?" says I'—and all at once she paused abruptly, for her eye had caught the sparkle of the diamond pendant resting by the doorway, where it had rolled from the smashed cardboard box, and now winked ironic greeting at her. 'Think I'm a thief!' she repeated mechanically, watching how it shone and glittered there, sparkling with a mocking sense of what only she and it knew.

'Quite right, too,' said the big policeman approvingly; 'and all I can say is, if every young lady was as honest as you—my word!'

He paused as though overcome by the thought, and then noticed where Annie was looking, and saw the diamond pendant for the first time.

'Hullo! what's that?' he asked. 'More of your little work, eh?' he said to the pale young man.

'Wish I may die,' declared the pale young man, but not as one expecting to be believed, 'if I ever saw it before.'

'Course you never did,' smiled the big policeman; 'innocent as a babe unborn, you are. Well, you come along with me now.—Miss, you'll not be scared waiting here alone a few minutes, will you? I'll send 'em round from the station at once, and they'll be here in two

ticks; so don't touch nothing till they come. You won't mind waiting just a minute till I get this beauty put away safe?'

'Oh no,' said Annie, 'not at all, thank you.'

'Right-o,' said the big policeman, and vanished with his captive; while Annie, left alone,

first picked up the fragments of the broken cardboard box, and then, sitting down on a chair, looked steadily and with defiance at the diamond pendant winking at her from its place by the door its ironic reminder of what only she and it knew.

THE MONTH: SCIENCE AND ARTS.

A ONE-MAN SAWING-MACHINE.

A MOST useful appliance for estates and large farms is the 'Wade One-Man Drag-Saw.' As the name indicates, it is primarily intended for sawing, its special purpose being to cut tree-trunks up into sections in the place where they have fallen, in order to facilitate removal. Hitherto such work has been carried out by hand, but owing to its greatly increased cost hand-labour is now prohibitive. The apparatus referred to consists of a two-stroke single-cylinder petrol motor, which drives, through a chain, a shaft having a crank-arm at one end for working the saw. Motor, petrol-tank, and gear are mounted upon a frame, having a wheel at the front and handles at the back; in fact, the contrivance resembles a wheelbarrow in general appearance, and can be trundled about from place to place by one man. When a tree-trunk is to be sawn up the appliance is wheeled to the spot, and the handle end of the machine is made to rest on the top of the trunk, to which it is fixed by spikes. The other end is carried by the wheel, which is securely locked. The saw will cut through a large tree in a few minutes at an almost negligible cost, in spite of the high price of petrol. Not only is this apparatus useful for sawing up trees, but the motor is fitted with a pulley, and can be used for driving root-cutters and other farmyard machines.

CATERPILLAR TRACTOR FOR STEAM-NAVY.

The construction of almost all large buildings, such as hotels, office blocks, &c., involves a considerable amount of excavation-work, and these operations are now commonly performed by machines known as steam-navvies. These appliances closely resemble steam-cranes, in that each consists of a jib for lifting, projecting outwards and upwards in front, which is balanced by the engine and boiler at the rear, the complete contrivance being mounted on a turntable, carried upon a wheeled truck. The 'shovel' is in the form of a rectangular box, with cutting-teeth on the front edge, open at the top, and fitted with a movable bottom. This shovel is mounted on the end of a long steel girder known as the 'dipper-stick.' When earth has to be excavated, the shovel is lowered to the bottom of the hole, and the dipper-stick is clamped to

a fulcrum, the result being that when the shovel is wound up from the end of the jib by the steam-engine it follows a circular path with the dipper-stick as radius, and cuts earth away until it is full. At the top of its stroke the shovel is high enough to be swung round over a lorry or a wagon, into which the contents are discharged by pulling a trigger, thus letting the bottom fall open. The operation is nearly automatic, the bottom closing and relocking itself as the shovel descends for another load. A variation in the mode of carrying a steam-navvy has been introduced recently by Sir W. G. Armstrong, Whitworth, & Co. for some excavation-work in the west end of London. In this case the appliance is mounted on a caterpillar tractor, and is driven by an engine of forty-five horse-power. Although the treads of the caterpillar-bands are smooth, so as not to damage the roads, the contrivance is capable of climbing gradients of fifteen degrees. It is also fitted with a hauling-drum and a wire-rope, by means of which it can haul itself up inclines of one in four. The weight of the machine is twenty tons, and the over-all length is twenty feet, while the width is ten feet. The shovel can lift three-quarters of a ton of earth at each stroke from a depth of fourteen feet below, and deliver it at eighteen feet above, the surface upon which the tractor is standing. Owing to the difficulty of carting away the earth fast enough, the output is usually limited to three hundred tons per eight-hours day, but the navvy is capable of lifting sixty tons an hour.

EFFICIENCY OF THE OPEN FIRE.

Some very interesting, and to many people astonishing, facts in connection with open coal-fires have been revealed during a research by Dr Margaret White Fishenden which was carried out for the Manchester Corporation Air Pollution Advisory Board. According to this investigator's report, apart from the loss in unburnt products in the form of ash, soot, or gas, the total efficiency of the open fire approaches 100 per cent., the only heat completely wasted being 'that which escapes from the top of the chimney (though even this is doing useful work in causing ventilation), and that which is conducted through the walls at the back of the fire to the outside.' The tests carried out comprised measurements of the heat radiated into rooms from various forms of open fires, under various conditions and

burning different fuels. With ordinary house-coal the amount of heat radiated ranged between 20 and 24 per cent. of that produced by combustion, and it was 'proved that the supposed great variation in radiant efficiency between different grates does not exist.' Experiments with what is known as low-temperature-carbonisation coke (a richer coke than the gasworks variety), which lights easily and gives off flames without smoke, gave a radiant efficiency of from 30 to 33 per cent. in a grate which gave only 25 per cent. with coal. Several preparations widely advertised as doubling the value of a ton of coal were tested, only to find 'that they had no effect whatever on the quantity of heat given out to the room from a given weight of fuel.' Experiments on the effect of draught showed that an adjustable register should be fitted to every open fire, by means of which the draught can be reduced to a minimum once the fire is burning satisfactorily. 'This register should be placed about a foot above the opening of the chimney, as otherwise smoke and dust will be driven into the room when it is closed.' Under such conditions the open fire may become quite an efficient means of heating a room, for, although only about 25 per cent. of the heat in the coal is given out as radiant heat, merely a small proportion of the remainder is really wasted, some of it being utilised in warming the chimney, thus raising the temperature of adjacent rooms and of the house generally. An interesting feature of the radiation from open fires is that the greatest effects are produced in a direction varying from forty to sixty degrees with the horizontal.

AN UNBREAKABLE VACUUM-FLASK.

Invaluable as is the vacuum-flask, it has the serious drawback of being easily broken, owing to the fact that the inner container is of glass. This defect is eliminated in an unbreakable vacuum-bottle now on the market, which is constructed entirely of steel. Although there are inner and outer containers, the latter being made up from several stampings, the joints are so welded that the complete bottle is to all intents and purposes in one piece. The inside is lined with 'amalgam,' a rich blue flexible enamel which does not crack or tarnish in spite of differences of temperature in the liquids carried. Gun-metal black, with nickel base and top, is the standard finish, but the body may be covered with leather if desired. The mouth is fitted with the usual cork and cup. The quart size will keep boiling liquids hot for over twenty hours, the two-quart size for over twenty-four hours.

SOMETHING NOVEL IN VACUUM-CLEANERS.

No vacuum-cleaner worked by one person can ever be quite so efficient as the corresponding apparatus driven by an electric motor; but a suction-sweeper that we have examined recently runs the electric type very close indeed. The

vacuum is produced by a rotary exhaustor which turns at about three thousand revolutions a minute. It is driven through multiplying gear by two light rubber-faced wheels at the rear of the appliance. These wheels actually drive the fan only while the cleaner is being pushed forward, but the momentum created keeps the fan running during the back strokes also. As in some other vacuum-cleaners worked by hand, a rotating brush, driven by two small wheels at the front of the machine, first stirs up the dust, which is then sucked up through the usual nozzle into a dust-bag clipped on to the outlet to the fan, the upper end of the bag being suspended from the handle of the cleaner. This dust-container can be instantly detached, and the dust emptied out through a large mouth closed by a special clip. All the working parts are completely protected from dust, and they require lubricating only at long intervals. The machine is constructed almost entirely of aluminium, and every effort has been made to secure lightness; in fact, the complete apparatus weighs only between six and seven pounds. As already indicated, the results achieved by it are remarkably good. The same makers also produce an electric vacuum-cleaner. Here again we have the rotary fan, but in this case it is driven by a tiny electric motor at no fewer than eight thousand revolutions a minute. This machine has so powerful a suction that no rotating brush at the nozzle is needed. In other respects it is very similar to the hand type, being made of aluminium and very light. The wire for carrying the electric current is provided with a plug which will fit any electric-lamp socket, or it may be attached to an ordinary wall plug. Various types of nozzle for cleaning curtains, upholstery, &c. may be used with the machine.

AN IMPROVED GAS OVEN.

The big reduction in its weight which takes place when a piece of meat is cooked in a gas oven is always cited as a serious drawback by the advocates of electric cooking. It arises from the constant stream of air through the oven necessary to keep the burners alight. Naturally this air absorbs moisture from the meat and has a tendency to dry it up. Electric ovens and those heated by coal ranges are entirely closed, and no circulation of air within them takes place, with the result that meat cooked in them suffers only a comparatively small shrinkage. Not only is the flow of air through a gas oven an undesirable feature from this point of view, but it has the serious drawback of carrying dust off the kitchen floor on to the food being cooked; while if an outside door is opened the temperature of the oven is immediately lowered. A gas oven that we have recently seen in operation obviates these disadvantages, and has the additional advantage of saving gas. As the oven is entirely enclosed (the burners being in

independent chambers at the sides), no circulation of air is necessary, and foods cooked in it are absolutely protected from dust. Other advantages of having the burners outside instead of inside the oven include the absence of all smell caused by fat spluttering on to the gas-jets, and the exclusion of mice and insects from contact with the inside of the oven at any time. The oven may be obtained alone, or it may form part of a complete gas range, fitted also with an open fire for airing and warming, and with a hot-water circulator controlled by a thermostat.

PHOTOGRAPHY BY TELEPHONE.

An excellent photograph was transmitted recently by telephone from Antwerp to Paris, and a reproduction of it appeared in the *Matin*. It showed a group of Swedish girl gymnasts passing in front of the camera, and was reproduced in eight minutes. In *The Times*, where a report of this performance appeared, the following explanation was given of the apparatus used and the principles upon which it works: 'The invention makes use of the inequalities of the surface of a carbon photograph in an ingenious fashion. It is known that these inequalities, which are exceedingly minute, vary with the depth of shadow—that is to say, with the effect of the light upon the surface of the medium. The method of utilising these conditions is as follows. The photograph to be transmitted is placed on a cylinder in every respect like the cylinder used in phonography, which, as it revolves, presents to a needle every point of its surface. The needle and the cylinder form part of a telephone circuit, and the sound of the needle as it passes over the diminutive elevations and depressions of the photograph is amplified by means of a microphone attached to the needle; that is to say, the current which passes through the telephone-wire varies in conformity with the inequalities of the surface of the photograph. It remains only to translate at the receiving end these variations of the current in such a fashion as to reconstitute the picture. The telephonic current is made to pass through an apparatus known to electricians as the oscillograph of Blondel, which is a sort of supersensitive galvanometer. It consists of two fine metallic wires carrying a tiny mirror placed between the poles of an electro-magnet. Each variation of the current through the wires causes the mirror to move. The light from an electric lamp is reflected by the mirror. By means of a simple optical arrangement of lenses and a transparent screen of graded tints, the light reflected from the mirror falls on a revolving cylinder covered with photographic paper—the counterpart of the transmitting cylinder—and the image is formed by successive projections of light which correspond to the variations in the surface of the transmitting photograph.'

'BRICKS WITHOUT STRAW.'

Referring to the statement made in the paragraph under the above heading in our October issue that there is no direct evidence of the use of straw in the making of bricks, nor does any trace of the ancient use survive in Egypt, a correspondent writes: 'During a four-years' sojourn in Egypt and Palestine, in the course of which I came closely in contact with the country people, or "fellaheen," I have frequently seen finely chopped straw, called "tibbin," used in the making of bricks. A particular occasion comes to mind when I set a party of natives to make bricks for the building of an outhouse, and the foreman came and asked for "tibbin," explaining that the bricks would not hold together without it.' An Essex correspondent also kindly informs us that in his neighbourhood there are some ancient buildings constructed of air-dried clay lumps, and these have straw in their composition. On the authority of a local bricklayer, he states that stubble used to be collected and sprinkled on the clay, and was trodden in by horses. The clay was then rammed into moulds, and the bricks thus formed, after lying on sticks to dry for fourteen days, were built with mortar in the usual way. The clay was derived from a boulder-clay formation, and as it contained small lumps of chalk, was unsuitable for making bricks to be burnt in a kiln; hence the use of air-dried bricks of the kind described.

A VALUABLE AID TO THE DEAF.

While it is obviously the case that the progress of science in some directions has been retarded by the Great War, it is no less true that in others it has been accelerated. The science of acoustics affords an admirable illustration of this truth, for the research-work undertaken during the war in order to provide a microphone sensitive enough to detect the whereabouts of enemy submarines has led to material improvements being made in an instrument known as 'The Acousticon,' which we believe, from experiments we have made, to be a real boon to those suffering from deafness. This handy apparatus, which is so compact in form that it can readily be carried about on the person, consists of three parts—the battery, the microphone, and the ear-piece, all of which are connected by fine, flexible wires encased in silk. The battery, which is of the dry-cell type, is so small that it fits easily into the waistcoat or blouse pocket, where it always remains. The ear-piece, which is hardly greater in diameter than a five-shilling piece, is carried in another pocket when not in use; when in use it may be held up to the ear, or clipped to it by an adjustable band, if it is desirable to leave both hands free. The microphone or transmitter may be carried permanently (even during use) in another pocket, or under a gentleman's tie or a lady's blouse; or, if preferred,

it may be temporarily attached to the coat or the blouse while it is being used. The microphone, which is, of course, the most important part of the instrument, is made of very fine vulcanite, thus avoiding the marked vibration inseparable from the employment of metal. On the face of the microphone are a number of openings, through which the sound is admitted. By means of a bevel it is deflected on to a cone, which guides it on to a highly sensitised diaphragm, the sound having been made more resonant on its way by the chamber through which it passes. From this diaphragm the vibration is conveyed to the ear-piece, where it is reproduced in tones which are louder or softer according to the needs of the user, who can readily adjust the instrument to his own requirements by means of a regulator at the back of the microphone. If desired, the apparatus may be worn in such a way that it is hardly noticeable; and, of course, the necessity of speaking into a receiver is entirely obviated. A special form of the instrument is adapted for use in churches and in halls where public meetings are held. A suitable microphone being fitted in the pulpit or the rostrum, it may be connected with any number of ear-pieces placed in the pews or seats where they are needed, and as each ear-piece is fitted with a regulator, the volume of sound can be modified at will. It is interesting to learn that one of these instruments was specially installed at Versailles during the Peace Conference for the benefit of the Right Honourable W. M. Hughes, the Australian Prime Minister, who was thus enabled the more easily to take part in that historic assembly. He now uses the instrument regularly in the Federal House of Parliament. Another form of the apparatus is being employed by American detectives to check the machinations of the criminal classes. When installed in a room where suspects are gathered, it enables a listener outside to overhear their conversation without their knowledge, and thus to be in a position to foil their plans.

A NEW UNIT OF GAS MEASUREMENT.

Time was when by far the most important test of the efficiency of coal-gas was its illuminating-power. With the practically universal use of incandescent mantles and the greatly extended employment of gas as a heating agent, however, heating or calorific power has now come to be the more important factor, and this has been recognised in a recent Act of Parliament. Under its provisions, gas may in future be sold at so much per therm, instead of at so much per thousand cubic feet. A therm is defined as 100,000 British thermal units, a British thermal unit being the amount of heat necessary to raise 1 lb. of water 1° F. Every local authority or gas company adopting the new unit is required under the Act to declare the

heating value of its gas, and provision is made for ascertaining by a system of tests that the declaration made is in accordance with facts. This change of unit, however, will not involve any change in the meters at present in use, for, if the heating value of the gas is known, it is an easy matter to change cubic feet into the equivalent number of therms. All that is necessary is to multiply the number of cubic feet by the declared heating value of the gas, and divide the result by 100,000. Thus if the declared heating value of the gas made by a certain corporation is 550, 1800 cubic feet will be represented by $(1800 \times 550 \div 100,000)$ therms, or 9.9 therms. It may be noted that, while the Act is at present a permissive one, it may, at the instance of the Board of Trade, become obligatory in the case of any or every corporation or gas company at the end of two years from now.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE BUILDER.

A DREAMER in a pleasant land,
With untrained eye and untaught hand
I laid the broad foundation-stone
To build a temple of my own.

In heat and cold, in sun and shade,
Stone upon stone the wall was laid,
And as the shapely temple grew
I builded better than I knew.

With careful hands and loving art
I traced the vision of my heart,
And saw with glad and wondering eyes
The temple of my dreams uprise.

In silent beauty as it grew
I builded better than I knew
Until the polished corners shone
Above the broad foundation-stone.

But when through tears and sunny gleams
I saw the temple of my dreams,
The cross of sacrifice was set
Upon the highest parapet.

I would not rashly claim as mine
The Master Builder's fair design;
Only because my heart was true
I builded better than I knew.

G. R. GLASGOW.

*. * TO CONTRIBUTORS.

- 1st. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

TAMMAS TOSH—BEADLE.

By JOSEPH LAING WAUGH,

Author of *Robbie Doo*, *Betty Grier*, *Cute M'Chayne*, &c.

CHAPTER I.

IT was Thomas Tosh, beadle, grave-digger, and manse factotum, who first drove me up Shinnel Glen, and in his own inimitable way introduced me to much that was of interest to me then, and is hallowed in recollection to me now.

Indeed, in all things parochial, Tosh was my guide and preceptor; and to me, a stranger in a strange land and among fremit folks, his titbits of local history, his information regarding near-hand cuts and byways, his naïve remarks, and artlessly expressed philosophisings were, in those days of my early ministry, both welcome and enlightening.

I am writing from memory, and I have little definite on which I can pin an assertion, but I am sure I never at any time put a leading question to Thomas in order to draw him out and elicit his opinions. Then, as now, so far as human analysis was concerned, I relied entirely on a keen sense of observation, a deductive, analytical faculty which seldom led me astray. Besides, such wheedling tactics were unnecessary in Tosh's case, for he was by nature chatty, sociable, and communicative, and volunteered, with a readiness and apparent relish born of knowledge and familiarity, oddments of domestic news and scraps of interesting information,

which oozed from him as freely and naturally as water from a moss-rock well.

It was only at times, however, that Thomas was voluble and talkative. The responsibilities of the glebe lands and the manse gardens lay heavy upon him, and when fencing on the glebe or gardening on the grounds he was, as a rule, too eident and preoccupied for lengthy converse.

'Ah, Maister Crosbie,' he said to me one day when I was thoughtlessly holding him in what he considered irrelevant, useless 'confab'—'ah, Maister Crosbie, but I maun get on; the day is aye ower short for me, an' talkin's no workin'—at least in my line. It's a bad job when your haun's get taigelt wi' your tongue, so, wi' a' due respect to your crack, I'll get on wi' my wark.' And before I had hunted up 'taigelt' in my 'Warrack' and fully grasped the meaning of the pithy old Scots saying, Tosh was lost to his surroundings in the subdivision of a two-pole potato-plot.

It was in the roomy, old-fashioned manse gig, behind stolid, jogging Donald, and with me, a patient, interested listener, that Thomas showed to advantage as a conversationalist.

The turn-out—horse, trap, and harness—had come to me, as I understand it had come to my predecessor, with the living. How it had

come to be reckoned a parish asset I cannot explain. My oldest parishioner couldn't enlighten me, and none of my heritors pleaded guilty of any deed of gift; but Tosh called it 'oor's' with an emphatic ring of possession, and looked so much part and parcel of the antiquated concern that I accepted it without qualm or question.

Tosh was no Jehu; his seat was contorted and inelegant, and his constant rein-tugging and whip-cracking entailed a physical exertion that tired him sorely. But he had a fairly accurate estimate of Donald as a 'goer,' an estimate based on a quarter of a century's acquaintance; and although I could have walked faster, I put up with Donald's 'five mile an' oor, no coontin' stops,' just for the pleasure of having Tosh's company and the benefit of his newey conversation.

The first outing we had together was on a July Monday afternoon. I remember it well, for, as the placed minister of Shinnel, I had on the previous day preached my first sermon, and was, of course, anxious to know how the parish had received it. Quite naturally I thought, considering the importance of the event and the fact that we were sitting *tête-à-tête* in the trap, he would take the opportunity of conveying to me the public impressions. But I was disappointed, for, notwithstanding the many possible openings the conversation offered, he was silent on the subject that concerned me so keenly.

'Ay, sir,' he said, as he 'raxed' me the strap of the stiff leather apron, 'it's Miltonbrae I think ye said ye wanted to veesit. Weel, weel, Donal an' me ken that airt brawly—it's a lang but no a sair road. Juist sling your 'brella on the lingers there; ye maunna lippen it behind ye, for it nicht fa' oot. A cane-backet gig looks weel when it's new, but the pairish boys o' a by-gane generation hae smoket the back oot o' this yin, an' cane-wark hereaway canna be renewed—imphm. Ay, ay, but bide a wee; ye maun buckle the strap o' the apron to the splash-board there, so that if Donal fa's ye'll be less likely to be shot oot.'

'Is Donald likely to fall?' I asked apprehensively.

'Weel, I—I wadna say *likely*, but when his mind's no on his wark he's guilty o' makin' a mistake; but, dod, sir,' he added blithely, as if exonerating Donald, 'if it comes to that o't, we're a' tarred wi' the same brush—deed are we—imphm. Weel, if ye're a' richt we'll mak' a stert.—C' way, Donal, then; tak' the gait canny, an' naue o' your braingin'.'

Donald, with bowed head, had been looking long and earnestly at the chuckie-stones in the gravel-drive, and it was only after much riving and tugging at the reins that he answered Tosh's call, and proceeded to walk slowly down the avenue. He didn't accelerate his pace when we reached the loaning, and, thinking Tosh was disappointed that Donald was not showing his

mettle before his new master, I remarked, by way of encouragement, that a slow horse was a sure horse, and that Donald was maybe a good follower at a funeral.

Tosh looked quickly towards me; then, with a laugh and a twinkle in his eye, 'Mebbe he is, sir,' he said. 'I canna say for certain, for I've never driven him at a funeral. It's like this, ye see—I canna baith bury the corp an' drive the minister. . . . Here's Maister Simpson comin' along the road. Ye wad shak' haun's wi' him at the induction, though mebbe ye'll no mind his face. . . . Mairret his deceased wife's sister, they tell me,' continued Tosh when we had passed. 'I dinna ken what ye think about that, sir, but in my humble opinion there's no muckle wrang in't. When inclination is coontered by the law o' the lan' there are aye mony law-brakars. . . . Knockjig in the hollow there—fair guid grun', but could brawly dae wi' mair than it gets. If ye dinna put it in ye canna expec' to tak' it oot, an' I've often telt Knockjig that he was wrang to work sae lang wi' road-reddens when guid byre manure was cheap an' handy. But I daursay he kens his ain grun' best, for he was born on't. So was his faither an' grandfather. They say there were Curries in Knockjig when Shinnel bell was first hung, and that waana yesterday. . . . That's the wey, Donal. Faith, ye're makin' the stoor flee noo;' and Tosh proceeded to pull his long, battered felt hat well down on his ears, as if anticipating a hurricane velocity.

Donald was certainly trotting, but he had a 'click spavin,' which made his movement so jerky and the gig so jolty that it gave me the hiccup. But I didn't like to complain, or discourage Donald in the way of well-doing.

'Streetch o' guid; fishin' watter there,' said Tosh, pointing with his whip. 'Tak's nacky wark, though, for the trees are ower near; but by wadin' up the middle and workin' wi' a short line—a grouse an' claret, a Mairch Broon an' a butcher—ye'll fill a basket or ye're hauf a mile up. . . . That's yin o' oor fouk—James Laidlaw by name—on the brae-face, workin' on the dyke. Grumblin' kind o' a buddy, an' by-ordinar' cat-witted, but a weel-meanin' sowl, an' the best dry-stane dyker in the shire o' Dumfries. Was bad for the dram at ae time, an' was reckoned a bonnie fechter at Thornhill fairs, but he quat drinkin' when his coo chocket wi' a tattie, an' noo ca's cannily along, workin' o' fore-nichts in his gairden an' breedin' canaries. . . . Juist think o't, sir—canaries! an' him six feet three in his stockin'-soles. Dod, if it was turkeys or even jeuks yin wadna wunner sae, but—humph! . . . An', mind you, they're no the slim, strecht-backet canaries that we've aye been used wi', but crampet, hurkle-backet, roon-shoudered wee sows, sae uncomfortable-lookin' on a spake that yin wunners hoo it is that cheery whussalin' comes naitral to them. . . .

[Christmas Number.]

Sunnybrae on the left there—a nice hoose an' weel bielled by the plantin'—brick, an' harled, an', as ye see, a red-tile roof. Robert Gaw the sclater—a Scaurbrigger, but a decent man—bides there. It belongs to Davie, his auldest son. Davie's dune weel in Glasca. Ser'ed his time to the sclaterin' wi' his faither here, took early to the toon, jined the richt kin' o' a kirk. Then he sterted on his ain, the congregation backet him to a man, an' he's never yince looked ahint him. I mind when the pair o' breeks he wore was a' he had in the worl', an' noo they tell me he has a pair for every day o' the week. His mither let oot that when he's here on holidays he dis haet a' but wear white serks an' smoke cigars at thrippence a time. But he's a fine falla, an' a guid freen to mony a puir body in Shinnel. An' a' on the quate, too—never a cheep or a brag, but a cairt o' coals here, a pun' o' bacca there, a bag o' meal to this yin, a hunnerwecht o' tatties to that. Dod, sir, it's graun'. Ay, I often think, nae maitter hoo high up a man may speil, he's nae credit to his native place if he isna mindfu' o' the needfu' fouk he was reared amang. . . . Toots, man, Donal, gee up; this is no a brae. . . . Dod, sir, auld horses are juist like auld fouk—they're quick to ken when the road gets stey. . . . Are ye—eh—quite comfortable sittin' there? Mebbe ye wad like to try your haun' at the drivin'.

I assured Tosh I was perfectly comfortable, and that I had no desire to take the reins.

'Weel, weel, so be it; some like to drive, ither to be driven—implm. An'—an' mebbe ye dinna ken much about horses, onyway.

'Oh yes, Tosh,' I said, 'I know a good deal about horses. In fact, I—I love horses. I was brought up on a hill-farm, you know.'

'Ay, man, d'ye tell me that?' and he looked towards me, both pleased and interested. 'Dod, sir, that's news to me. I've aye liket hill-fouk—they're a' thinkers, a' workers, kindly as the sun that cheers them, an' free as the bracin' wind that tans them. Ay, hill-fouk for me every time. Dod, man, if it had been noised abroad in the pairish that ye were uplan' bred an' yin o' oorsels—we're a' sheep-fouk here away, ye ken—we wad have plumpet for you on the votin'-day to a man. Ay—an', mind you, it was, at first, a scrimp majority—juist neck or naething wi' ye; an' considerin' the fremit subject o' your trial sermon on the wanderin's o' the Children o' Israel, ye were real lucky to pu' through. . . . Noo, had I been a minister staunin' for the kirk o' Shinnel, I wad have ramsacked the Word o' God frae Genesis to Revelations for nice verses about green pastures, an' feedin' flocks, an' carefu' shepherds, tacket them a' aroon' a hamely text, such as—weel, such as—och, ye ken yersel'. An' in my disoorse I wad have brocht in the—the—daivert! I'm gettin' taigelt an' I canna oot wi't—but I wad have

1920.]

brocht in onything but the closin' up o' the walls o' watter an' the droonin' o' the puir 'Gyptian sodgers in the Red Sea. . . . Believe me, sir, I never heard o' a Shinnel man sellin' sheep to a Jew; no yin in a hunner ever saw an airmy or traivelled on the sea. It's a' hearsay to us, an' often second-haun' at that. But we ken sheep, an' we ken aboot free hill-air and the—the—och, man. . . . But ye made up for't in your delivery—ay, and let me tell ye this, your voice was your salvation. We heard every word ye said. Glenheid's verdict at the kirk yett was, "Boys, he's the man for Shinnel, but wi' a voice like that he's a guid unctioneer spoiled."

'A what?' I gasped.

'A—guid—unctioneer—spoiled,' he repeated slowly and with emphasis. 'An' mind you, sir, Glenheid's a judge o' public speakin', for he gangs to every mart between Lanark an' Carlisle.'

I felt crushed and humbled, and knew not what to say or how to reply. To me 'Glenheid's' verdict was a humiliation. But it had its humorous side, and inwardly acknowledging it, I laughed till the tears rolled down my cheeks.

Tosh looked at me in amazement for a minute. 'I houp, sir,' he gravely said, 'ye're no lauchin' at me.'

'No, no, Tosh; I'm not laughing at you. I happen to have the sixth sense—the sense of humour—and the comical side of something you said appealed to me.'

'Oh, that's a' richt—but we sterted on the subject o' horses, an' ye said ye loved them. Unless ye had arable lan' ye wad hae nae use for horses.'

'That is so, Tosh. We had no arable land, but my uncle, who brought me up, rode to kirk and market on horseback, and he preferred saddle-mares with a strain of blood. Though hale and hearty, he rides seldom now, but two old pensioners of his, verging on thirty, are in Lettergill paddock to-day, and not very long ago they could do their fourteen miles an hour without turning a hair.'

'Holy Moses, sir!—fourteen mile an' oor, mighty me!—Donal, d'ye hear that? Gee up, you daverin', dotterin' auld fule. Faith, but if ye canna come up to them in speed o' fit, ye can beat them in years o' age. Ay, ye can.—An', look ye, sir, if we're no gaun scuddin' along the grun' ower quick ye'll get a glisk o' Shinnelcraig here. Ay, there it is amang the trees—a fair guid ferm, an' in capital he'rt, but the hill lan' to the west gets a bad name for the trimmlin'. It was lang in the haun's o' name-sakes o' your ain, but a harum-scarum, camsterie falla ca'ed Dawson has it noo. He's ne mairret an' he's no weel liket, but he's a capital guid judge o' black-faced tups an' wimmen-fouk. He used to come to oor kirk, but he had a word or twae wi' oor session aboot a bit bairn yin o' his servant lassies had, an' sin syne he's ta'en his Sabbath-a-day bawbee ower Dunreggan

to the kirk o' Glencairn. . . . Clapperstane, on the burnside there. Wattie Stitt, yin o' oor elders, bides there—a lang-faced, tankard-bucket man: ye couldna miss seein' him at the induction, for he was sittin' strecht in front o' ye, an' his dickie had slippet doon into the breist o' his waistcoat. Decent, hard-workin' man, as honest as the day, but sairly hauden doon wi' a thowless, yaumerin' wife an' a big faimily o' shilpet wee weans. His faither—auld Wattie—was an elder too, an' was cairtwricht there lang afore I mind. He leaved till he was eighty-nine, smoked bogey roll, an' gied and took a dram to the last. Awfu' open-haunded; so was his wife. Naeboddy ever left Clapperstane dry or hungry. Clonrae used to say that nae man in Shinnel had better qualifications for the eldership than Wattie, for, ither things forby, he was the husband o' one wife and given to hospitality. . . . Kirklan' Ha' in the howm there—a nice bit lairdship, wi' game galore—belongs to Major Dottle, a very birsy wee man, thrawn an' peppery when he disna get things his ain wey, but by-ordinar' kind when it comes up his ain back. He's a heritor, of course, an', as ye ken, bound by the law to dae his bit to keep kirk an' manse ticht and dry, an', faith, he'll dae his bit; but he'll dae mair if he's ta'en the richt wey. He was lang in foreign pairts among the blackamoors, an' the hoose is positively fu' o' idols, an' images, an' ivory birds an' elephants, an' sic like. . . . But, faith, sir, I maun haud my tongue. I doot I'm clatterin' ower much, an' makin' free enough wi' a stranger like you, but I—I must say I like to ca' the crack wi' you. Mair than that, sittin' in the gig here, ye hae time on oor haun', an' what I've telt ye disna hurt onybody we've been speakin' about. Ye unnerstaun', sir?

'Perfectly, Tosh; I know what you mean. We're not talking scandal, and I'm enjoying the drive immensely. You seem to have a very intimate knowledge of this country-side. Have you lived long in Shinnel?'

'Lived lang in Shinnel! Lovan, ay, sir. I'm Shinnel born—never sleepet a nicht oot o't in my life, or never had ony desire to do sae. An' where wad ye be better?—a cosy but an' ben, wi' a slopin' gairden facin' the sun, pure caller air, an' the best o' cauld wall watter. Mercies galore, an' health to enjoy them. What mair could yin want? Oh, sir, there's nae place like Shinnel; an' when ye've been a whilie here ye'll think so tae.'

'I like it very much already, Tosh,' I reassuringly said, 'and I am sure the more I know of it the better I'll like it. It's—it's quiet, of course, but—'

'It is mebbe quate, an' it's far frae the toon, and the railway, but that's whiles an advantage. Ye see, sir, we get time to think, an' time to work, an' we live every day—ay, every 'oor and meenit o' oor life. But it is quate, an' dootless ye'll feel lonely an' fremitwise at times. . . .

Only for a wee, though, for ye'll sune get into oor weys o' daein'. An' when ye get the manse toshed up, an' a nice wife in't—for, dod, sir, ye maun get mairret—ye'll sune think wi' me that there's nae place on earth like Shinnel.'

'Must one be married, Tosh, thoroughly to enjoy glen life here?'

Tosh looked at me, but made no reply. Then his eye wandered slowly along the off-shaft of the gig, the point of which he gently flicked with the whip-lash.

'Donal's graith is hardly respectable, an' barely safe,' he said at length, and quietly—more to himself than to me—'there's amaist as much string an' rape as leather about it. Ay, we'll hae to see to it—imphm.' Then, in an even quieter voice, and with just a sensation of 'catch' in it, 'Oor crack, sir,' he said, 'has some- way ta'en a queer turn. I—I hardly ken hoo to answer ye; and for the first time since we left the manse door he put his whip in its leather socket.

'Ye see, sir, it's—it's like this. I—I haena a wife mysel', an'—an'—'

'Oh, I'm sorry, Tosh,' I feelingly said. 'You're a widower. Pardon me, I didn't know.'

'Weel—I'm no a weedower either, sir—no—no; and he looked at me with a suddenly mellowed eye. 'I—I never was mairret, an' ye'll think it strange that I should be advizin' you to dae what I didna dae mysel'. No that I didna try, but—dod, sir, it's an auld story noo, though it's a' fresh in my mind as it were yesterday, but—weel, I didna get the lass I wanted, so as it wasna to be, an' I couldna love twice, I've—I've juist made the best o' a bad job.'

I have lived much among old folks, and am quick to notice evidence of emotion, or the subtle sign that tells of a hastily summoned memory, or a reborn thought of days that are no more. And when I feel a chord has been suddenly struck in an unnerved pulsing heart, when the feelings have been so stirred that moistened eye and quivering lip make a wrinkled, withered face beautiful and glorified, I know that a spoken word, however relevant and kindly meant, is often a discord and a distraction. We all have our Gethsemanes where we would be alone with our past failures and regrets. And in silence I left Tosh with his.

A gentle July breeze stirred the wayside grass, and whispered among the brackens in the lee of the turf-dyke side. Flecking sunshine and chasing shadows lay in turn on the quiet hills, and lightly danced on the sleeping pools and broken streams of Shinnel burn. A bumble-bee droned round and round us, and, wheeling, dipped into the scented clover. Then from the stretch of moorland beyond the birch-fringed glen the wailing, yamouring cry of a whaup came to us on the quiet, lown air.

Tosh raised his head, and looked towards the moor whence the call came.

[Christmas Number.

'Ay—that'll be as hamely a soun' to you, sir, as it is to me. I was juist listenin' for't. I kened it wad come to us here, for a' roon' hereaway is whaup's grun', juist as it's mine. I was born in that white hoose atour the muir there—the gable-en' faces this wey, an' the sun's shinin' on't the noo. Ay, mony a forenicht hae I sat there amang the howes, sometimes my lane, and ither times no, listenin' to the brattlin' o' Shiunel there and whaup-cry answerin' whaup-cry a' aroon' me. An' juist because o' thae auld days, there's noo, to me, a sough o' auld lang syne—a sobbin' kind o' sweetness in it that mak's my he'rt sair an' gled at yin an' the same time. Mind you, I like to hear the lark in the spring lift, an' the whusslin' o' the blackie, an' the chirp o' the bit robin, but they dinna juist—dod daivert! I canna tell ye what I mean, but, bein' hill-bred, ye'll mebbe hae an inklin' o' what I want to be at.'

'Ah, Tosh, my man,' I said, 'you have deeper feelings than you can well express. But some one else has done it for you. Listen :

'Fn' sweet is the lilt o' the laverock
Frae the rim o' the clud at morn,
The merle pipes weel in the midday biel'
In the heart o' the bendin' thorn.
The blythe bauld sang o' the mavis
Rings clear in the gloamin' shaw,
But the whaup's wild cry in the gurlie sky
O' the moorlan' dings them a'.

'For what's in the lilt o' the laverock
To touch ocht mair the ear?
The merle's low craik in the tangled brake
Can start nae memories dear.
And even the sang o' the mavis
But waukens a love dream tame
To the whaup's wild cry on the breeze blown by
Like a wanderin' wold frae hame.'

Donald had stopped, the traces had relaxed, and we had quietly and imperceptibly backed down the gentle incline into the side of the road and against the bank. But Tosh was unconcerned by the doings of Donald and the gig.

'Whae wrote that, sir?' he asked excitedly.

I wasn't surprised he didn't know, for the author has unaccountably not yet come into his own, but his honest heart would have 'stooned wi' pride' had he heard all that my old beadle said in his praise.

When we had wakened Donald from his reverie and coaxed him into a trot, Tosh turned to me.

'Maister Crosbie,' he said, 'I've never had muckle time to spend on books, but I wad like to hae a readin' o' *Kirkbryde*. The man that wrote what ye've juist repeated kens hill life. I see warrant he has sat wi' a lovin' lass on a quate hill howe, as I hae dune lang syne, wi' love in his he'rt an' naebodie near but God an' the whaup. Ay, I maun hae a readin' o' that book. An' I'll come an' get it sune, for I've a story to tell ye that'll no keep lang.'

1920.]

CHAPTER II

OF all the items of local information volunteered by Tosh, the most interesting, perhaps, to me was the reference to the 'stretch o' guid fishin' watter that needed nacky wark.'

From boyhood I had been an ardent disciple of dear old Izaak—I am so to this day—and the fact that my lines of life had fallen in pleasant fishing-places gave my living an added value and interest.

Sitting at supper that evening, long after Tosh had 'ca'ed' Donald to the grass, and left the manse with Rob Wanlock's *Kirkbryde* in his possession, I bethought me of the alluring stream with its broken water and its shadowy pools. In natural sequence my rod and reel came into my mental picture, and after a little cogitation and cud-chewing retrospection, the desire to throw a line on Shinnel water became irresistible.

My recently arrived effects were few and promiscuously scattered, but, after much rummaging, I unearthed all my fishing requisites with the exception of my waders. Then, thoroughly in the fishing 'tid,' and eager for an early start, I looked out a suit of old clothes, set my alarm-clock for 4 A.M., and went to bed.

Tosh proved himself a sound judge. It *was* a good stretch of fishing-water, and it *did* require nacky work; but, without boasting or vanity, I could say then I was a nacky fisher, and long before the first puffs of blue smoke circled and pirled above the village roofs, I had a baker's dozen of beautiful yellow trout in my basket. The want of waders handicapped me, but necessity knows no law. Taking off my boots and stockings, I tied them together by the laces, and slung them round my shoulder. Then, buckling my trousers well above the knee, I waded my way slowly up-stream, fishing diligently in the watery middle-way of an avenue of saughs and alders so thickly planted and densely foliated that the country-side, to right and left, was completely hidden from view.

After plying my rod successfully for an hour and a half, on reaching an opening with a turf-topped scaur on either side I waded out, and 'sate me doon ye bank upon.' I had eaten an apple, and, in the glorious early morning quiet, was having my first smoke for the day, when, a little up-stream to my right, I saw a fine rise to a natural fly. In a moment, almost before the widening circles had disappeared, my line was over the spot.

He came to me with right goodwill, but I was over-anxious, and, in my haste, I missed him. I cast again; he rose to my bob-fly, and, ashamed I am to admit it, I failed to hook him. Again and again I lured him, but without success. I ought to have been content, for my

catch of thirteen was quite a good one—more, in fact, than I could use; but this was by far the biggest trout I had seen that morning, and I was loath to leave without adding him to my basket.

Thoughtfully I had provided myself with a few good red-nosed worms, so, reeling in, I substituted a fine Stewart's tackle for my fly cast. Once more I sent my line up-stream and well beyond the stone underneath which I judged my prey was lurking. Gently, with the rippling current, my bait was borne down towards him. Then he came. I felt the tug, and jerked my wrist upward, only to bring in my hook completely stripped of its bait.

I was conscious of striking him, and knew from experience further effort was useless, so I again reeled in, and, crestfallen and disappointed, waded to the bank and relit my pipe.

Then suddenly, almost before I had tasted tobacco, the prompting thought came to me—*guddle him*. In less time than it takes to tell, with arms bare to the armpits, and trousers rolled up to the thigh, I was on the stalk. Crouching and quivering, I waded quietly—oh, how quietly!—to the half-submerged stone. I wasn't the placed minister of Shinnel now. Manse and glebe, pulpit and people, were forgotten, and I was a boy once more, with all a boy's eagerness and zest, with that alertness and joy of the chase and sport which, in bonds of sympathy and affinity, draw me in chumship to the Tink and the Romany.

Cautiously, with down-stretched arms and eager, tingling fingers, I groped round the stone. In the concave apex, tail down-stream, I found him. He moved upwards an inch or two with the tickle, and my hands, working together, followed him. I held my breath as I judged his girth and length; then at the psychological moment my fingers of both hands simultaneously closed round his body at the upper fin, and, in a trice, a well-fed, glittering two-pounder lay quivering and panting among the grass on the bank.

Breathless with excitement, exultant, and proud of my prowess, I looked at him where he lay. Then, in a flash, it came to me I hadn't given him a chance, nor had I played the game. I had tried him with legitimate lure, and he had baffled me. Only by stealth and physical and mental advantage had I overcome him. I felt the red blood of shame surging round my neck and cheeks, and, without further thought, acting on a sudden impulse, I rushed with him to the water-side, held him gently in the lukewarm sandy bottom until he had gathered himself together, then bade him a hand adieu as, like an arrow, he sped to his up-stream lair.

'WELL, I'M DAMNED!'

Under ordinary circumstances the expletive is explosive and disconcerting, but in the hush and sanctity of that quiet morning it came to

me with a startling force and incongruity that almost unnerved me.

I looked hastily around me, and there, in the opening on the opposite bank, with the early morning sunshine on his red, bronzed face, stood a tall, vagrant-looking fellow, with a double-stemmed cap worn sideways and tilted above his forehead, without collar or tie, and in a loose, ragged sporting-coat, for which I knew, at a glance, he had never been tailor-measured.

'Hallo, friend!' I said when I had recovered composure; 'did you speak?'

He looked steadily at me, shifted a quid from one side of his jaw to the other, and spat sideways.

'Maybe I did, but, dammit, man, I'm that surprised that I canna say for certain. Surely there's a loonie trip here this mornin' from the Crichton Asylum.'

'Never heard of the place,' I said; 'I'm a stranger here. Six A.M. is on the early side even for an asylum excursion; but if there is one, and if you have lost any of your chums, you'll probably find them nearer the village.'

'Ah, that's smart; I like that touch o' humour. Dammit, man, if you had been as nimble wi' your rod as you are wi' your tongue you wadna hae needed to guddle. Noo, look here—a' jokin' aside—tell me why, efter catchin' that fish, did ye let it away again.'

'Well, I—I can hardly tell you in so many words,' and I laughed uneasily; 'but—well, the fact is I missed him with the fly; then I'—

'Yes, yes—I know a' that; I've been watchin' you for the last ten minutes.'

'Well, if that is so, you must also know that I didn't give that fish what every living thing ought to get in this life.'

'And what may that be?'

'A sporting chance,' I promptly replied, and relit my pipe.

Shading the sun from his eyes with a long, thin hand, he looked at me for a minute; then, without taking off boots or stockings, he deliberately, and without concern, waded across the stream.

'Sonny,' he said huskily, 'shake.' In a tight clasp he held my right hand in his, and with his left familiarly on my shoulder, 'Man alive,' he said, 'that was worth seein'. Damme, but it was just grand. An' to let a beauty like you away juist because you—well, well, I'm jiggered. Sorry you're a stranger. Man, we could do wi' a wheen o' your kind in Shinnel Glen.—Shake again, my boy.'

Again I took the proffered hand, looking, I know, very shamefaced, and feeling I was receiving extravagant credit for a very trifling, unpremeditated act. Then, with a view to changing the subject and relieving myself from an embarrassing situation, I offered him my pouch, and asked him if he lived in these parts.

[Christmas Number.

'Ay,' he said, 'I live in Shinnel, but I'm not of Shinnel, an' for that thank God.'

He leisurely filled his pipe—a black clay cutty it was, and I envied him his possession of it—and when he had lit it we both sat down on the bank.

'Ay, man,' he continued, 'it's very strange I should have had this experience so soon after the happenings o' last nicht.'

He hesitated and seemed lost in thought.

'May I ask what happened last night?' I asked after a pause.

'Ay, ye may, an' I'll tell ye wi' pleasure, for it was then I found out that a freen o' mine has a he'rt o' gold when for lang I had judged he had a he'rt o' stone. I'm no' a stickler for moral virtue in a man. God knows I've no claim to it myself, but I like to see it in others. I saw it last night in him, I saw it this mornin' in you, and I'm beginnin' to jalooose there's mair guid than ill in the world after a'.'

'I hope so,' I said; 'in fact, I may say I know there is. But please leave my paltry case out of your consideration, and tell me how you found out last night about the heart of gold.'

Holding the black cutty aloft in his long, brown hand, he looked at me for a minute through floating circles of tobacco-smoke. 'Interested much in your fellow-man?' he asked.

'Intensely,' I replied.

'Great study—great study, sonny, but it has few students. Glad to know you're one. . . . Well, about the he'rt o' gold. . . . I share a cottage down in the village there wi' an auld man who, since I knew him, has been as close-fisted an' savin' as I have been open-handed and spendthrift. At one time, I believe, he was free enough, an' bein' unmarried, he had plenty to spend; but when he got aulder he got grippy—ay, so terribly grippy that his name was, and is yet, a byword in the parish for meanness.

'I often wondered why he saved and scrapit, an' how it was he denied himself the very necessities o' life, an' I set him doon as an oot-an'-oot miser—a puir, miserable skinflint, whose God was his dirty auld bawbees. An' listen, sonny; a' the time he was savin' siller, not for himself at a', but to feed and clead an' keep an auld widow freen oot o' the poorhouse, an' in a respectable, bein' cottage o' her ain. Noo there's a perfect God's gentleman for you.'

'Yes, a perfect God's gentleman,' I eagerly repeated. 'And was he in no way related to her?'

'Not by blood, but—an' this is where the true sentiment an' essence o' love comes in—she was at one time his sweetheart—the only woman he ever met that he could have married. Something happened that separated them. In course o' time she became anither man's wife; but he, for her sake, has remained single to this day. Her man died some years back an' left her penniless, an' a cripple wi' rheumatics, an' the

1920.]

authorities said she bude gang to the poorhouse. My auld freen couldna thole the idea o' her gaun there, an' his ploy began.

'We've chummed together for nearly five years, an' he never mentioned the subject to me till last nicht, an' if it hadna been he was in a bit o' a fix an' wanted advice he wad have been silent still.

'It seems he was in the habit o' giein' the money—twenty-five pound every year it was—to the Auld Kirk minister. He, in turn, took it regularly to the auld body as a gift frae a well-wisher wha didna want to be named. Naebody but the minister was in the secret, an' up till noo it's been weel kept an' has worked oot a' richt. But Maister Ferguson's away, a new parson has come, an' he must be telt, for he'll hae to carry on the ploy, an' my auld freen's in a swither aboot mentionin' it, as he's a young man, wi' mebbe little discernin' sentiment, and wi' little desire to encourage a deceit that to me is my auld chum's crowning glory.'

'Now—one moment,' I gasped, 'before you go further. Did your old companion tell you this in confidence?'

'He did; but I am mentioning no names, an', to you, a stranger, I'm just givin' it as an instance o'—'

'But, my dear fellow,' I stammered, 'I—I'm the new minister, and it strikes me forcibly that—that your old friend is my beadle, Tammas Tosh.'

In my excitement I had risen to my feet, and from his seat on the bank he eyed me incredulously up and down.

'WELL, I'M—'

'NOT DAMNED,' I promptly interposed. 'I don't know you from Adam, but you interest me very much. I even confess I like you, and I am deeply grateful to you for this mornin's crack; but I do not like your "DAMNS." Now that you know I'm a minister, you will surely respect my cloth.'

A blush, quick-spreading, deepened the tan of his face, and his dark eyes smiled. 'I'll respect your old fishing-clothes for the sake o' the manly man that stands in them. The cloth, as you ca' it, has neither acknowledged nor respected me, an' I've little cause to respect it. But I'm beginning to change my mind about the laity, an' it's possible I may yet think better o' the clergy. . . . I'm—I'm no fit to be seen speakin' to you, my slate'll need a lot o' washin', an' I've broken my word to my best freen in Shinnel. I'll mak' it richt wi' him, though. An' noo I'll thank you to shake hands wi' me once more, an' to forget, an' never mention till I bid ye, what I've said o' Tammas Tosh's he'rt o' gold.'

We stood hand-in-hand for a moment. Then, taking off his old stemmed bonnet, he slightly bowed his head. 'It's weeks o' Sundays,' he said, 'since I darkened a kirk door, but, by my

faith, I'm comin' soon to hear you preach. An' that's my pack wi' you, sir. Guid-mornin'.

Again he waded across the stream. As he jumped down to the landing-stone his coat-tail swung upwards, disclosing strands of wire and a bulk of rabbit-fur, which, somehow, didn't surprise me.

I sat for some time smoking and thoughtfully turning over in my mind the strange happenings of the past hour. I had come to Shinnel expecting to find the usual and the prosaic, to live in a placid, uneventful way among a people unemotional and undiluted by any tincture of romance, and thus early in my experience I had been introduced into an atmosphere of chivalry, sentiment, and harmless intrigue which obsessed me so completely that I have no recollection of walking home.

CHAPTER III.

THE weather during my first July in Shinnel parish was ideal, and the season one of the most propitious on record for crops and outdoor work. On four nights, at intervals of a week, rain fell gently and copiously; but the sun shone every day, and the warmth was tempered by a crisp, winnowing wind that gladdened the hearts of the haymakers, and made their work 'throughgaun' and lightsome.

The glebe-land was lying fallow, but there was a broad strip of excellent meadow to the west, bordering Shinnel water, which was ripe for the scythe, and in old Donald's interest I judged Tosh would be giving it his attention soon.

This, together with all of pulsing interest I had learned regarding my beadle, made him figure prominently in my thoughts; and though my coming Sunday's sermon was exercising my mind and making every minute precious, I often laid aside my pen and made frequent visits to the garden and courtyard in hopes of meeting him, but without success.

On the Saturday morning, however, on my coming down for breakfast, my housekeeper, Mary Ferguson, informed me that Tosh and Scamp were working at the hay in the low west meadow. I didn't know who 'Scamp' was, but it occurred to me he might be a dog. I ought to have been satisfied with my surmise, and to have refrained from giving Mary an opening by asking a question, for I had, very early in our acquaintance, found out that she was the most hawering, garrulous, bletherskate it had ever been my misfortune to meet. The first day I arrived at the manse, hungry and wearied after a long, tedious journey, she kept me standing in the draughty kitchen lobby for over an hour, listening to a disconnected, uninteresting harangue, which began with the whitewashing of the back-kitchen ceiling, included a detailed account of the different places she had been in, with thumb-

nail sketches of the mistresses she had served, and wound up with the dazzling career of a cousin of her mother's, who, from breaking stones in a stone-bing, had risen to extraordinary affluence as a Scottish packman in Bristol.

Her range of conversational matter was limitless, and as I had stupidly, and to my cost, given her two openings since which she had promptly embraced, I ought to have been on my guard on this particular Saturday morning, when my breakfast—for which I was ready—was getting cold, and my moments were so precious.

But I asked who Scamp was; it was her chance and my undoing.

'Of coorse, sir,' she said, resting her right elbow in the palm of her left hand and tapping her underlip with the tips of her nimble, nervous fingers—'of coorse, sir, you, bein' a stranger, wull no ken whae Scamp is. That's juist his nickname. I daursay he wad be christened Kennedy, but nane o' us Shinnel fouk ken for certain, as he's an inbrocht, an' a forby, queer, ill-hair't inbrocht at that. Fouk hereaway are maistly ca'ed by a by-name—Tam Frizzle's "Tartar Tam," Dauvid Mouncey's "The Sumph," Sam'l Cooper's "Whaupie," an' Andra Todd's "Wheezy." Puir Andra has wheezed wi' broonkitis ever since I min'. We leaved next door to him when I was a lassie, an' his breath cam' frae him like puffs frae a burstit pair o' bellows. Doctor Bonniton, frae the Brig o' Scaur, gied him up. Eh, lovan, sir, I wadna like to be gien up; it maun be an awfu' settler, haith ay—imphm. Weel, the doctor gied him up, telt him plump up it was no go an' he bude prepare for the warst. That's years gane by; Andra's wheezin' yet, an' wheezin' lookin'. Threatened fouk, they say, live lang. Ay, an' there's Sawnie Davison—"Shankie" we ca'ed him, because he was strecht up an' doon like a kirnan-rung. Weel, he took some eatin' complement wi' a queer name—I juist canna mind it. It was—was—no, it wasna; but it disna maitter, onywey. At onyrate he had this eatin' complement—he ate on an' was aye hungry, an' what he did eat did him nae guid. He got waur, an' at the lang hinner-en' he was telt by Doctor Bon—— Hover a blink noo; am I richt? Was it no Doctor Hotson frae—yes, it was—no, doo, I'm wrang; it was Doctor Bonniton, for I min' he was juist comin' oot o' Shankie's hoose when Mary Watt ran for him to tell him her wean had swallowed her Communion token. It was a gey near shave, for that was on a Setterday, but she got it back in time to gang forrit on the Sabbath. . . . Weel, as I was sayin', Shankie was telt to put his hoose in order. He did sae; but ae day, when he was daunerin' doon aboot the Brig-en', he forgaithered wi' Tosh the gravedigger. Tammas had juist been ower interested in the invalid, for Shankie gaed hame an' telt his wife that Tosh had lookit at him wi' a greedy e'e, an' that he was—was—— Eh, sir, I want to tell ye richt what he said, but I dinna

[Christmas Number

like—especially to you an' in a manse—but he said he was dashed if Tosh wad get happin' him; only, he didna say "dashed." Weel, he snoovled aboot an' better snoovled, defyin' the doctor an' Tosh an' the Almichty, an', haith, he got better o' his complent, an' leaved to dee o' the kink-host. . . . Had ye ever the kink-host yersel', sir?'

I looked at her resignedly. 'No,' I said, 'I—I don't remember'—

'Then ye havena had it. Haith, if ye had had the kink-host ye wad have minded o't. It's a sair trouble. I had a wee sister o' three year auld—three year an' three months, to be exact—an' she died wi't. I dinna min' o' her, for she died afore I was born, but I wore oot her daid-lies, an', bein' a bluid relation, I aye grat about her illness and death when my mither grat. That was the first an' only brek in oor faimily. Of coorse, I'm no' coontin' my grandfaither. He slipped away when he was eighty-nine. The doctor said that no power on earth could have keepet him leavin' hauf-an'-oor langer. He was quite hale an' herty, but his breath completely left him. . . . An' oor afore he des'd he had twae cups o' tea an' a boiled egg, so he wan away wi' a guid meal in 'im. Eighty-nine's a favourite age for Shinnel fouk to dee at. No that I say we can dee when we like. Haith, no. The Almichty measures the span, nicks the breath, an' Tosh does the rest—implim. . . . Talkin' o' Tosh, ye asked me, sir, whae Scamp was. . . . Your tea'll be warm enough below the cosy, but your eggs'll be cauld, and cauld eggs are, like cauld feet, bad for the digestion. Mrs Lourie telt me that her mither yince telt her—an' mind you, sir, that's hearsay only yince removed—that— Bless me, I left an empty kettle on the kitchen fire!'

She left the dining-room hurriedly, without closing the door; but I closed it and snibbed it, and my breakfast grace, though reverent, was a short one that morning.

Had I been particularly interested in 'Scamp's' identity and history, Mary's information would have been provokingly meagre. As it happened, he was unknown and of little concern to me, but I had learned his name was Kennedy, and later, when I was walking over to the meadow, by association of ideas my mind kept dwelling on a langsyne memory of a namesake family of his making horn-spoons in the old wool-shed of Lettergill. It was an old, happy memory, the reminder of others of my boyhood home which came crowding to me, and I lingered long at the meadow gate.

After a lengthy reverie I went down to where Tosh and his helper were sitting at their mid-day meal, and on nearing them I saw, to my astonishment, that Kennedy—alias 'Scamp'—was none other than my early morning companion of the previous Tuesday. He was talking to Tosh earnestly, and gesticulating with his arms, 1920.]

and intuitively I knew my trouting escapade was the subject of their talk.

'Come away, sir,' said Tosh cheerily; 'Scamp here has juist been tellin' me o' your guddlin' exploit.'

'Ay, but, Tosh, that's no a' my story,' Scamp quickly interposed. 'I've something else to tell you that maun be said in Maister Crosbie's hearin', though it affects you and me mair than him, an' I reckon noo's the time to speak.'

I knew what was coming, and admired Scamp, not only for his readiness to admit his breach of confidence, but for his honourableness in doing so in presence of all parties concerned. I also detected now what hadn't struck me before, that he had a slight lisp in his speech and a habit of substituting 'd' for 'r' as the initial letter of certain words, and once more my thoughts flew back to the Kennedy spoonmakers in Lettergill wool-shed.

Tosh was finishing his 'piece.' He flung the last bite to an expectant robin, took a long pull at his milk-flask and settled himself down.

'Ay, Scamp,' he said, as he wiped his mouth with the back of his hand, 'ye've something to say in Maister Crosbie's hearin' that affects you and me? That'll be the rent, I reckon. I ken ye've aye grudged what ye pay me as your share, but, Scamp, my boy, a bargain's a bargain. The amount o't, you ken, was settled between us, an'—an' I needed the siller. . . . Mair than that, Maister Crosbie needna be fashed wi' what concerns only you an' me.'

Scamp laughed good-naturedly. 'That rent's on your conscience, Tosh,' he said, 'or ye wadna jaloose it was in my mind when it's no. . . . What I want to say is this: Last Monday nicht you opened your he'rt to me, and telt me, in strictest confidence, pairt o' a story that, except to your auld minister, Maister Ferguson, you had never before telt to anybody. Noo, Tosh, ye ken I aye thocht you a miser—I've ca'ed you Shylock to your face—an' it wasna in a boastin' wey, or to put yourself richt in my estimation, that ye telt me what ye did. You had been readin' a book before ye spoke—*Kirkbryde* was its name: I looked at it efter—an' I saw your cheek was wet an' your he'rt sair. I ken noo what was bothering you; you were in a fix an' a swither aboot tellin' Maister Crosbie.'

My poor old beadle's face flushed, and a pained expression came into his eyes. 'Scamp,' he said, 'ye've forgotten Maister Crosbie's here.'

'No, I've no forgotten, Tosh. He kens a' aboot it already. I—I broke my word. . . . Oh, I'm no dependable. Ye've been the only freen I hae in Shinnel, an' for the first time I've split on you; but, believe me, when I telt him I didna ken he was the new minister. It was juist after the guddlin' affair. I was proud to shake hands with him, for I had proved him a sport, an' I telt aboot you, juist as a boast, that I was acquaint wi' anither sport, an' that was

you, Tosh. I'm vexed I broke my word, but mebbe in daein' sae I've broken the ice and made things easier for you. . . . No ill-feelin', my auld freen?'

Tosh slowly shook his bowed head.

'That's right, then. Shake, Tosh—good old Tosh.—Ay, weel, my scythe-blade'll be gettin' rustet, an' this meadow maun be doon afore nicht. . . . Good-day, Maister Crosbie.'

'Good-day, or, rather, *barr-a-davies*, Kennedy,' I said with a smile.

He turned his dark, surprised eyes on me. 'Where, sir, did ye hear that?'

'In Lettergill wool-shed, long, long ago. Namesakes of yours visited us regularly. They made all our spoons from tup-horn, and, as a boy, I learned a little of their speech.'

'Ay, sir, and you knew the Kennedys? I've heard o' Lettergill; it was yin o' the Kennedy "hames," and he spoke with an agitation he could scarcely control. . . . 'Well, sir, I, John Kennedy, poacher, jile-bird, an' ne'er-do-weel, am the last o' the tribe, that I ken o'. I'm no a credit to them, for I couldna mak' a spune, an' I've spoiled mony a horn. But I've never lost a freen I wanted to keep. *Barr-a-davies*.'

I watched his tall, lithe figure with admiration as he stepped through the swaths of lush cut grass, saw him lift his scythe and hone his blade. Then I turned to Tosh.

His long-crowned, battered felt hat was lying on the grass, and the gentle breeze was tousling his lyart locks around his ears.

'Maister Crosbie,' he said, with pained emotion in every lineament of his clear-cut, withered face, 'ye'll be thinkin' ye've landed among a forby unchancy fouk. . . . Ye're on the young side to be trachled wi' an auld man's deavements. Puir Scamp *has* made it easier for me, an' I will be muckle obliged if ye'll see me through this. . . . I'll tell ye a' about it some nicht sune—imphm. . . . Dod, there's nae waterin'-trough in puir auld Donal's gress gang. I'll hae to see he gets a drink.'

He opened a gate leading to a shady grass-grown loaning. Again I watched him in his Gethsemane, and, left alone, I turned my face to the silent, sun-kissed hills, and, with a welling heart, thanked God for guiding my footsteps Shinnelwards.

CHAPTER IV.

A SUNDAY or two elapsed before Kennedy kept his 'pack' with me in Shinnel kirk. He sat in Tosh's seat—the second from the back, and, though he was far from me and under the window, his gleg eye met mine when I read out my text. It was from the 16th chapter of Deuteronomy, at the 17th verse: 'Every man shall give as he is able, according to the blessing of the Lord thy God which He hath given thee.'

In taking up this subject I was in no way prompted or influenced by what I had learned of Tosh's magnanimity. The coincidence was certainly striking, and Kennedy, naturally, might have thought it intentional; but the fact is, it was a missionary service, authorised and recommended by the Assembly, and my text—an apt one—was doubtless quoted in many a church that day.

I was a bad beggar—I am so still—and I felt at a disadvantage, as I had had no experience of the parish as a giver; but I did my best. My sermon was new, and the first of a missionary character I had preached. Of its literary worth I will say nothing, but as a convincing exhortation to my people on the blessedness of giving it was an unqualified failure, as the diet's contribution conclusively proved. The sum total, as gleefully announced to me by Walter Stitt, was 'twal an' tippence, an' a hauf-sovereign—fower an' a penny up on last Sabbath; but as the small gold coin was my own contribution, I didn't join in Walter's jubilation.

Tosh, however, gave me an encouraging word in the vestry when taking my gown from me. 'Ye did very weel the day, sir,' he said as, head to the side, he smoothed out the bands on the table. 'Glenheid juist dovered yince, an' Scamp sat it oot withoot gantin'.'

'That's so far good, Tosh,' I said with a laugh, 'but the collection is no bigger.'

'Ay, sir—imphm—weel, that might be so, but, lovan, sir, it's a mighty movin' sermon that mak's Shinnel toom its pooch. We've snoodled sae comfortably along on auld lines an' in auld weys that we're dour to move. Dinna be dishertened aboot the collection—it wasna the sermon's blame. When all's said an' dune, ye canna tell us muckle new on the subject o' givin'. We're no a rich pairish—we gie as we can; an' when ye've come to my time o' life ye'll hae foun' oot that it's feckless wark shavin' a bald croon.' And he turned the key in the press-lock with a determined jerk which plainly said, 'So let it be.'

One morning later in the week, when shaving in the manse bathroom, his reference to a bald croon came back to me, and I smiled in my cracked mirror. I had just finished lathering my face, and remembering I had left my razor in my bedroom, was crossing the upstairs landing to fetch it, when Mary Ferguson hailed me from below.

'Well, Mary, what is it?' I asked, looking over the banister.

'Please, sir, there's a—there's a'—and, seeing my white, puffy, lathered face, she suddenly swayed, and flung up her hands. 'Preserve us a', sir, what a—what a sicht! Is there ocht wrang wi' you?'

'Hoots, Mary! I'm just about to shave, and'—

[Christmas Number.]

'Oh, is that a', sir? Haith, it's the first time I've served in a manse, an', someway, I never thoct o' a minister shavin'. . . . But what a fricht ye gied me! Mercy me, I haena got sic a glauf since æ nicht I was'—

'Now, now, Mary, I can't wait to hear your story; the lather's drying on my face. Why did you call me?'

'Oh, weel, sir, I juist wanted to tell ye there's twae grouse birds on the back-door step.'

'Well, give them some food and "shoo" them away. They don't belong to me.'

'But I—I canna, sir. They're baith deid.'

'Then they won't fly away, Mary, and I'll see to them when I come downstairs.'

On going out later I found a brace of fine, plump grouse on the window-sill. Mary, full of curiosity and scenting a tragedy, was very excited and commiserating. 'Puir wee things,' she said, as she applied the corner of her apron to her eye, 'they were lyin' wi' their bits o' heids thegither when I opened the back-kitchen door—lyin' thegither, as I say, on the cauld, hard, stane step. Yin o' them wad likely dee first, an' the ither wad juist creep near its wee deid neebor an'—an'—imphm. . . . Weel, weel, in fleein' aboot in life they wad often be thegither, an' noo in death they are not divided. . . . Sirce me, puir wee things!'

'Mary, Mary,' I said, 'you mustn't look at it in that light.'

'Weel, sir, mebbe I'm wrang in thinkin' they dee'd that way. Mebbe they were sittin' roostin' on the rone up abune there, an' fell doon when they were sleepin', an' got killed.'

'But grouse don't roost on rones.'

'Faith, sir, if they were tired an' like me they wad roost anywhere. I've seen me so fagget an' forfochten efter a lang day's washin' that I could hae sleepet on a turned-up harrow. Of coorse, mind you, sir, the washin's here are no worth speakin' aboot, an' I'm no complainin', but in my last place but yin—eh, mercy me, when I think o't! There was the—let me see noo—there was the maister, the mistress, five sons a' wearin' collars, an' fower dochters that wadna damp their fingers wi' sape-suds. The maister gaed through twae serks a week regular, an' a new-weeshen pocket-napkin every day o' his life, an' the——D'ye smell burnin', sir? I dae—quite plain. It's roon' hereabouts, too—juist like the smell o' a smiddy. Mebbe it's your pipe, sir.'

I told her I sincerely trusted it wasn't, but she complacently, and to my chagrin, confirmed it to her own satisfaction, and was about to launch into a story about singeing sheepheads, when I brought her back to the subject of the grouse.

After a little cogitation we both agreed that, although no card accompanied them, they were a gift from Major Dottle, and his keeper, arriving after we had retired for the night, had left them

on the back-door step. At all events we didn't look further into the mouth of a gift horse; the birds were duly cooked, and we ate them with a relish.

One morning, a week later, the gift was repeated, and in exactly the same way. As before, there was nothing to indicate who had sent them or why they were gifted, and I became suspicious and apprehensive. It occurred to me to make inquiry among my landed parishioners, but I hesitated, as I thought, if met with a negative, my inquiry might be interpreted as a hint for a contribution to the manse larder.

Then I suddenly remembered Kennedy's poaching proclivities, and the more I thought about it the more was I convinced that he was the mysterious donor. I wasn't sure how the law stood regarding passive acceptance of poachers' spoil, but I argued it was something akin to resetting stolen goods. As minister of Shinnel, and an example to my people, my daily walk and conduct, I felt, must be above reproach, and so, after much reflection, I decided to lay the case before Tosh, than whom no one in Shinnel was better qualified to advise on matters in which Scamp and his easy-going, lawless ways were concerned.

I hadn't an opportunity of seeing him during the afternoon; but after an early supper I put my pipe in my pocket and set out for the village.

I found him turning the head of a hazel staff when I entered his cottage. The daylight was beginning to fade, and there was a feeling of frost in the autumn night-air, but a tallow candle cast a gleam of light round where he sat, and a wood-log fire burned cheerily in his high-set grate. Kennedy's spaniel—a glib-looking liver-and-white—lay stretched on the tweed-rind hearthrug, a tortoise-shell cat sat blinking inside the fender, and a wag-at-the-wa' with a wee white face ticked loudly on the yellow-ochred wall.

'Lovanenty, Maister Crosbie, this is an unexpected treat,' said Tosh. 'Come richt ben, sir, an' sit doon. You're—you're mair than welcome, I assure ye. Dod, sir, this is an angel's veesit, for I've juist been thinkin' aboot ye;' and he laid down his knife, and drew a chair in for me.

I admired the staff he was making, and we discussed hazels, and the training, cutting, making, and polishing thereof—a subject always interesting to glen and hill men. Then I told him briefly the purpose of my call. He listened patiently and with interest to my story, and he smiled knowingly when I told him I jalooosed the birds were from Kennedy.

'Ye've guessed richt the very first time, Maister Crosbie,' he said, as he buttoned his sleeved vest—for, like many old men, he liked to sit 'easy.' 'He telt me himsel' he wad mind you wi' a tasty dinner noo an' again. Oh ay,

it was Scamp richt enough. But—but what about it, onywey?

'Well, Tosh,' I said, 'the birds, I presume, were poached, and you know I cannot accept game from Kennedy or any one else procured in an illegal way.'

'But, dear me, Maister Crosbie, Scamp didna steal them; he—juist got them, ye ken.'

'You mean, Tosh, he poached them?'

'Ay—juist that. Haith, sir, ye can tak' it frae me he didna buy them.'

'Well, Tosh, much as I appreciate his thoughtfulness, I must decline to accept them.'

'Faith, sir, it's easy seen you're new amang us. Shinnel fouk, I assure you, are, as a rule, no' sae squeamish in sic maitters. Puir Scamp wanted to do ye a guid turn. It's juist possible, sir—and my old beadle laughed slyly—that he had your text o' last Sabbath week in his mind, an' was givin' as he was able accordin' to the blessin' o' the Almichty—imphm. Onywey, if it's your wull, I'll speak to him about it, an' tell him no to dae't again.'

'That's exactly what I should like you to do, Tosh. Thank you very much, and also thank Kennedy from me; and I rose to go.

'Lovan, sir, dinna gang away. Sit ye doon for a wee. I was thinkin' about ye, as I said, when ye cam' in, an' your veesit's a timely yin.' He rose and snuffed the candle. Then from its brightened flame he lit another, and walking over to his bed, he pulled out from underneath it a small wooden kist with a hingeless lid.

'This, here, is my bank, sir,' he said, looking over his shoulder. 'It's no locket or protected in ony wey. Scamp has been three times in Dumfries jile for poachin' since he cam' to bide wi' me. He kens my siller's here, an' let me tell ye, sir, I've never missed a single broon bawbee—imphm. . . . Weel, that's that.'

Having got what he wanted, he shoved the box back underneath his bed, blew out the extra candle he had lit, and sat down beside me.

'An' noo, sir, when ye are here, ye'll juist tak' this. It—it's the siller Scamp telt ye about—what Maister Ferguson gied for me, an' what I'll be obleeged if ye'll gie—juist as it were frae a freen that didna want to be named. It's a whilie yet to the term, but the money's here, an' ye micht as weel hae't wi' ye.'

Fumblingly he counted out money in notes and silver.

'If it's a' the same to you, sir,' he said, placing the amount on the table, 'I'll bla' oot the cannle. The fire's bricht, an'—an' we can see to speak.'

In silence, and in the flickering firelight, I looked at my old beadle hero.

'Tosh,' I said at length, and with feeling, 'I've been thinking a good deal about you lately in connection with this. It is a beautiful act, and I should just like to tell you you honour me

in asking me to help you. I'm very proud of you, Tosh.'

'Ye speak ower kindly, Maister Crosbie, an'—an' it's very freenly o' ye, indeed; but, eh man, if ye only kened what a pleesure it is an' hoo easy it comes to me to dae this, ye wadna gie me sae muckle credit. I've nae relatives that I ken o'. She's a' o' langsyne left to me in Shinnel, an' what's siller for but to help her? Dod, sir, it whiles tak's a bit o' scrapin', an' I could sometimes dae wi' what I dinna get; but it wad be a cauldribe kin' o' a worl' if every yin thocht his ain want the worst. Ay, it's forty-nine years on the sixteenth o' next month since Mary Oswald an' me had a word wi' yin anither, an' we've bided a' that time in this same wee parish o' Shinnel. But I'm gaun ower quick; I maun stert at the beginning. Mebbe, though, ye've nae interest, sir, in an auld man's story.'

Without waiting to hear my reply he rose and tidied the hobs. Then he put a fresh log on the fire, and the leaping flame showed up the pictureless walls and the bare flag floor. There was nothing around to indicate a woman's presence, touch, or thoughtful care; no texts or knick-knacks; no ornaments on mantelpiece or chiffonier; no cushions; no curtain on bed or window. Yet everything, though comfortless, was cleanly; and in the glamorous quiet of the hour and the flickering mystic firelight I felt strangely impressed, and the thought came to me how appropriate and fitting was it all for the laying bare of a dented heart and the telling of a story of a love of long ago.

'Our lives, Tosh,' I quietly said, 'are all human documents, and to those who study human nature every document is of interest. I'll be delighted to listen to you; and I lit my pipe.

'Ay—weel, as I was saying, it'll be nine an' forty years come the sixteenth o' next month since last I spoke to Mary Oswald. I dinna mind when I didna ken her, for we were brocht up thegither at the heich en' o' the parish. We gaed to the same schule, an' in coorse o' time I took a place wi' her faither, wha looket efter a wee led ferm that's noo lyin' in to Auchenbrack, an' she helpet her mither wi' the hoose an' the kye.

'Man, man, thae were happy days, for youth an' hope made work lichtsome, an' nocht cam' wrang to oor haun's. An' they were happy forenichts too, for ootby, in the summer gloamin', we sat thegither till the stars cam' oot an' the whaups were quate. An' in the lang dark months the ingleneuk was the brichtest place on earth to me, juist because she was there. . . . Oh thae nichts in that high-wa'ed kitchen wi' its hame-cured hams on the bauk, an' its white-scrubbed tables an' chairs, an' the auld oak settle! Eh, what a cosy place it was! . . . Ay, an' the guesses we gied, the stories we telt, an' the sangs

[Christmas Number.

we sang—"Jamie Foyers," "Afton Water," "The Lea Rig," an' "When ye gang awa', Jamie"—nane o' your high-falutin sangs, but a' wi' their hamely memories, an' every yin kened an' felt by us, juist as if they had been in oor mooth when we were born. I dinna mind when first I heard them, for my mither crooned them in my ear when I lay on her knee, an' Mary Oswald sang them at her wark an' at her play—inby an' ootby; the kye were milket, butter was kirked, the wylie was turned—a' to the lilt o' her sweet bit voice in thae dear auld sangs. . . . Ay, an' then there was the dancin' on the—— Eh, dod, Maister Crosbie, did ye ever dance at a kirk?

'I have, Tosh—after a rare high tea—in the barn, and on a flag floor'——

'Ay, sir, that's it—ay, ay, an' the lichted cannies here an' there on the wa', an' the lassies, in braw goons wi' roses in their breists, an'—an' the white stockin's on the shapely taper ankles they showed in "Paddy O'Rafferty," "The Flooers o' Edinburgh," "Peteronella," an' "Pea-Strae." An', eh, Maister Crosbie, when the dram gaed roon' an' roon', an' better roon', an' we fettled to oor wark, an' the cannies spluttered oot an' never were missed, an' the fiddlers sleepot ower their drams but keepet scrapin' on their strings—eh, the liltin', an' the cleekin', an' the hoochin', an' the kissin'—mercy me, when I think back on't the bluid loup in my veins an' I'm young again. Ay, an' when the stoor was settlin', an' the maesic lownod, an' the caller air cam' in frae the open door, every Jock had his Jenny, an' I, wi' the lave, had mine—my ain Mary Oswald.

'It was on sic a nicht an' at sic a time I held her in my arms at the stackyard yett. She looket up at me, an' the glint o' her een was mellowed in the munelicht, an' her toozled bonnie-smellin' hair was blawn on my cheek. . . . What I said I canna tell, but efter I had said it she crept closer to me, an' she didna want to gang back to the dance. So we stood there, clespet haun' in haun', an' cheek to cheek, till the dancers quat an' a' was quate. . . . Oh, God, to my dyin' day, let the memory o' that dear nicht be mine.

'Then there cam' anither nicht I aye want to forget an' canna. It was comin' on for the Martinmas term, an' I was leavin' to better mysel' an' mak' a hame for Mary. Weel, juist then a pair o' new sheep-shears gaed amissin'. Naebody was blamed, but every yin was uncomfortable. Rab Todd was my neibor at the time—a big, wice-lookin' falla he was, but I never liket the way he looked at Mary—an' when the fracaw about the shears was at its heicht he said to Weelum Oswald that if I was willin' that my kist should be searched he wad turn oot his. I refused, for I was angry I should be suspected; but in the end I agreed. An' the shears were found in the bottom o' my kist. I juist stood

1920.]

tongue-tacket an' dumfounded. I never was guid at speakin' up for mysel, an' less able then than ever, when my guid name was at stake. I telt Weelum I didna put them there, but he didna believe me. "Tammass," says he, "ye were leavin' at the term—I've nae time to watch a thief; ye'd better leave the nicht."

'The haill thing had come so quick on me, an' the upshot o' it a' so unexpekkit, that I juist stood like a stookie. Then, without anither word, Weelum an' Rab gaed oot, steekin' the bothy door behind them with a bang, an', dazed an' baised, I sat me doon on my kist. Efter a wee, when I realised how things stood, I gaed ower to the hoose to see Mary. She was staunin' greetin' quately at the back-kitchen winda, an' when I spoke she didna answer me. Then in a wee, an' between her sabbin's, she telt me I had brocht shame upon her, an' broken her he'rt. I swore solemn to her I was innocent, but she shook her heid, an' telt me to leave her, an' never seek to see her face again. I looket lang at her, wonderin' hoo it cam' she wasna stickin' up for me an' takin' my pairt. . . . She soud hae dune, but, puir thing, she was young, an' mebbe didna tak' the time to think. I didna judge her then, an' I'm no to judge her noo. . . . Ay, I left at the darkenin'—gaed doon the glen ahint a cairt wi' my kist in 't, an' since that back-en' nicht the worl' has never been the same to me.

'When next I spoke to Mary Oswald she was a mairret woman, and Rab Todd was her man. . . . I was comin' hame ae nicht frae Brig o' Scaur, juist afore the darkenin'—no whusslin' as yince I did, an' wi' nae e'en for the beauty o' the gloamin' sky. Away on in front o' me was a woman cairryin' a basket, but she was weel aheid, an' I gied her nae thoct. Juist at the turn on the road in the wud, afore I cam' to Clonrae road en', I cam' up wi' her. She was sittin' restin' on a laigh pairt o' the dyke, wi' her basket beside her, an'—an' it was Mary Oswald. Man, my he'rt gied a stoun', an' I felt the bluid rinnin' cauld in my veins, an' I was so weak aboot my knees that I hadna the spunk o' a gorlin'. When she saw it was me she stood to her feet, an'—an' I noticed she was as putten aboot as I was, for she changed colour again an' again, an' she clutched at her shawl as if it was ower ticht roon' her neck. Naether o' us spoke for a wee—we juist looket at yin anither. Then her bit heid drapped, an' I was near enough to her to see there was a tear on her white, set face.

"Mary," I said—"we—we're baith gaun the same road. I'll cairry your basket, if ye'll let me."

"Thank ye, Tammass," says she, wi' a catch in her voice; "it's—it's really no heavy."

'Man, man, when I heard my name yince mair comin' frae her dear lips, I forgot for the meenit she belonged to anither, and the dyke-side o' Clonrae mairch melted afore me into the

stackyaird yett at the dear auld hame. I shut my e'en juist to keep the picter wi' me as lang as I could. . . . When I looket up again she had come forrit nearer me.

"There's something on my mind I wad like to tell ye, Tammas," she said. "I micht never get the chance again—no that it maitters noo, but I think it only richt an' just I should speak. Ye mind that nicht in the back kitchen when I—I"—

'She stoppet, an' gied a bit gasp as she saw the red bluid floodin' my neck an' cheek. "Oh, Tammas," she cried, "*you* have nocht to be ashamed o'. It's me an' mine that hae. Oh, I micht have kenned ye wares innocent then. . . . I ken for certain noo. He telt me himsel', no' confessin', but in a boastin' wey, hoo—oh that I should hae to say it o' the faither o' my wee bairn!—hoo he put the sheep-shears in your kist to bring shame on your name, an' mak' a brek between you an' me. An' it did. Oh! it was shameful—shameful, Tammas; and when he telt me, I was so sorry for your sake that I begget him to own it a' to you, an' ask your forgiveness. But he wadna—and—and I said I wad, if I got the chance"—

'A' at yince she hauf-turned, in a stottering wey, an' put a steadyin' haun' on the dyke-tap. In a moment I was beside her, and, tynin' a' reason an' discretion, I put my airm aroon' her.

"Mary," says I, "what's dune canna be undune, but, oh, my ain wee lost doo, look into my e'en—juist yince, an' for the last time put your airms aroon' my neck an'—ay, lassie, I'm here." . . . An' oor lips met in a kiss—oh, merciful God in heaven, forgive me an' her—but was there ever sic a kiss gien an' taen! . . . She steppet back, an' held doon her heid.

"Mary, my lass," says I, "look up. You've nocht to be ashamed o'. In the providence o' God we've met here, and we've been preveleeged the noo to taste for a moment o' a heaven that'll mak' up for years o' a hell before us. Be brave,

my wee woman, an'—an' gang your weys alane, an' I'll stay here a wee. Oh, Mary, if I didna love ye wi' a love as pure as the hezel air we're breathin', I wad say bide beside me here till the stars look doon on us, an' through the whisperin's o' the nicht till your bonnie broo was baptised in the dew o' the mornin'. But that canna be. You an' me maun pairt, here an' noo. Guid-nicht, my dear wee lass—an' guid-bye."

'She gied a bit sob as I turned frae her. I shut my e'en, for I couldna thole to see her gaun her lane. . . . Ay, Maister Crosbie, that's nine an' forty years come the sixteenth o' next month, an' her an' me have never spoken since. It has been a gey queer, drab worl' to me, but, in a wey, it has had its compensations, for I've been preveleeged to help her, an' God has gien me health to do sae. Ay, sir, an'—an' that's a'."

A spurting gleam from a smouldering log showed embers white and dead in the high-set grate, and a stillness lay in the little room like a benediction. Silent, busy with our thoughts, we sat, and the clock ticked loud on the ochred wall. Then, without a word, I rose. As I passed behind my old friend's chair I paused for a moment, and put my hand on his shoulder. And he understood.

Far up the glen the distant bark of a shepherd's dog disturbed the lown night-air. In Kirkland woods an owl hooted eerie and lonesome as I passed, and from the dark hillside the yamouring cry of a startled whaup came to me 'like a wandering word frae hame.'

Then the silence and solace of night lay deep on Shinnel Glen.

With head bared to the passing breeze I stood at the loaning gate. And my prayer to God was that as He had sent sweet peace and sleep to hill and valley, wood and field, so would He vouchsafe to-night to my aged friend Tosh the power of His love and the solace of His peace that passeth all understanding.

APPLERINGIE.

(Written to David M. Carruthers after reading Joseph Laing Waugh's story, 'A Sprig of Appleringie'—published in *Chambers's Journal* for July 1916—in which Mr Carruthers had enclosed friendship's sacred symbol.)

From a friend there came a symbol
Of his friendship true to me;
Pledge of friendship in the present,
And in all the days to be.

From a friend he had received it
In life's sacred morning-time;
Message of enduring friendship
Stronger grown in manhood's prime.

Double friendship thus it brought me
From my friend and his friend, too;
Double kindling power possessing,
It should make me doubly true.

'Twas a spray of appleringie.
It was old and faded, too,
But it brought me back my mother
With her loving eyes so blue,

Till I saw her in her garden,
Where her appleringie grew,
As she stood to smell its perfume,
When the world to me was new.

I could see her smile so radiant,
As she turned to kiss her boy,
And the glory of the vision
Filled my grateful heart with joy.

So uniting friend with mother,
Appleringie, I'll keep you;
Symbol of life's richest treasures;
Friendship fond, love ever true.

JAMES L. HUGHES.
[Christmas Number.

THE YOUNG PRINCE.

By ARTHUR BEVERLEY BAXTER,

Author of *The Blower of Bubbles*, *The Parts Men Play*, &c.

I.

OUTSIDE the windows of the palace where the young Prince lived, the people were singing songs and making merry.

It is true, they were not singing very loudly or very merrily, because as a race they took their music sadly, and much preferred doleful ballads to cheerful ones; and, in addition, as the palace was situated in a very fashionable neighbourhood, where the inhabitants naturally regarded all forms of merriment as a display of vulgarity, it is small wonder that the crowd were feeling a little diffident and somewhat self-conscious about the whole thing.

However, there had been an official proclamation setting forth that, inasmuch as the young Prince had just returned from a long trip across the seas, where his simplicity of nature and his tactfulness had made a great impression on all whom he had met, it had been decided to have a grand procession for him through the streets on New Year's Day, and that all loyal subjects should fill in the intervening Yuletide season by singing songs and making merry.

Of course, before the proclamation was made public it was violently debated in Parliament, after the manner of the times. The Radical minority, backed up by a strong section of the Press, contended that the whole thing was just another illustration of how far the Government had drifted away from the people, and that it would only isolate the country and make her friends hate her worse than ever. After much debate, during which the Minister for War said that unless the people's minds were diverted they might discover that he was running a small but enthusiastic war on behalf of the Mug Wumps against the Oojas, and the Minister for Travel maintained that unless the people were made happy he couldn't double the railway fares again, as he intended to do, the Radicals moved a vote of censure on the Government.

However, the Prime Minister, who enjoyed the advantage of not having heard any of the debate (being absent at the Fourteenth Peace Conference of Premiers), declared that the Radicals were a lot of scoundrels, and if members had a better Premier they had better go to him; and as every one knew they hadn't, they had better be careful how they voted.

At this Parliament passed an overwhelming vote of confidence in the Government, and adjourned for the recess, to the great relief of everybody.

1920.]

So on this particular Yuletide evening the loyal populace were doing their best. Bonfires were lit in the streets; coffee-stalls supplied vast quantities of sausages and tea; shopkeepers dressed their windows with all sorts of goodly things much too expensive for any one except a shopkeeper to buy; chemists did a roaring trade in gargles for sore throats; and all the best people gave dinners for each other, and agreed that the whole thing was a frightful bore.

As a contrast to all this gaiety, the scene inside the palace presented quite a different picture.

The young Prince was dining with his three gentlemen-in-waiting. One was a very apopleptic general who had never been to a war, and who spent his time bullying those who had; another was a young gentleman with a lisp and a pedigree, who knew all about Court etiquette; while the third was a bald, learned man, who was supposed to understand exactly what Cabinet Ministers meant when they made speeches, and who seemed very tired.

Except for the grunting of the general, there was no sound at the meal. The attendants moved over the thick rugs on tiptoe, and held their breaths when leaning over the Prince lest they should disturb his peace of mind. From outside the palace came the sound of the people singing a ballad (somewhat out of tune, but with great fervour) of unrequited love on the part of a woman who combined the priceless virtues of poverty and honesty.

'Awful tosh,' growled the general—'all this song and merriment stuff. Bah!'

'Music as an expression of a people's soul,' said the tired man with a sigh, 'especially when directed through constitutional channels to the portraying and demonstrating of devotion and duty towards'—

'Humbug!' snorted the general.

The young Prince said nothing, but his blue eyes seemed dreamy, and his head, which was covered with golden hair, sank listlessly on his breast. 'I am very dull to-night,' he murmured.

'Rubbish!' ejaculated the general, almost startling an attendant into spilling some royal champagne down the royal shirt-front.

'A pwince ith never dull,' said the expert in Court etiquette amiably. 'Woyalty ith quiet, or weserved, or even dumb—but only common people are dull.'

'Stuff and nonsense!' said the general, who had acquired a reputation for straightforwardness by being rude to everybody.

'Silence and speech,' said the tired man who

understood Cabinet Ministers' speeches, 'represent two conflicting fundamental points of view, the expression or giving forth of one's ideas and innermost thoughts as opposed to'—

'Take his bottle away!' said the general abruptly.

It was perhaps just as well that at this point in a scene which promised to strain the canons of Court etiquette the young Prince pushed his plate away and shoved his chair back, doing it all without assistance, thereby causing the attendants in the room to turn as pale as ghosts and rush madly to his help.

'I humbly beg your pardon,' said the Prince to his guests; 'I am not only dull to-night, but very unhappy. I desire to be alone, so as not to force my mood on others. Please remain here.'

With a boyish nod he walked from the room, while the three guests and the attendants all stood up as stiff as pokers.

II.

His hands in his pockets and his head still drooping, the Prince strolled through the palace until he came to the great gallery. A fire was playing cheerily, casting shadows that sported with the moonlight which crept into the darkened room through the windows. Although it was rather gruesome—for here were hung life-size portraits of most of the former kings and queens—the Prince found a melancholy pleasure in being by himself.

His eye rested on a king in a handsome ruffe, a king who had lost his head in a figurative sense, and ended up by losing it literally. There was another king, with a small head and large legs, who had developed a genial weakness for getting rid of his wives, which had earned for him the reputation of being an exceedingly amusing and hearty monarch. Opposite him was the portrait of a queen whose progeny had spread about the world, some of them planning for war, and others plotting for peace, and the whole outfit succeeding in embroiling humanity with their own family quarrel.

'Oh, why,' cried the Prince—'why was I born the son of a king? Why should freedom, which is the heritage of men, be denied to me alone? Why should my destiny, my love, my whole life be directed by the will of others?'

As no answer to these questions was forthcoming from any of the portraits, the Prince wandered over to a window and leaned against it, while the log-fire spluttered and hissed with great energy.

Suddenly he looked up. A most melodious voice was coming from the courtyard, a silvery, mysterious man's voice, that sounded strangely sweet on the snowy air. Although it was soft and caressing in quality, it seemed to penetrate the great gallery and actually to come from one of its corners. The Prince listened, enthralled. There was a mystic tenderness, a lilt that

sounded strangely familiar, and yet he could not recall ever having heard it before.

The song ceased abruptly. A window had been violently raised, and the general had thrust his head out. 'I say, you—you!' he cried. 'You singer fellow theah!'

There was no reply from the courtyard, but a murmuring laugh seemed to play about the palace on the wings of the winter wind.

'Go away and make that noise somewhere else,' cried the general. 'You ought to know better than to sing outside a palace.' Run away now!'

'Stay!' cried the young Prince, looking out of his own window.

'Be off!' bellowed the general, who had become stuck in the aperture, and could neither advance nor withdraw.

'I command you to remain,' cried the Prince.

As there was no response to either of these orders, His Highness looked down into the courtyard. There was no one to be seen, nor was there any sound but the soft swish of a few snowflakes blown against the palace walls, and the distant voices of the populace.

'By Jupiter!' roared the general. 'Come and pull me out. Do you hear me—you lackey fellows?'

A couple of attendants rushed respectfully at the imprisoned officer, and seizing one leg each, pulled him back into the palace, in recognition of which services he was about to kick them both downstairs, when he remembered that they were probably members of the Royal Waiters' Union, and might down trays.

'Alas!' murmured the young Prince, gazing towards the moon, 'even music deserts me. The very singer outside my window shuns the company of a royal slave.'

He turned wearily about, and started.

A young man was lounging carelessly by the fireplace, a roughly dressed fellow in corduroy trousers and a dark-velvet coat. He had a blue handkerchief thrown carelessly about his neck, and a stringed musical instrument slung over his shoulder. There was a lurking, rather mocking smile about his lips, and his eyes, catching the moonlight, sparkled like gems.

'A pleasant Yuletide, sire,' he said, with a bow.

The Prince started again. 'That voice!' he exclaimed. 'You—you are the singer?'

The intruder bowed. 'By command we are to sing to-night, and since being loyal to you is being loyal to myself, who more obedient than I?'

In spite of the rather involved nature of this remark, the Prince felt considerably relieved. He was naturally a brave youth, but he could not remember ever being alone before with a musician who disdained doors as a means of entrance and appeared from nowhere at all.

'How did you get here?' he asked.

[Christmas Number.]

'On a chariot of snowflakes,' answered the other, 'drawn by the wind.'

'Your words are mysterious, sir.'

'I myself am mysterious, sire.'

'But since you harness the wind, where do you travel?'

'From time to eternity, sire.'

At this rejoinder the singer strummed a chord on his instrument and leaned against a flickering shadow.

The young Prince scratched his head. In the course of his royal duties he had entertained many strange people, men of courtly manners from savage lands, and men of no manners at all from civilised ones; but he could not recall any one who ever made use of a shadow before, except to hide in it.

'How old are you?' he asked.

'As old as the seven seas,' answered the vagabond.

'You must have seen a great deal in that time,' remarked the Prince politely, somewhat at a loss for comment.

The musician laughed softly. 'Nothing to what I have done,' he said.

'Oh?' queried the Prince encouragingly.

'I remember beheading that chap,' said the stranger, nodding his head towards the king with the ruffle about his neck.

'The deuce you did!' ejaculated His Highness uncomfortably. 'What for?'

'Oh, he thought he was more powerful than I.'

'Do you,' said the Prince—'do you usually behead kings who think themselves more powerful than you?'

'Umphum,' answered the minstrel, with a slight yawn; 'behead or assassinate them, although I am not very fond of assassins. I say, shall I sing?'

'Do,' said the Prince, who wanted time to think.

Unslinging his instrument from his shoulder, the minstrel played two or three chords that floated eerily on the quiet air, and then commenced to sing:

'Tis the witching hour of night,
Orbed is the moon and bright,
And the stars they glisten, glisten,
Seeming with bright eyes to listen.

For what listen they?

For a song and for a charm,

See they glisten in alarm,

And the moon is waxing warm

To hear what I shall say.

Moon! keep wide thy golden ears—

Hearken, stars! and hearken, spheres!

Hearken, thou eternal sky!

I sing an infant's lullaby,

A pretty lullaby.

Listen, listen, listen, listen,

Glisten, glisten, glisten, glisten,

And hear my lullaby!

'Is that all?' asked the Prince when the song had ceased.

'It's enough for now. Did you like it?'

1920.]

B

'There's a good deal of "glisten" about it,' said His Highness, 'but it is very pretty. I don't see, though, that it is very relevant to our conversation.'

'Beauty is always irrelevant,' answered the intruder sententiously, catching a couple of sparks from the fire and tossing them in the air like glowing rubies. 'All beauty is unexpected.'

As neither of these generalisations seemed to bear contradiction, the Prince dropped the subject.

'Excuse me being personal,' he remarked, 'but—do you intend to behead or assassinate me?'

'I don't think so,' answered the vagabond.

'Oh, you don't think so?' said the Prince, not particularly cheered by the other's hesitation.

'One never knows,' went on the vagabond thoughtfully. 'Circumstances alter dynasties, you know. But I have always liked you ever since you were born, and I have a feeling, sire, that you and I will become better and better friends as the years go on.'

'Thank you! Thank you!' cried the Prince, who was naturally a generous-spirited lad, responding quickly to kindness, and who was considerably relieved to find that he was not on the visitor's executionary list.

'But there is one condition,' said the stranger quite sternly, 'one condition only, on which we can be friends.'

'Well?' queried His Highness rather haughtily.

'You must understand me.'

'Must?' The Prince twirled a very slight moustache.

'Must,' repeated the minstrel.

The young Prince frowned and folded his arms. 'May I ask,' he said coolly, 'who it is that says "must" to a prince?'

The vagabond stood up straight and his eyes flashed across the room. 'Am I unknown to you?' he cried. 'I, who permit your House to rule; I, who have smashed great empires and driven tyrants from thrones guarded by a million bayonets? Have you not heard of me, sire, who have made it possible for this kingdom to extend its sway from lands where the sun scorches the desert throughout the year, to the mighty north where winter builds great palaces of ice that float to sea in the summer months and harass the ships by night? Can it be true that you who will some day mount the throne have never heard of me?'

'Tell me!' cried the young Prince, profoundly stirred by this somewhat lengthy speech—'tell me! Do not keep me in ignorance longer. I know you are something more than man'—

'And almost god, sire.' The minstrel raised his hand, and a glint of moonlight revealed long, tapering fingers. 'I am Demos! Mine is the spirit of the people!'

There was a dramatic silence, which was eventually broken by the Prince. 'I—I am delighted to welcome you to my Court,' he cried

haltingly. 'I have read a great deal concerning you in the papers, and, of course, you're talked about a lot in Parliament, and even in the House of Nobles.'

'Ha!' ejaculated Demos.

'But—without appearing ungracious, I hope—may I ask what is the object of this visit?'

'To-night,' said the minstrel, 'the hearts of the people are unlocked. Kindness and goodwill are abroad. That is the message which I, Demos, bring to you this Yuletide. The people trust you, sire: I urge you, believe in the people.'

A pensive look crept into the Prince's eyes, and turning away from the stranger, he gazed thoughtfully at the scene outside. 'Demos,' he said quietly, 'take me out into the streets with you—now.'

The minstrel made a dissenting gesture, but the Prince, with a sudden impetuosity, bore down all opposition. 'Take me with you,' he cried. 'Let me feel the throb of life as a man, not as an imprisoned slave. Do not leave me ignorant, like so many of those whose portraits are here. I want to serve my people. I want to share their miseries and joys. Why spare me the facts of life? Let me be one of the people, if only for an hour. Shall I ring for a motor-car?'

'No, sire,' said Demos, throwing his instrument over his shoulder and adjusting his cap; 'I shall not even summon my chariot of snowflakes. He who would understand the people must go on foot.'

'Lead on, then,' cried the young Prince, 'and I shall follow.'

For a moment the intruder hesitated, then made a sign of assent, and together they left the palace, the Prince pausing *en route* to slip on rather a shabby overcoat which belonged to the man who understood what Cabinet Ministers really meant when they made speeches.

III.

A few minutes' walking took the two adventurers to the river, where men from the ships sprawled about fires lit on the pavement, and shook the night with their sounds of laughter and brawling.

Deserted ships lay at anchor or tied to the piers, while puny lamps at their mast-heads threw a misty light on the snowflakes tumbling through the air. Breasting the water like swimming mastiffs, puffing tugs ran by each other, their shrill whistles piercing the very clouds, while a distant church bell clanged lonesomely. A thin, filmy cloud was across the face of the moon, and a raw wind whiffed about the streets.

The Prince wondered at the strangeness of it all. There was not a sound that he had not heard a thousand times before, nor any part of the scene that was new to his eyes, but the spirit of adventure lent an unaccustomed vividness to it all.

He was free! No one knew him but the fantastic figure at his side. Life spread before him—not as a dull routine planned and executed by his officers, but as a mysterious vista holding romance, adventure—above all, the unexpected!

What would the visitor with the velvet jacket show him? In spite of the sharpness of the night, he found his blood tingling with anticipation.

Without pausing to exchange words with any of the groups that hailed them, Demos walked on and on until, leaving the river, they entered a shabby district where cottages huddled close together, as if offering apology for the few miserable feet of ground on which they stood.

'Your Highness,' said Demos, speaking for the first time, 'you have more than once lamented the fact that you were born a prince. You have sighed for the freedom that belongs to others, and wished that yours might have been the fate of obscurity. Let us select one of these wretched hovels. Perhaps we shall see that in many ways the destinies of the great and the obscure are not so far apart.'

He knocked at the door of a cottage, and it was opened by a young girl carrying a lamp.

'A happy Yuletide!' said Demos, touching his cap. 'I and my companion are poor wandering singers. It's a cold night, and pennies be scarce.'

A gust of wind leaped at the lamp and almost extinguished its timorous flame.

'You have come to a poor place,' said the girl, sheltering the light with her body. 'Wouldn't you do better where rich folk live?'

'Only the poor feel for the poor,' answered Demos, blowing on his fingers.

'I wish I had some money for you,' said the girl, 'but my mother's been that ill this last fortnight that I could not go out to work. You're welcome, though, to come and sit about the stove until you're warm again.'

The Prince murmured his dissent, but motioning him to follow, Demos took the lamp from the girl, and holding it up to light the way, went inside the cottage and into a room where a small stove was humming pleasantly from the activities of a wood-fire.

'Please speak quietly,' said the girl; 'she's asleep in the other room.'

Drawing up a pair of rickety chairs, Demos and the Prince held their fingers close to the crooked pipe that sprouted ceilingwards from the stove, while their hostess moved noiselessly about, filling a kettle with water and putting it on the stove. The Prince, to whom everything was as unreal as if he had been hurled into a chapter of the *Arabian Nights*, watched her with eyes that were strangely eloquent. She had the unconscious grace of sixteen years that could afford to be careless of her poor dress and the tawdry shawl about her neck.

When the kettle was filled and had broken

[Christmas Number.]

into a humming duet with the stove-pipe, the girl drew a box from a drawer, and placed it on the table.

'For the Prince's procession,' she said, holding up a pair of coloured-paper flowers wired together. 'Between them here—see—there will be the Prince's picture. I have made nearly a thousand, but the pay is not much these hard times.'

The Prince leaned forward. 'Are the flowers real?' he asked.

'No,' said the girl. 'Smell them.' She held the flowers towards him as evidence of their lack of perfume. 'But I pretend they are real,' she went on. 'Often at night I will cover all the table with them—like this. Then I turn the lamp low and lay my head down, and look along with my eyes half-closed. It is just like the country again—almost.'

'You are from the country?' asked the Prince.

'Of course,' said the girl, taking up some coloured paper and with deft fingers making it into the shape of petals.

'How old were you when you came to town?'

'I was ten. My father had a little book-seller's shop in a town near where we lived, but I don't think he made much money. All the poor people used to come into the shop of a night and read the books; and the rich folk didn't very often buy any. I don't suppose they need books like we do.'

The musical contest between the stove-pipe and the kettle having resulted in a distinct victory for the latter, Demos lifted it off the stove. The girl smiled her thanks, and poured the contents into a teapot that boasted an enormous handle, but lacked most of its spout.

'We'll let it stand a few minutes,' she said, sitting down and resuming her work.

'So you came to the city?' said the Prince, leaning back in his chair and watching with his dreamy eyes the quick play of her fingers.

'Yes. Dad thought he might get along well here, and if he did we could give mother—she's an invalid, you know—better care. At first, though, we nearly starved; but then dad got work in a book-shop round the corner. It was great fun then. Often at night he and I would go for a walk through the streets, and pretend what we would buy when he wrote a book all by himself and made a lot of money. Then we would come back home, and dad would have a book from the shop and read it to us—sometimes until after midnight. We were very happy then.'

With a sad little smile she put down her work, and foraging about the room, produced three ill-assorted cups.

'I have only bread to eat,' she said, 'but perhaps with the tea it will make you warm.'

With an inscrutable smile, Demos took a quarter-loaf of bread, and breaking it, handed a

piece to the Prince. Then, taking the mutilated teapot from the stove, he pointed to it with a chuckle. 'Though it lacks a mouth,' he said, 'it is not entirely without eloquence.' Manipulating it dexterously, he filled the three cracked cups with tea, and replaced it on the stove.

With a murmur of thanks the Prince took the bread, and not only devoured it, but drank his tea to the last drop.

'Well done!' commented Demos; 'you have eaten of the bread of the people.'

'Tell me,' said the Prince, looking towards the girl, 'what time will your father be home to-night?'

She looked wonderingly at him. 'But he is dead—the war, you understand.'

'I am so sorry,' said the Prince, and there was a quick stab at his heart.

The girl stopped her work, and in her eyes there was a look of trouble. 'The war came,' she said, 'and after three years they made dad go into the army. It seemed so funny. All he lived for was just us and books. He was always shy and ever so gentle. Wasn't it funny that they should take him for the army?'

'But we had to have men!' cried the Prince, his fingers pressing on the table until their tips were white.

'Oh yes—I know,' said the girl earnestly.

For a moment neither spoke, and then the Prince's intensity relaxed, and reaching for a flower, he fingered its paper petals. 'He was killed?' he asked.

'Oh no. He just died. He caught a cold in the trenches, and—well, you see, he wasn't very strong. It was funny, wasn't it, that they should make him go to war?'

'Destiny does not recognise obscurity,' remarked Demos, putting on his cap and slinging his instrument, which had been on the floor, over his shoulder.

'Good-bye,' said the young Prince. He put out both his hands with a boyish impulsiveness, and, smiling wonderingly, she gave him hers. 'Some day,' he said, 'a prince will come riding to your cottage, and once more you will see the country and flowers that have perfume.'

'What a pretty fairy story!' she cried.

The Prince was going to reply, but instead he stooped low and kissed her hand. Turning about, he could see nothing of Demos, and hurried into the street. He could just make out the vagabond figure ahead in the darkness. The fellow was singing softly, and the words floated back on the wintry air:

'Listen, listen, listen, listen,
Glisten, glisten, glisten, glisten,
And hear my lullaby.'

IV.

Full of thoughts which were incoherently resentful, yet strangely pitying, the Prince walked beside his guide without uttering a

word. He was just conscious that they had entered a labyrinth of dark, crooked alleys where, in some inexplicable way, the wretched hovels that fought for breathing-space seemed foul and sinister.

The raw air of the night became contaminated with the odours of unclean humanity wrestling with the musty stench of stagnation. A slovenly woman at a door leered on them, and croaked an invitation to enter. The Prince shuddered, and his companion laughed dryly.

'Your Highness,' he said, 'you have asked to see life as it is lived by your people. While the air of your palace is still fresh in your nostrils, come with me and see if even in the lowest dregs of human depravity there may not be some little gem for you and me.'

Stopping at a tumble-down dwelling that looked in the dark as if it had pitched forward on one shoulder and were in danger of toppling over on to the narrow street, the adventurers opened a creaking door and walked inside. There was a peculiar pungent odour that was nauseatingly sweet, as they groped their way through the unlit hallway. Reaching a door, they opened it, and looking in, saw a room where a dirty lamp suspended from the ceiling revealed a dozen huddled figures lying on the floor.

'What is it?' whispered the Prince.

Before Demos could reply there was a terrible cry in a woman's voice. The blood froze in the Prince's veins. Again the cry rang out, then subsided into a moan like the sound of a hound whimpering at the moon.

'What is it?' whispered the Prince again, his fingers clenched with horror.

'Opium,' murmured his guide.

From across the room came the sound of a soft, low laugh, and a girl with untidy hair matted across her forehead raised herself on her elbow and looked at them with lustreless eyes.

'It's all blue,' she murmured, with a soft ecstatic tremulousness in her voice—'blue as your eyes, dearie; blue flowers that smell like violets in a dream, and deep-blue skies. Look at the mist of blue rising from the sea! Blue-bells and forget-me-nots everywhere—*forget-me-nots!*' She laughed—a horrible shrill laugh. Her eyes blazed with fury and she beat the floor with her fist. 'Men!' she sneered between clenched teeth. 'Men!'

A figure from the floor reached out its hand and caught at the coat which the Prince was wearing.

'What season o' the year is this?' The voice was weary, but had the ineradicable timbre of youth.

'It is Yuletide,' answered the Prince.

'Yuletide?' repeated the fellow vaguely. 'That's odd—but I lose count nowadays. Doesn't matter, though. How's the war getting on?'

'It's over long ago,' answered His Highness, kneeling down beside the prostrate figure. In

the meagre light of the lamp he could see that, though drawn and pallid, it was the face of a mere lad.

'Why have you come to this place?' whispered the Prince.

'Why?' For almost a full minute the young fellow gazed stupidly into the other's eyes, trying to recall his disordered faculties from whatever heaven or hell the drug had hurled them into. 'I remember now,' he said wonderingly—'the clock.'

'What clock?' murmured the Prince.

'In here,' answered the young fellow, touching his head. 'Wait a minute. . . . It's coming back. The clock and the war! That's it—the war, all clear now. . . . Junior sub.—that's me. . . . Two years in the line and no leave. . . . Feeling a bit jumpy, but had to carry on. . . . Then a shell got me. I wasn't wounded—just *tick-tock-tick-tock*. . . . clock started in m' head—all day long—usually all night too—*tick-tock-tick*. They discharged me from hospital, and said I was all right. . . . Tried to work, but clock wouldn't stop—couldn't sleep—fagged all day and *napoo* for business. . . . They fired me. Every job—fired. . . . *Comprenez?* I boozed like hell just to forget. All the worse afterwards. Y' know, old boy . . . all the time—the clock hammering away somewhere in here.'

The young man clutched his head in his hands, then with a weary sigh sank back once more.

'Where was I?' he said. 'Oh yes . . . the clock. Fine li'l clock that, old son—no winding—just carries on . . . never stops . . . 'cept when I'm here.'

'But have you no friends who can look after you? Have you no family?'

' . . . Forget,' answered the youth, passing his hand over his brow.

'Try to remember,' urged the Prince, laying his hand on the other's shoulder.

'I forget,' repeated the young fellow dully. 'Where's the dope? The clock's at it again . . . ha! ha! ha!—some little clock, eh? Damned if I'm not getting fond of the blighter!'

Again he clutched his head and looked wildly at the Prince.

'Did we win the war?' he cried.

The Prince tried to reply, but his heart was bursting with agony, and the question left him faltering, silent. The lad clutched desperately at his coat with fingers that were thin and bloodless.

'Did we win the war?' he cried.

'Yes,' said Demos grimly.

v.

As they reached the street once more the Prince raised his hands towards the skies and drank in deep draughts of air as though to expel the foulness of the scene from both his lungs and his mind.

[Christmas Number.]

'Demos,' he said, 'take me away from this foul quarter. These dark alleys and miserable cottages give me a feeling that faces are grinning at me out of the dark—grinning and laughing to themselves about the war.'

'Who knows?' said the minstrel.

'Let us get away from here,' urged the Prince; 'take me to some place where the war has not crushed any one.'

'That, sire, is not easy; and yet'—

With a sudden air of determination the minstrel buttoned up his velvet jacket, pulled his cap over his eyes, and started off at such a pace that it was all the Prince could do to keep up with him, much less indulge in conversation.

He thought that once he heard Demos chuckle, but wasn't sure.

From the interior of shops and houses a fragrant odour of chops and sausages saluted their nostrils, and the Prince, who, as it will be remembered, had eaten very little dinner, began to feel his royal stomach demanding recognition of its rights. Except for vagrant filmy clouds that occasionally floated across the face of the moon, dropping their largesse of snowflakes as they went, the night was becoming gloriously clear, and the bracing elixir of frost was dispelling the cold dampness that had bitten like an ill-tempered cur at the fingers and toes of those who courted the open streets.

Merriment was on the increase with the night's maturing, and to the sound of pianos and fiddles light hearts and light feet were dancing the time away.

But, pausing neither to applaud nor comment, Demos and the Prince strode on until they reached the wider streets where clubs and stately residences offered their sanctuary from uncouth humanity. Past a silent park whose gates were locked they found themselves in a crescent studded with great houses ablaze with light, and pulling up at one of these, Demos went up the stairs and knocked briskly at the door.

In response it was opened by a funkey, to whom Demos extended his cap.

'Pennies for two poor singers,' he pleaded.

The funkey, who had been partaking generously of his master's whisky, waved stolidly at them.

'Run along,' he said patronisingly; 'don't bother me. Run along, like good fellers.'

'We are hungry,' urged Demos, 'and thirsty.'

'Cawn't be 'elped,' said the servant, with a hiccup. 'Master says, as we cawn't feed all the 'ungry vagabonds about, we won't feed none, so 's to be fair all round. Run along now, me good fellers, and don't disturb a conwiwial gatherin'.'

There was a roar of laughter from inside—a roar which had men's coarse voices for foundation, and the shrill cackle of women's for superstructure.

With sudden energy Demos seized the funkey by the waistcoat with one hand and the Prince's
1920.]

arm with the other; then, by executing a movement common to classical dancers and those who turn hydrants in the street, he swung the Prince into the doorway and the funkey outside of it, closing the door violently, and leaving both the victims of the manoeuvre blinking with unfeigned astonishment.

'Come on,' he said.

Reaching the dining-room, he drew aside the *portières* with an imperious gesture, and the Prince, who had followed him, found himself staring into a room where a dozen or so people were dining.

From the fingers, hair, and throats of women the glitter of diamonds leaped at the rays of light flashing from the cut-glass littered on the table. Like sunshine the crystal chandeliers showered illumination over it all, and basking in this shimmering spray, the plump shoulders and undraped backs of women shone like the *chef d'œuvre* of a cannibal feast.

At the entrance of the two strangers the hilarity ceased abruptly and all strained their necks to catch a glimpse of them. The host half rose from his chair and pointed at them with a smoking cigar, about which a golden band was wrapped.

'Hey, you!' he cried. 'Vot for you come in like that?'

'We are poor singers'—began Demos.

'They must be from the Royal Opera, then,' cried an extremely blonde woman who was given to hysterical humour.

'We are poor singers,' repeated Demos slowly, 'and have been begging from those who can ill afford to give. Now we come to those who have.'

'Listen here, my fine feller,' said the host, replacing the cigar in his mouth; 'the only reason we ain't poor like you is that we know enough to hang on to vot we got.—Don't it, Jacob?'

'Yas,' said the gentleman referred to, amiably; 'we wasn't born las' week.'

'What about your friend?' put in an enormous woman with a voice like a hurricane. 'What does he do?'

'He is learning,' answered Demos.

'From you?' thundered the female.

'No,' said Demos; 'from you.'

Another torrent of laughter succeeded this retort, and one of the guests who had been surreptitiously drinking his neighbour's champagne nearly choked to death.

'Now then,' said the host, 'you loafers better go along before I ring for the police.'

'A little food'—pleaded Demos.

'A little food?' repeated the gentleman. 'Not a chance. I know you tramps too well. I give you anydings to ead, and to-morrow all your pack come round and I don't get no peace no more.—That's straight talk, Jacob?'

'Yas,' agreed his guest. 'That's the ticket.'

'We are thirsty and ahungered,' pleaded Demos.

'Beggin' is against the law,' stormed the host, 'and I don't go for no breakin' the law.—Isn't it, Jacob?'

'That's righ', said Jacob placidly.

A violent knocking at the front-door beat a prolonged tattoo on the diners' ears.

'Hey!' shouted the host. 'If you doan' like the house, you ain't have to knock it down.'

The noise increased in violence, and one of the four sons of the house rose from the table.

'That's it, sonny,' said the host. 'Tell Rip Van Winkle out there to wake up and see who it was at the door.'

'I can tell you who it is,' cried Demos. 'It is servility clamouring for entrance. Let it in—you know how to treat it better than honest poverty.—Shall we go?'

He looked towards the Prince, who had just turned on his heel, when a shriek in a girl's voice made them turn round.

'Look!' she cried. 'It is the Prince—it's the young Prince!'

A roar of derision drowned her voice; but the Prince, with a curious smile, took a step towards the table and bowed to the girl.

'There!' she shrieked. 'Look at him!'

'Sire,' said Demos, 'let me present to you your new aristocracy.'

At the vagabond's words every voice was hushed, and by some odd coincidence the knocking at the door also stopped abruptly.

'Vot joke is dis—ugh!' blustered the host, although his face was pallid.

'The greatest joke of the times,' answered Demos.—'This gentleman, sire, had two things the nation needed when there was war—his ships and his sons. The ships he gave—at a price; the sons'—

'They was all indispensable!' roared the host, wringing his moist hands.

'In return for these invaluable services,' went on Demos, 'your Government, sire, has given him a title—has raised him to the peerage.'

'The feller's mad!' stormed the host. 'Mad!—Isn't it, Jacob?'

'Sure,' said the imperturbable gentleman referred to; 'he ain't at home upstairs.'

A medley of voices broke in hysterically, and, as if it were a signal to recommence, the knocking began again on the front-door.

'Mad?' shouted Demos, seizing his instrument and striking it furiously with his fingers. 'I am as mad as a rabbit; mad as a lover when the moon is full; mad as the civilisation that sends men to death and hugs things like you to its bosom.—Now, your Highness, will you stay here and sup?'

'No. Let us go,' said the Prince.

'Perhaps you would like to create another peer or two from amongst our friends?'

'No, no,' cried the Prince. 'I would prefer the stench of the opium-den to this place. I shall not forget'—he turned to the limp and

perspiring diners—'I shall never forget how you entertained the Prince when he came to your house. I bid you all good-night.'

'Good-nigh,' said Jacob.

With another savage chord on his instrument Demos paced from the room with the Prince in close attendance. Reaching the door, the minstrel opened it with such violence that the flunkey, who was standing outside, was precipitated by a series of somersaults to the very bottom of the steps, where he remained in an attitude assumed by comic acrobats when playing leap-frog.

VI.

'Bah!' ejaculated Demos as they found themselves once more in the crescent; 'I am too hot-headed. A fellow of my age ought to know better.'

'I was no less furious than you,' said the Prince, whose face still wore an angry flush.

'But, then, your Highness, I am so many centuries your senior.'

'I say,' said the Prince, changing the subject, 'I'm frightfully hungry.'

'Really?' queried Demos. 'I have been hungry for decades at a time.'

'But, then,' said the Prince comfortably, 'you were probably used to it.'

'So Marie Antoinette thought,' said Demos with a chuckle.

As this remark savoured of disrespect to royalty, the Prince thrust his hands in his pockets to keep them warm, and refused to say anything more, so as to let his temper cool. With an air of nonchalance they strolled on until they came once more to the end of the park.

At this point in their journey the long legs of Demos began to increase their pace.

'What's—up—now?' pleaded the Prince, who was forced to break into a half-trot to keep up.

Demos made no reply, but strode faster and faster. Houses, then shops, began to rush past them, until their lights appeared to be one long, streaming glare. The exertion made him so warm that the Prince unbuttoned his borrowed coat, letting the tails fly into the air.

After going through a dozen alleys, darting down as many murky lanes, and traversing an innumerable number of courts, they came to a spot where a dwelling-place had been pulled down, leaving an indiscriminate mass of broken bricks and corrugated iron.

Feeling his way cautiously, Demos led the Prince around the débris until they came to a low fence behind which a nondescript building was crouching in the dark. Feeling for the door, which was a huge affair, Demos knocked softly.

In response a very small aperture was opened and a breathy voice challenged them.

'Comrades,' answered Demos.

'The password, comrades,' muttered the voice.

[Christmas Number.]

'*World Revolution*,' said Demos.

The door was cautiously opened enough to admit them, and then swung to again.

The Prince looked curiously around. By the light of three or four weak-minded candles he could see that the place was a disused stable, with a table and chairs where the stalls had once been, and some thirty men standing or sprawling about on straw.

He thought he had never seen such faces—faces with sharp, crafty features, bilious of complexion, with ugly, unkempt hair begrudging the little space it had to leave for thick lips and rat-like eyes. Among the group were two or three whose smooth, lofty brows bespoke the idealist and the dreamer, but they were lost in the uncouth, hideous crowd.

A sharp murmur of inquiry ran about the place at the entrance of the new arrivals, and one man from the floor kicked at the instrument which hung from the shoulder of Demos.

'You'd look better with a bomb, comrade,' he snarled.

'Brother,' said Demos, 'you would look less like an ape if your hair were cut.'

A roar of anger swept the place, and a score of hairy faces, set with bloodshot eyes, stretched towards them, belching blasphemy in many tongues.

The tumult was brought to order by a hooded figure at the head of the place crashing his great fist on the table before him.

'Silence!' he hissed. 'Do you want the police about our ears?'

With a chuckle Demos cleared a place for himself and the Prince by the simple method of inserting his foot underneath a reclining comrade and tilting him over on top of one of his fellows—promptly sitting down in the vacated place.

'Silence!' hissed the president again.

'Silence!' echoed Demos, strumming an emphatic chord on his instrument.

Again the crowd became rigid with fury, and a mass of hairs bristled like those on a dog when a cat spits at it.

'Is Comrade Reiffensteinski here?' whispered the president.

'Yiss, comrade.' An undersized, dirty-faced foreigner got up from the straw, several strands of which clung affectionately to his beard.

'Report,' said the president, 'on what you have done in the down-trodden island for the sacred cause of revolution.'

The worthy Reiffensteinski smirked complacently and caressed his beard with his fingers. 'Only yesterday,' he said, 'we did execute another policeman.'

'Be quiet!' The president shook his fist at his followers, who had broken into shouts of approval. 'Tell us of the execution,' he said, turning to the little man. 'Such glorious deeds strengthen the soul of the people. *What's that?*'

1920.]

'Nothing,' said Demos, who had picked a note on his lowest string that sounded like the gullup of a bull-frog.

'The execution, comrade,' said the president, with an angry glare. 'Give us the story.'

The little foreigner smirked again, and with a sweep of his hands curled his beard like a baker kneading dough. 'He was coming from church, where he had been sacrament-taking. We was very clever. I lie in front of a motor-car—so; I groan and cry out. Four comrades lean over and shout, "Help! He is run over! He bleed to death!" The policeman hear, and come to us. "Can I do anything?" he say, and stoop down to me. Then—*then*!—from behind, the glorious comrades shoot him in the head—so—dead! We jump in the motor and run away.'

There was a subdued howl of glee, and Demos clutched at the Prince's arm. 'Steady,' he muttered; 'not yet; not yet.'

'You have done well,' said the president. 'Our glorious cause can never fail where such deeds are done.'

The little comrade sat down with a look of smug complacency and proceeded to chew a piece of straw.

'That concludes our reports,' went on the president. 'You have heard from Comrade Sneiderberg how in the great country now ruled by the proletariat there is no more rents, no more marriage, no more *bourgeoisie*. Every one is free to obey the tribunals. Every one is happy. Any one who is not, they shoot. Long live Revolution!'

'Long live Revolution,' chanted the gathering.

'The other small republic, as Comrade Reiffensteinski describes, is overthrowing the despot in every direction.'

'Long live Revolution,' chanted the crowd.

'Long live Reaction!' cried Demos, mimicking the president's voice.

'Long live Reaction,' echoed the others.

'Long live Retrogression!' cried Demos.

'Long live Retrogression!' roared the crowd.

'Long live'—

'*Silence!*' hissed the president.

'Hear, hear,' said Demos. 'Long live silence!'

An angry outburst again surged against the two intruders, but at another admonition from the president, who made use of an aperture in his teeth to hiss like an adder, the room became quiet again.

'Now,' said the president, 'we come to the great decision. Next week there is the procession in honour of the young Prince'—

A storm of curses stung the air. The Prince caught his breath, and Demos, hugging his knees, rocked himself thoughtfully like an Oriental philosopher.

'The Prince,' went on the president, 'is a deadly enemy to our cause. The people believe in him—the fools!'

'The swine!' snarled the comrade whom Demos had tilted with his foot.

'Fools and swine!' cried the president. 'But because the people love him, he must die.'

'He must die,' chanted the crowd.

Demos gripped the Prince's arm. 'Not yet,' he muttered; 'not yet.'

'The bomb is ready,' went on the president in a hoarse whisper. 'The cause absolves you. Which of the comrades will be the arm of destiny?'

An awesome silence followed the question. Bloodshot eyes glanced furtively about, and a hideous pallor was on almost every face. The air was charged with terror, and from a wretched human specimen lying face downwards in the straw there was the horrible sound of chattering teeth.

'I will kill the Prince.' A youth had stepped forward, one of those whose face and brow stamped him as a fanatic and dreamer. From between open lips came his feverish breath, and his light eyes were burning with the unquenchable fires of madness. Gasping and quivering with relief, the others swarmed about him, applauding, cheering, urging him on.

'Comrade,' said the president, whose own voice was still shaking, 'you have chosen well. The world will ring of your deed.'

'As for that,' said the youth—and the musical quality of his voice was startling in contrast—'or for my own life, I care nothing. I only know that things as they are are wrong. Existence as we have it to-day is damning the human soul. It is cruel; it is evil. The young Prince embodies the order of things as they are, and so I strike! Give me the bomb. I promise you that on the day of the Prince's procession, before night falls, he shall be a corpse.'

'Death to the Prince!' snarled the president.

'Death to the young Prince!' roared the crowd.

Demos clutched at him too late. The Prince was on his feet, his coat open, and had reached the table. 'You need not hunt me down!' he cried in a clear, ringing voice. 'I am here.'

He stood facing the crowd that surged towards him. For an instant there was a deathly silence; then a swirl of curses and imprecations swept over him like surf dashing against a rock. Although he was pale, his steady eyes and boyish mouth showed none of the fear that changed the disordered countenances of his assailants from the hideous to the grotesque. They shouted for his death, and shrieked for some one to strike him down, but no one had the courage to cross the little space that separated them.

'I am ready,' said the Prince, turning to the young assassin, who alone had remained calm and unfurried. 'Without a trial I have been condemned. Then kill me now, that others who will be beside me in the procession need not die as well. I have lived with only one thought

since I was old enough to think of such things—to serve my fellow-countrymen. I did not choose my life; but if by living I stand between the people and their rights, then take that life now. I am ready.'

A furious muffled cry of rage went up from a score of throats, and the president, leaning towards the assassin, put something in his hand. 'Now,' he cried; 'kill him!'

The young fellow looked down, and without a tremor saw that in his hand he had a knife whose long blade was tempered to a delicate point. Raising the gleaming thing before his eyes, he held it there like a crucifix. 'I shall strike first,' he said in his breathy, uncanny voice, 'and then each of you in turn. Thus shall the world know that it is the deed of the people.'

He took a step towards the Prince, and in an unearthly silence the two youths looked into each other's eyes. The assassin took a deep, trembling breath, and pressed his hand against his eyes as though he would clear the fumes of madness that were raising a mist before them. The fingers on the handle of the knife tightened their grip, and his arm was slowly raised.

'Just a minute,' cried Demos, elbowing his way through the crowd. 'I ought to have something to say about this.'

He caught the wrist of the assassin in a grip like steel, and slowly bent it back. There was a horrible crack, and the knife clattered to the floor. The young man made no sound, but the arm hung impotently at his side.

'You hounds!' Demos turned to the terror-stricken crowd, and seemed to tower like a giant above them. 'You prostitutes of Democracy! Century after century I have watched your kind, whispering "Murder" into the ears of fanatics like this poor fool—crying "Progress" while you know that Progress by its very nature would murder you. What brings you to this land, fouling the air with your pestilent breath, poisoning the hearts of men, and vomiting your filth in the open places everywhere? What is there about you that makes you come in the wake of war like rats following a plague?'

As Demos paused the terror of the crowd passed into fury, and shouting that they were thirty against two, they shrieked for his death, and a hurtling knife just grazed his cheek.

'Death to them both!' cried the crowd, surging forward.

'What!' roared the minstrel; 'you would kill both the Prince and Demos?'

'Demos? Demos?' Those nearest him struggled back as if they had seen a ghost.

'Ay—Demos!' He took a pace towards them, and with a cry of terror they shrank back. There was something overpowering, supernatural, in his towering wrath. 'I am weary to exhaustion of the crimes you have committed in my name. Honest revolt against injustice is as far

[Christmas Number.]

from your minds as the rising sun is from the waning moon. Progress grows by the deeds and the lives of men, not by their deaths. This lad, this royal Prince, like every man, is born with a challenge from his Age. Already he has given much, and will give more and more as time takes toll of his allotted years. Who strikes at him strikes at Me!’

He raised his hand in the air, and his eyes swept the gathering before him.

‘Back to your sewers! Back to the slime wherein your souls can have the nourishment they crave! Your hour is not far off; and if you force me to turn on you, history will record its blackest day of retribution.—Come, sire; the hours of the night are passing. Come with me, and see if any one will harm the Prince who is allied with Demos.’

With Demos’s fingers just touching the Prince’s sleeve, they walked slowly through the room, while the wretched anarchists fought to make a passage for them.

VII.

The night, which had held as many moods as the mind of a youth in love, had grown cloudy, and the moon, after a gallant stand, gave up the fight, retiring in complete discomfiture. Snow was falling heavily in big, soft flakes unharassed by any wind, muffling the noisy streets into an eerie silence. Footsteps that were wont to echo against window-panes like an aerial postman on his route fell noiselessly on the carpeted pavements, and street lamps struggling against the clinging shroud of white made the street like an avenue in a gigantic vault lit by dim candles.

Exhausted in body and in spirit, the Prince walked beside his guide, letting the snow play upon his hot face and forehead. He had asked to see his people—to share their thoughts, their joys, their troubles. He had done all this, but instead of joy it had brought him a feeling of impotence—a feeling that life was too dark and complex for him to grapple with.

He began to regret the evening’s adventures. He could have gone on looking at existence from the palace windows, inspecting the tragedies and sorrows of life as a general looking at a division drawn up on parade. Surrounded by officialdom, he could have faced his people and only noted those truths which officialdom permits august ears to hear. But now the memories of the night—the girl with the paper flowers, the young officer drugging himself to death, the diners who had amassed their fortunes while Youth went to its cross, the vile creatures in the stable screaming for his death—these things had burned themselves into his very soul.

‘And it is well.’

The Prince looked up with a start. ‘I didn’t speak,’ he said.

‘You thought,’ said Demos tersely.

1920.]

They had just turned into a decent business street, when a man of considerable girth opened a door which stood beside a cabinetmaker’s shop, and turning up his coat-collar, ran along the pavement to a pillar-box, into which he dropped a letter.

Having completed that task, he turned about, and inserting his hands in his pockets and lowering his head, proceeded, to the accompaniment of much blowing and puffing, to trot at a brisk pace back to his door again. Without seeing them, he bore down on the two adventurers, but just as the Prince stepped aside to let him pass the runner slipped, lost his balance, caromed violently off the Prince, and went head-first into Demos. That velvet-jacketed figure promptly sat down, and throwing his long legs forward, precipitated the impetuous stranger on top of the Prince, who suddenly found himself buried beneath sixteen stone of humanity, with his nose flattened against the pavement.

‘Hoy!’ shouted the owner of the sixteen stone.

‘Hoy!’ shouted Demos, making the echoes ring.

The Prince tried to speak, but as it only resulted in his mouth being stuffed with snow, he contented himself with wriggling violently.

‘Well, this is a hearty meeting, to be sure!’ cried the new-comer, shifting his position, and allowing the Prince to assume the perpendicular once more.

At the sight of that young man’s face, so caked with snow as to make his features quite undiscernible, Demos and the stranger broke into such a prolonged and good-natured laugh that the Prince could not withstand the infection, and laughed himself until the very farthest frontiers of his body glowed with warmth.

‘That letter,’ said the stranger, getting up on his feet and wiping the tears from his eyes, while Demos superintended the brushing and cleaning of the Prince—‘that letter you saw me post was from the wife to her brother. It’s asking him to take supper with us to-night.’

‘To-night?’ queried Demos.

The stranger nodded a great many times. ‘I’ve had it in my pocket for four days!’ he cried, bottling up a laugh that would have burst any ordinary man’s ribs.

‘Why?’—began Demos.

‘He’s—he’s an agitator,’ said the stranger. ‘Goes around getting men to strike—and the wife’s invitation was for to-night.’

The prospect of his own duplicity proved so overpowering that the good man began to develop strong symptoms of collapse again, and had to lean against a lamp-post until he recovered himself.

‘Hello!’ For the first time he noticed the instrument which Demos carried. ‘Musicians, eh?’

‘Yes,’ said Demos; ‘we have been wandering about the streets to-night.’

'Bless us!' said the old fellow, his face glowing with sympathy. 'Little money, I wager.'

'Little money,' said Demos.

'And little food?'

'No food,' said the Prince feelingly.

'Bless us! Bless us!' cried the stranger. 'What are we doing standing out here, then? No food—dear, dear! Come along—pick up your cap, sir—you're just in time for a jolly little party in honour of Ben Tiffle, my head man. This is my place.' He pointed to the cabinetmaker's shop, and to a large sign above the door. 'William Pressleswitch & Son—at your service, gentlemen.'

'At yours,' said Demos, with a courtly bow.

'We've been working late to-night, so we put off the party till now. Here you are—mind the step. Bless us! the laddie here will look a lot merrier for a bit of mutton and a pint of something.'

Uttering a great many words, and punctuating them with puffing and chuckles to prevent the two wanderers from either refusing his proffered hospitality or thanking him for it, the stout-hearted cabinetmaker led them upstairs, and ushered them into a cosy room where a homely scene was set.

'Mrs P.,' cried their host; 'two more friends for supper—and musical fellows, too.'

Mrs Pressleswitch, who (as is so often the case where a jovial husband is involved) was a thin, worried-looking woman, welcomed the new arrivals with as good grace as could be expected, at the same time using her eyebrows to telegraph to her husband her displeasure at his thrusting guests on her without proper warning.

Her guilty husband, however, ignoring the reprimanding eyebrows, led the Prince and Demos to an elderly man of seventy odd years, a man somewhat stooped with his age, but in whose face and bearing there was an air of conscious dignity born of long years of honest toil.

'This villain,' said Mr Pressleswitch, gripping the old man's arm with great warmth, 'is Ben Tiffle—old Tiff.—How long is it since you joined the house, Tiff?'

'Off and on,' said the old man sturdily, 'with him as was before you, and then with you, sixty-one year this month to a day.'

'Think of that!' cried his employer, slapping his worker on the back. 'Sixty-one years at the same shop, sound as a bell and spry as a kitten.—Ain't you, Tiff?'

'Wellzir,' said Tiffle, 'I creaks a little now in me joints, and I wouldn't be like to catch the eye of a gal lookin' for a bridal suite; but, as I often thinks, a feller is like a piece o' furniter. When he's real old, then he's a hantique, and more valuable nor ever.'

'Of course he is—of course!' cried his employer, fetching old Tiffle such a slap in the

chest that his value was in imminent danger of being reduced to zero. 'Bless us! What's this I see—young Sniggers?'

A scraggy boy, who had been standing behind a chair in an attempt to hide his knees and elbows (and he was *all* knees and elbows except for a shock of hair that stood straight up as if it never would and never could get over its surprise at being there), grinned from one ear to another.

'Sniggers,' said Mr Pressleswitch, 'come here.'

For answer the boy rested his elbows on the chair's back, and his chin on his hands, from which position of advantage he surveyed his master with humorous astonishment until, his elbows slipping, his jaw came into violent contact with the chair.

'Sniggers!' said Mr Pressleswitch as sternly as he could.

'I brung him,' said old Tiffle, shuffling forward. 'He was a-setting on a box all by hisself to-night. He hasn't got no home—only a bed in a attic. He's a—a forndling.'

Mr Pressleswitch took a pair of glasses from their case, and adjusting them on his nose, surveyed the lad as if he were some entirely new kind of creation.

'Tiff, my boy,' he cried, 'give me your hand! A foundling! Think of that—no home for the laddie whatever! Think of it, Tiff; no'—

At the very thought of such a prospect Mr Pressleswitch removed his glasses, and producing an enormous blue handkerchief, blew his nose as noisily as a trumpeter summoning a beleaguered garrison to arms, while the grin on young Sniggers's face grew and expanded until it seemed to go beyond his ears and make a complete circle of itself.

During this performance the pretty, brown-haired, black-eyed, dimpled daughter of the house took his cap from Demos and the coat from the Prince, blushing demurely the while (but taking good care that her downcast lashes did not hide her eyes altogether), and succeeded in driving a callow youth, who had expended a fabulous sum on a pink shirt and a large amount of brilliantine, to the very edge of insanity through jealousy. From somewhere a small boy appeared, who took up a position of vantage opposite the Prince, and inserting a thumb in his mouth, probably to stifle comment, gazed long and earnestly at the royal youth's handsome clothes.

'Well, Mrs P.?' queried the host.

'All ready, P.,' said his worthy spouse.

As a result of this cryptic incantation, the party invaded the next room, where they sat down to a merry and bountiful supper, doing more than justice to both the merriment and the viands. The daughter of the house flirted openly and outrageously with the Prince, who responded as well as his active duties with his

[Christmas Number.

knife and fork would permit; while the youth of the brilliantine and the pink shirt sank into an abyss of melancholy from which he did not emerge for the rest of the evening. Sniggers, whose face, as has been stated, bore a naturally astonished look, became so overcome with the procession of eatables that his eyes were enlarged to an unbelievable width; and as for his hair, it is a mystery that it did not come out, roots and all. But mere joviality was tempered by old Tiffle's sage philosophy, drawn from his contiguity with furniture; while Pressleswitch chuckled, and laughed, and talked without caring whether any one listened or not.

Only Mrs Pressleswitch was unable to shake off her feeling of maternal and wifely responsibility, frowning alternately at her husband, on general principles, and at her young son, who was tucking in such an enormous amount of food that one might have thought he had taken a vow to bring his life to a premature and spectacular conclusion on that very occasion.

'It is so exasperating,' said Mrs Pressleswitch during a pause in the noise. 'I expected my brother to-night. He is prominent in public affairs, and is probably detained making a speech.'

Mr Pressleswitch winked at Demos, and partially smothered a loud guffaw.

'P,' said his wife sternly, 'recollect yourself.'

'Hoy!' roared the shameless one; 'that's a good un.'

'Your health, madam,' said the Prince tactfully, raising his glass to their hostess.

With the greatest cordiality every one rose to do honour to the toast, which was somewhat marred by young Sniggers letting his ale 'go down the wrong way,' necessitating a course of thumping, which restored his breathing, but left his face looking as if he had just seen a dozen ghosts turning somersaults.

'My dear,' said the host as they sat down, 'we musn't forget—young Will, y'know.'

'Ah,' said old Tiffle, nodding his head; 'young Will, of course.'

The room became suddenly quiet, and the Prince looked wonderingly at the faces which had changed so quickly from gaiety to pensiveness.

'He would be sitting where you are if we had him now,' said the cabinetmaker, looking towards the Prince. 'A fine boy was Will—brimful of spirit, and a kinder boy to his old dad and mother never breathed, though I say it that shouldn't. I wouldn't like to think now, though, that we kept him back—would you, mother?'

'No, no,' said Mrs Pressleswitch softly. 'It wouldn't have been fair to Will.'

The cabinetmaker tapped the table with his fingers, and his face was touched with gentleness.

'Your son was a soldier, sir?' asked the Prince, his heart aching with the pain which he had lost for a little while.

1920.]

'A corporal he was,' said their host, 'and killed fighting for his country. I intended him to take over the shop when I moved on, but thank God there's this boy left, so Pressleswitch & Son will still be Pressleswitch & Son. But if there is another war—which Heaven forbid!—and the King wants my last boy, I'm ready, and he's ready.—Aren't you, son?'

The juvenile referred to had such an enormous quantity of pie in his mouth that he was forced to acquiesce by nodding several times, with an energy, however, which was far more convincing than mere words.

'Sir,' said the Prince, 'the nation will never forget the sacrifice of you and your wife.'

'Don't be too sure,' put in Mrs Pressleswitch, for whom the prospect of an argument was the best antidote to tears. 'Every day a lot of poor disabled fellows come to the shop asking for work, and if I didn't stop him, P. would have the place so full of one-legged soldiers that there would be no room for four-legged furniture. If the nation's got such a good memory, it's a pity it don't give more of the boys work, and not leave so much to people like my husband.'

'Now, now,' said that gentleman, 'it's little enough I can do by giving a few laddies a berth. If we have our health, plenty to eat, and a roof over our heads, do you think we want to make a lot of money with those poor fellows walking the streets hungry? Will was one of the boys, and in doing a little for them I feel as if I was doing something for him. But this isn't a cheerful subject for'—

'What about a song?' asked Miss Pressleswitch, looking archly across the table. A chorus of approval greeted this suggestion, and the Prince looked helplessly at his companion.

With a smile Demos rose from the table, and picking up his instrument, drew from its strings two or three chords of such haunting sweetness that they lingered on the air like the scent of flowers. The room grew strangely quiet, and all eyes were fixed on the strange figure with the corduroy trousers and the velvet jacket.

Resolving the chords into a plaintive minor theme, he commenced to sing:

'A young Prince stood in palace hall—

Sing a merry song of Yuletide;

Deep sorrow held his heart in thrall—

Sing a doleful song,

Sing a sad, sad song;

Listen to my song of Yuletide.

"What voice is heard this night?" he cried.

"The voice of pain," the wind replied;

"Wounds of Christ in a nation's pride"—

Hearken to my song of Yuletide.

'His royal robes in dust he cast—

O sing a brave song of Yuletide;

And through the palace portals passed—

O sing a good song,

Sing a brave, brave song;

Listen to my song of Yuletide.

"If to the throne I'm royal heir,
The nation's pain is mine to bear,
The nation's sorrow mine to share."
Sing a good brave song of Yuletide.'

When he had finished, and the last chord had hummed into silence, Demos slung his instrument over his shoulder and reached for his cap.

'It is late,' he said, looking at the Prince.

In spite of loud protest from every one, the Prince also rose, and after a hearty handshake all round they went downstairs, escorted by the cabinetmaker.

'I wish,' said that worthy, 'that the Prince could come and talk with us, like it sort of says in that song. He would see that there's labour *and* labour. He could note those fellows who do nothing but strike and hold everybody up for more money and less work; but he would find a lot of places like this shop, where men work like men and are treated as men. Whether he knows it or not, the Prince has more of that kind in the country than he thinks. We don't talk much, but we won't let the country go to the dogs either.'

'The Prince will be happy to know that,' said Demos; 'in fact, he knows it now. There is a great temptation these days to believe that the only people with voices are those who shout. And now, my friend, good-night, and a thousand thanks.'

'A thousand thanks,' echoed the Prince.

With mutual good wishes they left the good man, and walked briskly away.

VIII.

Suddenly the Prince's breath was almost taken away. There was the roar of rushing wind, and his eyes were stung with snowflakes.

He felt the arm of Demos about his waist; he heard him shout, 'To the palace!' and next moment they were hurtling through the air at a terrific pace. He tried to cry out, but the rush of wind made his voice inaudible. Clinging to his guide, he closed his eyes, and . . .

He was standing in the great gallery, and Demos was lounging before the fireplace.

'My chariot of snowflakes, sire,' said Demos, 'drawn by the wind.'

The Prince said nothing. He could think of nothing to say.

Demos laughed softly to himself, and stretched his arms with a yawn. 'Well?' he said.

The Prince looked wonderingly about. The portraits had not changed; the king with the ruffle and the king with the legs were as royally complacent as before. 'It is all like a dream,' he said.

Demos made no comment, but as he looked across the room the light of the fireplace revealed his face as more tired and less youthful than when he had first found his way into the great gallery.

'Sire,' he said, 'let neither of us forget to-night.'

The Prince looked up quickly. 'You are not going to leave me?' he said.

'I must,' answered Demos. 'Great troubles beset this land, and I must struggle against those who would thwart me, and those too blind to see me when I come before them. There is no rest for Demos.'

'But stay with me,' cried the Prince impetuously. 'There is so much we could do together. I want to take real flowers to that girl, and send her to the country. I want to save that boy from death in the opium-den. Without you, Demos, I cannot find them.'

'You are right, sire,' answered the minstrel; 'without me you are lost. But though I may never again appear before you as I am, I shall be near you always.'

The Prince clasped his hands together, and there was a great yearning in his voice. 'How,' he cried—'how shall I know you?'

Demos gazed earnestly at the Prince, and a look of infinite tenderness softened his features. 'I have no power of my own,' he said thoughtfully, 'except as it is expressed by men. My anger, my aspirations, my sympathy—all these lie mute and inexpressive until some one, greater than his fellows, gives them life. I search the day and haunt the night for him who will speak for me. I rob men of their sleep and set their blood on fire. I penetrate the secret places of their souls, crying out always and for ever, "Is there no one will speak for Demos?"'

The Prince leaned forward, and his eyes shone with a great resolution. 'Tell me,' he cried, 'who of us can speak for you?'

Demos unslung the instrument from his shoulder and fingered it idly. 'The people are struggling upwards—always upwards,' he said, 'and whenever a man helps them by some great thought or deed, he speaks for Demos; just as whoever sows distrust between nations, or lessens Man's belief in Man, leaves Demos dumb and powerless. Live for the people, sire. . . . Already you have been my spokesman. . . . Lead on through the years, and let your voice be mine. And now, my friend, my Prince' . . .

With a strange, pensive smile, he softly touched his instrument with his fingers.

Then—he was gone.

Only the last few notes trembled on the air.

The Prince rushed to the window. 'Demos!' he cried. 'Demos!'

From a long way off came the sound of the now familiar voice, borne on the wings of the wind:

'Listen, listen, listen, listen;
Glisten, glisten, glisten, glisten.'

'Demos!' cried the Prince.

[Christmas Number.]

TAMASHA: AN ECHO OF '57.

By A. M. PAULIN.

I.

MRS CARLTON stood in the doorway drawing on her white gloves. Her usually bright face wore a troubled look. A smart buggy, piled high with jasmine and roses, stood waiting for her in the sunshine without the deep veranda, the somnolent native groom who held the pony typifying the immemorial patience of the Orient as he rebuked the insect world with a yak's tail. The pony, on the other hand, being of English extraction, stamped with impatience.

'My dear,' said Mrs Carlton, as she glanced into the drawing-room, 'you are sure you don't mind my leaving you? It is most unfortunate your having this headache to-day. Of course, if you would rather not be left alone, I might ask Millie Ralston to finish the decorations.'

The girl on the couch gave a little laugh.

'Not leave me alone? What nonsense! Why, it's just a quiet afternoon I really want. Off you go, Peggy, and don't worry your dear head on my account.'

Mrs Carlton uttered a quick little sigh of relief, but still she hesitated.

'You see, dear, there's such a lot to do. The ballroom's so big, and I have the flowers for the table with me. I'm so anxious it should look its best for to-night's dinner, and you can help to finish the ballroom to-morrow. Millie will give me tiffin, and I shall be back for tea if I can; but don't wait for me. And you can order the dogcart later if you feel up to it. You can manage the little mare?' she asked anxiously. 'Very well, dear. *Au revoir*, and I hope you won't be bored.'

Waving her hand in farewell, Mrs Carlton hastened out to the buggy. A moment later her anxious face reappeared between the muslin curtains.

'My dear, I should go and lie down if I were you—in your own room, I mean. And take one of the dogs with you for company. And don't let the servants disturb you. They know their work, and even if they are sometimes a trifle noisy'—

She broke off abruptly and uttered a little nervous laugh as she stooped to pick up her parasol, which had fallen to the ground. There was not a speck of dust upon the glossy silk, but she shook it with vigour, her restless glance darting about the room as she did so.

'Now, darling, don't forget. Go to your room and have a good sound sleep. I shall tell ayah not to disturb you till you call, 1920.]

and the twins have orders to remain in the nursery.'

The girl on the couch stirred a little restlessly. Her head ached abominably, and she wished Peggy would stop chattering and be off to her duties. It was an effort to respond even with a smile to her sister's kindly anxiety for her comfort.

'It's all right, Peggy, my dear. Don't hurry back on my account. I'll sleep this headache off and be my own bright self again by the time you have finished. Run away now, or your flowers will all be withered.'

The invalid sank back and closed her eyes, and Mrs Carlton, with a last uneasy look about the room, slowly withdrew. A moment later the brisk clap of the pony's heels proclaimed that this time she was really gone.

Molly Carthew heaved a little sigh of relief. She had reached Sherabad in the early hours of the morning, after a singularly depressing journey in an overcrowded train. This was her first visit to her sister in Sherabad, and she resented it as a misfortune that her arrival should coincide with one of those occasional social gatherings known as 'meets,' a brief and festive season of feverish activity, of startling gowns, and the renewal of old acquaintance. For Molly was not in the mood for gaiety. She had her own good cause for sadness. To her it seemed overwhelming, and there is little doubt that it contributed in no small measure to the depressing effect of her journey.

The servants had gone to their midday rest, and she had the big, quiet house to herself. Sitting up with an effort that sent a stab of agonising pain across her forehead, she tossed the silk cushions into place, lay down again, and in a moment was fast asleep.

II.

Into her sleeping brain stole the memory of something Peggy had said. 'Do not let the servants disturb you. They know their work, and even if they are a trifle noisy'—

She turned restlessly upon the sofa, her pretty brows drawn into a frown of annoyance. Some one was setting the table in the adjoining room with a most unnecessary amount of clatter. Her headache was gone, but she felt dull and heavy, and the clink of silver and the clatter of china bade fair to banish sleep altogether. With an effort she roused herself to call a peremptory order.

For an instant there was silence. Then the clatter of dishes began again more loudly than

before, and Molly groaned. With a mighty effort she sat up, put her feet to the ground, and approached the curtained archway that screened the smaller dining-room. As her hand touched the curtain there was a sound as of a falling plate breaking in shivers upon the cement floor.

In spite of her annoyance a little malicious smile dawned in Molly's eyes.

'Poor Peggy!' she murmured, and tugged aside the curtain.

The room was empty!

Bewildered, she stared about her. A clean white cloth covered the dining-table; the silver shone resplendent upon the sideboard and the dinner-wagon; the teacups hung in orderly rows—not a knife or a spoon, not a plate, was out of place. She looked at the floor, but there were no scattered bits of china to tell the tale of a recent mishap.

Molly stood a moment, her eyes fixed on the glass door of the pantry at the other side of the room. She almost fancied that the shadowy outlines of a figure had moved across the frosted panes, and was minded to confront the culprit sure to be in hiding in the dark little recess. But a violent throbbing in her temples decided otherwise. Dropping the curtain, she re-entered the drawing-room, then hesitated. The room felt chilly. Her vitality was lowered by two hours of sleep, and her blood ran sluggishly. She shivered, and the glow of colour seen through the bead chicks tempting her, she picked up her cushions and turned to go out on the veranda, where a long chair set amongst palms offered a snug retreat. As she did so something made her swing sharply round—some sudden consciousness that she was no longer alone in the room.

But there was no one there. Yet Molly was convinced that but a moment before a withered, bearded face had stared out at her from between the curtains dividing the two rooms. How she had gained this impression she could not have told, for the heavy folds of the stuff curtains hung in their usual severe, motionless lines. Not a quiver disturbed them.

Molly had a steady nerve, but for a moment it was shaken. Then she remembered that this was India, the land of silent-footed servants and furtive ways. She had read somewhere that the few white men in India were subjected to a constant espionage by their own households, and the thought brought a vague sense of comfort, though, again, it would have puzzled Molly to say why.

In the sunny veranda sleep awaited her, and when she wakened some time later it was to find a grave-faced, white-bearded *kitmatghar* at her elbow bearing a tea-tray, while by her side a silver kettle bubbled happily over the spirit-lamp.

As she poured the boiling water over the tea-leaves Molly glanced curiously at the servant,

who still hovered about her. Was this the man who had peered at her round the *portière*? Surely not. This gray-bearded, venerable ancient who moved about his duties with a grave dignity would never be guilty of such furtive behaviour.

Mrs Carlton returned while Molly was still trifling over her tea. In spite of a nebulous decision to confide in her sister, Molly very sensibly preferred to keep her delusions to herself for the time being, and held her peace. She may have been assisted in this by the fact that Peggy began to talk the moment the buggy came to a halt, and by her volubility contributed largely to prevent the creation of a requisite 'atmosphere.' The advent, a little later, of Jim Carlton himself finally dispelled any lingering doubts which may have remained with her. Carlton was bluff and hearty, and of pervading sanity, and although his figure was no longer that of an athlete, it was difficult to escape the conviction that inflated leather had once bulked largely on his mental horizon.

The club dinner, and the concert which followed, proved a more welcome distraction than Molly had expected, and she went to bed that night healthily tired, and slept as soon as her head touched the pillow. Only once during the night did she stir and waken sufficiently to be aware of sounds in the adjoining dining-room, but Peggy had warned her that Jim might have to put in an hour or two at his office, and not to be alarmed if she heard him stirring at an unusual hour. So she dropped off to sleep again, and the sun was high in the heavens and her morning tea quite cold when she was aroused by the boisterous and jammy caresses of her blue-eyed nephews.

III.

Molly had been lying with her hands locked under a mass of raven dark tresses that overflowed her pillow, her eyelids closed, and her mind in the borderland of elusive sleep, when something sticky made itself felt upon her cheek, and the lisping accents of George, the elder of the twins by about a quarter of an hour, invited his aunt to arise and visit their grave.

Molly opened her eyes to be certain she was not dreaming still, and turned her head upon the pillow. 'What did you say, George?'

'Our grave, you know,' he repeated with solemn emphasis. 'The one in the compound where the angel-boy lives. To-day is his birthday, and Tim and me have decorated it with flowers. Course, Juman helped.'

'Juman, you know,' supplemented Tim—'he's our own *chup'assi*—fightfully old, hundreds and hundreds of years. Says he feels as if he'd never be dead. It must be nice to feel like that. All same, says he's going to die with his beautiful red coat on. He's timendously nice, and all winkled and funny.'

[Christmas Number.]

'Talks a lot of stories about the angel-boy, Aunt Molly.' George was solemn in all his utterances. 'Knew him when he used to play like us, an' now he's playin' in heaven.'

'Yes,' said Tim, 'an' singin' hymns like anyfin'g.' He climbed on the bed and sat astride his aunt. 'Uncle Billy says he wouldn't miss it for anything.'

'What did you say, Tim?'

Molly sat up suddenly and caught the imp by his arms.

'You hurtin' me!' cried Tim, looking very frightened. He had never seen his aunt look like that, with her eyes so wide open and eager, her lips apart, and her cheeks aflame.

'You said Uncle Billy, Tim. Do you mean Captain Freeland? When did he say that?'

Tim shook himself free. His wondering eyes were still fixed on his aunt's face. 'He's in there, lyin' in bed with a pipe—not a nice new pipe. Worse than father's. He came by the mo'ning train same as you day before, and he knows a little boy who wouldn't eat his toast, an' he fell frough a hole in his pocket an' got lost.'

'And no one never found him again,' said George. 'Uncle Billy said to cut along and ask you for a hairpin to clean his pipe, an' you can have it back again if you want, and that when he's our real uncle he won't never need to have a dirty pipe, and he won't feel like nothing on earth no more.'

'Did he say that?'

But Molly needed no assurance of this, for the wording was characteristic.

'Go on, Tim. What more did he say?'

'Fed up with life in gen'ral, and to dig you out, an' we'd make a mo'ning of it.'

Molly lay thinking for some time after the boys had departed with the required hairpin. Peggy had not told her that Captain Freeland was expected, and she saw the hand, if not the cloven-hoof, of her brother-in-law very plainly in this, for Carlton was a simple soul who loved nothing so well as to prepare little surprises for his friends. And it may be said of him that at least his intentions were good.

Presently Tim reappeared in the doorway.

'I don't want the hairpin back, Tim, if that's what you're after.'

'Uncle Billy says he's treasurin' that hairpin. He's not givin' it back. Wants to know if you're up yet. He's in his baf whistlin'. Shall I call your baf?'

When Molly appeared on the veranda, Captain Freeland, with the twins behind him, was stalking a sparrow with a pinch of salt. He straightened up at once.

'Good-morning, Miss Carthew. This is indeed a surprise!'

'Good-morning, Billy. Don't talk nonsense.'

'Your word is law, Molly. I've come four hundred miles for no other purpose than to obey you. Shall we start with the vegetables?'

1920.]

'If you like. And do try to be sensible. You've no idea how quick the twins are.'

'Haven't I? They've been sitting on my chest since six o'clock. They're on my side. They are both firm supporters of the cause.'

IV.

They began to make a morning of it. They started with the vegetable-garden, the cow-house, the stables, and the well, and ended at a solitary grave under some low palms just beyond the tennis-courts. It was a carefully tended spot, and to-day the corroded old railing was festooned with strings of marigolds, and red chillies, and jasmine; and banana-plants were tied like mighty plumes at the corners, their fresh green fronds meeting high over the flat stone in a shady canopy.

George ventured the information that Juman had gone to a great deal of trouble over these primitive decorations.

'Juman says all the little boys and girls who comes to this bungalow dec'rates it, because the angel-boy he like it, and to-night we'll light tiny, weenie *chiraghs* and make *tamasha*. And the little boy he'll p'raps come back.'

'Only for a little bit,' explained Tim; 'Juman says he like it too well where he is. Same time, he's liking this sort of *tamasha*. It's diffunt.'

And indeed the little earthenware saucers with their wicks soaked in coconut-oil were already in place for the *tamasha*.

'Can you read what is on the stone?' Molly asked.

Captain Freeland leaned over the railing and peered at the worn inscription. 'It seems to be very badly weathered. From where we are I can only make out "Elizabeth" and "her son." The date seems to be 1857. That is significant.'

He turned and surveyed the distant bungalow intently, and after a pause remarked casually, as though to cover his thoughts, 'It wants doing up.'

'Daddy,' said Tim, looking very important with his hands in his pockets, 'says it wants swopping.'

Freeland laughed and stretched a finger towards the pillared veranda, where an old lady swathed in flowing white raiment was gesticulating wildly.

'Off you go, nippers,' he commanded. 'Ayah looks very excited about something. The first to reach that veranda cleans my pipe with a feather. One, two, three, off!'

Molly's eyes were fixed on the supple figure of her old playmate as he watched the children scurrying over the lawn. The race was a dead-heat. As they fell into the old ayah's arms together the young man turned to his companion.

'Molly,' he said severely, 'I have travelled four hundred miles to have it out with you.'

Molly made no reply to this challenge. Her

head was slightly bowed to afford the speaker an uninterrupted view of the top of her sun-hat.

'Four hundred miles, Molly. Think of that. I also invite you to glance at your past. You have degenerated.'

The girl glanced up sharply. 'Have I a past?' she asked. 'And have I degenerated?'

'I remember you as a girl of character—one who could make up her mind quickly and with decision, and stick to it. When I first proposed to you, you were no bigger than Tim, and you accepted me with enthusiasm. I don't blame you, Molly. I was rather a fine fellow then, with an Eton collar and a knife of my own, and I had just stood you an ice. That, however, was a mere boy-and-girl affair compared with what followed. I need scarcely remind you of the top of a rolling wain of hay. Hardly had my heart been laid quivering at your feet than you had your head out of the litter calling on Hornby, who was driving the cart, to bear witness to our betrothal. Had I not caught you by the ankles you would have been over.'

'I shouldn't. I was perfectly safe.'

'Thereafter our correspondence was marked on my side by devotion, on yours by gossiping irrelevance. Such affection as you displayed was merely sisterly. Years passed, and then you broke to me the fact that you had put up your hair. My experience did not run to the fact that that is synonymous with putting up the price.'

With a grim smile the speaker observed an unmistakable tremor in the sun-hat.

'I came to realise the fact gradually. But there is no price I am not prepared to pay.'

'And yet,' observed the girl quietly, 'you have not written to me for nine weeks!'

'To be precise, nine weeks and three days. You know why. You would have none of me.'

Molly looked up nervously. 'Billy, you know that is not true.'

'Then why on earth'—

'I've been perfectly miserable. You meant to make me miserable. I think you have treated me abominably.'

'I'm a plain soldier, my dear, and not very good at reading between lines. But it struck me that diplomacy had failed, and that it was time to fetch out the guns. I still believe I am right.'

Captain Freeland's hand had been fumbling in his pocket for some minutes. He now withdrew it and took possession of Molly's hand. 'Molly,' he said, as he slipped a glittering hoop over the third finger, 'there goes with this a devotion as deep and enduring as that of the old servant who lights these little lamps to the memory of a child he loved.'

Molly turned with shining eyes and cheeks aflame, and taking a carnation from her breast, laid it on the rusty old railing. Captain Freeland looked away.

'Come along, dear, and we'll tell the children,' he said. 'We can wait in the nursery till they return from their walk.'

v.

The twins spent the day in publishing the marked improvement in Freeland's avuncular status, but beyond this fact Molly's ideas are somewhat confused. In a haze of happiness which left room for few other considerations, she assisted Peggy with the finishing touches to her elaborate decorations, and the ball which followed on a riotous little dinner-party was a fitting conclusion to a wonderful day. But, like the rest of the day, it was past and gone in a flash of colour before it had well begun. Molly awoke as from a dream, to find Captain Freeland tucking the rugs about her as he plucked the reins from their clip on the dashboard, while Peggy threatened to overtake them in the car if they did not hurry.

But there was little need to urge them, for the pony was in no mood for dalliance, and Captain Freeland had his hands sufficiently full. She was a spirited little mare, and the night was frosty. Before many minutes she had spun through the wide gateway and into a long, shadowy drive where the scent of tuberose and jasmine hung sickly sweet. Here the waves of perfume seemed to rouse Molly. She had been lying back almost in a trance, dazed, stupefied with happiness, like a bee lost in a garden of wonderful flowers. She was now aware of a curious impression. It was as though time had stood still and she were looking backward down the years. No longer was this a strange, new place. She seemed to have known it all her life, and the hush that echoed the clap of the pony's feet thrilled her, and the very echoes rang familiar. Familiar also was the white façade of the house, swimming in moonlight through the trees, and the cluster of clear yellow stars burning in the still air by the palms, where the little *chiraghs* strove bravely to cast a beam in an unknown world.

And then an unaccountable fear assailed her. Had they come too late? She could not have said why the question leapt to her brain, or why her fingers closed convulsively on her companion's arm as the dogcart rattled under the porch and drew up. But she knew—it flashed upon her that she certainly knew—that something was wrong.

As Captain Freeland lifted Molly down he felt her grow suddenly still in his arms. He glanced down at her in surprise. Her listening face was turned towards the darkened room to the right of them. A cheery clatter of dishes came to them from the half-open door of the dining-room.

Captain Freeland stared. 'Queer hour to be working with china,' he commented. 'Going picnicking to-morrow?'

[Christmas Number.]

Molly shook her head. For a moment she could not speak. She was afraid—horribly and unreasoningly afraid. It seemed to her that something terrible was about to take place, something it was out of her power to prevent, something connected with that ugly clatter of china going on in the dining-room.

'Cold, little woman?' Captain Freeland drew the thick coat closer about her. 'Wait a minute and I'll see if that noisy fellow can't produce something to warm us up.'

The next moment he was striding across the matting. Molly strove to cry out, to stop him, but she could not. His hand was on the door, when the sounds within stopped. There came the noise of a sharp crash, and the splintering of broken china.

With a cry that reached through the long veranda Molly sprang past him and darted into the room. Captain Freeland, thoroughly startled, was in time to see her run round the table, stumble over a footstool, and fall forward, her hands thrown out as though in an effort to reach some one or something.

He bent and lifted her carefully. She was a slight girl, but she lay in his arms a dead-weight, and he saw that she had fainted.

'Bearer!'

The shout rang through the building, but there was no response. Freeland glanced angrily round. Odd! He could have sworn the man was there, at his elbow, that very instant. Again he shouted.

'Huzo-o-or!'

The voice of the coachman answered him from the porch. Captain Freeland grunted. Let him get Molly to a couch and he would soon have this extraordinary household 'showing a leg.'

He carried his burden out into the veranda, and placed her gently in a long chair, set a cushion under her head, and hurried back to the dining-room in search of brandy. A decanter and glasses stood ready upon the dinner-wagon. Pouring out a stiff peg, he turned back with it to the door, when for the first time it struck him as odd that there was no sign anywhere of their nocturnal disturber. The room wore its usual air of stiff tidiness. Save for an overturned chair, not a piece of furniture was out of place. But the thought of Molly filled Captain Freeland's mind to the exclusion of all else.

He found her lying back as he had left her, her face ashen, her eyes half-closed. Stooping, he slipped a hand under her ruffled hair and forced a drop or two of brandy between her lips. A moment later her eyelids flickered, and he saw the colour steal back to her white cheeks. Yet another moment and she heaved a great sigh and sat up, her eyes wide open, and turned on him with an expression half of consternation, half of amaze.

1920.]

c

'What is the matter?' she asked, seeing the brandy in his hand and the anxious look in his eyes. 'Oh!'

With a sudden, startled cry she held out her hands. The fingers of the long white gloves were wet and stained with blood.

'My darling, you're hurt!' Captain Freeland caught the shuddering girl in his arms and held her comfortingly close. Gently he drew off the long gloves and dropped them out of sight under the chair. Both looked down in surprise at the pretty round arms and dainty fingers thus revealed—no mark marred their whiteness. To all appearance the girl was unhurt. Freeland took up the glass and persuaded her to take a long sip of the brandy, and presently the shuddering ceased and she began to cry, but quietly, and her convulsive hold on him gradually lessened.

VI.

It was not till her sobs ceased altogether and she lay still in his arms that the perplexed soldier let his curiosity get the better of him.

'But what happened, sweetheart? What in the name of moonshine set you off like a squib and'—— He stopped, for the shuddering had begun again. 'All right, dear; don't worry about it now.'

But Molly was herself again, though a very shaken self. She sat up and pushed the hair from a white face in which the eyes shone like great lamps. 'Bill,' she said in a tense whisper, 'I don't know what made me do it—rush into the room, I mean. It was just a feeling, a knowledge, that there was something there—some one wanting help terribly. My dear, it was awful—she was in such desperate need. I had to go. I don't know—I can't tell—but something awful was happening—had happened. I was too late.'

She clutched him feverishly, and her voice fell lower.

'Bill, did you see anything?'

'Great Scott, Molly! You haven't fever, have you? Your hands are like coals. See anything? Of course I didn't see anything. There wasn't anything to see. Not so much as a teacup on the table.'

He laughed uneasily, for there was something uncommonly queer about that.

'Bill, you are sure you saw nothing?'

'Nothing whatever. Come, my dear, be sensible. Here's the car coming up the drive.'

'Oh, Bill, you must have seen something!' Molly's voice rose in almost a wail. 'Just before I fell I trod on a broken plate. I felt it go scrunch under my foot.'

'Nonsense, my dear girl.'

Captain Freeland rose to greet the Carltons as they alighted. He made a strong effort to snatch back his usual careless manner, and it may be

that the carelessness was a trifle overdone, for Carlton glanced at him sharply, and Peggy, after a quick look up and down the deserted veranda, hurried towards the girl seated in the shadows by the drawing-room door.

'Molly, my dear, what is wrong? Has anything happened?'

For Molly had turned her white, strained face to her sister. Peggy sat down suddenly on the arm of Molly's chair, and their eyes met in a long stare.

'Oh, Molly, what have you seen?'

Molly sat up and caught her sister's shaking hands. 'You know? You have felt it too? Peggy, what is it? Oh, it was awful.'

Mrs Carlton stroked the girl's bowed head. Molly was trembling, and her face was hidden in the elder woman's dress.

'Poor old darling,' Peggy murmured consolingly. 'I didn't say anything to you, for I hoped you would not notice.'

Molly raised her white face. 'But what is it? Something awful happened in there to-night.' She nodded towards the dining-room door. 'Peggy, what was it?'

'My dear, I don't know. I have never really seen anything. Not really *seen*. Tell me what happened. I'm dying to know.'

Molly told her briefly, and Mrs Carlton nodded her head.

'Yes,' she said, 'it's just like that, but one sees nothing—at least I never have, and I have heard it many times. And twice—only twice—I have experienced that awful dread. The first time it nearly killed me. I was afraid to tell Jim. He thinks it's all imagination, but—well, you can't get a servant to sleep in the veranda. There is no need for a watchman here, even if you could get one to come. But let us move into the drawing-room. It's cold here, and I see Bill has coaxed the fire into a blaze.'

They wheeled a sofa towards the fire, and sat down in the genial warmth. Captain Freeland was squatting on the fender-stool, absently poking at the glowing coals; and presently Carlton came in carrying a silver tray with glasses and a decanter. He set down the tray on a small table and surveyed the silent company. As he looked from one to another a frown gathered on his somewhat anxious face.

'What is the matter with you all?' he asked. 'You look as if you had been seeing ghosts. Molly, you are as white as a sheet; and you, Bill, my friend, would be none the worse of a peg.'

There was silence for the better part of a minute while the three people addressed looked at one another a little guiltily. No one appeared anxious to begin what, in the presence of this philistine, promised to be rather a difficult explanation. At last Peggy found her voice.

'Jim!'

She hesitated as her husband plunged his

hands in his pockets and came nearer, regarding her with amused suspicion.

'Have they been breaking the china again?' he asked.

'Yes, they have.' His wife glared defiance at him.

His face betrayed the greatest astonishment as he looked from one to another, and asked, 'Who heard the fellow this time?'

'I, for one.' Captain Freeland's demeanour was inclined to truculence, a perfectly natural attitude for a champion with nothing better to rely on than the evidence of his own senses. 'And so did Molly.'

'Ah, then we have evidence at last,' remarked the sceptic soberly. 'Did you *see* anything?'

'You'd better ask Molly. All I saw was the blood on her gloves.'

Carlton, pulling forward a chair, subsided massively directly in front of the girl. 'Now, Molly,' he said impressively, 'tell us all about it. What did you see? And please remember that hearsay is not evidence.'

VII.

Molly leaned forward and described the adventure simply. Her story was corroborated with approving nods from Captain Freeland, and Peggy's look of triumphant vindication did not escape her husband's notice. How often had she told him just such a tale? Had the clattering not gone on in his very presence?

'I know, Peggy. I know,' he said in answer to the look as the story came to an end. 'My coarse clay is outside the pale. These séances are wasted on me. But you will observe that nobody seems to have seen anything so far.'

'What about the gloves?' asked Freeland.

'Then we have something tangible, after all! Produce them, Bill. Produce them.'

Captain Freeland rose and walked out to the veranda. A moment later he returned and held out the long gloves in view of every one.

'Well?' asked the sceptic, with a sly glance towards his wife.

Molly's eyes grew round as they searched in vain for the crimson stains.

'Why,' she cried, 'they're gone!'

Captain Freeland's hand was trembling, and his mouth was as wide open as Molly's eyes.

He dropped the gloves one after another upon the fender-stool.

'Well, I'm'—he began, as Carlton lay back shaking with quiet laughter.

This was too much for Peggy. She jumped up and stamped an angry little slipper. What annoyed her as much as anything was the fact that Bill Freeland was visibly weakening. Indeed, he was heard to murmur something suspiciously like 'rational explanation.'

'Surely, Bill,' she exclaimed with withering contempt, 'you don't doubt the evidence of even *your* senses?'

[Christmas Number.]

Captain Freeland felt that he was in danger of becoming involved in a family dispute. He would have preferred to take up the conventional attitude towards that which is beyond the ambit of common experience, but felt it would be unchivalrous to leave Molly to fight it out by herself.

'N-no,' he stammered. 'Oh no. Certainly not. I heard 'em, right enough.'

He had picked up the gloves once again, and was running them through his fingers.

'And we saw the blood distinctly. Couldn't both be mistaken, could we?'

Silence followed the question. Whatever Carlton may have thought about it, he refrained from comment—an unsportsmanlike attitude which Freeland resented.

'Hang it all,' he exclaimed angrily, 'it was wet!'

Carlton rose with an overdone stage shiver, tiptoed across the room, and peered nervously under a couch. He looked up in time to avoid a well-directed sofa-cushion, and drew himself up with dignity.

'I can't argue against personal violence,' he declared. 'Not a man of my figure. When young people begin to get disorderly, it's high time they were in bed.—Peggy, that imaginative girl had better sleep with you to-night.—Bill, I'm going to smoke a last cigarette before turning in. It's a shame to leave a fire like that.'

VIII.

As soon as the men were alone Carlton's demeanour underwent a change. He stood with his back to the fire and looked down gravely on Freeland, who sat huddled in an easy-chair, filling his pipe.

'Bill, I'm going to tell you a story.'

Struck by the serious note in his friend's voice, Freeland glanced up expectantly.

'I had rather discuss'—he began, but Carlton stopped him.

'All in good time, Bill. Let me tell you the story first.'

He selected a cigarette from his case, lighted it, and threw the match into the fire. Thereafter he seated himself in an easy-chair and leant forward, gazing abstractedly into the fire as he smoked and talked.

'In the year 1857,' he began thoughtfully and with great deliberation, 'there dwelt in this house an Englishman with his young wife and a little boy. He was their only son, and to-day happens to be that little fellow's birthday. Of the man himself I know nothing, but I like to think of the wife as beautiful. She was certainly a woman of courage, who saw to it that her husband's resolution never faltered; who kept bright and staid, with a song upon her lips, the keen-edged sabre which he—Heaven have mercy on him—shrank from touching. For he
1920.]

had run out of powder and shot, like the rest of this little station, and had no means of procuring any.

'News did not travel fast then—even bad news—and though it was known that the country was up, that the great mutiny was an accomplished fact, the extent of the danger, together with its probable direction, could be gauged only by bazaar rumours filtering through one's servants. These became daily more disquieting, but it was not, of course, safe to allow for exaggeration, and this little station, isolated by nature and cut off on every side by murdering hordes, knowing not at what hour of the night death might leap out on them—a cruel, hideous death at the best—lived on with sinking hearts, looking for a sign. We still count on a warning, you know, but the difficulty is to recognise it when it comes. This woman, Bill, left little to chance. She, along with a few others of her kind, provided for the worst. Trusting not in warnings, they made their husbands promise and swear terrible things on their prayer-books. As a consequence she lies in that grave out there along with her son.'

The speaker paused for an instant, and then resumed.

'Try if you can to picture the feelings of those men, the thoughts that made cowards of them in the grim night-watches—and we may depend upon it there were sleepless nights, and to spare. The husband—he was a planter, who had begun life on the sea—used to hang over the boy's cot for hours at a time when he thought every one else asleep. But Juman, the *chaprassi*, was watching.'

'Do you mean'—

'Yes, the old chap with the red coat tricked out with gold braid. He must have been a comparatively young man then. He told me the story one day when I displayed a particular interest in the grave. It was after Peggy had begun to hear the breaking dishes that I, noticing that these experiences coincided more or less with the decorating of the grave, threatened to turn the fellow out of the compound. I expected him to be either scared or angry, but he was neither. He simply told me the story, and then asked me if I believed that he could possibly have anything to do with such an extraordinary manifestation. From the manner of his telling I gathered he had little sympathy or respect for the father. He had been the child's own servant, and must have had some good reason for his devotion, for he has never abandoned the compound; and every Christmas, and at three other dates in the year—birthdays and the night of the tragedy—he adorns the grave as you have seen, and sleeps, or rather lies, upon the stone. For I have no doubt it is some form of vigil.'

'I suppose,' remarked Freeland, looking up, 'that every native is a possible devotee.'

'Oh, I dare say. It is a pity their devotion,

whatever form it takes, is almost certainly a tribute to false gods. This man is probably expiating some sin, or implementing some solemn vow. He may have taken it rashly, in a hasty moment; but there it is. He has sworn before his gods, and what is a life's discomfort to an eternity of degradation?

'Well, it happened. A few got away to perish unheard of, others to turn up leagues away after incredible privation. They got their warning all right, but it was shorter than they had counted on; and when the mob—not the mutineers, but the dregs of the bazaar—broke into this compound, the wife was on her knees in that room, packing a small tiffin-basket by the light of a hurricane-lamp. This basket had been long in readiness for a hurried departure, but there were finishing touches to be added. The boy was beside her, a curly-headed, blue-eyed little fellow of six, laughing and getting in the way. It was all a splendid picnic to him, poor little mite.

'Behind his wife, by the table, stood the husband, his sabre strapped at his hip, and he was handing down a plate when the doors were suddenly burst open, and the rioters, who had crept to the house unheard, poured in. Without a moment's hesitation he flung down the plate. His wife looked up in alarm, and before the splinters of china had done spinning, the sabre was playing in the lamplight, and the first chapter of that night's work had been written.

'The man had kept his promise, and now he wreaked his vengeance. The old servant tells me he drank blood that night, and I do not doubt it must have been a very complete vengeance indeed. But the bitterest part was to follow, for the rabble had no stomach for that sailor's style of fighting, and those whom he failed to corner pressed on to easier conquest. How was he, poor devil, to know that had he fought from the first all would have been well? He could not possibly know that the mutineers, having other work in hand, had passed on. This bungalow, you see, is rather out of the station.

'That is the story. As for your ghosts, or whatever you choose to call them, why try to account for what by its nature is unaccountable? You can theorise to your heart's content, but you won't prove anything either to your own satisfaction or anybody else's. I've never heard them myself, but I'm not complaining. They seem to be at their best about Christmas and those other dates I mentioned, and the white-haired old *dirzie* who sits on the veranda and stands between Peggy and death from inanition tells me that has always been the case. We all know the stock explanations—the dominating, brooding intelligence that affects certain types of mind and not others, and I fancy that is the nearest we shall ever get to it. At any rate,

Bill, it's good enough for me. You had Molly's influence against you, as well as that other.'

IX.

Freeland did not reply, but knocking the ashes from his pipe, strolled to the door and opened it. He looked up at the clear, starry heavens, but that was not what he had come to seek. What he desired to see was the little yellow lights 'making *tamasha*' on the lonely grave by the palm-trees, and it was with a curious feeling of disappointment that he found all the lights out except one, and that one burning low.

'After all,' he observed, closing and locking the door, 'it is difficult not to bother. One can't get away from the fact that we both saw the blood on those gloves.'

'A shadow, Bill. A shadow. You were ready to imagine anything.'

'Well, perhaps. I'd prefer to believe it was a shadow. But, as I said, it's difficult not to worry about it, especially now that Molly knows so much.'

'Nonsense!' said the other, rising and throwing his cigarette into the fire. 'Peggy knows as much, but I have not thought it necessary to tell her the story. If she thought that pitiful business was being re-enacted in there at stated intervals, she'd go out of her mind. But come along. We'll have other things to think of in the morning.'

In this, however, he was mistaken. An old bearer crept into Carlton's room at a very early hour of the morning and roused him, and when Freeland opened his eyes an hour or two later, it was to see Carlton sitting on the side of his bed with a cup of tea in his hand. His face was unwontedly grave.

'I was just making up my mind to rouse you, Bill. I must talk to some one. I'm terribly shaken.'

Freeland laid his hand on Carlton's arm.

'No, Bill, it's nothing you can help me with. I've received a shock, and I want some one to help me to think. You remember that story I was telling you last night? Well, I have just seen the end of it.'

He sipped his tea thoughtfully and went on. 'This morning the bearer called me up very early to tell me that the old *chaprassi* was dead. I found the old fellow lying on the gravestone within the railings, wrapped up in his blanket. His head rested on his turban, and he was wearing his red coat, the badge of his servitude.

'As it would never do for the children to find him there, the bearer and I carried him to his quarter—there was nobody about to see—and laid him on the ground, for he possessed no bed of any sort. It was an ordinary servant's quarter, scrupulously clean, with a little courtyard enclosed by grass matting to give it some sort of privacy. A little to one side was a

[Christmas Number.

chula, a cooking-place made of bricks covered with mud, where he prepared his food.'

'Nothing unusual in that, is there?' Freeland asked.

'No; nothing. The poorest of our three hundred million can command as much. The entire furnishing of the place consisted in one or two cocoa and biscuit tins containing condiments and rice, a few cooking-utensils of brass, and a longish dealwood box fastened by a hasp and staple.

'I was about to turn away, when the bearer suggested I might glance through the old man's personal belongings, as he was without relatives. The box being securely padlocked, therefore, I told the bearer to look for the key, and as it was not in the pockets, the bearer undid the dead man's red *chapkan* to see if by any chance it was hanging about his neck.

'It was there all right, but so also was a large, old-fashioned locket containing two beautiful miniatures on ivory. One was the portrait of a remarkably handsome woman, the other that of a curly-headed child of five or so—a merry, laughing, mischievous little face.

'And then the truth began to dawn on me, and I drew back the woollen vest on which the locket rested. Bill, the chest, for all it was like parchment with incredible age, was that of a white man, and on the thick of the forearm there appeared tattooed a wreath and an anchor

surmounted by a crown, and the name H.M.S. *Orion*.'

'Ah, he must have been one of those middies we used to read about as boys.'

'Possibly. His log will show that. It's on the floor beside me—half-a-dozen volumes of it. Look at this.'

Carlton stooped and lifted something from the ground. It was a heavy old cavalry sabre.

'It was in the box, under his few scraps of clothing, and you may mark the fact that it has never been cleaned. And this,' he added, holding out a tattered little volume bound in ivory boards, 'is another reminder. Read the inscription.'

Freeland, who was by this time sitting up in bed, took the prayer-book in his hand and coned the faded ink on the flyleaf. He bowed his head over the page rather lower, and rather longer than was strictly necessary, for there was not much to read.

'For sixty years a servant in the house that was once his own,' he mused. 'And this may have been the book on which he swore.'

But Carlton cut short his reverie.

'We'll bury him alongside of his own. I'm wondering what we are to tell the children.'

'Tell them,' said the soldier, 'that the other little fellow came back for his *chaprassi* last night, and that the old gentleman took his beautiful red coat with him.'

THE BEST SONGS OF ALL.

I HAVE sat by a Cossack camp-fire and heard the
soldiers sing,
With the red light on their faces as they made the
wild hills ring
To songs of headlong charges, till one almost seemed
to hear
The beating of the horses' hoofs, and the clash of
sword with spear.

I know the measured cadence of the dark canoe-men's
song,
As, swaying to the paddle-stroke, they urged their
boat along
Down the palm-fringed river where the hippo splashed
and played,
And the mangroves spread their snaky roots beneath
the jungle's shade.

I remember the sweet singers of many a distant
land;
Have listened to an emperor's choir within a palace
grand;
Heard gladsome voices that rejoice, and the fierce
war-like call;
But the melodies of Britain, I love them most of
all.

Her sons who sail the world around and keep the
old flag free
Have earned the right to sing of her as Mistress of
the Sea;
But though Britannia rules the waves, it's not by
deeds of shame,
For nations alien to her race have cause to bless
her name.

And what can cheer the longing hearts of wanderers
o'er the foam
Like to that tender melody that tells of Home, sweet
Home?
And who can match the kindly song when hand and
voice combine
To conjure up in friendship's name the days of Auld
Lang Syne?

And give to me a sailor's chant to the swing of the
capstan-bars,
When the anchor breaks from its ocean bed, and the
cable clanks and jars,
For it's up and away from foreign soil to rest on
British ground,
And every voice will join with joy in the song of
the homeward bound.

R. O. D. ROSS-LEWIN.

A QUESTION OF PRIDE.

By CHARLES SIDDLE.

L

THERE is much to be said in defence of the parent who attempts, prudently or otherwise, to influence the choice of a daughter approaching marriageable age—much! But it has been said so often, by so many indignantly virtuous parents!

I would have evaded Sir Jacob Dring if I could decently have done so, for I detest the man; but my position was badly chosen strategically, and he had me cut off. I resigned myself to the inevitable.

'I appeal to you, major, as a reasonable man. Is this good enough?'

I believe all self-made men pride themselves on the elimination of the trimmings of conversation. Personally, I don't like it.

'I'm afraid I don't follow you,' I said. 'Good-evening, Sir Jacob.'

The fat little man humoured me, but it was not done neatly. As an adult speaking soothingly unto a child, so humoured he me.

'Oh, good-evening, major; good-evening. I'm upset. I am, really. This boy-and-girl business between your friend Mallory and my daughter is getting past a joke. It must be stopped—at once!'

Well, I was with him there. Young Eric Mallory shares chambers with me—he is the son of an old comrade—and he is far too good a boy to be wasted on the daughter of a successful soap-boiler. I had told him so with much emphasis, and I was determined not to submit without a struggle. But, personally, I hadn't much hope.

'I should be glad to see it stopped,' I said, 'but at present I don't see how we can do it. They seem determined to marry.'

'Marry! Did you say marry? I'll see them both—I'll see them—— Why, damn it, major, do you think I've raised myself to this—this position—he nearly said 'height'—'only to see my daughter marry a penniless young waster like Mallory? Be reasonable!'

I looked at him with some distaste. I don't like stereotyped points of view and penny-novette attitudes to life. Hang it all! a man owes it to himself to break away from the lines laid down for him by every sentimental scribbler since Richardson. I have always argued that no sane man would act as a posthumous justification for an old story, but here was Sir Jacob Dring doing it obstinately in my hearing; and, besides, what right had he to object to Eric?

'Eric is not a waster, and he is not penniless,'

I said coldly; 'but if you feel like that about it, why not put an end to the whole affair!'

'But I can't, major; I can't. That's the trouble.'

This was becoming boring. I got up. 'Oh, very well,' I said, covering a yawn. 'In that case, nothing remains to be done. Good-night, Sir Jacob.'

The little man became positively apoplectic. 'Here, I say, arf-a-mo—I mean, wait a minute,' he said. 'This is your concern as much as mine. The boy is your ward. Tell him what you think about it, and make him see reason.'

The man was actually endeavouring to bully me into taking over his job! Besides, if he would only keep his daughter in her place, there would be no need for any concern.

'My dear sir,' I assured him, 'Eric is not my ward, and if you knew how strongly I have protested, you would not look to me for help. I have done my best, and failed. The only hope is with you and your daughter. I don't want to discourage you, but if Eric says he intends to marry your daughter—and he certainly has said so—then he will marry her, unless'—— I paused.

'Unless?' echoed Sir Jacob anxiously.

'Unless your daughter, being younger than he is, is correspondingly more emphatic that she will not marry him.'

I watched his face with some curiosity, being anxious to know what Hetty Dring was likely to do. Eric had not, when I saw him last, discovered that important fact. Judging by Sir Jacob Dring's face, neither had he. He hesitated, not meeting my eyes, and then lowered his voice.

'To tell you the truth, major,' he said unhappily, 'I don't know what Hetty'll do. I—I never did. It is not a right state of affairs—now is it?—but I never did know what she'd do.'

I felt rather sorry for the little man, not because his daughter was a mystery—good heavens, what did the fellow expect?—but because he took it so much to heart.

'My dear Dring,' I said more cordially, 'take my advice and leave 'em alone. You can't do any good by interfering, and you might do a lot of harm. Give 'em their heads and trust in Providence, as ninety-nine out of every hundred modern parents have to do. It is the fate of our time.' I paused, then added feelingly, 'Thank God I'm a bachelor!'

My generous philosophy was wasted on him.

'Then you won't do anything?' he asked, going stubbornly back to the original question.

[Christmas Number.]

He might have been a woman! One doesn't mind this convenient inconsequence in the other sex, but a man should really listen.

'Don't say "won't," Sir Jacob. I cannot.'

He sighed resignedly. 'I didn't think you would,' he said, again ignoring my correction. 'Good-night, major!'

'Good-night.'

II.

I watched him go slowly out of the club. His back looked very obstinate. I sat quite still for a long time, speculating profitably on the ways of parents and the worries of family ties. I often do. It is the only compensation I can claim for an early disappointment. Eric found me, half-an-hour later, still thinking; but the compensatory joy cannot have been very evident in my expression.

'Why so sad, fond lover! Prithee, why so sad?' he quoted, laughing. He was in very good spirits.

'I was not sad,' I said indignantly; 'I was congratulating myself on having no family.'

'Quite right, sir; quite right,' said Eric with ridiculous gravity. 'It would be deuced awkward to explain if you had—deuced awkward!'

The sense of humour of children! I dropped the subject.

'I have recently suffered under your friend Sir Jacob Dring,' I said. 'He desires me to use my authority with you.'

Eric laughed delightedly. 'A jolly good notion, too,' he said. 'Fire away, sir.'

'Thank you! I am at present tired of trying. Have you any news?'

'News? Good news, pressed down and running over. I shall win her, sir. I shall win her. What a girl she is! I can assure you, major'—

'No doubt,' I said. 'You have done very little else since I knew you.'

'Oh, I say, don't be childish!' (I am sorry, but this is the way my junior speaks to me.) 'I am the happiest man ever—I am really. Hetty told me to-day that she will marry me if I can persuade her father to give his consent.'

This was distinctly encouraging. Judging from Sir Jacob's expression when he left me, he was not likely to fulfil the conditions.

'I see!' I said. 'And you think'—

'Think! I think nothing. I'll have that consent within forty-eight hours. A man cannot waste his time thinking about a small matter of that kind when he has succeeded in a miracle! I tell you, sir, it is a miracle. A girl in a million, and—and she will condescend to me! Why I can't tell you. No man could tell you.'

'No, indeed,' said I, stooping to an old joke. Eric was too much in earnest even to be annoyed.

'You don't know her, sir, do you? But I'll bring her to see you, and then you'll know what life can do for a man. Her eyes—— But you've 1920.]

heard all this before.—Here, waiter, bring me a bottle of—what shall I say?—it must be worthy of her, but not vulgar—I don't know—oh, I can't think—bring me—— Dash it all, major, what shall we have?'

'Bring a half-bottle of good, dry 'Montillado,' I said.—'You need no stimulant, Eric; and, by the way, how do you propose to convince the old man? He is very determined. Does Miss Dring insist upon his willing consent, or may you—ah—assume willingness?'

'Oh, she wants him to consent gladly—that was how she put it. You don't know Hetty. She is fond of him, and she wants him to be happy too. Jolly decent of her, I think!'

I agreed; but it seemed to me to complicate matters. In my experience, parents reverse the maxim familiar to us all—they can be driven, but not led! But as I was not anxious to welcome Miss Hetty Dring, I was more relieved than I cared to show. Perhaps nothing would come of the affair, after all.

III.

Forty-eight hours is not a long time, except in prospect for the very young, and Eric did not achieve his victory within the time he had allowed himself. Indeed, at the end of forty-eight hours he was inclined to be despondent. The first flush of inspiration was fading, and he was beginning to wonder why Hetty need insist on so old-fashioned a trimming as a parent's blessing. As for the old man's money!—words cannot express Eric's contempt. Hetty, on her side, agreed that financial considerations were negligible—not contemptible—but maintained that her father was extremely reasonable as a general rule, and that much might yet be done to resign him to the prospect of such a son-in-law. Unfortunately for his chances of success, Eric made two attempts to rush the enemy's position; and as his best friend cannot credit him with the bump of diplomacy, the interviews were stormy and staccato in the extreme. So far as I could gather, references to lunacy, pig-headedness, old-fashioned notions, and selfish prejudices formed the burden of Eric's song; and spluttered complaints of impertinence, profligacy, fortune-hunting, and idiocy relieved the charged-up feelings of Sir Jacob Dring. I don't doubt both men felt some relief at getting their opinions ventilated, but the practical results were on the debit side of the conciliation account. It was very evident that an arbitrator was urgently needed, but I felt no call to the higher life.

Negotiations being at a standstill, I was not surprised to receive a visit from Miss Hetty Dring. It was easy to guess that Eric, unable to penetrate what he called my armour of selfish indolence, had suggested to the lady that a personal appeal would be useful; and as I looked at the very charming young lady who faced

me across the fireplace, I admitted that he was right. Hetty was not at all like her father—there was no hint at breathless sociability, no sign of doubtful but pursuing half-breeding. Whatever her origin, Miss Dring was a beautiful and very well-bred girl. Moreover, she had intelligence. I liked her at once, and felt a trifle ashamed of my stubborn neutrality. The friendly sincerity of the clear gray eyes, the firm but not unsympathetic lips, and the healthy natural beauty of the face promised just the balancing sense of humour mixed with responsibility necessary to correct Eric's optimistic carelessness. By sheer good luck he had blundered on the best possible mate for him.

'I wanted very much to see you, Major Holloway,' said Hetty, smiling at me adorably, 'because I knew I should like you very much, and because I wanted you to like me. You are almost like Eric's guardian, aren't you?'

I smiled. 'You know Eric, I think?' I said. It was delightful to see how quickly she took my meaning.

'I know,' she said. 'But, all the same, even a nominal guardian counts with a girl at a time like this—and I want your help.'

It was as I expected. The post of arbitrator—or, more correctly, advocate—was to be thrust on me.

'Anything I can do'—I said, without much enthusiasm.

'Thank you,' said Hetty. She drew her chair just a little nearer. 'You do think a lot of Eric, don't you, Major Holloway?'

I nodded gravely. I do, you know. He is a worry sometimes, but the best boy on earth—and the son of my old friend Mallory. Besides—I am almost ashamed of the ordinariness of my story, but it is true, nevertheless—his mother was the only woman who ever troubled my happiness, and—

'Yes,' I said, 'I think a lot of him, Miss Dring, and his happiness concerns me closely.'

'Oh, then, it will be all right,' said Hetty, smiling at me sympathetically with the innocent eyes of a child. 'Then you won't mind being very abusive, and—and harsh—and horrid to my father for a little while?'

I stared at her in amazement. 'Really!'—I said.

'I know. But it is the only way. Listen!' She crossed over to my side and whispered, not because we were likely to be overheard, but because all women like an atmosphere of secrecy and mystery. It was a startling request she made, involving another interview with her father and a sort of active partisanship; but her visit had influenced me, and, moreover, the task allotted to me appealed to my sense of humour. We had tea together, and elaborated our plan of campaign; and I think the most potent factor in winning my consent to become an accessory before the fact was the pleasure of giving Eric

the victory in spite of himself. I could imagine his down-fallen air when he found that, after all, he owed something to me. When a man gets to my age he likes acting as a beneficent Providence—or, at least, as a deputy for one—and I was an easy victim. When Hetty left me I was pledged to secrecy and to falsehood—a very reprehensible position. In the light of after-events, I cannot sufficiently admire Hetty Dring's innocent expression and the sincerity of her gratitude. I felt quite pleased with myself, and went out to my club with all the rakish gaiety of a thorough reprobate.

IV.

When a man of my age embarks upon diplomacy he is playing with edged tools, but, fortunately, he doesn't always know it. I greeted Sir Jacob Dring with marked coldness when we met at the club soon after my interview with his daughter.

'Look here, Dring,' I said, knowing his distaste for that form of address, 'have you settled that ridiculous affair between your daughter and my friend Mallory?'

'Settled it? How do you mean, settled it? I've put my foot down and forbidden any more nonsense between 'em.'

'Oh!' I said doubtfully. 'And do you think your daughter will give him up now and relieve his friends of any further anxiety?'

The change in his manner was astonishing.

'Anxiety? His friends! What the devil do you mean, sir? What have they to be anxious about?'

I relaxed my manner a little and became confidential. 'Well, you know, Sir Jacob,' I said, 'the boy has his way to make, and his mother is beginning to worry. We want him to do well, and in his circumstances he cannot afford a foolish marriage.'

The man positively gaped at me. 'Foolish marriage!' he repeated helplessly, quite lost in the incredulous horror of such a description.

'Exactly,' I said. 'We are thoroughly agreed on that point. My boy needs a lift which only a well-chosen wife from his own class can give him. Your daughter needs—well, I don't have to tell you that. It is not my affair. But my promise to see he doesn't make a fool of himself is being made very difficult. I am sorry to have to complain, sir, but it is my belief your daughter encourages him; and he never could resist a woman.'

The speech which had been boiling up in Sir Jacob's heated mind now threatened to overwhelm him. I have never seen a man so helpless before the rush of his own eloquence. The words began to release themselves in a tumbled mass, and for quite a long time I listened to a very comprehensive lecture on impudence, social strata, and much else of a like nature. I gathered that Sir Jacob resented bitterly any

[Christmas Number.]

suggestion that Eric Mallory was manifesting folly in desiring Hetty Dring. If he looked in the highest quarters until the day of his death, he would find no other so suitable or so desirable.

'But, my dear sir,' I said at last, 'I quite thought we should have your help.' This rather cut him off from his base. He began to wonder what he really did want, and before he could decide I attacked again. 'Yes,' I said, 'I quite thought—indeed, I led his mother to think, too—that you would see reason. "Sir Jacob is a man of the world," I said to her only last night, "and he understands that it wouldn't do. His daughter is young, and fancies herself in love; but he will show her how impossible it is for a young man in Eric's position to sacrifice"'——

I had no time to continue. The word 'sacrifice' hit the bull's-eye.

Sir Jacob Dring ascended in a blaze of glory. 'Sacrifice, sir! Sacrifice!' he shouted, regardless of club rules. 'I never heard such snobbish nonsense in my life. If Hetty wants him, she shall have him, and we'll soon see whether there is any sacrifice. Damme! I'll give them the smartest house in London and the smartest wedding. I'll make him marry her now, if all his relatives cut him off for it; I will, by ——!'

It seemed to me that I had done all that could be expected of me, and as the noise was becoming a general nuisance and threatening to get me disliked, I left the enemy in possession of the field. Certainly Hetty Dring knew her parent, and possibly she was sincere in saying she loved him. Personally, I loved him not at all, especially when in eruption, and I retreated hurriedly and without dignity.

v.

I was pleased and proud of my success as a diplomatist. There is no question of the fact that my skillful handling had saved an awkward situation. True, Hetty had suggested the plan to me; but it is the execution which stamps success or failure on a scheme. As I went home to my rooms that evening I felt more interest in the affair than I had entertained hitherto. Somehow, the feeling that one has made a match possible renders excitement natural and proper. I forgot all about my objections to Sir Jacob and his soap-boiling.

Eric was very late in returning—disgustingly late. I waited, expectantly, until an hour long past decency, and still he had not returned. I was fairly confident, but every now and again doubts would intrude. Would the salutary effects of my remarks have worn off before the old man was committed definitely? Could Eric be trusted not to spoil everything by some indiscretion? Was even Hetty safe? I wished I could have been there to supervise them all. It is maddening to contemplate one's good work
1920.]

hopelessly ruined by some other person's carelessness.

Eric returned. 'Well?' I said eagerly.

He looked down on me with a curious smile which might have meant anything. 'Well!' he echoed tantalisingly.

'Is it all right?' I asked.

Still Eric did not reply directly. 'Are you very eager for it to be all right?' he asked curiously. 'I mean, eager for your own sake. You really want me to marry Hetty?'

I could have shaken him. Had I gone to all this trouble for nothing? 'You—you are not going to tell me you don't care for her? Why, confound you! the girl is too good for you. If I were your age I'd be mad for her. Mad! Have you no emotions at all, you modern young men?'

Eric laughed, and at last I caught the hint of repressed excitement. 'Don't worry, major,' he said. 'I—I'm nearly crazy with joy. It is all right. Sir Jacob is a perfect trump. We are to be married at Easter.'

I jumped up and clutched his hand. 'Oh, good!' I said. 'Congratulations!' I hesitated, half inclined to tell him what he owed to me; but I didn't know whether Hetty would approve, so I said nothing. I needn't have bothered!

It was perhaps twenty minutes later. We were sitting over a cigar and a last whisky. Eric looked across mischievously. 'You know, major,' he said, 'Hetty is a positive marvel. The way she managed you two men'——

I sat up. 'Managed! What do you mean?' I asked, startled and a little uneasy.

Eric laughed. 'I should think you would be able to guess,' he said. 'Don't you remember how we started out? Hetty and I were keen; you and Sir Jacob were strongly antagonistic. You didn't fancy soap-boiling; he didn't fancy a penniless son-in-law with nothing but family and remote prospects. Now you are as keen as can be, and so is he. Why?'

My uneasiness grew deeper. Had I been so clever, after all? 'Well?' I said.

'It was Hetty's idea,' said Eric, 'and I must say it worked. Successful diplomacy is your price, and justly outraged pride is his. Confess, now! You felt a lot more enthusiastic after you had been allowed to manipulate the strings?'

For a moment I was very angry. I could see the whole plan now. Sir Jacob Dring was like an open book to his daughter, and by allowing me to exercise a little dictated diplomacy she had killed the two birds with one stone. My antagonism had vanished with his. As I looked into Eric's laughing eyes and thought of the innocent eyes of the girl who had visited me, my sense of humour triumphed. 'I surrender,' I said, laughing too. 'I am beaten, but it is in a good cause.' I raised my glass. 'Here's to the future Mrs Eric!' I said. 'May her shadow never grow less!'

LOCHEIL.

By IAN DOUGLAS.

I.

EVAN CAMERON is a name useful enough for a romantic novelist to handle, but from any one who bears it in real life it demands a standard of merit somewhat difficult to live up to. There is something in it that lures the imagination back across the centuries to the rugged Western Highlands; one looks to see a fearless clansman, and if instead there answers to its call but an undergrown clerk, neither robust nor tanned, there seems to be some mistake.

The Evan Cameron of this story, when he reached man's estate, quite realised his own unworthiness to bear the name. This depressing conviction had been brought home to him only by slow degrees, for, as a boy at school, he was immoderately proud of his ancestry, with no suspicion that the clan, in himself, had fallen on evil days. In Glasgow, where he had been brought up, the name of Cameron was so common that it never entered young Evan's head to test his own or any one's character, whether it were of true Highland stock or not. He was, indeed, scarcely old enough to analyse that splendid clan tradition to which, he never doubted, he was a rightful heir. Clan Cameron to him was an ideal; Loch Eil was an Olympus where noble Highland chiefs held sway more widely than ever did the shadowy old Greeks of the myths; and their clansmen followers were gallant heroes who lived again in the hundreds of their Glasgow namesakes.

Cameron had been carefully brought up. An injury to his ankle, when he was little more than a baby, had left a permanent weakness that made him limp very slightly at times, and the disability, though it incommoded him little for walking, yet so affected his habits that it debarred him from the ordinary boyhood's sports. He was driven, at first by these circumstances, and latterly by inclination, to a studious and somewhat effeminate way of life. In preference to outdoor occupations, he gave his spare time to reading, although his taste in literature always favoured tales of open-air life, of pirates, of Indians, or of his clan's wild traditions. As a result of this seclusion from rough-and-tumble schooldays, during all his childhood he shrank from physical dangers and discomforts.

His own weakness he knew of by many tokens. Two cousins, boys of his own age, lived in a village among the Campsie Hills, some twenty miles from Glasgow, and at times he spent a few summer days with them. This visit, so far as Evan was concerned, was one of

duty, not pleasure, since he little relished the break in his habits inevitable when matched with his stronger cousins. In their wild hill scrambles, or in certain little episodes involving, say, a farmer's orchard, his city training placed him in a sorry light. To be sure, he could have evaded a charge of cowardice, if it had been brought, by pleading his injured ankle, but none the less he would often bitterly regret his own lack of nerve—until, at least, the holiday was over and he could forget his deficiencies, with Fenimore Cooper's aid, in town. For such regrets never worried him long.

'When I am a man,' he consoled himself, 'I shall be brave, like all Highlanders.' And so an unhappy subject was easily dismissed.

It should not be supposed that Cameron's character, apart from his lack of physical courage, was weak, although he would have been the last, in those days, to admit that mere mental or moral grit counted. He was a worker at school. While far from precocious, he had the will and a bull-dog tenacity that made him lay hold on a baffling subject and worry it till he had the mastery. Thus, he hated mathematics; yet he could set his book before him and read and re-read the page of figures till by dint of sheer persistence they were his. He had a confidence in his own opinions, too, which he held with Celtic stubbornness, and that the more firmly because no one shared them. In the school debating society he was the apostle of lost causes, of Women's Suffrage, of Socialism, and the half-dozen other creeds that the boy of 1910 classed as 'rot'; and it was almost his boast that in all his debating career he had only once been on the winning side when the vote was taken.

II.

On account of all these little strokes of personality, Evan Cameron left school at the age of eighteen on tolerably good terms with himself. As a senior at school, he had been allowed to go his own way without interference, and his abstention from larking and games was never remarked on, so that he had almost forgotten the bitter moments of the old Campsie days.

Three months after leaving school Cameron took the step that makes the average Scotsman overhaul, *ab initio*, his philosophy of life—he went to England. Like many of his compatriots, he crossed the border expecting to be received by the Saxon degenerates as a superior being, the son of a Heaven-blessed race. He found instead that he was merely a 'Scottie'; that his new neighbours had never heard of MacConnuil Dhu,

[Christmas Number.]

and thought Cameron rather a funny name; and that he would have to fight hard, and for years, if his superiority was to be acknowledged.

He had been in London, without adventure, for barely two months when he was sent to Farham, a lonely spot in the Essex marshes, where his employers, who were public-works contractors, were erecting oil-fuel tanks for the Admiralty. As there was no living accommodation ready to hand near the works, the whole of the employees, staff and navvies alike, were provided with temporary quarters, and Cameron found himself sharing a large hut with nine others, mostly young civil engineers, and all, except himself, Englishmen.

For the first time in his life, his brief London sojourn apart, the young Scotsman found himself in daily contact with those of another race, and it did not take him long to realise that their sympathies and culture were very different from his own. From every moment of their leisure, he discovered, they would untiringly extract the last drop of entertainment. In the evenings—it was May when he joined—and on Sundays, they played cricket, or even a pretence of tennis on the hard mud; if the weather was bad, there was bridge or euchre until midnight; and at least weekly a taxi would be phoned for to take them to Netleigh, the nearest town which boasted a music-hall.

Cameron was admitted readily to these little parties, and at first, not wishing to appear ungrateful to his new friends, he joined in whatever was going on. Soon, however, the novelty palled. He was neither cricketer nor tennis-player; cards and the theatre he had been brought up to regard as luxuries to be sparingly indulged in, and he grudged their claims on his time. He began to excuse himself, and to fall back on his books, and on what is more real than books to his race—his imagination.

Now, to be truthful, his English friends had occasionally found the stolid Scotsman prove rather a drag on their exuberance, and, though ready enough to welcome him, on grounds of 'decency,' so long as he was willing, they dropped him without protest when he drew back. Thus Cameron soon found himself thrown entirely on his own resources, and, lacking the communion of a kindred spirit, developed a persistent habit of introspection that sought to analyse his own character and the traits of his nation, both now brought into high relief among the English.

At his work Cameron was more in his element. His restless industry and determination carried him forward as by sheer weight where his colleagues would often stop dead, or, at best, shelve a difficulty. His duties were, in general, to pick up the rudiments of public-works accounting practice, and, more particularly, to assist the chief cashier in the weekly payment of about a thousand navvies. Hard work he was not afraid of, and the punishment he had

inflicted on his school mathematics swept him through the intricate figuring at easy speed. The cashier, himself still young, soon recognised that his junior was a man to be trusted in emergencies, and singled him from the other clerks when special jobs cropped up demanding a quick brain and a level head. In office-hours, therefore, Cameron enjoyed himself, and would willingly have prolonged them till late at night, for the sheer pleasure of knowing that he was doing good work and building up a reputation. The cashier objected.

'Look here, Cameron,' he said shortly; 'eight hours' brain-work is enough for any one. If you work longer, the quality suffers. This office closes at five o'clock.'

But the cashier remembered to tell the mess that night—his junior being absent—that Cameron was a rattling good man who would get on in the business, and the mess expressed in reply its joint and separate respect for the dour Highlander, notwithstanding its firm conviction that he was a d—— queer chap.

In the mess Cameron was not a shining light. He had been no conversationalist in the Glasgow days, and now in this strange English society his shyness made him even more laconic. His companions were not slow to draw him, attacking him with pretended insults to which he could reply only with an inane smile and a non-committal monosyllable, for he feared that a spirited defence would lead to an argument wherein he would be driven, almost at once, to stammering confusion. To his credit, he took assaults on himself with no resentment. It was only when his country's virtues were questioned that he raged inwardly, and his jealousy for Scotland's honour burned hotly on many occasions, and the more because of his impotency to defend her among such brilliant dialecticians.

'Why,' he sometimes asked himself after one of these dinner-table encounters—'why have they so little respect for Scotland? Clearly they must have some evidence on which to form such scathing opinions.' And the most noteworthy evidence, in his own opinion, was himself. It was his own fault, then, he argued to himself. He was the particular whence they deduced the general, and how could he convince them that he was no true type of his country's sons? These English were manly, courageous fellows, of dominating, overriding personality; he was a bookworm, timid—good at his work, perhaps—but unassertive, confident of Scotland's merits, yet betraying her whenever she was maligned.

Had it only been three hundred years ago—ah, how often would his broadsword have flashed red across that mess-table as he washed out the Sassenachs' insults in their blood! And away his imagination would go on a wild day-dream wherein he was a chieftain of old in his own Lochaber, his blade foremost in battle, and his voice unquestioned in peace. Give him his back

to a mountain rock, with his claymore in his hand, and then let these Saxons taunt him if they dared. But—the reality came back. He had been carefully brought up. There it was; it was all the fault of his upbringing. Had his been the rude childhood of MacConnail's son, to whom even a snow-pillow was refused as effeminate in the wintry bivouac, he would have been different. As it was, he was a townsman, a Sybarite; even among his city schoolfellows, he remembered now, he had been counted rather a muff. He was not a typical Scot; he was but a miserable exception to a glorious rule.

III.

Thus young Evan drifted along for fifteen months, contented enough when working, and in his solitary leisure morose or strangely happy according to circumstances. A fancied slight would bring on a fit of 'blues,' sometimes to be blown away on a lonely walk by the salt air of the marshes, often to run its course for days. Such self-consciousness, say the wise men, is a sign of conceit. It was not so with the Highlander, for in his worst attacks it was on himself that the blame was mercilessly laid; all his pride was reserved for his ancestors, whom he revered as from afar, without forgetting how much he had fallen from their standard. Their history and traditions he knew by heart, for he would read of them for hours together when the others had gone to the theatre. Maps too—maps of Scotland, of the Highlands—he pored over, rejoicing in the Gaelic names—which he could not pronounce—of each river and mountain; planning walking-raids across the moors of the Cameron country; weaving romances; leading Prince Charlie to safety across some mist-hidden pass; trapping a regiment of the dragoons in a desolate glen. On the return of the Englishmen from the town the maps were hastily folded up.

In August 1914 the staff melted away, man after man hurrying to his own county to join up. Evan Cameron stayed behind. His excuses were of the best, for his weak ankle would certainly not have passed an army doctor thus early in the war, and, if any one was indispensable, he could claim to be, since the cashier had been the first to go, and Cameron now found himself in charge of the whole local accounting for the contract. This promotion doubly made for his happiness, for not only was it a recognition of his abilities, but it gave him less leisure for melancholy thoughts, since with a short-handed staff the office-hours no longer ceased at five o'clock.

For the first six months of the war, therefore, Cameron was fairly content. During the whole period he never had a day off, and, except for a weekly run to the bank at Nettleigh, was never more than four miles from the works, so that the recruiting tide passed him by unnoticed. All the remnant of the contractor's staff were, for various reasons, in the same position as himself;

and as no white-feather ladies ever ventured across the marshes, Cameron's status as a supposititious army-dodger was not specially evident. The daily papers, of course, he read, with their exhortations, but his were not the emotions to be easily stirred by a leading article. Working, as he did, some eleven hours a day, he could assure himself that he was, at least, no slacker. As for enlisting, he had never regarded the army as having any connection with himself, and now, in the isolation of Farham, it never occurred to him that fighting was no longer merely the profession of a small class of mercenaries. When he read in his letters from home of Glasgow friends who had joined up, it was more with a feeling of wonder than of self-reproach.

About Easter 1915 work slackened. The shadow of conscription was over the land, and there began a steady stream of would-be clerks to the works, where the urgency of the contract promised protection. The manager was only too pleased to bring his staff up to strength, and, as a result of this augmentation, in May Cameron was unexpectedly granted a fortnight's much-needed holiday.

It was no problem to decide where to spend his holiday, and the same night he went to London, *en route* for Glasgow. This was his first venture into civilisation since war broke out, and within two hours of leaving Farham his eyes were opened. In the train to town he noticed that the other occupants of the compartment, five ladies and two soldiers, eyed him significantly, and Cameron wondered painfully if, after his long exile, he had committed some barbarism in his dress. Furtively he fingered his tie, his hat, and cast inquiring glances down his figure, but the puzzle was unsolved. Then a remark by an elderly lady (which Cameron possibly was not intended to hear) set him thinking, and by the time the train reached Liverpool Street he had realised two things: firstly, that this great Citizen Army was not a mere stunt of the Jingo press; and, secondly, that he, Evan Cameron, being outside such an army, was a shirker. Three hours' wait in London deepened the impressions, and Cameron's lameness, half-unconsciously, became much worse in consequence, until he noticed a recruiting-sergeant watching his limp with a sardonic smile. Then Cameron flamed red and hurried away. His compartment in the Glasgow express he shared with four troopers of the Ayrshire Yeomanry, gloriously fit and entirely content, who talked all night among themselves and ignored Cameron. And as these were the first fellow-countrymen he had met for nearly a year, he felt their want of friendliness bitterly.

In Glasgow he met with the same disappointment. Of all his old friends not one remained; they were at Gales, or Aldershot, or in France. An old class-mate, whom even Cameron had always regarded as rather a milksop, he met in

[Christmas Number.

the uniform of the Gordons, and was told cheerfully of an imminent move abroad. This cheerfulness annoyed Cameron, for he knew that, while the other was rejoicing to fight for his country, he himself had never even thought of it before, and now, having considered it, he was far from being allured by the possibility. True, he hated to be an outsider, especially in his own town. Against that, however, he set the rough soldier's life, and six months' slavery of military training, with the prospect of death in France as the background of it all, and his heart failed him.

He was glad to return to the seclusion of Farham. But even there he found that his new ideas had altered his views completely. Now, as he read the stories from the front, it was no longer as hired gladiators that he could regard the soldiers, for he knew that in every Scottish Division's advance had fallen his own school-fellows; the Camerons had been there, sons of Locheil like himself. He began to shun the newspapers and deliberately to try to forget the war. About this time, however, a military guard was placed over the works, and the soldiers, volunteers all, lost no chance of taunting those workmen and members of the staff who appeared of military age. Their gibes were powerless against the majority of the thick-skinned navvies, but to the Highlander they were vitriol. 'When are you going to join up?' 'What about the army?' 'How'd you like to fight for England?' Their questions, flung after him as he hurried past the pickets, echoed the barely stifled voice of conscience, and brought him face to face again with his betrayal of his race.

He would not admit to himself that he was a coward; after twelve months of open-air training, he promised himself, he would be equal to any one for grit. Sometimes he would almost make up his mind to try his luck—probably his ankle would ensure rejection; but months passed and he did nothing.

IV.

At last, one November morning in 1915, an incident occurred that drove him, in desperation, to take the decisive step. In one section of the marshes, about half a mile from the huts, there cropped out a low shelf of rock, and this was being cleared away by blasting. It was the usual practice to prepare a long series of shots early in the morning, and to light the fuses when the workmen had returned to the huts for breakfast.

This morning Cameron had strolled out alone for a breath of air before settling in his office, and although he knew of the blasting routine, his thoughts were so preoccupied that he walked right on to the ridge under which the fuses were at that moment burning. A look-out man had been posted at a distance to warn chance passers-by, and, observing Cameron's danger, he first
1920.]

shouted, without success, and then, although he knew that the shots were about to fire, ran towards him. To reach the Highlander, who was walking away from him, the man had to run up the steep face of the ridge, and, even as he was climbing, the first shot exploded a dozen yards from him.

At the detonation Cameron's heart jumped wildly, and, quite flustered for the moment, he faced this way and that, seeking a path of escape. At the foot of the ridge he saw the watchman, his leg broken by a hurtling stone. An instant's thought told Cameron of the man's danger, for, lying helpless as he did underneath the rock, the next shots might bury him in a fall of stone. Cameron's heart seemed to beat like a great hammer in his ears. For the first time in his life he was faced by a clear choice between life and death. If he did nothing, almost certainly the watchman would die; if he went to his aid, they would possibly both be killed.

'Help!' he shouted wildly, but the excavations around were deserted, and no other rescuers were in sight. Suddenly Cameron clambered down the ridge to the injured man, and tried to drag him away from the overhanging rock-face. He had gathered the man in his arms—a few yards would mean safety to both—when a distant shot at the far end of the ridge exploded with a heavy crack. Cameron started to his feet, glanced round frantically, and then, leaving the man who had come to save him, ran madly for the huts. He was a good quarter-mile away, when an irregular salvo of explosions thudded out behind him.

That day, and through the wakeful night that followed, Cameron was in a state of dazed misery. Towards morning he slept fitfully, and in his fevered dreams there came to him endless processions of kilted men. Some were in rags, shouldering a flintlock or armed only with a bow or a claymore; others carried the rifle and equipment of modern war; all, tattered or spruce alike, were bronzed and fearless of face. All, as they came towards him, swung past with averted head, and from their midst there came as from one voice, 'We are the Camerons that fought and died that the Clan might live. You we know not; get you kinsmen among the nameless dead.' And away into the distance marched that deathless gathering of the clan, leaving him alone. He had no illusions now; he knew that he was a coward.

By daybreak his mind was made up. Without telling any one, lest they should dissuade him, he arose early and set off at once for Netleigh. Before noon he was outside the recruiting-office, tired and washed-out after his restless night, with his ankle throbbing painfully, but feverish to get it all over before his determination ebbed.

V.

He was rejected, permanently unfit, on account of his lameness. Well, there it was settled for

him; for once in his life he had played the man, and Fate would have none of him. So be it; but all the way back to Farham he had to swallow down the lumps that rose in his throat. And as his taxi passed slowly through the gate of the oil-fuel area a waiting soldier wondered, audibly, why the handsome young fellow was not in khaki.

Cameron settled down to the office-life again. After the immediate disappointment, he ceased to regret his rejection; for his cowardice at the blasting, however, he could not forgive himself. A new hope came to him one day. A former civil engineer on the contract, Dixon by name, who had won the Military Cross for the destruction of a bridge under fire, was home on leave, and ran out to the works to see his old friends. Cameron was able to corner him, tell him the whole story, and plead for his opinion. To his surprise, Dixon displayed no contempt for his action.

'Ninety per cent. of men would have done the same as you did,' he said. 'Courage is a d—funny thing, Cameron. I've noticed there are two kinds. There is the courage that comes from a familiarity with danger; you haven't that, you say, and it's no fault of yours. And, again, there is a courage, often of the most dramatic kind, that is sometimes shown by a man from whom you didn't expect the pluck of a rabbit. It's an inspiration—a sudden atavism, caused by emotion perhaps, a throw-back for a thousand years to an age where no cowards could have survived to have descendants. You might easily exhibit that kind; your people were rather keen warriors in auld lang syne, weren't they?'

'They didn't transmit much bravery to me, if the blasting incident counts for anything,' put in Cameron sadly.

'I don't admit that,' said Dixon. 'You went to the fellow's help at first, and that's more than most men would have done. You mustn't look back at your failures, Cameron; look forward—always look forward to the next time. Very likely you'll surprise yourself next time; and, once you have won self-confidence, you need never fear the result.'

VI.

The 'next time' was long in coming. Cameron remained at his post throughout the war. He continued to read his histories of the clan and to pore over his maps, but now that word of Dixon—'Inspiration'—had impressed itself on him. On his next chance, it would come, perhaps; some noble thought driving him on, regardless of peril; some memory from the brave old centuries carried hidden from father to son, and suddenly reviving in himself. If an opportunity would only come, he thought, that he might put himself to the test, to stand a Cameron or fall a coward! But his proving did not come. A score of miles to the south hostile aeroplanes raiding almost

nightly would drop their bombs, and Cameron was often roused by the distant firing, and would stand, with racing pulse, at the hut door, wondering if death were coming for him that night, and praying for strength to meet it without flinching. But the raiders did not visit the oil-tanks, and Cameron never saw danger close at hand.

Peace came, and he was still waiting. In the main, he was happier now than he had been; he had on record for himself that he had done his best, if late, to enlist, and he did not despair that, at an early date, he might wipe out his cowardice of the ridge. His work he enjoyed to the full. As his old chief had died of dysentery at Malta, Cameron had been made cashier permanently in his stead, and he performed his duties with a methodic energy that earned him the sincere goodwill of his firm.

His principal job now was the supervision of the little staff who paid the workmen's wages. To draw the necessary cash, usually amounting to about six thousand pounds, he motored weekly with a clerk to Netleigh. This trip was made early in the day, and later all the money was checked in detail in his own room, a small apartment some ten feet square, opening on the larger office wherein worked his staff. The checking was generally complete before five o'clock, and the money, coins in trays and notes in bundles of one hundred pounds, Cameron locked up in a large safe behind his desk.

One bank-day Cameron had been unlucky. His car, a hire from a local garage, broke down about half-way from Netleigh. As the road was very quiet, there was little hope of assistance from passing vehicles, and, while Cameron stood by the money, the clerk had to be sent back on foot to Netleigh for a relief-car, with the result that Cameron arrived at the works with his precious burden a matter of four hours late. Such a loss of time threw back his work so far that five o'clock found him with a pile of untouched papers before him, and he decided to stay and finish his task.

'Smithson,' he called to the office-boy, 'bring me a cup of tea, will you, please? And you might ring up the mess to say I'll be late. Don't you wait. I'll lock up the office, and hand in the keys at Hut 52.'

By a quarter past five he was alone in the office. Some twenty yards away, in the next block of offices, he heard talking and some one singing, and knew thereby that one or two draughtsmen were working overtime. The wages money, ready to go into the safe, he left lying on the table for the moment, while he drank his tea and delved into an intricate problem of costing. The solution was elusive.

'There must be an error somewhere in the figures,' he worried it out, 'unless the estimates were grossly out. Oh, Fisher's estimates; must be right; must be the costing, then. . . . Cost of supervision, so much; cost of labour'—

[Christmas Number.

'I want you to keep perfectly quiet,' said a voice in the room. Cameron looked up. He had not heard the door open, and now two men, cloth masks over their faces, were standing in front of the desk. Cameron jumped to his feet, remembering, too late, that the safe behind him was open, and that six thousand pounds was lying exposed on the table.

'Sit down,' said one of the visitors, 'or'—and he tapped the desk with a revolver whose barrel glinted ominously towards Cameron.

Cameron's face went white, and he sat down quickly. Both men, he saw, were armed, and while the one laid his revolver on the table and hurriedly scooped the packets of Treasury-notes into a handbag, the other covered the cashier vigilantly. Cameron stared as if hypnotised at the weapon; a tiny bore it had, but from it, he knew, should he move or call out, would come death. If the man's finger should twitch, even—or perhaps the thieves intended to murder him in any case to safeguard their retreat! A deadly fear overcame him. His blood throbbed so fiercely that its rush seemed to choke him; his hands went to his throat, but trembled so that they could scarcely find their way. Then the room began to sway about him, and strange lights shot across his eyes; quickly the lights went, and the world grew misty and darker, darker. He was fainting—he wondered if he were already murdered; and just as his consciousness slipped from him, he heard a voice crying in his ear, 'Locheil! Locheil!'

VII.

Then it seemed to Cameron that he opened his eyes. The four walls of his den, the desk, the bandits were gone. He was crouching far up a mountain-side in the bracken that fringed a birch wood. With him lay a rough band of forty men, dressed, like himself, in a rude red tartan kilt, and armed with target and claymore. He saw how his fellows peered eagerly through the undergrowth, how they fixed their targets more firmly to the arm and drew down their bonnets; he marked how they seemed to await a signal for—something, something. He saw, too, that from one to the other along the line there crept a man, tall of figure and dark of hue; his dress was finer than that of the others, with collar and sleeves of tossing lace; his sword and dirk were silver-hilted, and in his belt was thrust an enamelled pistol. As he moved he spoke a word to each clansman, and as he passed a new fire kindled in each eye. And Cameron, as he watched him, wondered what it meant—these wild men, the rocky hill-side, this crouching in the bracken.

Slowly, clumsily, he raised his head and cast a hurried look over the glen beneath. A bare two hundred yards below him he saw a party of soldiers, some sixty strong, clothed in red tunics and grouped around a roaring wood-fire. 1920.]

Their arms incautiously laid aside and their open, careless manner told that they had no thought of enemies, no expectation of attack. Their noisy shouts came up to Cameron as in a strange tongue. This strangeness puzzled him, for he seemed to know that it was English they talked.

Ah, he realised what it all stood for. This was war; these careless men in red were his foes, and, with his comrades, he awaited a fateful signal to rush to bloody conflict, to slay and be slain. He understood the clansmen's excitement now; theirs was the stern warriors' joy, grudging every minute of delay. The leader was drawing nearer along the little line, and Cameron could hear his words.

'For honour and the King!' the man was crying. 'Fight, and let the eagles of Lochaber wheel afar to the Sassenach flesh. For Locheil and the King, an ye be Camerons!'

And as he passed, that chieftain with the daring eye, a strange thrill came to Evan Cameron; into his veins there seemed to come strong new blood, and to his arms strength. In his understanding a new thought was born—the Clan, his Chieftain, and his Duty. For them let his arm be the first to strike, and if he died, it would be for the undying honour of Locheil.

Suddenly a shrill whistle stabbed the air, and, from their ambush, the Cameron's warriors rise as one and pour in yelling torrent down the slope.

'Locheil, Locheil, fight on!' And Evan Cameron is shouting in the van.

And then again that dark mist blinded his eyes, a mist that passed quickly, and once more he was in his office, leaning limply forward in his chair. His vision, long as it had seemed, had been an affair of seconds of time. Still before him, one bandit, lips parted in a contemptuous smile, menaced him with the revolver; the other was still sweeping the loot into his bag; everything was unaltered. But the slogan of his clan was ringing in the Highlander's ears, and the latent, centuries-old instincts were clamouring to burst their bonds. A glance over the desk before him showed Cameron his weapon; a pair of scissors, the blades a bare four inches long, lay beside his hand, and like lightning he seized them. Then in that little Essex office his war-cry rang out, and, like a wild cat, Evan Cameron was over the desk at the robber's throat. The wretched man's smile froze on his lips, and twice, without aiming, he fired. Cameron felt a burning stab in his shoulder, but heeded it no more than if it had been rain. Into his enemy's neck he drove the scissors till the blades snapped off in the wound and the man collapsed screaming on the floor.

Then, disdaining to look at his fallen foe, Cameron wheeled to meet the other. The frag-

ments of the broken scissors he hurled in his new opponent's face, and sprang with empty hands at his throat. Together the men fell grappling on the table, which, already burdened with the weight of coin, collapsed with a crash, and a struggle for life began on the floor. As the thief had contrived in falling to snatch the revolver, Cameron with one hand was engaged in pinning down the weapon, while his other grasped his antagonist's throat and alternately tried to choke out the miscreant's life and to smash the skull on the boarded floor.

After his one death-thirsty slogan, no sound came from Cameron's lips, for he wanted no outside help. This was his own affair. These men had come against a Highlander's honour and life; now let them learn the penalty.

The fight was soon over. The combatants wrestled madly across the floor; the desk was upset, and the chairs. Then into the red pools they rolled together where the injured bandit was kicking convulsively in his agony, and a chance blow from his heavy boot broke Cameron's wrist with which he held the revolver in check. His maddened opponent did not lose his chance,

and at point-blank range he fired again and again at the Highlander's head.

Cameron felt a smashing blow on his forehead, and then another; a momentary arrow of pain shot through his eyes, and then daylight faded quickly. He seemed to be falling, falling; and the world and his life were slipping from him. He heard, as if far away, a shouting and a tramping, as would-be rescuers, too late, rushed in. Some one, he thought, tried to raise him, but for that he cared nothing. For another scene was before his eyes. He stood again as he had stood long before at the great march-past of his clan; again the innumerable kilted columns were coming towards him—but this time they did not pass him by, and now the ranks were opened to let him enter.

The draughtsmen in the room that had been Cameron's saw a movement of his lips as if he tried to speak, and bent to catch his dying words. Englishmen all, how could they guess his whisper was but the faint earthly echo of that great cry of 'Locheil!' from ten thousand throats as Evan Cameron marched away in the midst of his deathless clan?

Volume X. of the Seventh Series of CHAMBERS'S JOURNAL is now completed, price 15s. net.

An Index, with Title-page, price Twopence, has been prepared, and may be ordered through any bookseller.

A cloth case for binding the whole of the numbers for 1920 is also ready, price 3s. 6d. net.

Annual subscription, including postage to any address, either at home or abroad, 15s.

The January Part of CHAMBERS'S JOURNAL will contain—in addition to the customary features of entertaining and fascinating Short Tales and Original Articles of a popular and informative character—the First Instalments of a stirring Serial Story, entitled

THE MOUNTAINOUS MR NEUBURG,

By W. DOUGLAS NEWTON,

Author of

'War,' 'Green Ladies,' 'In America with the Prince of Wales,' &c.

The many admirers of his already published books, and of the short tale 'Instinct' appearing in the present issue of CHAMBERS'S JOURNAL, will read with intense interest this new story of Mr Douglas Newton's—a bright, brisk story of modern adventure and romance, in a setting ever varied, ever picturesque.

END OF THE TENTH VOLUME.
